- Failure of governments, when registering sole proprietorships, partnerships, and corporations, to determine if the officers listed in the Articles of Incorporation are who they say they are. This potentially allows criminals access to personal information through credit rating and data mining services.

The failure of corporate or government organizations to protect consumer privacy, client confidentiality and political privacy has been criticized for facilitating the acquisition of personal identifiers by criminals. Using various types of biometric information, such as fingerprints, for identification and authentication has been cited as a way to thwart identity thieves, however there are technological limitations and privacy concerns associated with these methods as well (TISN, 2009).

Regional Legal Responses

South Africa

- Section 85 of the ECT Act read with s 86 criminalises the unlawful possession of and utilisation of these devices. Anyone found in unlawful possession of any of such devices can be prosecuted and be sentenced to an imprisonment or receive a fine.
- Section 15(1) and s 47(A)(1) read with s 80(1)(a) and 83(b) of the Customs and Excise Act 91 of 1964 stipulate that anyone found being in possession of or who purchases or sells (s 102(1)), imports (38(1) read with s 39 and s 40) or exports such devices can be prosecuted and sentenced to prison.
- Section 155(2)(A) of the Criminal Procedure Act 51 of 1977 stipulates that a receiver of property obtained by means of an offence will be deemed to be a part in the offence in question.
- Criminal charges of aiding/abetting an accessory after the fact can also be brought against any person who helps in the illegal copying of card information.

United Kingdom

In the United Kingdom personal data is protected by the Data Protection Act 1998. The Act covers all personal data which an organization may hold, including names, birthday and anniversary dates, addresses, telephone numbers, etc. Under English law (which extends to Wales but not necessarily to Northern Ireland or Scotland), the deception offences under the Theft Act 1968 increasingly contend with identity theft situations. In *R v Seward* (2005) EWCA Crim 1941 the defendant was acting as the "front man" in the use of stolen credit cards and other documents to obtain goods. He obtained goods to the value of £10,000 for others who are unlikely ever to be identified. The Court of Appeal considered sentencing policy for deception offences involving "identity theft" and concluded that a prison sentence was required. Henriques J said at para 14: "Identity fraud is a particularly pernicious and prevalent form of dishonesty calling for, in our judgment, deterrent sentences."

Increasingly, organizations, including Government bodies will be forced to take steps to better protect their users' data. Stats released by CIFAS - The UK's Fraud Prevention Service show that there were 89,000 victims of identity theft in the UK 2010. This compared with 2009 where there were 85,000 victims. Men in their 30s and 40s are the most common UK victims and identity fraud now accounts for nearly half of all frauds recorded.

United States

The increase in crimes of identity theft led to the drafting of the Identity Theft and Assumption Deterrence Act. In 1998, The Federal Trade Commission appeared before the United States Senate. The FTC discussed crimes which exploit consumer credit to commit loan fraud, mortgage fraud, lines-of-credit fraud, credit card fraud, commodities and services frauds. The Identity Theft Deterrence Act (2003) [ITADA] amended U.S. Code Title 18, § 1028 ("Fraud related to activity in connection with identification documents, authentication features, and information"). The statute now makes the possession of any "means of identification" to "knowingly transfer, possess, or use without lawful authority" a federal crime, alongside unlawful possession of identification documents. However, for federal jurisdiction to prosecute, the crime must include an "identification document" that either: (a) is purportedly issued by the United States, (b) is used or intended to defraud the United States, (c) is sent through the mail, or (d) is used in a manner that affects interstate or foreign commerce. *See* 18 U.S.C. § 1028(c). Punishment can be up to 5, 15, 20, or 30 years in federal prison, plus fines, depending on the underlying crime per 18 U.S.C. § 1028(b). In addition, punishments for the unlawful use of a "means of identification" were strengthened in § 1028A ("Aggravated Identity Theft"), allowing for a consecutive sentence under specific enumerated felony violations as defined in § 1028A(c)(1) through (11). The Act also provides the Federal Trade Commission with authority to track the number of incidents and the dollar value of losses. Their figures relate mainly to consumer financial crimes and not the broader range of all identification-based crimes. If charges are brought by state or local law enforcement agencies, different penalties apply depending on the state.

Structured Survey Conducted in Manhattan, USA in July 2012

This survey showed a decrease in the total number of victims and a decrease in the total value of identity fraud from US\$47.6 billion in 2003 to \$15.6 billion in 2006. The average fraud per person decreased from \$4,789 in 2003 to \$1,882 in 2006.

The 2003 survey from the Identity Theft Resource Centre found that:

- Only 15% of victims find out about the theft through proactive action taken by a business;
- The average time spent by victims resolving the problem is about 330 hours;
- 73% of respondents indicated the crime involved the thief acquiring a credit card

In a widely publicized account, Michelle Brown, a victim of identity fraud, testified before a U.S. Senate Committee Hearing on Identity Theft. Ms. Brown testified that: "over a year and a half from January 1998 through July 1999, one individual impersonated her to procure over \$50,000 in goods and services. Not only did she damage my credit, but she escalated her crimes to a level that I never truly expected: she engaged in drug trafficking. The crime resulted in my erroneous arrest record, a warrant out for my arrest, and eventually, a prison record when she was booked under my name as an inmate in the Chicago Federal Prison." In Australia, identity theft was estimated to be worth between AUS\$1 billion and AUS\$4 billion per annum in 2001. It is here where it was indicated that in the United Kingdom the Home Office reported that identity fraud costs the UK economy £1.2 billion annually (experts believe that the real figure could be much higher) although privacy groups object to the validity of these numbers, arguing that they are being used by the government to push for introduction of national ID cards.

IMPLICATIONS FOR MANAGEMENT PRACTITIONERS

When a crook uses one's good name to commit fraud or robbery, the impact on one's reputation, employability, and credit is severe and can last for years. One may even find oneself arrested for crimes one did not commit. So it's important to protect one against identity thieves. The telltale signs that one's identity has been stolen can be subtle and go unnoticed for months, even years. Inexplicable charges on one credit card bill may be chalked up to clerical errors. Letters from creditors one has never heard of and certainly never did business with may be ignored. But eventually, an enormous credit card bill, legal papers or police show up at one's door. You are denied a mortgage or a job. Then the real nightmare of proving "I didn't do it" begins.

General Dishonesty

(3) A person is guilty of an offence if: a) the person does anything with the intention of dishonestly *causing a loss to another person*; and b) the other person is a Commonwealth entity. Penalty: *Imprisonment for 5 years*. Likewise, each state has enacted their own privacy laws to prevent misuse of personal information and data. The Commonwealth *Privacy Act* is applicable only to Commonwealth and territory agencies and to

certain private sector bodies (where for example they deal with sensitive records, such as medical records, or they have more than \$3 million turnover PA).

SUGGESTED RECOMMENDATIONS

Anyone who finds any strange device on an ATM or know of person(s) in possession of such a device or devices should immediately contact the police near that area. It can be maddeningly difficult to clear your name, costing hundreds of hours and thousands of money loss (Fick, 2009). That's why it's important to take steps NOW to make it as difficult as possible for a scammer to victimize you. Take action on these ten tips as soon as possible, and you'll tip the scales in your favour:

- Check your credit report on a regular basis, to see if there is any incorrect information, or accounts you don't recognize. My article [Free Credit Reports Online](#) explains how U.S. citizens can get three free credit reports per year.
- Shred your sensitive personal documents before throwing them away. A battery-powered cross-cut shredder can render your banking and credit card information unreadable and costs less than \$30. "Dumpster diving" is a favourite, low-tech way by which ID thieves collect bank statements, credit card numbers, Social Security Numbers, and other bits of your identity from your trash.
- Be wary of telephone solicitors asking for personal or financial information to "verify your identity." Common scams involve someone who claims to be from your bank or credit card Company, claiming that there is a problem with your account. If you did not initiate the call, hang up and call the toll-free number on your statement, then ask for the security department.
- Keep important documents, such as tax returns, birth certificates, social security cards, passports, life insurance policies and financial statements secure in your home. A fireproof safe is a good idea, but remember to bolt it to the floor or hide it well.
- Make sure no one is looking over your shoulder when you enter your debit card's PIN at an ATM or point-of-sale terminal. I recommend the "two finger method" where you point two fingers at the ATM keypad, but only press with one. This makes it nearly impossible for someone nearby to discern your PIN while you're entering it.
- Memorize PINs, account numbers, and passwords; do not write them down. And for heaven's sake, do not put such data on scraps of paper kept in your wallet, purse, or laptop case!
- Get blank checks delivered to your bank branch, not to your home mailbox from which they may be stolen. On a similar note, eliminate junk mail which may contain "convenience checks" and credit card offers that can also be intercepted from your mailbox. Visit the [Privacy Rights Clearinghouse](#) and [OptOut Prescreen](#) for help eliminating these dangerous nuisances.
- When you order a new credit or debit card, mark the calendar and follow up promptly if it does not arrive within 10 business days. Ask the card issuer if a change of address request was filed, and if you didn't do it, hit the panic button.
- Don't give your Social Security Number to any business just because they need a "unique identifier" for you. Instead, ask if you can provide alternate proofs of identity, such as your driver's license or birth certificate.

Consider placing Fraud Alerts with the major credit bureaus, so new accounts cannot be opened without your knowledge. Call Equifax, and they will pass along the request to both Experian and Trans Union. Fraud alerts expire after 90 days, so you can repeat the process quarterly, or lock down your credit file with a Credit Freeze. A freeze is permanent and free (in most U.S. states) but it may interfere with loans applications, employment screening, signing up for utility or phone service, new insurance policies, and other transactions. You'll also need to contact each credit bureau (Equifax, Experian, and Trans Union) to request the credit freeze.

FINDINGS

Confusion over exactly what constitutes identity theft has led to claims that statistics may be exaggerated. An extensively reported study from Microsoft Research in 2011 found that estimates of identity theft losses contain enormous exaggerations, writing that surveys "are so compromised and biased that no faith whatever can be placed in their findings." This paper finds that because of the lack of adequate knowledge by our courts as to exact punishment to be meted for perpetration of this crime SECTION 66C of the Indian Information Technology Act 2000 Chapter IX provides that:

Whoever, fraudulently or dishonestly makes use of the electronic signature, password or any other unique identification feature of any other person, shall be punished with imprisonment of either

description for a term which may extend to three years and shall also be liable to fine with may extend to rupees one lakh.

The law courts can thus safely be guided from now on by this section in order to attach *ratio decidendi* in delivering a sentence based on cybernetic ID crimes committed.

CONCLUSION

This paper aimed to show that prevention is better than prosecution. Devoting time and resources to implement strategies that make it difficult for criminals to perpetrate their crimes within organisations is more efficient and cost effective than trying to catch them after you had been the victim of a cyber attack. And in the unlikely event that you do fall victim to cyber crime and you have the right strategy and systems in place, you would also have a disaster recovery plan in place that enables the organisation to effectively and efficiently deal with the consequences of an attack, an audit trail that can point your investigation in the right direction and evidentiary material available that could stand the scrutiny of a court. Catching and eventually prosecuting cyber criminals are difficult and costly, both in terms of money, time and resources. For businesses and government alike the reputational damage attached to a cyber attack can also be costly.

INSTITUTIONAL MECHANISM OF THE INNOVATION DEVELOPMENT OF RUSSIAN ECONOMY

**Tatiana Leonova , State University of Management, Russia
Maxim Eygel, Higher School of Economics, Russia**

ABSTRACT

The current status of the Russian economy, its role in the international division of labor and status of innovational potential leave much to be desired. Overcoming of these negative tendencies is possible only under activation and development of venture innovative activity, creation of new forms of innovative infrastructure. An innovative type of development involves variation and updating of forms of activities in accordance with shifts in the technological base, values, stereotypes of the production and consumer behavior in society and business entities, with any changes in the socio-economic system and its links with the outside world.

INTRODUCTION

The institutional structure of society while creating, regulating, organizing and controlling the various social processes, provides solutions to emerging problems in a systematic manner. The completeness and maturity of the system determines the orientation of social institutions and the stability of society. Since the latter is in a state of a constant change, then the institutional structure is transforming, where some institutions emerge, others die off, their functions, context, form, content, location and role in the system of social relations are changing.

The authors define the institutions – both developed formal (laws, constitutions) and informal (contracts and voluntarily adopted codes of conduct) restrictions, as well as coercive factors that structure their interactions. Together they form the incentive structure of societies and economies. Institutional development of the economy is also influenced by the interaction between institutions and organizations, when first determine the "rules", while the latter are the "players". Based on the above definitions, the author defines the institutional mechanism as a set of methods and means of influence on the institutions, their management and development.

In the economic terms we can define institutional mechanisms at the macro, micro and meso levels. From the standpoint of the structure of the economic mechanism, the integrity of the institutional mechanism is provided by stable relations of its individual elements. The structure will be characterized, first, by the presence of connection of the formation, operation, adjustment and implementation of institutional constraints in the economy, and secondly, by the time sequence of their implementation, in third, by a set of feedback loops that have a stabilizing effect.

VENTURE CICLE

It can be argued that the wider the range of institutions, the higher the rate of new transactions, the more options for development due to a variety of areas of selection decisions. Mobility of the institutional system, its flexibility and ability to respond to evolutionary change provides an opportunity for the development of economy and society as a whole, and promotes this development and directs it, to create favorable conditions for the formation of new structural units of the market.

Venture enterprise, despite it doesn't have a great history allows us to analyze the major trends that show its development cycle and the role of government in enhancing the venture business. Venture cycle in

its development goes through four stages: fundraising – finding the venture enterprise or project – realization of the project - exit out of business.

There are several reasons why the venture capital cycle may falter, or it may not be fully completed. In the first stage it may be the lack of funds or lack of attractiveness of venture financing. In the second stage it is insufficient development of the scientific environment, not generating innovative projects or lack of information on the availability of such projects. In the third stage the lack of a sufficient number of innovative management and heavy tax burden, not allowing venture capital firms to grow and be successful. On the fourth stage the problem is in underdeveloped stock market and mechanisms of intellectual property protection, etc.

At a time when there is no transition from one stage to another in the venture cycle, there is "marking time" or a complete cessation of the project, government regulation may contribute to the consistent and timely implementation of the venture capital cycle, which is based on its specific role in the innovation economy. The authors believe that this is due to:

1. Lack of investment in research and development. Markets do not have sufficient degree of information security. If there is no intellectual property protection, you can not sell the information on the open market, as any buyer can reproduce and resell the goods at low prices. Moreover, the potential buyer can determine the value of information only after receiving the goods, then he has no incentive to pay for this information.

2. Information obtained from R&D, can now be assigned to only partially. Thus, in the absence of effective information market, companies, focused on profits, invest in R&D less than necessary. To remedy this situation, the government should support R&D, especially basic research at universities, research institutes and enterprises.

3. Coordination between the participants of the innovation system. The effectiveness of the innovation system depends on the relations between enterprises, research institutes, universities, development institutes and government agencies. At the same time, institutions and individuals who work there may have very different priorities, which may hinder cooperation. If the differences in priorities are sufficient to reduce the long-term effectiveness of the innovation system, a system error occurs. Here, the government can contribute by creating incentives that promote the movement of knowledge between organizations in different phases of the innovation process, thus reducing system failures in the commercialization of new technologies. In this regard, the government should provide funding based on their chosen priorities of innovational development of economy.

4. Inertness of innovational systems. Institutional change is based primarily on the extensive adjustments, while the external stimuli may trigger a more rapid change. When the development of innovation systems is constrained at the level of institutions and organizations, government intervention can stimulate new ways of development. Thus, innovation policy can contribute to greater flexibility in the R&D and its development.

5. Lack of comprehensive information on prospective studies.

It is difficult and expensive for market participant to obtain information on promising areas of business development. But even if he has information, he may decide that it is unprofitable to use it, or considers it has mistakes. In this situation, it is the state, having a community of independent experts, based on the trends of the market should determine the long-term trends in public investment in innovation. But private capital, if it agrees with the direction of investments of the state may participate in joint investment or to invest in those independent innovations, which are considered as promising.

Thus, we can assume that without state influence on the development of venture businesses, it will continue to be a subject to severe fluctuations. The role of the state is to smooth out these fluctuations. It should play a major role during the recession and weaken its influence in the growth period. Should be designed public policies of the venture business, based on the goals and strategies of innovational development of economy.

"FIVE-FACTOR MODEL"

The author's study shows lack of availability of only three factors, such as government, business and universities, for an effective innovational economy. The development of venture business is possible only in the presence of innovative ideas that should be generated based on the high level of education. Therefore, the development of venture business model is, in author's opinion, should consist of five elements that define the institutional framework of venture businesses:

Figure 1. “Five-factor model” of innovational development of the Russian economics in the area of venture business.

1. The state which is an active participant in the innovative development and determines the rules of the game on the market, but also regulates the implementation of these rules, as well as funding research and development.
2. Infrastructure of the venture entrepreneurship which represent the non-financial development institutions, which are created to overcome market failures and stimulate the development of venture businesses.
3. Institute of education in the development of venture business should include all levels of training of various specialists, able to generate further knowledge and professionals who can manage innovation.
4. Institutional structures that are designed to generate ideas for their implementation by venture entrepreneurs.
5. A business that implements these ideas into real products.

This "five-factor model" shows how necessary that all these elements of the venture business interact with each other and institutional mechanisms should have been developed that allow you to do it. The state structures providing financial support and management impacts on all elements of the venture business. Business structures can finance structures that generate knowledge, educational structures and institutions of development. Development institutions, in turn, may generate knowledge of the structure of finance, education structure and business structure. All elements of the venture business must interact with each other. If it doesn't happen then the state through the managerial impact is trying to create an institutional framework for enhanced cooperation among all elements of the system.

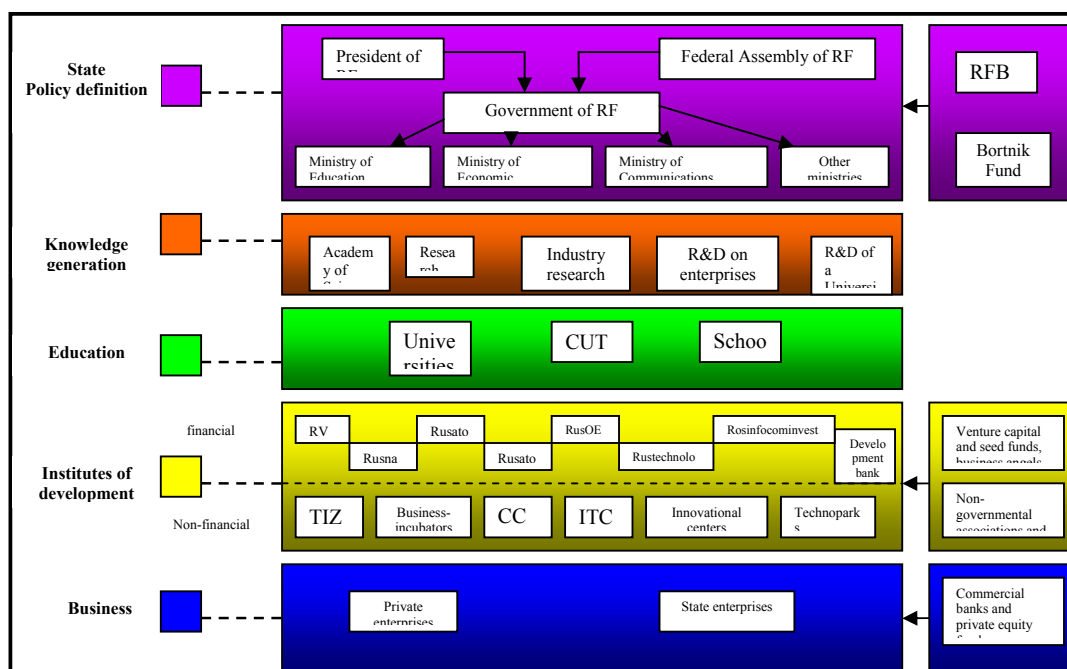

Figure 2. The institutional structure of the innovative development of Russian economy in the area of venture business

Figure 2 show that the Russian system of institutional support for the venture business has all the elements necessary for its operation. But we need to introduce new and improved old institutional arrangements to enhance the interaction of all elements of this system. A special role in this process is assigned to the state.

THE ROLE OF THE STATE IN THE INNOVATION ECONOMY

The state's role in the innovation economy grows and public policy is not just a list of priorities, but an interconnected system of strategic objectives and their feasibility. There are a number of significant environmental conditions and limitations in space, the choice of management decisions that must be taken into account in the formulation of economic policy. Innovational policy is part of the economic policy of the state, so the methodology of its formation is common.

The first in a chain of public policy component - the choice of values – it allows to continue through what is called the generator of the development goals, starting from the values , to form the objectives of management or development within this state policy. It is important to understand that only after the formation of values and goals, the problem field of management can be formulated, since it is reflexive of value choices. It is important that the objectives are complementary, or neutral at least, but not mutually exclusive.

The next step is to define the tools and / or mechanisms of state regulation, which will be used to achieve these goals. After that - the definition of the resources needed to implement the goals. In their presence, we can talk about the possibility of transition to the next step - the definition of public authority responsible for achieving this goal. A very important factor affecting the efficiency of the implementation of public policy, is the period to achieve this goal. In this case, particular importance should be given to internal

The final stage of the development of public policy - the definition of outcome indicators and performance indicators, implementation of public innovation policy. Thus, on the basis of the mechanism represented by the state innovation policy by developing a matrix of the state innovation policy conducive to

the implementation of the institutional mechanism of innovative development of Russian economy in the venture business. The table below shows one of the possible options for its use.

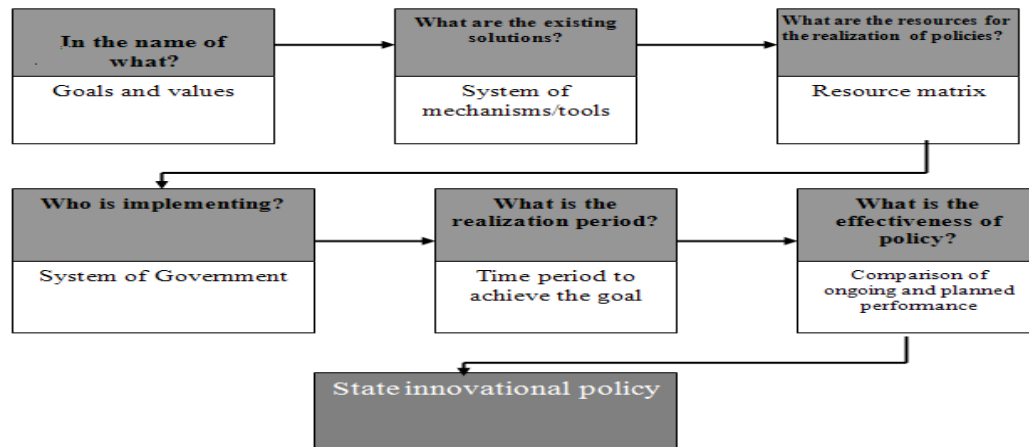

Figure 3. The scheme of formation of the state innovational policy

Goal	Instruments	Resources	The liable agency	Realization period	index
Increase in innovation activity of enterprises	Improvement the legal framework	Tax breaks for small innovative enterprises	The Russian government	2014	Shares of companies engaged in technological innovation
Russia's withdrawal to the international innovative market	Participation in international innovative conferences	Financial breakthrough for innovative technologies, oriented on the international market	Commission under the President of the Russian Federation on the modernization and technological development	2017	Russia's share in world markets high-tech products
The increase of innovational products in the global market	Improvement of customs export regulations	Reduction of export duties on hi-tech products	Federal Customs Service of Russia	2017	The share of export of Russian high-tech products in total world exports of high-tech goods
Increasing the share of GVA innovation sector in the GDP	Stimulating innovation companies by creating a favorable investment climate	Accelerated depreciation of R&D	All the organs of the NIS	2015	Share of GVA of the innovation sector in the GDP
The increase in domestic expenditure on R&D in GDP	Improving the regulatory framework to increase private investment in R&D	Special tax regime for innovational active companies	The Russian government and business sector	2015	Gross domestic expenditure on R&D in GDP
Increasing the contribution of Russian scientists in the world fundamental science	Increasing motivation of Russian scientists to develop innovative national proposals	Increasing the share of budget funding of basic science	Academy of Sciences, Academy of Medical Sciences, universities, Agricultural Sciences, Research Center, Research Center, FSPC	2016	The share of Russian researchers in world number of publications in scientific magazines
Raising the prestige of Russian universities in the world	Increased funding of scientific research-based universities and allowing researchers to participate in international researches and conferences	Raising funds from international and Russian scientific foundations by Russian institutions of higher education	The Ministry of Education and Science, Russian universities	2018	The number of universities in the international ranking of 200 universities

and external innovation policy lag.

Table 1. The matrix of the state innovation policy in the venture business

A very important factor affecting the efficiency of the implementation of public policy, is the period to achieve this goal. In this case, particular importance should be given to internal and external innovation policy lag.

The matrix (table1) shows a clear interdependence of public policy objectives, instruments of state control of resources, aimed at realizing this goal, the responsible government, implementation period and targets to be achieved at the time of implementation of this goal.

IMPLEMENTATION

Thus, the author of the article proposes to develop and implement innovative public policy in the venture business, aimed at the formation and development of innovative economy in the Russian Federation on the basis of institutional "five-factor model" of development.

REGIONAL DEVELOPMENT IN THE NATIONS OF THE SOUTH: THE SUCCESSES AND FAILURES OF THE CARIBBEAN COMMUNITY AND COMMON MARKET

Frank Paul Le Veness
St. John's University, USA

ABSTRACT

The Caribbean, along with many other nations of the South, sometimes referred to as developing nations, has initiated regional integration as a method of overcoming the negative political, economic, and social effects of colonialism. From its origins in the 1960s, the effort has risen from a Free Trade Area to a Common Market to a Community. This paper examines the successes and failures, particularly from an economic vantage point, of this development effort.

BACKGROUND

As reported by this author, at times with colleagues, the concept of serious regional integration in the Caribbean dates to the period of independence. During the post-World War II period, it may well be argued that two forms of development processes evolved. The first was on a relative grand scale, virtually world-wide, so to speak, and included the programs basically of European reconstruction after the devastation of that war and in the face of the spreading Soviet threat, as it was viewed by the American government. This included the creation of the International Bank for Reconstruction and Development, and over the years, its related agencies (now the World Bank Group), the International Monetary Fund (IMF), the Marshall Plan, and other practices emerging from the Bretton Woods conference and agreement. However, a second effort emerged, one which argued that regional cooperation would also be a most successful way of economic, political, and social development, particularly for the nations of what was then called the Third and Fourth Worlds, today the nations of the South, who were emerging in relative degrees of poverty, often to a significant degree as a result of the negative effects of colonialism and, it is often stated, an attempt by major powers to maintain economic, if not direct political control, in the post-colonial period, a practice dubbed as neocolonialism.

Juan M. Fernandez, for whom I want to offer special thanks and credit, and I, previously chronicled the emergence of the concept of such integration in the Caribbean, including a paper delivered at GBATA (Le Veness and Fernandez, 2009, *passim*). The integration effort, recognized as necessary by the United Kingdom, emerged as a British proposal for unification of its former colonies under an institution to be named the Federation of the West Indies, which took shape as early as 1958. However, this proved to be a non-starter, as the newly emerging nation-states were not about to permit unification under one central authority. Trinidad and Tobago quickly withdrew, with the famous phrase coined by its Premier, Dr. Eric Williams, "4-1=0." Nevertheless, there was a considerable concern expressed concerning the viability of small nation-states, often referred to as mini-states, and their possible survival in the global economic and political society. Cooperation was, indeed, perceived as the best road for development, creating larger markets, possible free movement of labor and finances, cross-fertilization of industrial endeavors, and the like. In short, there was an effort to overcome specific vital concerns, including what the Caribbean Community Secretariat listed as: "(a) high rates of unemployment, (b) the vulnerability of the high-cost agricultural export sector; (c) near-stagnation and, indeed, slow death of Domestic Agriculture; (d) the lack of 'forward and backward linkages' in the national economy – around Minerals, Manufacturing and Tourism; (e) continuing and growing foreign ownership and control of the economies; (f) low national savings, increasing tastes for foreign goods and high consumption levels of imported goods; (g) the failure to

develop extra-regional exports of manufactures and new non-traditional agricultural exports; (h) the existing of few “linkages” between the national economies of the Region – whether measured by the proportion of intra-regional trade to total trade or by ‘linkages’ between the productive sectors of the national economies” (CRS, 1973, 10).

In 1965, in the Treaty of Dickenson Bay, a number of the new states created a free trade zone, entitled the Caribbean Trade Association, which was subsequently enlarged to include the other former British dependences, including all the smaller Leeward and Windward Islands which were formed into the Associated States, and later, after independence, the Eastern Caribbean Common Market. Benefits included: (a) to promote the expansion and diversification of trade in the area of Association; (b) to secure that trade between Member Territories takes place in conditions of fair competition; (c) to encourage the progressive development of the economies of the Area; (d) to foster the harmonious development of Caribbean trade and its liberalization by the removal of barriers to it” (CARIFTA Charter, Art. 2).

However, there were several limitations to CARIFTA. First, it only dealt with the question of internal markets and the lowering and elimination of tariffs and other artificial barriers to trade among the member nations. It did not include such vital issues as Direct Foreign Investment, have the advantage of a unified currency system, have control over tariffs and other trade barriers or agreements between member states and other nations outside of CARIFTA, and the like (see CCRS, 1971, 51; CCRS, 1972, Chaps. 3, 5, 6). As a result, and, undoubtedly viewing the success of agreements in other areas of the world, particularly the European Common Market, the islands initiated negotiations which led to the first Treaty of Chaguaramas which became effective on 01 May 1974.

The new treaty created the Caribbean Common Market and Community, and organization designed specifically to overcome the short-falls of CARIFT by enlarging the economic control of the Heads of Government Conference, Secretariat, and other elements of the new Common Market and Community both with regard to economic affairs and with regard to political and social concerns. This included a free trade area among members, unified economic policy with regard to other global trading partners, free movement of labor and capital within the region, innumerable social services, from weather forecasting, to shipping, to continuing and higher education, and the like. Bauman (2008) noted that the main concern of CARICOM has been “to promote economic integration of member countries by means of a common market, coordination of a common external policy and functional cooperation in terms of health, education, culture, communication, and industrial relations” (p. 6).

However, the world economy has significantly changed, and particularly, has globalized. This is witnessed, for instance, by the conversion of the post-World War II General Agreements on Tariffs and Trade (GATT) with its various amending Rounds, e.g., Uruguay Round, Kennedy Round, and the like, and the creation of the World Trade Organization (WTO). All of this, not least the WTO, has its many critics, many of whom believe that this new world order, if it may be named that, and its institutions, including the WTO, sustain a world trade pattern that favors the nations of the North. In some cases, it is suggested that this may be a deliberate endeavor to limit the development of South nations, for purposes of maintaining and increasing the wealth of North nations by creating limited development in harmonization with the manufacturing and other industrial, and even agricultural, patterns of the North, and/or fearing that such development in the South might well place an unacceptable strain on the world’s resources, which those North nations are not willing to share with the South in a sufficiently acceptable manner. ““The recent globalization process poses significant challenges to small developing economies, such as those in the Caribbean which are already dealing with a number of issues in their pursuit of sustainable development” (UN/ECLAC, 2002, Chap. 11).

Whatever the case, and it is far beyond the scope of this paper to undertake a discussion of these global economic (and, therefore, political) conflicts. What needs to be stated is that by the opening years of the Twentieth Century, there was sufficient global economic change, that it was strongly believed that the original CARICOM provisions were in need up revision and updating. The original Treaty of Chaguaramas was in need of serious revision.

CARICOM FACES THE TWENTY-FIRST CENTURY

A Fernandez and I reported earlier (2009) citing Khary (2002), the Caribbean islands face the problem that “their small island states face significant hindrances to development such as modest populations, limited expanses of viable land, and insufficient capital flow.” He adds, “CARICOM’s members are not large

nation-states with significant amounts of resources at their disposal. Unlike the EU which one can argue has France and Germany as its 'economic anchors' CARICOM does not have a 'superpower' to rely on to stabilize it. Even worse, the global shift toward free trade has hit the Caribbean hard removing market protections of major industries like bananas," (p. 9).

To counter these developments, in 1992, a Caribbean Single Market Economy (CSME) was initially proposed, and in 2001 the CARICOM nations gathered and revised the Treaty of Chaguaramas, a major change in which was the incorporation of the CSME. Fernandez and I reported a number of changes which resulted from this redesigned treaty. For example, it seeks "the achievement of a greater measure of economic leverage and effectiveness of Member States in dealing with Third States, groups of states, and entities of any description" (Revised Treaty). It seeks to "stimulate and facilitate improved competitiveness in regional economies and to heighten power in the different theatres of international economic negotiations" (Girvan, 2005, 1). It is interesting to note that the revised treaty puts the members of the Caribbean Common Market into compliance with the World Trade Organization, a factor which did not have to be considered in 1974, but which could have a significant impact on their future trade relations. It might be well to recall the so-called "banana war" between St. Lucia, a CARICOM member, and the Central American nation of Honduras, a case heard before the WTO, which was lost by St. Lucia. As we had reported in the 2009 paper at GBATA, the Foreign Minister of the Bahamas, Fred Mitchell reemphasized: "This decision was taken against the background of a fast moving world economic situation, where trade liberalization is the order of the day, and where The Bahamas must position itself or get left behind in the global economic gain" (2005). Valerie Alleyne-Odle, n.d.) has noted that "[t]he CSME is aimed at integrating the economies of CARICOM into a unified market in which goods, people, services, capital and technology can move freely across borders under the same coordinated and harmonized economic policies. The enlarged economic space is intended to minimize the inherent weaknesses resulting from small size. In addition to economies of scale, there is expected to be derived significant economies of scope" (p.3). Three other identified benefits included "the free movement of factors of production would result in increased efficiency in the allocation of resources for both goods and services and create a more conducive business environment" hoping to attract more intra-regional and external investors, "the achievement of macro-economic harmonization in such areas as monetary, financial, investment, incentives and fiscal policies" assisting the business community, including labor, and, very importantly, "the greater efficiency enjoyed under the CSME for intra-regional competition will serve as a platform for more enhanced international competitiveness of the Caribbean economies" (pp. 2-3). She concludes that the CSME "may be seen as an instrument that creates the enabling environment which can deliver the desired social change and improved standard of living....stimulate endogenous growth within CARICOM economies; enhance international trade competitiveness, and the increase scale and scope of the production base for regional and extra-regional markets" (p. 13). However, she ends with a note that becomes so urgent later on, and is further discussed later in this paper, that the scheme needs "[t]he establishment and effective functioning of the attendant institutional framework" which is so vital to its success (p. 13).

Perhaps one of the most important aspects of that 2001 revised treaty was, in effect, the creation of a Caribbean Single Common Market and Economy (CSME). This has really changed the economic condition of the region. Members now are expected to harmonize to the point of virtually becoming one economy, with common policies which would enhance that reality, such as common movement of labor (so difficult in areas of relatively high unemployment and underemployment), one economic policy, such as a tariff and quota system, trade policy toward non-members as well as each other, movement of investment capital, and integration into a global economy which seeks to establish freer, and eventually, at least in theory, free trade. However, it would seem it can still be debated as to exactly how much power the CSME would offer central authorities and how much would be retained by the states, presumably to be determined in the coming years. One worrying comment was expressed by Bank of Barbados Governor Dr. Desislle Worrel, who stated that in the CSME, "economic issues are debated from an exclusively national perspective, with little or no attention paid to the implications of developments elsewhere in the region" (2007, 82).

Specifically, the Revised Treaty seeks "the removal of all restrictions on movement of capital payments (Art. 40), "equity and portfolio investments, and payments relating to investment flows (Art. 40), and [T]he establishment of a regional stock market.....seen as an integral part of the deepening and widening of the integration process in CARICOM..... as [they] move to establish the CARICOM Single Market and Economy" (Robinson, 2006, 31). In short, the purpose of the Revised Treaty is to "achieve sustained economic development based on international competitiveness (Preamble), a significantly different goal than that set by the original Treaty of Chaguaramas in 1974.

AS TO THE FUTURE.....

Much has occurred since the Revised Treaty of Chaguaramas took effect at the start of the Twenty-First Century, and yet, much has tended to remain the same. For instance, in a study produced in 2003, it was noted that a mere 0.2% of total trade occurred between the Central American nations of the Central American Common Market (CACM) and the CARICOM nations. This study cites an earlier (1999) report which notes that “CARICOM trade with CACM” is influenced by historical factors, language differences.....and the scarcity of established linkages” (Harding and Hoffman, 18). This is an illustration of the type of seemingly almost unchangeable condition which needs to be corrected if greater Caribbean economic integration is to be achieved.

In addition, the world economy has continued to globalize, and true to the fear of many, the downs of that world globalization, such as the economic crises at the end of the first decade of this century has caused severe problems for many of the nations of the South, including the CARICOM nations. ECLA (2010) noted that “countries in the region have been hit hard by the global economic and financial crisis, in part because their economies and public finances were already fragile before entering the turmoil (p. 118). It noted that the downturn was particularly severe with regard to commodity exports, but less so with regard to services. Naturally, the tourist industry was extremely hard-hit by the world conditions. What is even more interesting, ECLA reported that even when analyzing the period 1990 to 2008, although the aggregate of goods exported had risen for the region, the actuality was that only Trinidad and Tobago had made substantial gains. The position of the remainder of the nations remained rather flat (pp. 121-22). What is perhaps another serious indicator, was that during that same period, though the service industries had main significant gains, the percentage of their participation in the total of world service exports had declined, though that is an extremely vital sector for most of the CARICOM members with the exception of Trinidad and Tobago, Suriname, and Guyana (p. 123). Even trade within the group “is a relatively small but growing share of total trade.” However, it “is skewed towards a few countries and a handful of products, as for example, Trinidad and Tobago, by far the leader in such production, relies heavily on oil and its products in sales to other member countries (p. 125).

Clearly, however, much of the downturn can be attributed to the global crises of the period. For instances, Mohammed and Anvanwu stated that “Caribbean Community (CARICOM) countries have experienced severe economic decline since 2008. While countries across the globe were impacted by the economic and financial meltdown, the intensity of its effects upon CARICOM states was so utterly devastating that by 2009 several member states had approached the International Monetary Fund (IMF) for assistance to stabilize their economies. These scholars suggested [d]eclining commodity prices, travel receipts, remittances and external demand meant that virtually every CARICOM country was negatively impacted. By 2009, the more developed countries (MDCs) of CARICOM had declined by 1.2% while overall decline in the Eastern Caribbean Currency Union (ECCU) countries was estimated at 7.3% (2011) p. 77 citing an ECLAC 2010 report).

ECLA offered the following recommendations in its report that there were a number of steps which that area needed to effect: “(i) deepening of subregional integration by taking concrete steps word the implementation of commitments made thus far and correcting existing deficiencies and weaknesses of the ongoing Caribbean integration process; (ii) empowerment of institutional and human-resource capacities to take full advantage of the opportunities that trade agreements with developed economies offer, particularly the Economic Partnership Agreement (EPA) with the European Union; (iii) diversification of exports to promote value generation, knowledge incorporation and productivity upgrading in export-related activities, and (iv) enhancement of intra- and extra-regional cooperation efforts on “supply-side constraints” accompanied by increased financial resources (including those available from aid for trade (AfT) initiatives) to overcome such constraints in the face of increasingly difficult fiscal balances and limited financial resources in the region” (p. 117). However, it cautioned that although intra-regional trade could be considerably increased, it would probably never be a major portion of the total trade picture.

Among the positive results, in 2010 the Eastern Caribbean states, i.e., the Leeward and Windward Islands, which had established a Common Market (ECCOM) as early as 1968 within the larger CARIFTA organization. This was due to the perceived need on their part of protect goods and services from the significantly larger economies of the major economies of CARIFTA. These same nations had also moved from an Eastern Caribbean Currency Authority to an Eastern Caribbean Central Bank, as well as establishing an Eastern Caribbean economic union through its 1981 Organization of Eastern Caribbean States (1981). The purpose is, of course, is “to allow for the free circulation of goods, services, labour, capital and the

establishment of a common external tariff” (p. 128). What this has effectively created is a single banking system, securities exchange, joint diplomacy, and aviation and communications authorities. OECS Authority decisions are legally binding on all member states, a condition not part of the current CSME (129). This “indicates that the OECS governments have finally acknowledged that the status quo is not sustainable and that they must move towards greater economic and political union, if they are to break the cycle of dependency and become viable in a globalized economy.” That author, Thomas Andrew O’Keefe, President of the Mercosur Consulting Group in Washington, also concludes that “an economically and politically integrated OECS may give the participating states sufficient self-confidence in order to end their foot dragging to greater economic integration within CARICOM” (p. 21).

Returning to the consideration of CARICOM as a whole, that same 2009-2010 Report listed a significant number of reforms which were needed to improve economic conditions in the region. Some of the major reforms are (1) despite the fact that members, except The Bahamas, have officially adopted a Common External Tariff (CET) “there is a broad scope for tariff suspensions and reductions and national derogations from the common tariff,” (2) “Free-movement of goods within the single market is still being hindered by non-tariff barriers such as phytosanitary standards and technical barriers.....,” (3) there is “a need for the free movement of capital, skilled labour and managerial expertise” in the service area and in general “free movement of capital and labour,” (4) there is need of legal authority to compel compliance in these areas, (5) there is a shortage of public finance, (6) there is a need for “coordination and harmonization in fiscal policy,” (7) there is a need for implementation of proposals to assist the Eastern Caribbean states, and so forth (129-32).

Mohammed and Anyanwu (2011) add that CARICOM nations “vulnerability and susceptibility.....of their economies to external shocks in a post-crisis global trading economy” they note the need for “diversification strategies,” several of which they suggest, while cautioning that [a]t the regional level, the lack of standardization and harmonization of national standards and regulations not only presents challenges for increased intraregional trade it also prevents the pooling of regional resources towards building the capacity to meet these growing requirements in national, regional and international markets (p.78). They conclude that regional firms must be willing to diversify both with regard to products and with regard to markets. In short, so much revolves around competitiveness in this global economy (p. 88).

Last year, Landell Mills Development Consultants issued a lengthy and quite critical report concerning the future possibilities of CARICOM at the behest of the Heads of Government Conference of CARICOM through the CARICOM Secretariat. In their findings, were both lengthy and very specific. In summary they suggest that the organization has three specific problems, “frustrations with its slow progress” which have “continued to mount,” “a serious weakening in its structure and operation over a number of years,” and “continuing economic retrenchment since the 2008 financial crisis and the risk of a further downturn in 2012” (Stoneman, Pollard, Inniss, p. 7) . Their conclusion, very briefly, are that the future of CARICOM really depends upon the following: “(I) The Full and unequivocal support of Member states,” (II) Targeting the delivery of a narrow range of specific, practical and achievable benefits over a reasonably short time horizon; III. A credible reorganization and strengthening of the CARICOM construct, including the Secretariat and CARICOM institutions, focused on the management of implementation (p. 7). They suggest, that “[d]espite Member States maintaining a serious commitment to regionalism in principle, many of their decisions, practices and actions have – often inadvertently – undermined and weakened CARICOM in reality.” In addition there is a need “to settle on clear priorities as to what it can and cannot do,” and limit its priorities, as the report indicated it hoped would be the case after the Heads of Government meeting in 2011. Thirdly, those interested “need to become more realistic about the insurmountable constraints of geography, lack of size and complexity faced in developing a successful regional construct in the Caribbean” (p. 8). The report continues “whilst these constraints impose limitations on what can be done and the speed at which it can be done, the fundamental challenge is to address the plethora of weaknesses in the CARICOM construct that have prevented it making acceptable progress over many years” (p. 8). Included in the report are specific suggestions to restructure the office of the Secretary-General, to implement new and stronger management procedures and authority over member states, and the like. This at a time when finances both at CARICOM headquarters and in the member states are difficult to raise, to say nothing of increase.

Probably in expectation as to what might be expected from the report, upon taking the position of Secretary-General of CARICOM, Ambassador Irwin LaRocque (15 August 2011) noted in his acceptance speech, in what truly may be prophetic words, that “it cannot be business as usual” and that “[T]here is a general view out there that all things CARICOM, rightly or wrongly, are the purview of the CARICOM

Secretariat. That is not necessarily the case; but if it is determined that this is how it should be, then the requisite reforms must be undertaken. There cannot be responsibility without authority” (LaRocque, 2012a, p. 10). He emphasized the need for functional cooperation. The Landell Mills report, noted above, recommended an entire Change Process for the organization. In 2012, Secretary-General LaRocque implemented such a procedure and appropriate organization, and it remains to be seen what will emerge in terms of reform. He did note in 2012 “that the secretariat has already lined up the necessary resources to get it done and intends to start in earnest the change process or the transformation process” (Restructuring, 2012). This year, “his emphasis will be on leading the transformation process within the Secretariat and the Community at large” (LaRocque, 2012, p.9).

Ambassador Sir Ronald Sanders, a Visiting Fellow at the Institute of Commonwealth Studies of the University of London wrote a rather devastating piece earlier this year in which he suggested that member countries have effectively stopped cooperating with the CARICOM scheme of integration, and are at best “paying lip service to the process of economic integration. Rather, they are concentrating on their own individual national development, most of which are doing quite poorly, as is evidenced by the fact that the OECS nations along with Barbados have “dangerously high debt to GEP ratios of over 65 percent and some are well over 100 per cent. Jamaica’s economy has been in dire straits for years and there appears little hope of a dramatic improvement anytime soon. He adds that many nations have become dependent upon Venezuelan inexpensive oil (Petro Caribe), on loans from the Caribbean Development Bank, which has had several downgrades by Standard and Poor’s because of failure of states to repay, and on other international aid sources, none of which may be guaranteed over the long term. This author sees a possible demise of CARICOM in 2013 if what I might call the “race to the bottom” is not halted. He suggests that some of the more successful nations, namely, Trinidad and Tobago, Guyana, and Suriname might decide to abandon CARICOM and join with other groupings such as in Latin America. As it so correctly concludes, “It is down to leadership.” As Ambassador Dr. Clarence Henry of Antigua and Barbuda to CARICOM stated, “that regional integration requires constant tweaking” in this “evolving global multiplex of nations.” On a practical note, he urged the development of a type of Marshall Plan funded regionally and administered by the CARICOM organs” (CCS, 2013b). That would be most interesting, a type of “boot-strap” operation, but would require financial support of a nature which might not be easily acquired from intra-regional members.

Ambassador Irwin LaRocque, the CARICOM Secretary-General has noted that the IMF had predicted an economic slump in the United States and in Europe which would certainly affect the Caribbean nations, and cited an IMF Report “Caribbean Small States: Challenges of High Debt and Low Growth” [February 2013], which states that the Caribbean nations “to varying degrees and with some exceptions” are confronted with “extreme versions” of conditions common to small nations, namely, “low growth, high debt, significant vulnerabilities to natural disasters, and low resilience to shocks” (CCS, 2013a).

Again, on a positive note, the ECLA does note that the 2008 agreement known as the Economic Partnership Agreement (EPA) between the European Union members and the Caribbean members of so-called ACP (Africa, Caribbean, Pacific) group. This is designed to foster the elimination of artificial barriers, such as tariffs, to trade relations and also to serve to enhance the economic development processes of the nations involved. In short, recommendations are for increased integration, harmonization of policies, diversification of industry, and so much more, all in an effort to improve the economic base, in significant part by improving trade relations nations outside the CARICOM group.

Within the region, there have been some important initiatives, for example, the Agribusiness Development Programme as a part of the Caribbean Integration Support Programme (CISP), which, it might be noted, is funded by the European Development Fund (EDF) (CCS, 2011). There was also the institution of the Caribbean Renewable Energy Development Programme (CREDP), and in March of this year, at the 41st Special Meeting of the Council for Trade and Economic Development (COTED), a main item of the agenda was the approval of a Regional Energy Policy and Agreement by member States on Targets and Strategies for Renewable Energy (RE) and Energy Efficiency (EE) as a beginning part of the Caribbean Sustainable Energy Roadmap and Strategy (C-SERMS) (CC Energy, 2013, 1). Very important has been the creation of a Caribbean stock exchange.

It remains to be seen what lies ahead. Sadly, I must conclude that some of the optimism I engendered when I coauthored that GBATA paper on this subject with Juan M. Fernandez, has evaporated. The Caribbean nations are in a crisis. They are financially strapped and are trapped in a milieu of limited resources, high unemployment, lack of regional and extra-regional investment, deep debt, significant trade deficits, depleted tourism, and so much more. It will take massive efforts, as indicated by this paper, to correct the situation. Does the area have the ability, and if so, does it have the fortitude to undertake this

process, or will it either turn to other organizations of integration, while hoping for the best, or be condemned to a future of continuing dependency and poverty? Dr. Kenny Anthony, Prime Minister of St. Lucia recently spoke of the economy of the CARICOM nations as “caught in the most debilitating economic crisis since independence” (CCS, 2013c). He is so right!

RELATIONSHIP BETWEEN ORGANIZATIONAL FACTORS AND ENTREPRENEURIAL COMPETENCIES: A STUDY OF COORDINATORS OF UNDERGRADUATE COURSES IN THE SOUTH OF BRAZIL

Suzete Antonieta Lizote and Miguel Angel Verdinelli
Universidade do Vale do Itajaí – UNIVALI, Brazil
Amélia Silveira
Universidade Nove de Julho – UNINOVE, Brazil

ABSTRACT

This study analyzes the relationship between organizational factors and entrepreneurial competencies of coordinators of undergraduate courses in two community universities in Santa Catarina, Brazil. The organizational factors studied were: management support, freedom at work, rewards, and time available and organizational limitations. Eight entrepreneurial competencies were considered; five included in an achievement set, and three in a planning set. The method was quantitative and descriptive, adopting a structured questionnaire as the data collection tool. Factor analysis, canonical analysis, and multiple regression analysis were performed. The results revealed a positive relationship between the constructs. The most relevant competencies were organizational limitations or uncertainty about tasks, and freedom at work, which indicates the importance having clarity about rules and decisions that should exist both at the level of performance expected of the coordinator, and the freedom that they must feel in their work.

INTRODUCTION

Managers of many different organizations have realized, over time, that in order to improve organizational performance and adapt quickly to the business environment, organizational factors and entrepreneurial competencies are important institutional factors (Mello, Leão & Paiva Jr., 2006). It is also believed that companies that achieve above average results, compared to their competitors, are those that have individuals among their staff, who create and develop innovative actions (Hashimoto, 2006). These are employees who have entrepreneurial competencies and who, when they receive the appropriate support, stand apart for their achievements. These corporate entrepreneurs see the business as a place where their competencies are developed and manifested in real actions (Lenzi, 2008). They seek to perfect them, and feel personal gratification at being an integral part of the organization.

Therefore, as suggested Birley and Muzyka (2001), sharing the vision of internal processes, beliefs, values, interests, goals, and objectives of an institution with the employees, together with knowledge of external factors, offers opportunities to develop their competitive capabilities. In this context, when the employees of an organization apply the fundamentals of entrepreneurialism, it is known as intra-entrepreneurialism. Which basically is to encourage proactivity and innovation, i.e. anticipating changes in scenarios, needs, and expectations, and implementing ideas that will give the company competitive advantage.

More specifically, when it comes to Institutes of Higher Education (IHE), whose basic inputs are intelligence and knowledge, and where people are simultaneously raw material and instruments of intellectual production, organizational performance is tied to organizational factors and entrepreneurial competencies. IHEs see themselves as reflexive centers of knowledge, with highly trained professionals

whose role is to produce and socialize knowledge. These institutions are instruments of renewal and change and, historically, have contributed to advances in culture, science, technology, and social and technical innovation. They are the ideal place for discussing ideas and ideologies and, also, an intellectual space where organizational factors and entrepreneurial competencies should be the indicators for recognizing success.

According to the model of Moriano *et al.* (2009), organizational factors may be viewed as having five dimensions: management support (AD), freedom at work (LT), rewards (Rc), time available (TD), and organizational limitations or uncertainty about tasks (IT). At the same time, there are competencies associated with entrepreneurial attitudes that further understanding of the attributes that shape meaningful answers in interactions with internal and external groups. As proposed by Lenzi (2008), these are linked, among others, to eight entrepreneurial competencies: those of the achievement set, which include search for opportunities and initiatives (BOI), calculated risk-taking (CRC), demand for quality and efficiency (EQE), persistence (PER), and commitment (COM); together with those of the planning set, which include search for information (BDI), establishing goals (EDM), and systematic planning and monitoring (PMS).

The increasing competition and demanding requirements create a scenario in which organizational factors and entrepreneurial competencies can represent competitive advantages for IHEs. Bearing in mind that individual competencies allow IHE teachers to recognize and act on opportunities for innovation, assuming the inherent risks, D'Este *et al.* (2012) state that professors who integrate diverse knowledge into their work, presented from different methodological perspectives, are more likely to develop competencies and to propose innovative visions and applications. It is based on these arguments that the question that this work seeks to answer emerges:

To what extent are organizational factors significantly related to the entrepreneurial competencies of the coordinators of undergraduate courses in IHEs?

More specifically, with a focus on interest, and in order to answer this research question, the investigational hypothesis presented is that organizational factors are positively related to the entrepreneurial competencies of these coordinators.

ORGANIZATIONAL FACTORS AND ENTREPRENEURIAL COMPETENCIES

The development of intra-entrepreneurial behavior, according to Moriano *et al.* (2009), is either favored or restricted by the type of procedures defined by organizations for employees to perform their activities. Hornsby, Kuratko, and Zahra (2002) identify five organizational components that promote this behavior:

1) Management support: it is essential that management accept employees with intra-entrepreneurial behavior, as well as enabling conditions and resources for the development of innovative ideas (Stevenson & Jarillo, 1990, Kuratko *et al.*, 1993). Management, as conceived by Dornelas (2003) and Hisrich and Peters (2004), should ease the way for intra-entrepreneurs to overcome bureaucratic barriers and/or to obtain resources. According to Daft (2002), it reflects the extent to which the managerial structure itself encourages employees to believe that innovation and entrepreneurship are part of everyone's role in the organization. He also maintains that the conditions that reflect management support are: rapid adoption of employees' ideas; recognition of people who succeed in moving ideas forward; support for small, experimental projects; and allocation of capital to initiate projects.

2) Freedom at work: consists of giving autonomy to employees to make decisions, delegating authority and responsibility to them (Zahra *et al.*, 2002). For Birley and Muzyka (2001), Dornelas (2003), and Cozzi and Arruda (2004), this means the existence of values like respect and confidence in people, encouraging action, and stimulating decentralization of power. Hernandez and Caldas (2001) argue that the autonomy given to employees urges them to find the best solutions for business. Hashimoto (2006) advises that the organizational system must be sufficiently flexible to give autonomy of decision and action to the intra-entrepreneurs of its teams.

3) Rewards: encouraging employees to take on new challenges (Kuratko, Montagno & Hornsby, 1990; Birley & Muzika, 2001, Dornelas, 2003, Kuratko, Hornsby & Bishop, 2005). But to be effective, they must be based on goals, feedback, individual responsibility, and performance-related bonuses. For Marvel *et al.* (2007), besides being able to provide challenges and increase accountability, the organization may also present the ideas of its intra-entrepreneurial employees to the highest levels of the organizational hierarchy.

4) Time available: encouraging employees to think of new ideas or new products, or improve existing procedures (Covin & Slevin, 1991).

5) Organizational limitations: Moriano *et al.* (2009) redefined this as uncertainty about tasks, referring to the lack of clear rules and indecision around the level of performance expected of the employee. According to Birley and Muzika (2001), Dornelas (2003), Kuratko, Hornsby, and Bishop (2005), management processes must be open, accessible to all, and frequently reviewed, so that learning can be disseminated throughout the organization. For these authors, lack of strategic direction can inhibit actions that have real impact. According to Hashimoto (2006) within the intra-entrepreneurial organization, the most important communication is that which flows downwards, from higher management to the other departments. The chosen strategic direction, details of the mission, feedback generated from external information, and institutional changes, originating internally, should all flow from the top down.

In their study of intra-entrepreneurial behavior, Kuratko, Montagno, and Hornsby (1990) conducted an exploratory study using five different constructs: executive management support, rewards and resources available, organizational structure and limitations, propensity for risk, and availability of time. However, empirical analyses performed by the same authors reduced these factors to: management support, organizational structure, and rewards and resources available.

Kuratko and Hodgetts (1995) outline the key steps to creating a work environment that is conducive to intra-entrepreneurial employee behavior:

a) Set clear goals: these need to be mutually agreed upon by employees and managers so that the specific steps may be achieved;

b) Create a feedback system and positive reinforcement: the creator-inventors or potential intra-entrepreneurs must be aware that acceptance and rewards exist;

c) Emphasize individual accountability: confidence and responsibility are key success factors in any innovation program;

d) Provide rewards (or awards) based on results: the rewards system should praise and encourage people to take risks.

Zahra and Garvis (2000) created the ICE (international corporate entrepreneurship) scale in order to identify the presence of corporate entrepreneurship in subsidiaries of American multinationals. In their study, they found that the companies surveyed had tolerance for high-risk projects; actively sought out challenges instead of merely responding to the competition; emphasized long-range strategic actions instead of small tactical changes; and rewarded calculated risk-taking.

Now, within the scope of this paper, entrepreneurial competencies must be addressed. Some authors have sought, within the theme of entrepreneurial competencies, to create typologies that enable researchers to identify the skills needed to perform their jobs. Among them is the work of Lenzi (2008), which addresses the work developed by Cooley (1990, 1991). Lenzi (2008) proposes ten characteristics of entrepreneurial behavior, also called entrepreneurial competencies, grouped into three sets, as follows:

1) Achievement Set: composed of Search for Opportunities and Initiatives (BOI); Calculated Risk-taking (CRC); Demand for Quality and Efficiency (EQE); Persistence (PER); Commitment (COM).

2) Planning Set: includes Search for Information (BDI); Establishing Goals (EDM); Systematic Planning and Monitoring (PMS).

3) Power Set: comprised of Persuasion and Networking (PRC); Independence and Self-confidence (IAC).

This model is currently used by the United Nations Development Program (UNDP), and by the Serviço de Apoio a Pequena Empresa [Support Service for Small Businesses] (SEBRAE) in Brazil, for entrepreneurial training programs like the Programa para Empresários e Futuros Empreendedores [Program for Entrepreneurs and Future Entrepreneurs] (EMPRETEC).

It should be noted that Lenzi (2008) developed his thesis with emphasis on the identification of an association between the Jungian psychological types and the entrepreneurial competencies recognized in individuals considered to be entrepreneurs. The sample consisted of a hundred and twenty-six subjects, in eleven large companies located in the state of Santa Catarina, Brazil. In this study, the entrepreneurial competencies that stood out were: calculated risk-taking, persistence, commitment, search for information and persuasion and networking. It was also found that there was a high degree of significance in the association of predominant psychological types with the entrepreneurial competencies identified by coworkers.

Before the study of Lenzi (2008), which served as a reference for this role, Morales (2004) also used the work of Cooley (1990, 1991), seeking to measure the relationship between Jungian psychological types and entrepreneurial skills. The research was conducted with eighty-two entrepreneurs in the state of Santa Catarina, Brazil. In this sample, the two dominant entrepreneurial competencies were search for information and persuasion and networking. There was low correlation between psychological types and the entrepreneurial competencies studied in the group researched.

Rosa and Lapoli (2010, p. 24), studying entrepreneurial talents in the state of Santa Catarina, state that in certain contexts, some competencies are more meaningful for individual actions than others. They argue that "[...] to achieve high performance in a particular market, some competencies may be more important, but in general they must all be present if an entrepreneurial action is to generate the desired results [...]"

Schmitz (2012) sought to identify the entrepreneurial competencies required by the management of Institutes of Higher Education. The research was conducted in three universities in Brazil and one in Portugal. The sample consisted of one hundred and thirty-four interviewees. The research results identified independence and self-confidence and the most significant entrepreneurial competencies. A summary of the cited studies is presented in Table 1.

Table 1 - Studies on entrepreneurial competencies.

Author	Topic / Research	Results
Morales (2004)	Relation between Jung's psychological types and entrepreneurial competencies	In their study found that competencies were dominant individual entrepreneurs
Lenzi (2008)	Identification and association of Jungian psychological types and entrepreneurial competencies	In their study found that competencies were most prominent in large size companies
Rosa e Lapoli (2010)	Talents entrepreneurs	In their study describing the relationship between the competencies and contexts of achievement for individual entrepreneurs
Schmitz (2012)	Identify the entrepreneurial competencies of university administrators	In their study found that competencies were more significant for university administrators

MATERIAL AND METHODS

The data for this study were obtained from professors, coordinators of undergraduate courses, at two private, community universities in the state of Santa Catarina, Brazil, via a survey, collecting data through a questionnaire. The first block of the questionnaire related to organizational factors, in accordance with the model of Moriano *et al.* (2009), and included five dimensions (AD, LT, Rc, TD and IT). The second block included, in accordance with the proposal of Lenzi (2008), eight entrepreneurial competencies, those of the achievement set (BOI, CRC, EQE, PER and COM) and those of the planning set (BDI, EDM and PMS). The third block focused on descriptive data of the respondents that were not used in this work.

The data collection tool was designed to evaluate the respondents' perceptions using a five-point Likert scale. For the organizational factors, thirty-five statements were developed; eight each for AD and LT, six each for RC and TD, and seven for IT. For each entrepreneurial competency, three statements were considered and their responses totaled.

The one hundred and twelve completed questionnaires were filled out by the coordinators, as the social subjects of the research. There were no missing data for the entrepreneurial competencies, and only seven among the organizational factors, which were filled out using the median of the other responses to fill out the missing response.

Multivariate methods were used to analyze the data – factor analysis, canonical analysis, and multiple regressions - using the SPSS and STATISTICA software programs. Factor analysis is a multivariate technique that was used in exploratory mode for the two blocks of the questionnaire, seeking to verify whether the data collected showed significant correlations between the indicators (answers) and the construct being measured (dimension of organizational factors). The premises for using it were previously verified in the Kaiser, Meyer, and Olkin (KMO) test to measure the overall adequacy of the sample and the Bartlett sphericity test. The minimum accepted commonality was 0.5 and the unidimensionality, according to the Kaiser criterion for factor retention, had to express an extracted variance greater than 50%.

After confirming unidimensionality for each organizational factor individually, a factor analysis was developed with all the indicators that had been retained in the earlier analyses. The premises were also verified, in this case, by the Bartlett and KMO tests. A restriction was set that the indicators must have a minimum correlation with the factor that expresses it, or a factorial load equal to or higher than an absolute value of 0.55, and that normalized varimax rotation would be applied to the solution obtained to distribute the variance between the extracted factors more evenly.

With the variables referenced to the entrepreneurial competencies, the procedure entailed summing the scores of the three indicators of each one of them so as to create a database for processing by factor analysis. Verified the feasibility of their execution set the same minimum value for the factor loadings of 0.55 in absolute value. Normalized varimax rotation was also applied to the solution obtained.

Considering the interest in correlating the importance of the organizational factors with the entrepreneurial competencies, canonical analysis was used. The objective of this multivariate technique is to measure the linear relationship that may exist between two sets of variables quantified in the same observation units or individuals. As such, the coefficient of correlation between the linear combinations (canonical variables) that are generated for each set is calculated. Canonical variables are extracted seeking to maximize the correlation between the sets (Mingoti, 2005). As Hair *et al.* (2005) pointed out, the restrictions for performing a canonical analysis are less rigid than for other multivariate techniques, since the aim is to measure the association between the linear combinations of the two sets by the coefficient of correlation, without the assumptions that must be met by the variables in other analyses, such as those of multinormality and homoscedasticity.

In summary, the analysis involves finding the linear combinations of each set of variables, the canonical statistical functions, so that their correlation is a maximum. The number of canonical variables that can be generated is equal to the lowest number of variables in one of the groups, and each time a new pair is generated it is, by the restrictions imposed, orthogonal or independent from those already created. These linear combinations are also called canonical factors, and they express a part of the variability that exists in the other set, which is known as redundancy. Thus, in this research, redundancy of the competencies represents the amount of variance in these variables explained by the canonical function of the organizational factors.

In this study, canonical analysis was performed in five ways: 1) based on the factorial scores generated by the respondents from the factor analysis of the organizational factors with the factorial scores of the competencies; 2) based on the factorial scores of the organizational factors with the variables of the achievement set of competencies (BOI, CRC, EQE, PER, and COM); 3) based on the factorial scores of the organizational factors with the variables of the planning set (BDI, EDM and PMS); 4) with the factorial scores of the organizational factors and the variables retained by factor 1 of the competencies (CRC, PER, BDI, and PMS); and 5) with the factorial scores of the organizational factors and the variables retained by factor 2 (BOI, EQE, COM, and EDM). Finally, multiple regressions were performed for each one of the eight competencies as dependent variables, and for the factorial scores of the five organizational factors as predictive variables.

RESULTS

Initially, an individual evaluation of the unidimensionality of the data obtained to measure the organizational factors was made through exploratory factor analysis, with the limitations detailed in the methodological procedures. Having verified this condition, a joint factor analysis of all dimensions was performed. Both the KMO test (0.728) and the Bartlett test ($p = 0.000$) show that the data are appropriate for the use of this analytical technique. The Kaiser criterion for correlation matrices, which only considers auto values higher than 1, was used for the extraction of significant factors. The results, following normalized varimax rotation, are shown in Table 2, which displays correlations higher than 0.55 between items and factors. The total variance extracted was 66.75%.

It can be seen that each latent variable expresses a dimension of the organizational factors considered in the study, and that the factorial scores generated represent the predominant linear combination of that factor. Therefore, it was possible to consider the factorial scores derived from each factor as representative of the dimension that is correlated with it. For example, the scores of the first factor represent the effect of management support (AD), and the same may be said of the others. Based on this reasoning, the factorial scores of the five extracted factors were generated and added to the database for subsequent use during the study.

Because the data collected to measure the entrepreneurial competencies of the undergraduate course coordinators included three answers for each one, a summative scale by competency was developed as proposed by Lenzi (2008). Thus, the database to be processed consisted of eight columns, the first five relating to the achievement set competencies, BOI, CRC, EQE, PER, and COM, and the other three to the planning set competencies, BDI, EDM, and PMS. The results of the KMO test (0.743) and the Bartlett test of sphericity ($p = 0.000$) confirmed that it was possible to perform factor analysis.

The results obtained using the Kaiser criterion to determine the number of factors that have significance showed two auto values higher than 1, accounting for 62.98% of the variance in the data. The matrix of factorial loads generated by varimax rotation is displayed in Table 3. From its analysis, it follows that the sets of entrepreneurial competencies are not represented by factors independent of each other, but rather, competencies from both sets are shared in both factors. Two competencies from each set are seen in factor 1: calculated risk-taking (CRC) and persistence (PER) from the achievement set, and search for information (BDI) and systematic planning and monitoring (PMS) from the planning set. Factor 2 has three

competencies from the achievement set and one from planning: search for opportunities and initiatives (BOI), demanding quality and efficiency (EQE), and commitment (COM) are grouped together with establishing goals (EDM). The factorial scores for all of the undergraduate coordinators participating in the study were obtained and saved in the database for use in subsequent analyses.

Table 3 – Factorial loads in the factor analysis of organizational factors. Principle component extraction and normalized varimax rotation. BOI: search for opportunism and initiatives; CRC: calculated risk-taking; EQE: demanding quality and efficiency; PER: persistence; COM: commitment; BDI: search for information; EDM: establishing goals; PMS: systematic planning and monitoring.

With the database of factorial scores created, a canonical analysis was performed in order to evaluate the relationship that one would expect to find between the organizational factors and the competencies. The maximum number of canonical functions in this case can only be two, as it is equal to the lowest number of variables in any of the groups. The variables used in the analysis, that is, the factorial scores, having been derived from different factors, are consequently independent of each other. This condition is important in the evaluation of statistic canonical variables; the results are shown in Table 4.

Table 4 – Results of canonical analysis between organizational factors and entrepreneurial competencies expressed by the factorial scores derived from the factor analyses performed.

Canonical Function	Canonical Correlation	Canonical R ²	χ^2	p-value
1	0.479596	0.230013	33.78979	0.000202
2	0.230125	0.052958	5.82202	0.212868

Source: Research data.

Only the first function is expressive, as shown by the significances of the results by probability or p-value. In addition, the multivariate tests were significant, as shown in Table 5.

Table 5 – Multivariate tests of the significance of canonical analysis. For the Wilks' λ the F value is exact.

Test Name	Value	Approx. F	p-value
Pillai	0.283	3.494	0.000
Hotelling	0.3546	3.688	0.000
Wilks	0.7292	3.592	0.000

Source: Research data

When performing the analysis, it is important to take into account the canonical correlation as well as the redundancy index, since this is equivalent to the coefficient of determination in a multiple regression. Table 4 shows the canonical correlations for the two functions and Table 6 displays the redundancy index for the first function, which is equal to the product of the average canonical load multiplied by the canonical correlation of the function squared.

Table 6 – Value of the redundancy index for the first canonical statistical variable. The variables are the competency scores retained for each factor, in accordance with Table 3.

Variable	Canonical Loading	Canonical Loading-sqr	Average canonical load	Canonical R ²	Redundancy
sCF1	-0.42774	0.18297			
sCF2	-0.9039	0.81703			
		1	0.5	0.230013	0.1150036

Source: Research data.

The redundancy index for the second function is 0.02648, which implies global redundancy, expressed as a percentage, of 14.1485%. This shows that the organizational factors have a positive association and significant association (Table 4) with the competencies, but expressed at a low percentage.

Given these results, the study carried out a canonical analysis between the scores of the organizational factors and the entrepreneurial competencies, calculated by their summative value. The first processing was to perform an analysis between the factorial scores of the organizational factors and the competencies of the achievement set. The results obtained indicate that only the first two canonical functions have statistical significance, with canonical correlations of 0.5084 ($p = 0.000$) and 0.3982 ($p = 0.028$), respectively. Redundancy however remains low, reaching 13.14% for the five functions.

In the second processing a canonical analysis of the factorial scores of the organizational factors with the competencies of the planning set was done. In this circumstance, only the first canonical function has significance ($p = 0.000$), with a canonical correlation value of 0.4762. The percentage of total redundancy only reaches 11.75%.

Taking into account that the factors extracted in the factor analysis had competencies with high loads in both the sets (see Table 3), two more canonical analyses were performed in which the factorial scores of the organizational factors were crossed with the competencies that had been correlated with factor 1 (CRC, PER, BDI, and PMS) and with factor 2 (BOI, EQE, COM, and EDM). In the first analysis of the first two canonical functions there are correlations significant to 5%, with values of 0.4310 and 0.3886, but the total redundancy was the lowest of all, reaching only 9.17%. In the second analysis, the first two canonical functions also had significant correlations, with values of 0.4829 and 0.3971. It is in this analysis that the highest total redundancy was obtained, reaching 16.07%.

The results obtained have shown that there is a relationship between the organizational factors of higher learning institutions, and the entrepreneurial competencies of the coordinators of undergraduate courses. However, from the analyses performed, it is not possible to clearly determine which competencies are the most important to promote, or which organizational factors are the most suitable for this purpose. Seeking to respond to this question, and have a more effective approach for decision-making, a multiple regression analysis was performed in which the predictors were the organizational factor scores, which are standardized by construction and independent from each other, and each dependent variable was one of the competencies. The results are shown in Table 7, where p -values less than 0.05 and the adjusted coefficients of determination are shown.

Because the predictors are independent of each other, the lack of significance cannot be attributed to multicollinearity, but rather to the fact that a specific organizational factor does not influence the manifestation of the competency that is being considered in the regression. Taking this into account, the first thing to highlight is that rewards (Rc) does not show significance for any of the competencies considered. This may be a consequence of the respondents being coordinators of undergraduate courses, for whom there are no monetary rewards equivalent to those received by the coordinators of graduate courses *lato sensu* when they form a class. On the other hand, the entrepreneurial competency, search for information (BDI), has no organizational factor at the 5% significance level to promote it.

Of all the organizational factors, the most recurrent are freedom at work (LT) and uncertainty about tasks (IT), also called organizational limitations. They influence four of the entrepreneurial competencies

considered and, together, influence BOI, search for opportunities and initiatives, which is also related to management support (AD) and time available (TD).

Table 7 – Multiple regressions for competencies predicted by factorial scores of the organizational factors. P values smaller than the significance level.

	AD	LT	IT	TD	Rc	Ajusted R ²
BOI	0.0399	0.0135	0.0338	0.0149	*	0.1289

FINAL CONSIDERATIONS

The analysis of the data obtained from the coordinators of undergraduate courses of two private community universities confirms the research hypothesis, showing that the organizational factors are positively related to the entrepreneurial achievement and planning competencies studied here. However, a more detailed analysis shows that they do not all have the same impact. The greatest recurrence in the regression analyses occurred with organizational limitations, or uncertainty about tasks, and freedom at work, which is a sign of the importance of clarity of rules and decisions, which should be articulated at the level of performance expected of the coordinators, and the freedom that they must feel at work. At the other end of the spectrum, a factor with no influence over any of the competencies at the level of significance adopted (5%) was the use of rewards, in contrast to when the interviewees were coordinators of graduate courses *lato sensu* (Lizote & Verdinelli, wp). Search for opportunities and initiatives are the entrepreneurial competency for which the undergraduate coordinators must feel maximum support from the upper management of the organization. Except for rewards, which have no influence, the four factors considered are shown to be significant. Demand for quality and efficiency implies that coordinators require the dedication of the professors as much as of the students. Since some actions sometimes cause reactions, the relationship between this competency and management support is understandable: the coordinator must feel the backing of his/her superiors. The two competencies of the planning set that relate to organizational factors, establishing goals and systematic planning and monitoring, are influenced by tasks. This means that for coordinators to develop or display these competencies, the extent of the organizational limitations, which Moriano *et al.* (2009) call uncertainty in tasks, must be clear. As this is an initial study, part of a broader study in development, new approaches may offer new insights on the question by considering aspects that were not addressed in the study, such as: segregation by knowledge area, public versus private systems of higher learning, the employability index of the graduates, the reputation in the job market of the institution being analyzed, among others.

ETHICS IN HOSPITALITY RESEARCH: ALIGNING ECONOMIC AND SOCIAL PERFORMANCE

Kenneth R. Lord and Michael O. Mensah
The University of Scranton, USA
Sanjay Putrevu, State University of New York, USA

ABSTRACT

This research explores the contributions that an analytical mindset grounded in ethics can bring to scholarship in hospitality. Ten principles defined by Byron (2006) provide a useful framework for further conceptual development and empirical testing of the role of ethics in the mutual realization of economic and social performance within the foodservice industry. An examination of the studies reported in one recent issue of a hospitality journal reveals gaps in the consideration of integrity, veracity, human dignity, participation, social responsibility and subsidiarity that, if appropriately addressed, could enhance performance both economically and socially.

INTRODUCTION

Bologna is good; it is sausage, of course.
They make it of dog and they make it of horse.

The above couplet comes down to us from Lee Caldwell (1965), an American band director in the 1950s and '60s. The eminent musician, who passed away in 1966, could not have foreseen that decades later the discovery of horse DNA in processed-meat products would capture the attention and elicit the anger of consumers across a continent.

A drive to reduce costs presumably played at least a partial role in the decision-making of the perpetrator of the horse-meat scandal. That motivation is a constant reality in the hospitality industry. Operating with high costs, low margins and often unpredictable and sometimes fickle consumer loyalties, restaurateurs and hoteliers are understandably keenly focused on the economics of survival and success. It is hardly surprising, then, that scholarship in hospitality bears the imprint of the same focus.

Attention to ethical concerns has grown in both scholarship and practice related to multiple sectors of the global economy in recent years. While ethical and social consciousness is motivating the discovery efforts of a growing number of scholars in hospitality as well as in other disciplines, studies addressing whether and how such a focus might enhance, rather than detract from, the unrelenting quest for economic viability and profitability remain sparse.

The intent of this research is to explore the contributions that an analytical mindset grounded in ethics can bring, not in contravention but in support of sound financial models, to scholarship in hospitality management. Following an overview of prior scholarship, we will examine one potentially relevant ethical framework. Finally, the usefulness of that framework in contributing mutually to economic and social performance in the food-service industry will be analyzed in the context of the findings and conclusions presented by the published authors in a recent issue of a hospitality journal.

HOSPITALITY ETHICS

Multiple scholars have spoken to the issue of ethics in the hospitality industry. A sampling of those contributions provides a sense of recent work in this domain that has guided and establishes a context for our efforts.

It was nearly two decades ago that Tracey and Hinkin (1994) warned that the “classical management style” in hospitality, in which centralized decision making left “little room for individual freedom, creativity and innovation” would cease to be effective as opportunities for “turning things around” through cost-cutting dwindled (pp. 18-19). The answer, they argued, lay in “transformational leadership” focused on such priorities as displaying conviction in and behaving in ways consistent with defined beliefs and values, going beyond self-interest for the good of the group, considering decisions’ moral and ethical consequences, and treating employees as individuals and listening to their concerns.

Upchurch (1998) identified an array of areas in which managers in the hospitality industry confront ethical issues, including guest or customer rights, sexual harassment, vendor and community relations, employee empowerment, yield management, and the balance of organizational and personal values. Observing that the bed-and-breakfast proprietors in their sample relied primarily on egoism (“maximizing self interest”) to resolve ethical conflicts, he called for a “structured approach to ethical awareness training.” Stevens and Brownwell (2000) recommended, after examining how employees in the industry acquire ethics-related information, that organizations establish clear ethical guidelines, provide training relative to those standards, reinforce them through coaching, and model desired behaviors. Later, comparing the ethical viewpoints of hospitality students and human-resource directors in the industry, Stevens (2001) found that the professionals gave lower ethicality scores to an array of ethically dubious scenarios than did the students. She concluded that “experience and heightened sensitivity to possible litigious situations may have played a role in perceptual differences” (p. 233).

Jones, Comfort and Hillier (2006) went in search of socially responsible practices among the United Kingdom’s ten leading pub operators. What they found were varying degrees of activity surrounding such priorities as promoting responsible drinking, providing no-smoking facilities, accommodating customers with disabilities, ensuring responsible purchasing, communicating effectively with employees and treating them fairly, fostering sound environmental practices, supporting local causes and contributing to charities. Their overall conclusion, however, was that “there is little explicit evidence that pub operators are fully integrating CSR into their businesses” or that they were systematically seeking “to measure, monitor, benchmark or compare their CSR performance over time or within their sector of the economy” (p. 339).

ETHICAL FRAMEWORK

While ethical philosophies, theories and models abound, the framework selected for this examination is that developed by the renowned Jesuit ethicist William Byron (2006). He identified and defined ten “old ethical principles” that he claims “meet the challenges of our new corporate culture” (pp. 5-7):

- Integrity: “wholeness, solidity of character, honesty , trustworthiness, and responsibility”
- Veracity: “telling the truth in all circumstances; it also includes accountability and transparency”
- Fairness: “justice, treating equals equally, giving to everyone his or her due”
- Human Dignity: “respectful recognition of another’s value simply for being human”
- Participation: “right not to be ignored on the job or shut out from decision making with the organization”
- Commitment: “a committed person can be counted on for dependability, reliability, fidelity, loyalty”
- Social Responsibility: “obligation to look to the interests of the broader community and to treat the community as a stakeholder in what the corporation or organization does”
- Common Good: “aligns one’s personal interests with the community’s well being”
- Subsidiarity: “delegation and decentralization, keeping decision making close to the ground.... no decision should be taken at a higher level that can be made as effectively and efficiently at a lower level in the organization”
- Love: “an internalized conviction, that prompts a willingness to sacrifice one’s time, convenience, and a share of one’s ideas and materials goods for the good of others.”

ALIGNING ECONOMIC & SOCIAL PERFORMANCE

To examine the extent to which the consideration of ethics might inform current hospitality research to enhance both its economic and social impact, the findings and conclusions drawn from the six articles published in the October-December 2012 issue of the *Journal of Foodservice Business Research* are examined in light of the above principles.

After learning through survey data that “customer satisfaction increases as customer’s expected wait time decreases” (p. 325), Iqbal, Whitman and Malzahn (2012) conducted breakeven analysis to examine the economic feasibility of adding an additional server. Their results led them to conclude that “as the cost of adding a new server increase[s], more customers should be attracted to achieve breakeven in two or five years,” with breakeven achieved earlier “as the purchase per customer increases” (p. 327). They argue further that “[t]his research is equally valid for other restaurants where customer wait time is high” (p. 328). An unstated assumption in this form of modeling is that customer wait time is the sole mediator of the impact of the size of the serving staff on customer patronage and order size. There is no denying that excessive wait times can spell trouble, especially for the quick-service segment which was the focus of this study. But is it the only, or even the most important, determinant of customer satisfaction and behavior?

What this overlooks is the reality that restaurant dining is a social phenomenon. Byron (2006, p. 124) wrote that “[c]ommitments are the cement of social relationships.” A plausible hypothesis is that the frequency with which customers choose to patronize a dining establishment, their willingness to endure modest inconveniences such as travel and wait times, and the liberality of their spending once seated is a function of their satisfaction with the relationships they have established with the restaurant staff. One might also posit that the extent to which servers exhibit the personal and professional traits that facilitate and maintain such relationships with customers is a function of the satisfaction they feel in their working conditions. While most value the effect of continuous serving with respect to tipping (except in the quick-service sector), the added stress and fatigue that come with significant understaffing may inhibit the very traits that cement customer loyalty. As Byron (2006, p. 125) suggests, when management commitment to satisfactory working conditions is lacking, “there will be a morale problem on the production side, and it is virtually certain that product and service quality will also diminish,” which in turn will be associated with “customer discontent leading to negative economic consequences.” Thus research that models customer patronage and satisfaction as a function of the restaurateur’s commitment to the satisfaction and well-being of both servers and customers, as well as wait time, may help inform and motivate restaurant staffing strategy that is both economically and socially optimal.

The work of Lee, Kim and Kim (2012) provides a glimpse at the contributions that can be made to ethical and profitable restaurant-industry practice. Applying justice theory (which views responsible employee behavior as stemming from “fairness/justice judgments” in the employer-employee relationships – p. 336) and accountability theory (which treats employee behavior as an outcome of “accountability toward the leader” – p. 337), they proposed and obtained support for an array of hypotheses about the ability of ethically based management approaches to induce desired behaviors. They concluded that managers should not only “focus on treating employees fairly” but also “be flexible enough to initiate ‘identity improvement’ chances to employees although it seems ‘unfair’ to the leader.” To achieve this, “the leader should carefully observe the employee’s specific abilities and interests ... so that the employee can develop his/her ideal identity that is compatible with the identity that is desirable in the workplace.” In so doing, they suggest, “the manager may ultimately treat all employees fairly, rather than equally” (p. 355).

The compatibility of the findings and recommendations of Lee, Kim and Kim’s research with Byron’s treatment of the principle of fairness is obvious. Their suggestion that an ethical manager sometimes needs to provide continuing opportunity and encouragement to underperforming employees even when it seems “unfair” to the employer in the short-run is consistent with the following approach advocated by Byron (2006, p. 74): “We cry, ‘Unjust,’ when corners are cut, the social structure is ‘out of plumb,’ or when things are simply not ‘on the up and up.’ You always have to be careful, of course, to control that tendency, when the scales are tipped against you, to ‘get even’ and to baptize mean-spirited and unfair revenge ‘in the name of justice.’ You can trick yourself into believing that avenging yourself by harming those who have harmed you is ‘right and just.’ That behavior is both obvious and unworthy; it is clearly inconsistent with your own human dignity.”

Allowing for second, third or more chances for employees to rise to their “ideal identity” may, indeed, be moving beyond simple fairness and into the last and ultimate ethical principle espoused by Byron – love. Quoting fellow Jesuit ethicist Lowney (2003), Byron (2006, pp. 181-182) argues that “love-driven

leadership” requires “the vision to (1) see each person’s talents, potential, and dignity; (2) the courage, passion, and commitment to unlock that potential; and (3) the resulting loyalty and mutual support that energize and unite teams.” The empirical support that Lee, Kim and Kim (2012) obtained for their hypotheses offers not only another voice in support of the applications of the principles of fairness and love in the hospitality industry but evidence that such ethical management practices engender the types of ideal employee behavior that can generate positive economic performance.

Ferreira, Maier and Johanson (2010) probed the impact of two economic downturns on food and beverage revenues in private clubs in the United States. A summary of their major result is “that private clubs reported a loss in their food and beverage operations in the ... fiscal years ending in 2010 and 2003, indicating the economic downturns during these periods had an overall negative impact on the food and beverage operations at private clubs” (p. 374). The authors proposed an array of strategies designed to “minimize the impact of a slow economic recovery following the recession of 2007-2010,” including offering “family-oriented programs,” focusing on member satisfaction, controlling prices with “resourceful menu planning, efficient food production and portion control methods,” introducing non-peak-time social events, providing variable price options for party events, “identifying potential repeat sales and new member business opportunities,” and reducing overhead through “staffing and operational efficiencies” (p. 375).

The proposed marketing and operational tactics make business sense under such economic conditions. What they do not implicitly demonstrate, however, is a shared concern with their customers and the communities in which they operate for the continuing plight that underlies the depressed expenditures not only in their sector but throughout the economy. “What ... can be expected of the economic ‘haves’” in such times, Byron (2006, p. 139) asked, writing of the social-responsibility principle. “Clearly there is an ethical responsibility to do something, and there may be an obligation in charity to do even more.” Patrons of private clubs, on average, probably qualify for the “haves” designation. While Ferreira, Maier and Johanson’s (2010) results suggest they experience some budget constraints, at least with respect to discretionary expenditures, they are probably not the logical target of the “obligation in charity” to which Father Byron alludes – but they may be willing partners in programs that recognize and seek to alleviate the plight of those suffering more intensely around them. Their response, if but modest financially, may be more substantial in terms of enhanced respect, appreciation and long-term loyalty to the organization in which they hold membership. As a research issue, at least, it is worthwhile examining the long-term social and economic benefits of adding a social-responsibility component to the operational and marketing strategies employed by food-service organizations serving upscale segments in challenging economic times.

Ozdemir (2012) conducted a scholarly analysis of restaurant menus and variables affecting their performance. “[C]hanges in menu offerings,” the article posits, “should fulfill the expectations and needs of existing and potential customers on the one hand, and should be consistent with the objectives of restaurant firm on the other hand” (p. 381). In what is presented as a “new way of thinking about menu performance” (p. 395), it observes that “popularity, profitability and cost” are the principal dimensions of ... menu performance” (p. 378) and offers propositions that those dimensions will be responsive to menu planning, pricing and design.

The incorporation of ethics into menu analysis does not require different dimensions or variables than those identified by Ozdemir, but surely menu planning, pricing and design may well be enhanced socially and economically by the explicit consideration of at least some of the principles identified earlier. Byron (2006, p. 69) writes that “transparency, clarity, and honesty ... will raise veracity to a new and higher level.” Transparency is more than meticulous avoidance of false or misleading information; it is a commitment to consistently providing customers with all the details relevant to their ability to make informed decisions that will lead to their satisfaction and welfare. Research on menu planning and design might examine the social and economic consequences of providing such details as calorie counts, ingredients that some may avoid for health, religious or other reasons, and sustainable sourcing.

Mathe (2012), in a study of an industry issue of clear relevance to social responsibility and the common good – food safety – arrived at the interesting conclusion that “lower labor costs result in greater ... food safety” (p. 398). That conclusion grew out of an inverse correlation between official food-safety-audit scores and labor costs in quick-service restaurants. Mathe’s rationale for that relationship is as follows: “with fewer and more experienced hands in the kitchen, there is less room for error since each employee is responsible for certain tasks and less job shifting occurs. With many hands in the kitchen the opportunity to make a mistake would be more common” (p. 403). She thus concluded that “higher levels of labor costs might actively detract from quick service restaurant performance ... in terms of food safety” (p. 409).

While Mathe's concern for food safety is to be applauded, in our opinion the conclusion that higher labor costs can lead to less food safety rests on dubious grounds and, if used by restaurant managers for staffing and food-safety planning, could put consumers at risk by making such determinations on the basis of potentially spurious criteria. How might such a pattern of results arise if higher labor costs do not have negative effects on food safety? Mathe examined the correlations among three variables: food safety, labor costs and gross revenues. In any food-service organization, it is to be hoped (and given the results of this study it is reassuring) that greater food safety is associated with higher revenue. One would hope such a result implies that consumers become aware of and are less likely to patronize restaurants with risky food-safety performance. The correlation between labor costs and gross revenue was found to be negative. We don't claim to understand why, as the author's explanation ("labor costs that are too high create inputs that do not provide output that improves average costs" – p. 406) says nary a word about revenue, but such is the case for whatever unexplained reason. If food safety and labor costs are positively and negatively associated with revenue, respectively, within that data set a negative association between food safety and labor costs is not surprising. It could be what statisticians refer to as a spurious correlation rather than a causal relationship. Looked at from a different perspective, there are labor issues that one might expect to be associated with food safety. For example, food-safety training – which comes with an indirect labor cost that would not have been captured in Mathe's analysis – may be expected to reduce unsafe food handling or other risky practices. Consistent quality monitoring, which could modestly increase labor costs, should also improve food safety. If decisions based on this study induce managers to reduce the very components of labor cost that enhance food safety, the results could be unfortunate and potentially disastrous. In short, the author would do well to remember the old statistical adage, correlation is not causation.

According to Byron (2006, p. 40), the principle of integrity requires the avoidance not only of deception but of "careless misrepresentation of information on which others may rely." Food-service scholars should be cautious about building causal inferences on correlational results that are not solidly grounded in theory and/or additional empirical evidence, especially when such inferences could lead to decisions that affect the health or well-being (be it physical, financial or emotional) of others.

Edelstein, Chiu and Molinski (2012) conducted a survey investigating "the perceived corporate culture of nutritional professionals." They summarized their findings as follows: "a great deal of corporate culture revolves around the interactions between manager and employee and that positive corporate culture is equated with good managerial practices. An effective manager leads to satisfied employees, resulting in a team that works together in a positive environment" (p. 411).

As an employer, Byron (2006, p. 98) noted, abiding by the principle of human dignity (upholding one's own and promoting that of one's employees) requires creating "an exceptional working atmosphere" that includes "challenging jobs with reasonable workloads, excellent support systems, a sufficient number of qualified associates to share the load, leaders who serve and a perspective that places faith and family first." The principle of workplace participation, he suggests, is grounded in one simple action – listening. He quotes Casey (1997, pp. 315-316) as follows: "Listen, listen, listen. If your mouth is open, you are not learning." Another key is "honest and open communication."

Edelstein, Chiu and Molinski (2012) arrived at their conclusions regarding the ingredients of a "positive environment" by isolating and measuring traits of communication between manager and employee that map well onto the characteristics of human dignity and workplace participation described by Byron: "How well the direct manager communicated with employees," "Whether the manager listened to employee's opinions on a regular basis," "If they were aware of what their manager was expecting from their work performance," "If the manager gave adequate support and worked as a team," "If the manager gave feedback to help improvement," "If the manager encouraged success by reducing fear of failure," and "If the manager was interested in their professional growth." Their measurement approach and their results elucidate and validate the importance of dimensions of human dignity and workplace participation in the foodservice industry.

A principle with the potential of bringing further clarity to research on working culture that promotes both social and financial performance is subsidiarity. Pollard (1996, p. 140) advocates that managers "[k]eep pushing down decisions" and "[e]rr on the side of delegation and not centralized control." Whether the employee be a nutritionist or a server in a restaurant, empowering decision making at the point of customer contact could potentially lead to more satisfied workers and customers. It is, at least, a

conceptual and empirical question that could appropriately be addressed in further work on corporate culture in the foodservice industry.

CONCLUSION

A review of hospitality literature revealed sporadic attention to and encouragement of ethics and social responsibility. The ten principles defined by Byron (2006) provide a useful framework for further conceptual development and empirical testing of the role of ethics in the mutual realization of economic and social performance within the industry. The examination the studies reported in one recent issue of a hospitality journal reveals both the increasing frequency with which such issues are being considered and the greater understanding that might accrue from the systematic consideration of those principles in future research.

As scholars plumb the depths of the relationships between economic and ethical/social considerations in the hospitality industry, an important consideration will be the moderating influence of legal and cultural variables in an industry that is becoming increasingly global. For example, to what extent are managers' proclivity to initiate and employees' and customers' responses to strategies motivated by the principles considered in this study a function of their predispositions with respect to cultural dimensions like individualism, uncertainty avoidance and long-term orientation (Hofstede, 1980, 2001; Hofstede and Bond, 1988)? Lord, Putrevu and Shi (2008) showed that they affect consumers' cross-border vacationing motivations, but the effects of these and other cultural constructs in moderating the influence of ethically and socially driven strategies on the economic performance of hospitality organizations has yet to be examined.

"Hospitality exists within lived experience," O'Gorman (2007) reminds us. "[I]t is a gift given by the 'host' to the 'guest,' and then shared between them.... [T]he true gift of hospitality is an act of generosity experienced by the 'guest,' which turns a stranger into a friend for a limited period of time" (p. 201). A single-minded focus on economic efficiency may help a restaurateur to keep serving for another day, but it is through the application of the principles ethics and social responsibility that such friendship is cultivated – and therein lies the basis for enduring success.

AN ANALYSIS OF MUNICIPAL FINANCIAL MANAGEMENT IN SOUTH AFRICA

Tebogo Mabile and Nicolene Barkhuizen
North-West University, South Africa

ABSTRACT

The aim of this discussion paper was to investigate the practical and financial implications of municipalities in meeting the explicit goals of South Africa. Very limited research currently exists on municipalities in the South African context. The findings showed that the municipalities are not able to effectively manage the finances allocated to them. In addition we also found that the lack of proper leadership and inability to manage the necessary funds will have a direct impact on the service delivery of municipalities. Recommendations are made.

INTRODUCTION

The South African Constitution of 1996 constitutes the public sector in South Africa as National, Provincial and Local spheres of government which are interdependent, interrelated and distinctive. To prevent conflict between spheres and promote the concepts of interdependence and interrelationships, the principles of cooperative government and intergovernmental relations are set out in section 41 of the constitution. In particular those related to financial management are; effective, transparent, accountable and coherent government must be provided for the republic as a whole. The Constitution deals specifically with local government and determines the status of municipalities. A municipality must strive, within its financial and administrative capacity, to achieve its objectives. The purpose of the Municipal Financial Management Act (Act 56 of 2003) is to establish the basis for financial management that is essential to improve and sustain service delivery. Municipal councils are required to adopt credible budget with realistic revenue and expenditure estimates, accommodating all operational and maintenance costs expected by the municipalities.

Local government is that part of the public sector closest to the communities and is therefore indispensable in the role it plays in ensuring the delivery of municipal services. With the scarcity factor facing all three spheres of government in South Africa, municipalities exist with limited financial resources, receiving an equitable share from the national government and provincial while on the other hand it collects money from the community for service and goods rendered. All individuals with the responsibility of carrying out the duties set in the framework of finance of every institution must therefore recognise the need for efficiency and effectiveness in the municipality finance.

This paper investigates the practical and financial implications for meeting explicit goals of South Africa. South Africa has been labelled the protest city of the world. Protests are symbolic of a non-functioning local government. The protests are a legacy of the resistance struggle against the apartheid separate development. Service delivery protests have become a debated phenomenon. Poor leadership, especially in municipalities, as well as financial mismanagement has been reported in the media on a daily basis. The audit reports found +/- 95% of municipalities in the nine provinces of South Africa qualified on issues of managing finance.

BACKGROUND TO THE STUDY

The South African Local Government is made up of 226 local municipalities, which are there to deliver services effectively and efficiently. The Local sphere of government after the pre-1994 was essentially a service provider, but has since evolved in its roles, which include driving economic development as one of its objectives. Local government consumes more of funding from the national government, and use this money to provide for the services required by the communities, which are basic needs. The Municipal

Financial Management Act 56 of 2003: ensures that secure and sustainable management of the financial affairs of municipalities and other institutions in the local sphere of government is used effectively and efficiently, that is to maintain good financial administration in municipalities. The Local Government Municipal Systems Act, 2000 (Act 32 of 2000), establishes a framework for planning, performance management system, effective use of resources and organizational change in a business context.

Local government in South Africa are made up of various types of municipalities. The largest metropolitan areas are governed by metropolitan municipalities, while the rest of the country is divided into district municipalities, each of which consists of several local municipalities. Since the boundary reform at the time of the municipal election of 18 May 2011 there are 8 metropolitan municipalities, 44 district municipalities and 226 local municipalities. Municipalities are categorized into three groups:

Category A: municipalities that fall in this category, which are the single- tier ‘metropolitan municipalities’, have the exclusive municipal executive and legislature authority over their area of jurisdiction. Background to this form of municipal government was the fact that metropolitan urban governance requires an institutional set-up that is entirely different from municipal governance in smaller cities and rural areas. The rest of the country is divided up into **category B (local) municipalities** that share their authority with **category C (district) municipalities**. In other words, a number of category B municipalities make up category C municipality. The demarcation of municipalities prior to the first elections of the new Constitutional dispensation produced 226 local municipalities grouped together to form 44 district municipalities. (De Visser, 2005, p. 74)

CHALLENGES FACING SOUTH AFRICAN MUNICIPALITIES

The Municipal Structures Amendment Act of 2000 acknowledges the weaknesses of local municipalities (B) and re-allocated functions such as infrastructural development, bulk supply and services, from municipalities to districts (category C). As a consequence, districts are *de facto* confirmed as the main developmental and infrastructural operators and service providers in rural areas of South Africa (Perret, and Lhopitallier, 2000; Davids, 2003). Districts are given power over all municipalities under their jurisdiction, which includes ensuring the Integrated Development Programmes are developed (their own and the municipal ones), and building capacity where necessary. This poses some issues in terms of:

- accountability, since district staff does not represent the local population, or the elected individuals at municipal level;
- dependency, from a B municipality view point (especially on capacity building);
- reversibility, since some economy of scale made at district level (large areas) might not be duplicable at municipal level (much smaller size), whereas the Act stipulates that the power should be gradually put back at municipal / local level, as capacity grows;
- Participation, since increased distance and lack of communication do exist between districts and the local level.

Also, such design lies onto the assumption that districts do have the capacity in staff and skills to help local municipalities, which is not always the case (Davids, 2003).

Independence and the Revenue of Municipalities

Local rural municipalities derive about 40% of their income from national and provincial transfers (as compared to 8% for urban municipalities). Yet, their share of national revenue is 4%, in the form of the Equitable Share (Davids, 2003). The Equitable Share is a mandatory, non-conditional, entitlement, which means that Local Government can allocate and use it with limited control from national and provincial levels. Some observers insist that more Equitable share being directed towards local rural municipalities would be instrumental in making them more autonomous and efficient, and would release the pressure onto impoverished population (away from cost recovery objectives attached to water and electricity supply). The current situation reflects both a reluctant national government to actually decentralize, and the prevailing neo-liberal ideology (Naidoo & Veriava, 2003).

Actual Participation of Local Government

Participation has repeatedly been put forward by policy documents as a compulsory element of local governance and rural development as well, yet with various and discussable implementation features. Information, and sometimes consultation, has indeed been carried out (forums), but co-design, co-decision and actual partnership, as defined in Perret and Mercoiret (2003), have seldom taken place.

The 1994 Reconstruction and Development Programme forums raised enthusiasm among communities and civil society organizations (CSOs), which enthusiasm was not accommodated further by the then inexperienced local government (Davids, 2003). Even the recent Integrated Sustainable Rural Development Programme (ISRDP) points out community participation as key, yet with little mention to rural Non-Governmental Organisations (NGOs) and CBOs. Besides obvious lack of capacity and skills to actually organize participation by local municipalities, some objective hindrances do exist. Unlike urban settings, rural areas lack an active civil society (Greenberg, 2003). Furthermore, certain non-governmental initiatives were sidelined or ignored while drafting the ISRDS. Finally, participation of all rural areas meets physical and social hidden barriers (the poor cannot be easily reached, owing to remoteness and transportation issues, participation of women, the youth, the elderly may be socially sidelined) (Davids, 2003).

There are no doubts that rural South Africa and more especially former homeland areas (Bantustans), still lack basic services and infrastructures. Huge efforts and delivery have taken place since 1994, but there are still lots of needs left unattended. While the government tries to provide basic constitutional services (i.e. free basic water policy), it also tends to increasingly and contradictorily implement cost-recovery, “containing costs”, and “market-driven” principles (Hart, 2002). Rural people start to witness the shift away from mere “welfarism”, as a leading principle of emerging democratic South Africa, to a colder neo-liberal and deregulated approach (e.g. state withdrawal of agricultural support, subsidies and extension, “user-pays” principals applied to water supply, etc.). Certain private/public arrangements become uncertain, unsustainable and unattractive (Naidoo & Veriava, 2003).

Key questions remain as to how to promote Reconstruction Development with such contradictory objectives? How to avoid creating new forms of dependency for rural people, while also releasing pressure and unlocking opportunities for them? (Hemson *et al.*, 2004).

Implementing ISRDP within IDPs: sectoral temptations

The ISRDP Programme forms an opportunity for bridging rural development and local governance. It is supposed to harness and bring national and provincial means and capacity at local level. It is supposed to fit into the local IDPs, and to be driven by local municipalities. In spite of such a clear and rational framework, the first implementation stages that have taken place in some municipalities show certain flaws and setbacks:

- IDPs are often seen as outputs or products by both local policy makers, line departments, and development operators, whereas IDPs should be on-going processes, whereby participatory negotiation of development goals should play a major part;
- So far, many ISRDP bear no relation to the demands set out in local IDPs, but rather reflect potential deliverables from line departments, which often seem to compete with each other (for visibility purpose) rather than co-operate; hence some sectoral initiatives and projects that can be seen here and there, and which have little to do with integrated, demand-driven approach (Davids, 2003);
- Most municipalities have been selected on the basis of needs (as perceived by external observers), and of political lobbying and pressure, and not of potential (if any) or level of readiness (Everatt, 2003).
- Furthermore, the new municipalities; most initial time has been spent in capacity building at local government level, rather than on delivering.

ISRDP policy and implementation guideline documents repeatedly emphasize the notion of potential for development of rural areas where the municipalities have been located, i.e. in former homeland areas. Observers raise a number of issues regarding that notion of potential, as a basis for development policy and efforts:

- Former homeland areas had been specifically and purposively delineated during the apartheid era for their lack of potential for development (poor endowment in most natural resource) (Hart, 2002);
- Furthermore, all efforts seem to have focused onto despoiling them from development assets (poor institutions and economic environment, poor infrastructures, etc.);

- Agriculture keeps been pointed out as the first potential mover for development in rural areas (Brooks, 2000), whereas rural people themselves do not see agriculture as an answer to their plight (May, 1997);
- Urban areas absorb best-educated people, and most energetic layers of rural society (Hemson, Meyer, Maphunye., 2004); women, children, and the elderly are *de facto* key role players in rural areas;
- Putting forward the notion of potential for development (especially economic development as ISRDP implicitly puts it) relegates welfare and service provision to satisfy basic (constitutional) human needs as secondary matters.

Once again, the contradiction between welfarist and neo-liberal approaches is pointed out here (Davids, 2003; Naidoo & Veriava, 2003). In some instances and rural areas, it would be best to simply acknowledge the current lack of potential for economic development in the short term, and to focus on the severe backlogs in most infrastructures and services.

Financial Controls and the Sphere of Local Government

In analysing the municipal financial management in South Africa the above challenges become difficult to deal with because they are been exacerbated buy the mismanagement of funds. Analysis of the audit outcomes of municipalities (including metros) and municipal entities reveals the following aspects (Audit General, 2010:4):

- The 53 municipalities that achieved improved audit outcomes are concentrated in KwaZulu-Natal (21%), Eastern Cape (18%), and Limpopo (17%). A majority of the 23 municipalities that reduced their number of disclaimed or adverse outcomes from the previous year are in Limpopo.
- Of the 79 municipalities that remained disclaimed or adverse from the previous financial year, 17(22%) are in the Free State, a further 17 (22%) are the Northern Cape and 15 (19%) are in the Eastern Cape.

Financial activities, which are usually repeated to achieve a given goal or set of goals articulated in element one of financial management system are threatened as province-to-province analysis of municipalities, audit outcomes of the 2008-09 report demonstrate. This status quo requires an improvement, since failure to manage public finances in certain municipalities means little or no public delivery to those that need it most. Consequently and at the receiving end are communities that continue to battle to meet basic needs (Ntonzima, 2011).

With the revelation of details of material losses/impairments, unauthorised expenditure, fruitless, wasteful and irregular expenditure, including material under-spending of budget and unspent governments grants by municipalities and municipal entities, acts to seriously tighten financial controls application cannot be overemphasised (Audit General, 2010:9), stated below is a summary of the above revelations:

- Material losses exceeding R5billion were incurred by 65(22%) audited;
- Unauthorised expenditure exceeding R2,4 billion was incurred by 82(28%) audited;
- Fruitless and wasteful expenditure of R117,4million was incurred by 92(31%) audited;
- Irregular expenditure amounting to some R2,3billion was incurred by 139(47%) audited;
- Under spending of budgets amounting to R1,5billion occurred at 28(9%) audited;
- Unspent government grants amounting to R1, 6billion occurred at 60% of audited.

What is questionable is regarding the above picture is role of the financial manager (a role that is played currently in many of the South African municipalities by a Municipal Manager and Accounting Officer) in each municipality, which is but one office that should be under control because of all the above-mentioned occurrences (Ntonzima, 2011).

THE AUDITOR-GENERAL'S VIEW ON THE CURRENT STATE OF SOUTH AFRICAN MUNICIPALITIES

According to the media release in the auditor-general of South Africa's website, it has stated the following:

- About 91% of the municipalities depended on consultants to balance their books while they employed staff to do the same job;

- Officials in key positions at about 70% of audited municipalities were incompetent.
- With the commitment of the leadership, any size municipality could achieve clean audits, as already proven by a few determined ones.
- government's interventions to address the skills gap, including coordination and commitment by all parties to implement legislation on minimum competency levels
- The lack of skills, the fact that numerous errors needed to be corrected by auditors during the audit, despite consultants that were brought in to assist municipalities having increased from 86% last year to 91% of municipalities in 2011. In addition, 13% of audits in a few provinces (North West, Northern Cape and Western Cape) had not been finalised in time for inclusion in the general report being released on the 23rd of July 2012
- Fruitless and wasteful expenditure – where money was spent and goods were not delivered or interest accrued on late payments – amounted to R260-million, up from R253-million in 2010. Unauthorised expenditure – where municipalities overspent on their budgets – remained high at R4.3-billion, compared with R6.3-billion in 2010.
- A lack of consequences for officials and political leaders for poor performance and bad action. Mayors and councillors in more than half of all municipalities were to blame for bad audits due to their reluctance to act on the auditor-general's recommendations after previous audits.
- Consistently committing to take ownership of municipal performance practices, insisting on adequately qualified staff and effective performance management practices
- With the commitment of the leadership, any size municipality could achieve clean audits, as already proven by a few determined ones

RECOMMENDATIONS

The small gains in good governance are undermined by the little provision of information to the public and lack of meaningful participation by the residents. It may be argued that there cannot be transparency and accountability in the management of public institutions unless the public know what the institutions are doing on their behalf and unless mechanisms for public participation, transparency and accountability are institutionalized. The positive effects on good governance in the municipalities, and indeed in all local authorities, can be further enhanced if the councils can provide pertinent information to the residents, the mechanisms for citizen participation are more institutionalized and if there is more meaningful participation.

The improvement of performance of municipalities require the national government to increasingly assume a significant role to ensure that adequate financial and non-financial resources, differentiation of capacity levels of municipalities and targeted interventions are both channeled and considered in order to effectively and progressively assist the local sphere of government achieve its constitutional imperatives.

- **Placing responsibility on management in power:** Responsibility should be vested in the manager in charge as every decision should run past him or her. This should not rest only on managers but also political heads as they are responsible in effective leadership and control.
- **Scan the geographical environment before Develop of budget:** The extent to which the municipality has on service delivery should be determined by the geographical environment. This will assist in the allocation of the right budget for the municipality to avoid providing large amounts of funds to municipalities that need less.
- **Development of continuous evaluation and reports:** Development of continuous evaluation can be imposed on all the financial spending and weekly reports to be made without having to wait for the full assessment of all financial activities. The municipalities should have a report on expenditure when it happens.
- **Continuous Training of financial management:** Continuous trainings should be developed to tackle the issues that official have in the practice of finance. The training should incorporate a practical acting role in performing duties that officials are exposed to in daily activities. The trading should also inform about the application of legislation regarding finances.
- **Performance indicators:** Performance should be the major aspect when it comes to functions of activities in the municipalities. There should be a performance chart to which it states the level of expected results that must be generated by official.

- **Restructuring of financial expenditures**

Developing better means of spending municipal finances can reduce expenditure by setting priorities to what items should be bought and that cost should be compared for fruitful expenditure. Municipalities in order to be regarded as the best governed municipalities should by far adopt more of the private sector functions and principles, by doing this they will be able to achieve their objectives and goals. The constitution and legal framework, established for municipalities should be contributing towards building a world class municipality. These can be only achieved through reasonable and attainable goals:

- There should be more flexibility within the municipal reporting levels; that decision making should be also trusted on subordinates.
- Municipal-community participation relationship should be introduced as a legal framework; by encouraging the involvement of communities in municipal matters
- More qualified graduate must be recruited in their different fields of specialisation, to ensure that there is more adequate human resources management
- There should be less of the political interference in the management decision making of the municipality
- There should be more clear actions and legal consequences to those who are corrupted
- The introduction of privately owned accounting firms will be more efficient in dealing with the financial matters in line with its legislation framework.
- No political deployment should be allowed, as this have an impact on the output of the municipalities.

CONCLUSION

It is vital for local municipality to have accurate financial statement in order to identify the growth within the municipality and that way also people know what has happened to the tax money. An incorrect inventory balance causes the reported value of assets and owner's equity on the balance sheet to be wrong. After all, Municipal government must be at the forefront of involving citizens in all aspects of governance and development by providing them with practical and effective opportunities for participation. In providing service delivery to the community at larger the most important factor to consider is the financial resources, therefore it is of great importance to acknowledge and adhere to the concerned legislature and procedures set out in the local sphere. Municipal finance administration therefore concerns the compliance and application of using tax payer's money.

Municipalities in South Africa are found to be disorganised in all the nine provinces of the country. This is very an alarming situation that our municipalities find themselves in; the financial management of the municipalities are not being controlled in very effective and efficiency manner by those who by law supposed to be managing these funds. The Auditor General in all the aspects in his report finds that municipalities are not managing its funds accordingly year after year. This is the mismanagement of the country's revenue and those who are found to have done wrong are not punished for their doings.

FACTORS INFLUENCING THE USE OF INFORMATION AND COMMUNICATION TECHNOLOGY IN THE KENYAN HIGHER EDUCATION SECTOR

Jimmy Macharia, United States International University Nairobi, Kenya
Theuns Pelsier, North-West University, South Africa

ABSTRACT

Previous studies have shown that in the higher education sector, information and communication technology (ICT) provides the impetus for change from the traditional concepts of teaching and learning, as well as the prime motivation behind the change in scholarly and professional activities. Consequently, the aim of this study is to answer the empirical question of which environmental, technological, organisational and individual factors are most likely to influence choice behaviour for using ICT in student learning in Kenyan higher education. Path analysis statistical techniques in structural equation modelling (SEM) were used. The findings show that environmental, technological, organisational and individual factors play a significant role in ICT diffusion and infusion.

INTRODUCTION

Information and communication technology (ICT) artefacts such as the internet, the World Wide Web, email, and learning management systems (LMS) have become some of the major concerns of modern organisations, including higher educational institutions and multinational corporations (Ryan and Rao, 2008; Casal, 2007; Eynon, 2005; Ochara et al., 2008). Several researchers have posited that effective ICT adoption, diffusion, and infusion are critical for organisations, like universities, for the performance of their activities, which include learning, teaching, research, communication, and management (Aguila-Obra and Padilla-Mele'ndez, 2006; Peansupap and Walker, 2005; Yan and Fiorito, 2007; Fink and Disterer, 2006). The study of the barriers to ICT adoption, diffusion, and infusion in learning and teaching in the higher education sector has now become an area of interest to researchers (Al-Senaidia et al., 2009).

Consequently, university administrators, despite the meagre resources, are continuously investing in ICTs to support learning, teaching, management, and research and also to help deal with educational budget cuts (Cheung and Huang, 2005). The ICTs that are of specific critical importance to higher education institutions include the internet, email, administrative, and learning management systems.

Although information systems (IS) research on technology diffusion has flourished in recent years (Bagchi and Udo, 2010; Venkatesh and Bala, 2008; Al-Senaidia, et al., 2009), the problem of ICT diffusion and infusion in learning and teaching institutions of higher education is persistent (Al-Senaidia et al., 2009). A review of published literature shows that the majority of the studies that were conducted to determine the factors that influence the adoption and diffusion of ICT were done in various business-oriented sectors of the developed economies and only a handful of studies were done on the higher education sector (Peansupap and Walker, 2005). Most of the studies have ignored the factors that influence the adoption and diffusion of ICT in the education sector in general, and higher education in particular. Therefore, in the literature, the education sector, and especially higher education, is markedly absent in research on the technology acceptance of IS (Tubin, 2007; Uhomoibhi, 2006).

To address this gap, this study aims to answer the empirical question of which environmental, technological, organisational, and individual factors are most likely to influence choice behaviour for using ICT in student learning in Kenyan higher education.

LITERATURE REVIEW

The three major characteristics of the environment of higher education institutions that make ICT a critical component of their success and survival in a digital age are: the rapidly changing higher education landscape due to local and global forces; the demand for flexible learning and teaching by the diverse range of learners; and the challenge of delivering quality education.

This changing context of higher education, both in Kenya and internationally, presents new challenges for learners, lecturers, university management, and higher- education policymakers. The increased application of ICT in learning, teaching and research has been identified by Mostert and Quinn (2009) as one of the most ubiquitous recent major changes in higher education.

Minishi-Majanja (2007) established that in the higher education and human capacity-building sector, ICTs are the impetus for change from the traditional concepts of teaching and learning, as well as the prime motivation behind the change in scholarly and professional activities. Consequently, an acute need to determine how well these types of ICT are adopted by students and diffused and infused into their learning activities has been recognised recently by researchers (Siragusa and Dixon 2009).

To address quality education delivery, the importance of the use of ICT in fostering a paradigm shift for the provision of quality education within the higher education sector has been advocated by Yang (2008). As a result it is necessary that higher education institutions themselves search for ways to effectively train the students with the required skills and to guarantee that the students who graduate will be creative, competitive, and critical thinkers (Yang, 2008). ICTs are transformational tools which, when applied appropriately, can promote the move from the traditional teacher-centred to a learner-centred learning environment and, in turn, enhance the quality of higher education. One way in which ICT enhances quality is by motivating learners to be engaged in their learning. “ICT such as videos, television and multimedia computer software that combine text, sound, and colourful, moving images can be used to provide challenging and authentic content that will engage the student in the learning process and tele-collaboration” (Achimugu et al., 2010).

Kenya has ten public universities, namely the University of Nairobi, Kenyatta University, Jomo Kenyatta University of Agriculture and Technology, Moi University, Egerton University, Masinde Muliro University of Science and Technology, Maseno University, Dedan Kimathi University of Technology, Technical University of Kenya and the Technical University of Mombasa. More than 20 private universities have different levels of accreditation status provided by the Commission for Higher Education (CHE).

It is evident from Table 1 that although a number of studies have been done on the library component of some universities, the subject of investigating the environmental, technological, organisational, and individual factors that influence the adoption, diffusion, and infusion of ICT by students in institutions of higher education has not been addressed adequately.

Although e-readiness reports have their own limitations, the KENET (2007) e-readiness studies of higher education institutions (HEIs) in Kenya came to the following conclusions:

- HEIs are not ready to use ICT for learning.
- ICT is not yet a strategic priority for HEIs.
- ICT strategies have not been aligned with the educational and development goals of the HEIs.

RESEARCH METHODOLOGY

This study employed a descriptive research design, which was found appropriate because it corresponded with the purpose of this study. The purpose of this study was to investigate the influence of environmental, technological, organisational, and individual determinants of adoption, diffusion, and infusion of ICT, by students in higher education institutions in Kenya.

This design utilised a cross-sectional approach making use of a survey method that used a self-administered questionnaire for data collection. According to Sekeran (2003), a descriptive study determines and describes the characteristics of the variables of importance in a context. Further, in this study, a triangulation methodology was adapted in the study of ICT adoption, diffusion, and infusion. Approach triangulation was used where both quantitative and qualitative techniques were employed. Using a

qualitative approach, a review of existing literature on the subject matter – adoption, diffusion, infusion, and technology acceptance determinants and assessment mode – was done. In addition, a discussion of the instrument constructs was done with a panel of experts to improve its validity and reliability (Mangan et al., 2004).

The target population consisted of students from universities in Kenya. From this population, the actual sample of 1 800 student respondents was chosen. These students were from the original sample of 16 public and private universities, which were selected from 30 accredited universities by the Commission of Higher Education (CHE) in 2007. The units of analysis were the individual students from the departments in the selected sampled universities. Students who were officially enrolled in the respective schools were chosen. Because a key objective of this research was to understand the ICT diffusion factors and process, it was necessary to focus on university departments with a sustained ICT deployment history. Therefore, rather than use a random sampling approach, a purposive sampling technique was applied to select the participating schools/departments within a university in the sample that use ICT in the running of their academic programmes.

A total of 1 314 questionnaires were returned (73% response rate) of which 222 were excluded from the data analysis process, largely due to incomplete answers. Therefore a total of 1 092 questionnaires were usable. There were three separate sampling levels: firstly, of universities for inclusion in the study, secondly, of schools/faculty/departments in the selected universities, and thirdly, of individual students in the selected schools/faculty/departments. Public universities were selected because of the parallels between them and private universities in respect of ICT in universities. The commonality of programmes that use ICT and the student involvement of ICT in learning and teaching made them valid comparators for the Kenyan situation. The validity of the study would have been restricted if data were only collected from urban-based universities. Universities in the rural setup were chosen as suitable contrasts to urban universities because they have very low ISP/ICT vendors within their localities.

DATA DISCUSSION

A total of 1 800 questionnaires were distributed to the 16 sampled universities in Kenya. The response rate was 73%. Out of the total questionnaires returned, 222 questionnaires were excluded from the data analysis, largely due to incomplete answers, resulting in 1 092 usable questionnaires. The gender distribution was 51.65% male compared to 45.70% female. The majority of respondents fell into the age cohort of 30 years and below (83.42%). Among the participants, experience in the usage of LMS had the lowest mean of all the groups. Experience in using computers was higher than that of the internet, email, and LMS. The ICT usage was measured using self-reported scores where one unit of access to ICT was assumed to be approximately 1 ½ hours or 90 minutes, which is equivalent to one lecture period.

Table 2 represents the minima, maxima, means and standard deviations for the key variables in the research. Generally, the respondents in the sample strongly agreed that ICTs (internet/ World Wide Web, email, and LMSs) were useful (PU - mean = 5.740) in their studies. Further, they agreed that it was easy to use ICT (PEOU – mean = 5.42). Perceived Usefulness of ICT had the highest mean score of 5.74, while Computer Anxiety had the lowest mean score of 3.23.

Table 2: Descriptive statistics

Variable	N	Minima	Maxima	Mean	Std dev
CP – Competition Pressure	1092	1.00	7.00	5.0032	1.56811
GS – Government Support	1092	1.00	7.00	4.5760	1.59978

Influence of environmental factors

It is evident from Figure 1 that Competition Pressure (CP) has the greatest influence on PEOU ($\beta=0.121$, $p<0.05$), followed by Government Support (GS), Vendor Support (VS), and lastly Socio-Economic (SE) factors. On the other hand, Perceived Usefulness (PU) is only influenced by Competition Pressure (CP) ($\beta=0.144$, $p<0.001$). From the study results, we can conclude that Competition Pressure is the only factor that influences Perceived Usefulness, while Vendor Support and Government Support both influence Perceived Ease Of Use. The Socio-economic factor is the only environmental factor that positively and significantly influences both Perceived Usefulness and Perceived Ease Of Use. This is a remarkable finding since the technology-organisational-individual factors' models seem to have been neglecting this set of variables in their theorisation, methodology, and practice.

Influence of technological factors

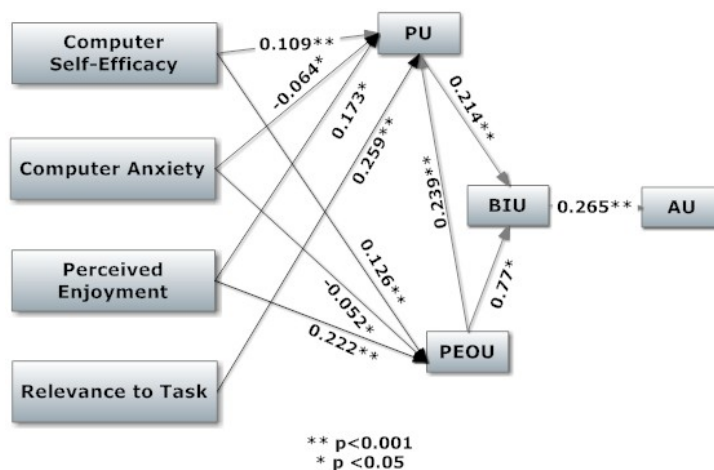

The participants in the survey sample strongly believed that ICT Relevance (REL) to their daily activities was a key factor in influencing their uptake of ICT (see Figure 2). At the same time, it was noted that Perceived Enjoyment (PE) towards ICT was one of the key influencing elements for a user's ICT uptake. The technological variables of Perceived Enjoyment and Relevance were positively correlated with both Perceived Usefulness and Perceived Ease Of Use. Furthermore, Computer Anxiety was negatively correlated to Perceived Ease Of Use. It can be concluded that: (1) Perceived ICT relevance to studies had the greatest significance influence on Perceived Usefulness of ICT by students, and (2) Perceived Enjoyment was the highest technological determinant of Perceived Ease Of Use and ultimately, intention and usage of ICT.

Figure 1: Model for environmental factors

PU = Perceived Usefulness, PEOU = Perceived Ease Of Use, BIU = Behavioural Intention, AU = Actual Usage

Figure 2: Model for technological factors

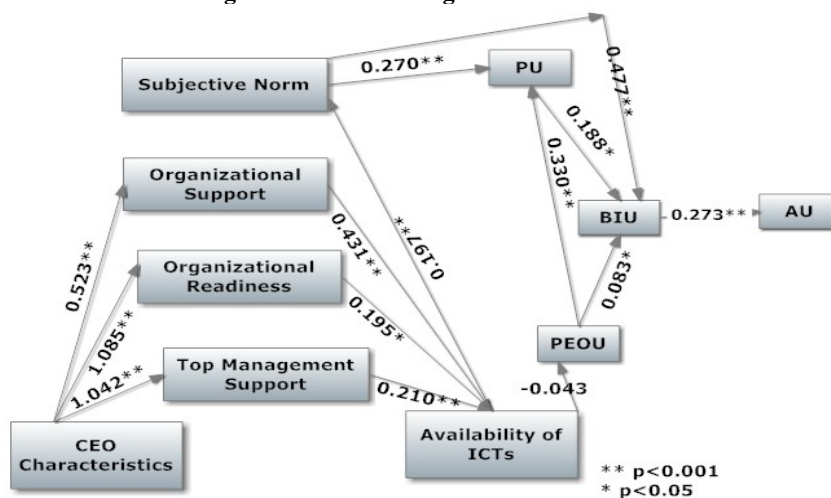

PU = Perceived Usefulness, PEOU = Perceived Ease Of Use, BIU = Behavioural Intention, AU = Actual Usage

Influence of organisational factors

The study reveals (see Figure 3) that institutional top leadership is required to lead ICT development in their institutions.

Figure 3: Model for organisational factors

PU = Perceived Usefulness, PEOU = Perceived Ease Of Use, BIU = Behavioural Intention, AU = Actual Usage

From the results of this study, the following can be concluded:

- (1) CEO characteristics significantly influence organisation support, organisational readiness, and Top Management Support.
- (2) Organisational Support has a significant influence on Availability of ICT.
- (3) Organisational Readiness has a significant influence on Availability of ICT.
- (4) Top Management Support has a significant influence on Availability of ICT.
- (5) Availability of ICT has a significant influence on Access to ICT.
- (6) Availability of ICT has a significant influence on Subjective Norm.

Influence of individual factors

The study recognised that while individual factors, Access to ICT and Perceived Time, had a positive and significant impact on user ICT adoption, diffusion, and infusion, the factor Perceived Resources did not (see

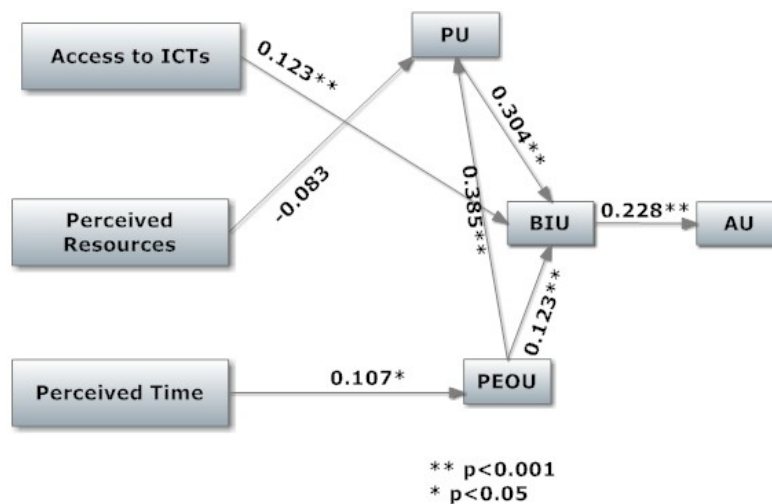

Figure 4). It can be concluded that Access to ICT for students to engage in ICT usage is the highest individual determinant of intention and usage of ICT. Secondly, the ICT that is offered for adoption, diffusion, and infusion should not only be useful for their daily activities, but also be easy to learn and use. ICT with a greater degree of complexity will decrease the uptake of the ICT. Therefore, the findings of this study conclude that (1) Access to ICT has a direct and significant influence on student Behavioural Intention to use ICT, and (2) Perceived Time has a significant influence on Behavioural Intention to use ICT.

CONCLUSION AND RECOMMENDATIONS

Some practical implications can be derived from the study. In the first place, the framework is dynamic in that out of a possible 130 factors that can be included in ICT diffusion models, a researcher can select the most relevant variables and plug them into the four sets of external variables for analysis. Prescriptively therefore, the study suggests that environmental, technological, organisational, and individual factors are responsible for driving ICT diffusion and infusion by individual users.

The results confirmed that Perceived Usefulness has a strong direct effect on Behavioural Intention. This suggests that the functionality of an ICT system must be emphasised to potential users. Researchers can help determine ways to do this effectively, and efforts should focus initially on greater internal training, management support, and Vendor Support. Education and training programmes should aim to increase awareness of potential applications and emphasise the benefits of using them. In addition, ICT system developers must address usefulness, as well as the ease of use, as an important design objective when developing systems. Ease of use also had a direct effect on use, as well as an indirect effect via Perceived Usefulness. This suggests that efforts to improve Perceived Ease of Use can have a strong influence on ICT in institutions of higher education. Since internal support, which includes internal training, influenced ICT diffusion, the need for institutions of higher learning to provide training for students to encourage them to use different ICT artefacts for their daily study activities, is highlighted.

Figure 4: Model for individual factors

PU = Perceived Usefulness, PEOU = Perceived Ease Of Use, BIU = Behavioural Intention, AU = Actual Usage

Another internal factor of even greater practical importance was Organisational Support. This may indicate that vendors, consultants, and educational institutions should provide formal computer education and training programmes specifically designed for higher education ICT users. Vendor Support had a strong influence on usefulness. Furthermore, Vendor Support had a much greater effect on usefulness than Government Support. Vendors and consultants are often reluctant to provide training to institutions of higher education ICT users because of the assumption that universities are knowledge towers. Thus, strategies are required to make Vendor Support more available in ICT deployment.

A possible strategy can involve a vendor-training component in the deployment of any new system. The vendor can provide IS support on a regular, possibly monthly basis for each institution. In addition, support and training sessions can be made available to institution users through an external information

centre that can be utilised and funded by many institutions. Alternatively, a government agency or an educational institution can operate this external information centre. Researchers can examine the effectiveness of such strategies aimed at providing external support to institutions of higher education.

LIMITATIONS

Firstly, the limitations concern the fact that the sample was drawn from one geographical location – Kenya. To generalise the findings globally a sample drawn from several developing nations, especially in Sub-Saharan Africa, and another from the developed world for comparison would have been more significant. Therefore, generalisability must be considered a concern. A second limitation is due to the cross-sectional nature of the research, including the quantitative data characteristics. Longitudinal studies would be helpful to compare adoption of the ICT over time.

MANAGERIAL GUIDELINES

The aim of the study was to answer the empirical question of which environmental, technological, organisational and individual factors are most likely to influence choice behaviour for using ICT in student learning. The study produced useful insights into the factors that influence technology acceptance decisions by students and provided new ideas in the understanding of ICT diffusion and infusion. The emergence of the role of CEO characteristics, Availability of ICT, and, Access to ICT in the adoption, diffusion, and infusion process by the individual in an institution is a major theoretical contribution which has practical ramifications.

Firstly, the CEO is the dominant influencing factor affecting Organisational Support, Organisational Readiness, and Top Management Support to an ICT implementation. This requires university top management to be the key drivers of ICT project implementation in their universities, if they want to increase the chances of successful adoption and utilisation. This will ensure adequate availability of resources that will enable the institution to make ICT available for student access.

The study calls for CEOs to have a higher level of commitment to any ICT implementation. This important theoretical relationship has significant practical utility, as there have been increasing concerns about the utilisation of ICT to facilitate learning, particularly enterprise systems that are inherently complex to understand and use (Venkatesh and Bala, 2008). Indeed, like many companies, higher education institutions have had several cases of enterprise system failures because of user resistance and underutilisation. This can only become worse in an institution where the system is not made available and accessible to the intended users.

LINKED DATA: TECHNOLOGIES AND OPPORTUNITIES IN HEALTHCARE

Bonnie MacKellar and Christina Schweikert
St. John's University, USA

ABSTRACT

The principles of Linked Open Data have been applied to a variety of knowledge domain areas in order to provide ease of access to developers and researchers and to provide a structure that allows semantically meaningful queries and interlinking to other related information. In this paper, we introduce the concepts and technologies involved with Linked Open Data and provide an overview of existing datasets, platforms, and applications, with a focus on healthcare and biomedical applications.

INTRODUCTION

One of the key problems in healthcare is that of data interoperability. There are a myriad of standards and proprietary representations, creating many “data silos” in healthcare. While this problem is well-known when it comes to electronic medical records and patient data, it is also a large problem with respect to public datasets of health information. Biomedical researchers often want to work with more than one dataset and have to spend a lot of time translating a myriad of formats. It also makes it difficult to build applications that utilize public datasets for patient-focused searches for medical information, such as drug side effects or clinical trials. Linked Data is a movement to overcome interoperability problems in all domains, and facilitate “smarter” ways of searching data, by using semantic web methods. Linked Data also focuses on tools to make it easier to publish large amounts of data in a standardized representation.

This paper focuses on the Linked Data concept, related technologies, and various areas of application. Particular attention is placed on utilizing linked data in the healthcare and medical fields. This year, 2013, celebrates the 20th anniversary of the open web which was made publicly and freely available by CERN in 1993. The World Wide Web was revolutionary since it enabled information to be published and accessed from anywhere across the globe. Since its inception, and to the present day, the WWW mainly consists of informative documents that are accessible over the Internet and are connected by established hyperlinks. The documents are primarily developed in HTML (Hypertext Markup Language), which specifies the way the information on the page is presented in a browser. HTML tags describe the design and look of a web page, rather than describe the information contained on the page. Most of the information on the Web is inter-meshed within HTML type documents, or available for download in a variety of formats. This web of documents has created this “global information space” (Bizer et al, 2009) that is so fundamental today across businesses and industries. However, there has recently been an emphasis on the need to publish structured and well-described data that can be linked to other data sources across the Web. Standards have been developed to create this “global data space” (Bizer et al, 2009) that enables data from various domains to be interconnected. The principles of Linked Data (Berners-Lee, 2006) form the foundation for a Semantic Web that is made up of defined, structured, and interconnected data.

LINKED DATA FUNDAMENTALS

One of the problems with the current Internet standard is that there is no way to represent the semantics of web resources. The HTML markup language describes the visual presentation of a resource and provides no means of representing the contents. This makes it difficult to build automated tools that are capable of intelligent search and query. For example, an Internet resource may contain information about dog breeds. A query facility that allows us to pose the question “Which breeds are used for hunting?” should be able to return information from this document. The HTML language describing this document; however, will only specify the layout of the document - that is, where images are located, which information is presented in

tables, which text serves as a header, and so on. Thus, an automated query facility would not be able to retrieve information from this page.

The Semantic Web, first proposed by Tim Berners-Lee in 1998 (Berners-Lee, 1998), is a set of technologies intended to overcome this problem. The idea is to represent information in an Internet resource in a standardized language which represents the contents of the resource. This language is known as the Resource Description Framework (RDF). A document encoded in RDF represents its contents in the form of triples which are simply predicates. An example might be <dachsund> <used-for> <hunting>. By representing all of the information in the document in these triples, it is possible to create automated reasoners that work with this representation. In reality, the representation of this data will be more complex since concepts like “dachsund”, which are considered to be resources, will have an associated Uniform Resource Identifier (URI), which is an Internet standard for naming entities. Besides RDF, a number of other technologies are standard components of the Semantic Web. XML is often used as a way to serialize RDF triples, leading to a standard called RDF/XML. The standard query language is called SPARQL. The query described above would be represented in SPARQL as: SELECT ?breed WHERE ?breed used-for hunting

Ontologies can be developed in the Semantic Web using a language called OWL (Web Ontology Language). And, of course, the underlying protocol for all of this remains the Internet standard HTTP. One of the main premises of the Semantic Web is that searches and queries can proceed across distributed documents, much as searches on the current Internet proceed. The key to this is the use of standard URIs. So, for example, a commonly used set of Semantic Web resources is FOAF, or Friend of a Friend, which is a public ontology describing people and their relationships to other people and to activities. A typical triple might look like this: @prefix foaf: <http://xmlns.com/foaf/0.1> .<foaf:person> <foaf:name> <”John Smith”>, which asserts that the name of a particular person is John Smith. Since the FOAF concepts all have a unique URI, they can be freely used in other RDF documents, which means that information about a person’s friendships can be integrated with other kinds of information. This ability to mix information from distributed sources is one of the most powerful capabilities of the Semantic Web, and leads to a powerful reason for publishing data in RDF on the open web. The term Linked Data refers to a paradigm for publishing data on the Internet using Semantic Web technologies, a set of best practices that leads to maximum interoperability. Tim Berners-Lee, inventor of the World Wide Web, defines four basic guidelines for Linked Data that outline how to publish data, link it to other related data, and enable it to be discovered by others (Berners-Lee, 2006).

1. Use URIs as names for things.
2. Use HTTP URIs so that people can look up those names.
3. When someone looks up a URI, provide useful information, using the RDF and SPARQL standards.
4. Include links to other URIs so that they can discover more things.

The last step, that resources should be linked to other URIs, is vital since it is these links between data (both internal and external links) that builds this data space for the semantic web. As of 2013, over 40 billion pieces of data have been published as Linked Data. Datasets vary from DBpedia, which is an RDF representation of Wikipedia, to the British National Bibliography, to RXNorm, which is a pharmacological terminology from the U.S. National Library of Medicine. So, if the Linked Data paradigm requires usage of technologies such as URIs, RDF and SPARQL, how is it different from the Semantic Web? The answer is that the Linked Data paradigm is a concrete means, governed by the W3C, of achieving the Semantic Web in a globally distributed fashion. Another point of confusion is the difference between Open Data and Linked Open Data. Linked Open Data (LOD) refers to data that is available under an open license and that is published to the Web with the Linked Data standards (Linking Open Data Project). On the other hand, Open Data, such as the many websites maintained by government agencies, may make data openly available but not in a format that can be linked easily to other datasets. A typical example might be data that is provided in CSV format uploaded from spreadsheets. This format does not contain information about the meaning of the contents and does not allow for SPARQL queries; thus it is not Linked Open Data.

RESEARCH ISSUES IN LINKED OPEN DATA

There are a number of issues that researchers are actively working to resolve. Since this is an effort to integrate many, large datasets from many organizations and countries, obviously differences in data representation can be a big problem. Merely converting all datasets blindly to RDF triples is not enough to ensure linkability, since different datasets represent concepts in varying ways. For example, one dataset might represent diseases simply as a simple text label, whereas another dataset may represent diseases in a structured fashion, with many subfields containing details about the disease. It can sometimes be a challenge

to determine if a concept in one dataset is really the same as similar concept in another. Approaches to alleviating this problem include the use of standard ontologies such as the Unified Medical Language System (UMLS), or the Translational Medicine Ontology (Dumontier, Andersson et al, 2010) which is being developed specifically for medical information in Linked Data. Another approach is to use automated tools for resolving conflicts. A number of these tools are described in the W3C report (Sahoo et al, 2009). Another issue is efficient processing of distributed SPARQL queries. One of the central premises of Linked Data is that datasets can reside anywhere in the Internet, but should be queryable in a transparent fashion. In order to do this, a query processor must be able to divide up the components of the SPARQL query and send subqueries to the relevant servers, finally then recombining all of the results. Examples of query processors that can do this are DARQ (Quilitz & Leser, 2008) and SemWIQ (Langegger et al, 2008).

Finally, issues of tracking provenance, and variation in licenses can be a problem, especially when building applications that integrate data from many datasets. This issue was recently explored by Rodriguez-Doncel (Rodriguez-Doncel, 2013). He found that of 338 Linked Open Data datasets that he explored, 132 had no license specified at all, 16 actually carried closed licenses, 5 carried licenses with restrictions, and the rest had various types of open licenses, such as licenses that specify that the data may be shared with attribution, or that require that the same license be carried on any work that used the data. This can pose problems for applications that freely navigate through the Linked Open Data cloud because the application must have an automated way of determining if a dataset can be used given its license restrictions.

LINKED DATA IN HEALTHCARE

The healthcare, medical, and science fields have an enormous amount of diverse data that is housed across the globe in various kinds of institutions and organizations. Healthcare and biomedical informatics are leveraging this distributed knowledge by employing semantic web technologies (Dumontier, 2010). The biomedical field already has a vast amount of vocabularies, data standards, and knowledge bases, some of which are being made available as Linked Data. In order to establish standards and to promote the use of semantic web technologies in the biological and health sciences, the Semantic Web for Health Care and Life Sciences Interest Group (HCLSIG) was established under the auspices of the W3C in 2005. This group focuses on the development of core vocabularies that can bridge the many biological and healthcare vocabularies that already exist, on best practices for resource identification in the semantic web, and on scientific and scholarly publication (Semantic Web for Health Care and Life Sciences Interest Group (HCLSIG) Charter). The HCLSIG group contains a number of task forces that focus on specific projects. The BioRDF task force (HCLSIG BioRDF Subgroup) has developed standards for using RDF and OWL to represent, integrate, and query data in the life sciences and healthcare domains. Another example, the Linking Open Drug Data (LODD) task force is focused on enhancing pharmaceutical research by connecting drug and medical databases that are available on the Web (Samwald et al, 2011). Some of these datasets include: DrugBank, ClinicalTrials.gov / LinkedCT, RxNorm, UMLS, SIDER, among others. Linked Life Data (linkedlifedata.com) is a platform that facilitates semantic queries that can retrieve data from multiple biomedical resources; it is an integrated data warehouse that connects a variety of biomedical databases. In this paper, we will explore the applications of linked data in the healthcare and biomedical areas.

APPLICATIONS AND EXAMPLES

A variety of applications that are built on the principles of Linked Data have emerged. Many of these applications are specialized and dedicated to a specific knowledge domain, while others aim to be more general and encompass a broad knowledge base. DBpedia (Auer et al, 2007) is an example of a general knowledge platform that is based on extracting information from Wikipedia and making it available as Linked Open Data. Wikipedia is a very large and diverse resource that is constantly evolving; this makes it challenging to manage the data itself, in addition to the meta-data. DBpedia's strategy for extracting semantic relationships from Wikipedia takes advantage of structured information found in the articles, such as infobox templates, categories, geographical coordinates, links, and images. Pattern recognition techniques are used to find these templates, as well as other syntactic constructs used by Wikipedia for meta-data. Semantic relationships discovered in these structural elements, as well as relationships that exist in Wikipedia's relational database, are used to create RDF triples. The DBpedia dataset currently contains information on 3.77 million things, which are described by 400 million facts; DBpedia is also available in 111 different languages (The DBpedia Data Set). DBpedia now has its own ontologies that were developed based on common types of infobox information; classes include types such as Place, Person, Work, Species, and Organization, to name a few. The ontology is represented in a directed-acyclic graph and has 2,350,000 instances (The DBpedia Ontology). In keeping with the principles of Linked Open Data, DBpedia is

interlinked with many other open and relevant datasets by RDF links. DBpedia can be accessed as linked data with a semantic browser, through a SPARQL endpoint, as well as RDF dumps.

Figure 1: DBpedia within the Linking Open Data Cloud (<http://lod-cloud.net/>)

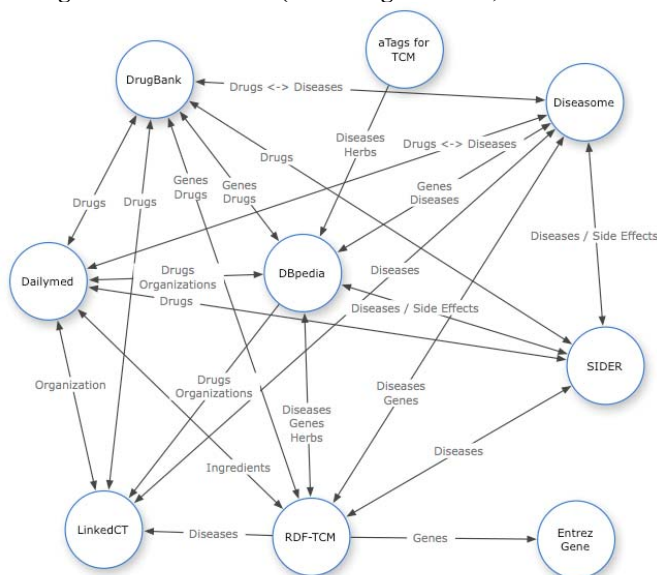

The Linked Open Drug Data task force (W3C Organization, The Linking Open Data Project), which is part of the W3C HCLS IG, has focused on identifying and publishing open access datasets in the area of pharmaceutical research as Linked Open Data. These datasets include the following: DrugBank (drug data), LinkedCT (clinical trials information), DailyMed (drug information), ChEMBL (drug information), Diseasesome (disease information), TCMGeneDIT (gene-disease-drug associations from Chinese medicine), RxNorm (drug information), UMLS (standard medical ontology), SIDER (adverse effects of drugs), STITCH (molecular interactions between chemicals and proteins), the Medicare formulary, and the WHO Global Health Observatory. These datasets will be described in more detail below. The datasets are all fully interlinked with each other and with other datasets published by other groups in Linked Open Data format. One of the main contributions of the LODD group, besides publication of the datasets, was to develop a set of best practices for the publication of this type of data. One of these is the use of semantic link discovery methods for creating the links between datasets. These methods use approximate string matching to determine whether a concept in one dataset is the same as a concept in another dataset. Unfortunately, the labels used in different datasets may have variations in spelling; this is why approximate matching must be used. For example, in LinkedCT, there is a concept labeled “Alzheimer’s disease”, while in Diseaseome, the analogous concept is labeled “Alzheimer_disease” (W3C Organization, Linking Open Drug Data (LODD)). Automated link discovery tools must be able to determine that these two concepts should be linked with each other. A number of automated link discovery tools were developed as part of the LODD project, in particular, LinQuer (Hassanzadeh, Xin et al, 2009) which works with relational databases, and Silk (Volz, 2009), which discovers links between data sources. The following diagram, from the LODD website, shows the interlinking between LODD datasets.

The individual datasets within the LODD project contain a diverse set of information useful to medical researchers and practitioners. Here, we will further describe them. Since the purpose of this platform is to publish datasets that support pharmaceutical research, most of the datasets pertain to pharmaceutical information. For example, DrugBank (Knox et al, 2011), which is provided by the University of Alberta, combines detailed drug information with drug target information such as sequence, structure, and pathway. The dataset contains 6729 drug entries, as well as 4254 non-redundant protein sequences which are linked to the drug entries. The drug entries are very detailed, containing 150 data fields. This resource is widely used, with more than 4 million page visits per year, by pharmacists, researchers, doctors, and the general public. Another drug-oriented dataset is RXNorm (Nelson et al, 2011), which is a standard nomenclature provided by the U.S. National Library of Medicine. It contains over 166,000 unique drug names and ingredients, derived from FDA databases. Unfortunately, due to licensing only 6 of the 12 drug vocabularies in the RxNorm dataset can be made available as part of the LODD cloud. DailyMed (U.S. National Library of Medicine) is also from the U.S. National Library of Medicine and contains information about 4000 medications, including information obtained from the package inserts. SIDER (Kuhn, 2010) also is based on medication package inserts, but focuses on reports of side effects included in those inserts. It contains around 63,000 adverse effect reports. There are also non-drug-related datasets within LODD. One of the most important is LinkedCT (Hassanzadeh & Kementsietsidis 2009), which is derived from the

clinical trial information maintained at ClinicalTrials.gov, maintained by the National Institutes of Health. Diseasome (Goh et al, 2007) is a dataset that links disorders and the genes associated with those disorders. And finally, LODD has published an RDF representation of the Unified Medical Language System (UMLS) (U.S. National Library of Medicine) which is a repository of biomedical vocabularies developed and maintained by the U.S. National Library of Medicine. The vocabularies that make up the UMLS are drawn from domains ranging from genomic annotations to cancer terminology to laboratory tests and results. These vocabularies are widely used throughout the biomedical world and serves as a standard biomedical ontology. Publishing the UMLS as Linked Open Data is extremely important to the ability to write software applications that can reason about medical data. LODD has been a very important effort for integrating large biomedical datasets. Even though it is focused on pharmaceutical data specifically, it has the potential to support applications that integrate many areas of biomedicine.

Figure 2: Interlinking of LODD Datasets (W3C Organization, HCLSIG/LODD/Interlinking)

Bio2RDF (Belleau et al, 2008) is another Linked Open Data project that is trying to integrate data in the life sciences using a Linked Open Data approach. They focused on building automated tools for converting the original datasets to RDF, since one of their goals is to keep the data up to date. The approach requires three steps: first they build namespaces for the various data providers. Then, each data source is analyzed in order to build a Linked Open Data model. Finally, a conversion program (an rdf-izer) is built to convert the data in the data source to RDF format. The converted data is stored in a large database called a triplestore, which can later be queried. The resulting triplestore contains data from 20 different public bioinformatics data sources, including NCBI's Entrez Gene, the OBO open source ontology, and the MGI mouse annotations, all queryable in an integrated fashion. Nolin et al describe an sample application in which information from various datasets in Bio2RDF are combined in a query which identifies a protein interaction network appearing in the first hours of an HIV infection as monitored by a time course microarray experiment. This requires that information about the expression microarray, RNA/protein encoding genes, Entrez Gene, a protein-protein interactions database, PubMed, and MeSH all be integrated. Research in the biomedical and health domains generates and relies on a massive amount of data that needs to be integrated and analyzed from multiple perspectives. For example, a research problem that involves identifying genes or proteins of interest, analyzing their molecular properties, investigating molecular interactions within cellular and physiological processes, and relating this to available pharmacological and clinical data would need to integrate information from heterogeneous data from a variety of sources. The Linked Life Data platform (Momtchev et al, 2009) and Pathway and Interaction Knowledge Base (PIKB) dataset integrates over 30 data sources and enables users to make semantically rich queries. Relationships between genes, pathways and interactions, diseases, and drugs can be explored with SPARQL queries.

The Fujitsu Open Data platform (Fujitsu Laboratories, 2013), announced in April 2013, is a new data storage technology that stores and queries interconnected Linked Open Data. This is a joint project involving Fujitsu Laboratories of Japan and the Digital Enterprise Research Institute of Ireland. It will be globally available and free of charge. It features a distributed query facility that is optimized for Linked Open Data queries, which will be capable of processing hundreds of billions of triples. Fujitsu is also

collaborating with the National University of Singapore on a project which uses the Open Data platform to create a sensor network for home-based patients for disease prevention and management (Benn, 2013). Data from the sensors will be stored on this cloud based platform, and can be combined with medical information from other Linked Open Data datasets to provide more information for physicians using the system. Even more importantly, the data from the sensors, anonymized to protect privacy, will be published as Linked Open Data, providing an enormous dataset for medical researchers. There are an increasing number of research efforts that use the data integration capabilities of Linked Open Data. One example is OpenTox (Willighagen et al, 2011), which uses computational methods to predict toxicities of drugs. This is an area in which multiple biological and chemical information sources need to be integrated. The OpenTox platform is based on Linked Open Data and supports toxicology model building. It has several interfaces: a SPARQL query interface, a web service interface that provides descriptor values for a given molecule, and a scripting language that allows interactions to be automated. The THESEUS Medico project (Sonntag et al, 2010), which focuses on semantic search for medical images, uses medical linked data to identify relationships that are important for annotating and searching radiology images. For example, a radiologist inspecting images produced from scans of a lymphoma patient may want to determine if a shrinking lymph node was caused by a new medication. If the images have been annotated with links to data, this query can easily be answered in the system. The application uses the Linked Open Drug Data platform described earlier, and specifically draws on the datasets DrugBank, Disasome, and DBpedia, and links these with two semantic resources for radiology and anatomy. This information is used to annotate the medical images.

CONCLUSIONS AND FUTURE WORK

The Linked Open Data movement clearly shows a lot of potential for healthcare and biomedical informatics specialists, especially in the area of public health. The uniform, semantic representation allows data from various data sources to be freely recombined and integrated, using a standard query language. This will make it much easier to build mashups based on large quantities of healthcare information. For example, consumer applications that annotate mentions of drug names in healthcare articles with additional information on side effects or molecular pathways can easily be built. Since government data is increasingly published as Linked Open Data, one could envision mashups that combine public health data with other public data - for example, linking cancer occurrence statistics with data on locations of different types of businesses. There are, however, a number of issues that need to be overcome. More tools to automatically convert data locked in proprietary formats to RDF need to be built. Tools that allow minor differences in terminology to be resolved need to be built as well. Better methods for processing queries made across globally distributed datasets are needed. And finally, there are licensing issues to be worked out since even different datasets, even public ones, are published under varying types of licenses. However, researchers are actively working on all of these problems, and large companies such as Fujitsu and Pfizer are becoming interested and involved in the concept. There is much promise here for making large stores of health and biomedical information easily accessible to more people across the world.

MOVING TOWARD SUSTAINABLE HOUSEHOLD FOOD-PRODUCTION SYSTEMS: CONSTRAINTS AND CHALLENGES IN RURAL SOUTH AFRICA

Thanyani Madzivhandila
University of Limpopo, South Africa

ABSTRACT

Rural households' food production provides the foundations on which transformation of the socio-economic conditions and sustainable food security for the poor can be realised. Households produce food for their own consumption and in some cases for selling in order to improve their food and income security. The attainments of these securities assist the household to avoid dependence on external food production channels and food production sources which can be expensive and unaffordable. However, like any other development activity, rural households' food production systems have been subjected to different challenges and constraints. Drought, floods, pest attacks and limited labour are some of the main challenges that the poor rural households are battling with daily. These challenges delay the process of crop production and/or destroy the plants and animals that the household produces and are rearing for food. This paper argues that without a formulation of remedial well-thought strategies and tactics directly targeting diverse challenges and constraints of households' food production process, sustainable food security for the poor will remain a pipe-dream. The paper discusses complex challenges and constraints that are faced by households throughout their food production system. The paper concludes that in order for South African government to attain a sustainable food security for the poor, its strategies and intervention need to directly target the constraints and challenges that poor households are facing.

INTRODUCTION

In recent years, food security has been subjected and heavily tied to market forces that are prejudiced by the socio-economic and political conditions of the society in which they live (Stocking, 2003; Misselhorn, 2005; Pretty, Thompson & Hinchcliffe, 2008; Thornton, Jones, Ericksen & Challinor, 2011). These mentioned conditions and deciding factors are seen to be hostile in rural areas and have left the majority of poor people suffering from hunger and starvation. Stocking (2003) argues that, with these inevitable socio-economic challenges, the majority of rural communities particularly in the tropics and subtropics have been experiencing a decline in household food production, with sub-Saharan Africa and parts of Latin American, the Caribbean and central Asia suffering worse. Also, global inequality in food entitlements, For instance, people's ability to acquire food and gain access to and control of production resources has remained a biggest obstacle to achieve food security for all (Pretty et al., 2008). The direct causes of the inadequate food access are poverty, environmental stressor and conflict. Hence, addressing the social factors surrounding food security serves as a window through which we observe the complexities and challenges emerging from competing structures of production and consumption (Misselhorn, 2005; Pretty et al., 2008). In order to address the question of sustainable food production successfully, this paper is structured in four parts, which includes a discussion on households' food production and security in rural areas, considering adopted systems, technology used and other major aspects of food production in rural areas. The highlight of the environmental context in rural areas and its role as an enabling factor for a sustainable food production is also discussed. Challenges and constraints that are associated with food production are also discussed with a reflection of the crucial steps to be taken on the quest towards the adoption of sustainable food production. Lastly the paper concludes on the strategies and intervention that are needed to directly target constraints and challenges of food production providing recommendations for a successful and sustainable food production systems in rural areas.

HOUSEHOLD FOOD PRODUCTION AND SECURITY

Food security is seen as less sufficient global and national agricultural production, and increasingly as livelihoods that are sufficient to provide enough food for individuals and households through their own production (International Food Policy Research Institute (IFPRI), 2002; Stocking 2003; Pretty et al., 2008; Olawepo, 2010). These production systems are usually characterised by poverty, small holdings, simple implements are used to cultivate, and land fragmentation is on the increase (Olawepo, 2010). However, according to Pretty et al. (2008) technology such as irrigation and improved crop varieties has changed the situation for few people but insecurity still prevails for the poorest and most vulnerable. Two identifiable types of food production in rural areas are livestock farming and crop production.

Livestock Farming in Rural Areas

Livestock farming as a means of producing food is common amongst households in rural areas. It contributes to household subsistence needs in many ways; for example, slaughtered livestock provide meat for home consumption, while other animals such as chickens may produce eggs (Calzadilla, Zhu, Rehders, Tol, & Ringler et al., 2009). According to Ayinde et al. (2010), growing of livestock such as chickens and other birds in rural areas is less costly to acquire and maintain; hence, they are easily to slaughter for immediate consumption within the household. Furthermore, chickens and other small animals survive solely on scavenging; possibly being fed with some kitchen scraps and very little attention is given to health care or management. The other most common animals reared by households in rural areas include cattle, buffaloes, sheep, goats and pigs. Traditionally, animals such as cattle are kept as draught animals with milk as a by-product and buffaloes as dairy animals (Khan & Usmani, 2005). According to Calzadilla et al. (2009), most rural areas do not meet the requisite preconditions for livestock production, especially grazing land and pastures for animal feed. Without optimum feeding, animals do not produce up to their production potential and are vulnerable to various diseases (Khan & Usmani, 2005). The most common animal diseases experienced in rural areas are internal parasite, rabies, indigestion and foot/mouth disease (Khan & Usmani, 2005). With all these constrain to raise livestock, many households tend to focus more on crop production as their main strategy to secure food.

Crop Production in Rural Areas

Crop production in rural areas is characterised by very low yield due to lack of irrigation supplements (Calzadilla et al., 2009). Crop production is rain-dependent in most of rural areas and when rain is scares the households usually have minimal harvesting. The major food crop produced by households includes maize, sorghum, potatoes, beans and vegetables. According to Olesen & Bindi (2002), the crops produced by households particularly in rural areas are vulnerable to excessive heat that ultimately destroys them. The heat and drier soil conditions in these areas increase the vulnerability of crops to wind erosion and evapotranspiration (Calzadilla et al., 2009). Crop production is largely subsistent, hence it is practiced with less productivity enhancing inputs and yields. Calzadilla et al. (2009) identified lack of improved seeds, pest attacks and weed infestation as the major constraints facing crop production, particularly in rural areas. The limited availability of land is also a major concern in rural areas. The success of crop production in these areas relies on small piece of land that many households own in their backyard and in most cases such land is already degraded because of mismanagement and over-cultivation. Hence, the environmental conditions play a major part in the success and/or failure of food production in rural areas.

ENVIRONMENTAL CONTEXT IN RURAL AREAS

The environmental condition in rural areas plays a major part in determining the ability of households to produce their own food. Hence, the challenges that are faced in these areas reflect the interrelationship among resource change, human productive activities and the accompanying transformation of people's lives (Rozelle, Huang & Zhang, 1997; Hinrichsen, 2000; Olesen & Bindi, 2002). In practical reality, the poor people endured degraded environments, to which they often contribute further degradation (Blaikie, 1985). The poor often destroy their immediate environment by cutting down forest, their livestock overgraze grassland and they overuse marginal lands to produce food for survival. This situation has meant that, natural resources becomes under increasing pressure in rural areas, threatening health and development of food production and security. Water shortages, soil exhaustion, loss of forest and water pollution afflict many rural areas (Hinrichsen, 2000). Also, as Olesen & Bindi (2002) indicated, the high rate of population without the improvement of the standard of living, provision of services and employment has posed a threat and contributed to the deteriorating environmental conditions in rural areas. Moreover, degradation of land

for agriculture, forest and wetland resources has extended the depth and breadth of deprivation in many rural areas. The severities of the environment problems in rural areas are dependent not only on their cause but also on the vulnerability of the specific natural resource setting. For instance, most poor rural households practice food production in mountainous land and hilly regions which are vulnerable to soil degradation (Olesen & Bindi, 2002). Such places are mostly dry, open and vulnerable to erosion either when it is windy or when there are floods and with over-cultivation, soil exhaustion inevitably occurs (Olesen & Bindi, 2002). The environmental conditions in rural area expand the space on common obstacles and challenges which are associated with food production and security.

CONSTRAINTS AND CHALLENGES OF FOOD PRODUCTION AND SECURITY

The ability of agricultural production to provide for and support the growing population has been a concern for generations and continues to be a number one priority on the global policy agenda (Thornton et al., 2011). The challenges associated with this sector are immense, and have threatened the production based resources in a form of loss of water through contamination, loss of genetic resources, habitats and species, adverse impacts of pesticides, weeds and insects. Hence, in most of agro-ecosystems, declining crop yield is exponentially related to loss of soil quality through climate related problems such as drought and floods. Also, HIV and AIDS has currently been found to be a perpetuating factor that is unique, slow-moving and devastating shock that strips households food production and livelihood assets as a creeping emergency that progressively erode the lives and livelihoods of the affected household (Speth, 1993; Rosegrant & Cline, 2003; Stocking, 2003; Gregory, Ingram & Brklacich, 2005). Other important constrain associated with food production is high cost of crop damage due to poor or non-existing storage facilities, with Spoilt fruits and food crops being common feature, and increased water scarcity.

Impact of HIV and AIDS on Food Production in Rural Areas

The HIV and AIDS epidemic is another global concern, in addition to its direct health, economic and social impacts, the disease also affect food production, security and nutrition. Adult labour is often removed from affected households and these households are left with less capacity to produce or buy food (Hendriks, 2005). Concurrently, HIV and AIDS had add to disinvestment by families in farming activities and a move towards livelihoods strategies more adaptable to unstable and insecure circumstances which are previously associated with political and economic instability and conflict, together with poor financial resource and poverty. In other words, HIV and AIDS is a shock to households' food security and the latter cannot be properly understood without considering its effect. While the immediate, devastating effects are at the individual level, the consequences are much broader, for instance, from the intolerance strains on traditions and the child fostering mechanism, to extreme pressure on health systems and also loss of productive labour (Mtika, 2001; Hendriks, 2005). Moreover, Mtika (2001) also argues that the disease contributes to psychological strain including depressed families, stress, suicide, isolation, self-pity, stigma and hatred had affected household's abilities to sufficiently producing their own food.

The Impact of Climate Change on Food Production in Rural Areas

Climate change is one of the most important stressor which affect food systems of many rural areas in several ways which range from direct effects on crop production (for instance, changes in rainfall leading to drought or flooding, or warmer or cooler temperature leading to changes in the length of growing season) to changes in markets, food prices and supply chain infrastructure (Rosegrant & Cline, 2003; Barnet & Adger, 2007; Brahmhatt & Christiaensen, 2008). In warmer or tropical environment, climate change have resulted in more intense rainfall events between prolonged dry period, as well as reduced or more variable water resources for irrigation. Such conditions have promoted pests and diseases on crops and livestock, as well as soil erosion and desertification. Particularly in rural Southern Africa, the short and long-term climate and environmental stressors are found to be endemic to the food production livelihoods and practices (Speth, 1993). Hence, many rural households' food systems had failed to deliver food security because the related determinants and/or the links between them are disrupted by climate change and other climate related stressors. Two categories of occurrence (natural and human processes) namely flood and droughts are virtually universally accepted to be the primary indicators of climate change. Barnet & Adger (2007) state that, flood and drought had continuously destabilized the poor household's food production, clean water, energy supply and environmental health, amongst others.

The manifestation of climate change through floods is perceived to be the most dangerous event signalling its existence (Khandlhela & May, 2006). Climate change increases the surface temperature, changes precipitation patterns, which constitute into severe heavy rains. The sea levels rises when the water warms, glaciers and ice melt into the sea. Hahn, Riederer & Foster (2009) wrote that the long term changes in the hydrological cycle (that is the flow of water throughout earth due to higher temperature; more evaporation; melting of ice; more intense rainfall) contribute to the manifestation of climate change in the form of floods. Floods which constitute heavy rains do not only frustrate household food production processes but also contribute to destruction of infrastructure, closure of schools, damage to traditional dwellings and sometimes loss of lives (Khandlhela & May, 2006; Hahn et al., 2009).

The other indicator of climate change which is largely observable and/or measurable in rural areas is drought. Drought occurs when there are changes in the hydrological cycle which ultimately change the precipitation process (Devereux, 2007; Simelton, Fraser, Termanen, Forster & Dougill, 2009). Devereux (2007) illustrated that drought manifest when there is a build-up of water vapour the atmosphere and change occurs in the climate patterns. Drought can take shorter or a longer period; however the persistent moisture deficiency below long-term average condition; balanced precipitation and evapotranspiration will increase the period of drought in a specific area (Fraser, 2006). Fraser (2006) mentioned that drought is more than a simple lack of rainfall in a hydrological sense it occurs when surface water supplies steadily diminish during dry spell and in an agricultural sense it occurs when the moisture shortage lasts long enough and hits hard to negatively impact cultivated crops and livestock. According to Devereux (2007) moisture deficits may have different consequences depending on the time of year at which they occur, pre-existing soil moisture content, and other climatic factors such as temperature, wind, and relative humidity can also pre-empt the manifestation of drought particularly in rural areas. The challenges associated with food production require strategic interventions which will cater for sustainable food security for the poor in rural areas.

MOVING TOWARDS SUSTAINABLE FOOD PRODUCTION AND SECURITY

The goal of achieving sustainable food production and security in the decades ahead emerges as one of the greatest challenges humanity has ever faced. Agriculture outputs should be increased and people should have the income to buy them. That is, food security which commonly includes food supply, access, adequate utilization, and safety and in some cases cultural accessibility of food for all people at all times has to be a priority in the global food agenda (Speth, 1993; Duhaime & Godmaire, 2002; Rosegrant & Cline, 2003; Hendriks, 2005; Pretty et al., 2008; Gregory et al., 2005). In other words, food security is seen to exist when all people, at all times, have physical and economic access to sufficient, safe, nutritious food to meet their dietary needs and preference for an active and healthy life. According to Hendriks (2005) in order to achieve sustainable food production and security, there is a need to a radical policy and investment reforms on multiple fronts, including human resources, agricultural research, rural infrastructure, water resources, community based agricultural and natural resources management (Rosegrant & Cline, 2003). These policy reforms which should be progressive in nature must not only increase agricultural production in a larger scale but also facilitate household own production, boost income and reduce poverty in rural areas where most of the poor live. Hence, in countries with heavy dependence on agriculture, progress towards improved reforms will not only depend on making agriculture more productive in a national scale but also it will require an intervention at the local small-hold farm practice and significantly at the household level. One aspect which is making sustainable food production a requirement to the alleviation of hunger in third world countries is the global increase in food prices (Rosegrant & Cline, 2003). These increases which are coupled by the increased poverty rate are threatening household food security by reducing the purchasing power and available resources for purchasing food and eroding income. Furthermore, Duhaime & Godmaire (2002) stated that, continuing rising of food prices and heavy reliance on food purchases increase vulnerability to food insecurity as greater reliance on wage income discourages home production of food. Sustainable food production will mean that, the combination of three elements of food securities are merged, for instance, human resource (people) should be available, production should flourish and access should be maintained and facilitated (Hendriks, 2005). Food access indicators include food entitlement and socio-economic indicators that indicate ability of household to cope with various stresses induced by economic and social change. Most food security outcome indicators measure more than food consumption for example, malnutrition indicators also capture the influence environment aspects, bio-utilisation factors, health and sanitation on nutrition, growth and development.

The sustainable production of food is the first pillar of food security; hence food security is a basic human right. Failing to attain these human right may not necessary capture all dimensions of poverty, but it may indicate it as an important indicator of wellbeing (Hendriks, 2005). Sustainable food security will mean improved systems of food production, distribution and economic access to cope with climate change. Moreover, subsistence food production is strongly influenced by the availability of water. The majority of poor households are situated in places with limited water and they are likely to have limited food production because they are not able to irrigate their crops during dry seasons. Again, Gregory et al. (2005) stated that achieving sustainable food security will require more than improving productivity and profitability while minimising environmental impact, it also focus on goals of households food security and sustainable agriculture. This process requires that we look not only at the aggregate supply of food but also at income and land distribution at household livelihoods and dietary needs. Concurrently, the requirement for sustainable food production will have to increase substantially over the next few decades to feed increasing global population

CONCLUSION

Sustainable food production alone will not be sufficient to meet many people's food security requirements. However, food security still depends on the ability of people to produce their own food particularly in rural areas. Crop production and livestock farming still form a crucial base for households' dietary needs in rural area. However, the socio-economic and environmental conditions in these areas are seen as a stumbling block for the success of food production and ultimately food security. Again the challenges and constraints associated with climate change and HIV and AIDS are continuing to threaten the process of food production. The adoption of strategies and mechanism to facilitate sustainable food production among households in rural areas is paramount to realisation of food security.

WHEN WORD AND WORLD COLLIDE: CONFLICTS IN CORPORATE SOCIAL RESPONSIBILITY

Vincent Maher and George Priovolos
Iona College, USA

ABSTRACT

This paper analyzes the cases of a well-known global corporation (Toyota), a highly-ranked institution of higher education (Emory University) and a celebrity athlete (Lance Armstrong), all of which have systematically promoted an outward appearance of “clean hands” wrapped in socially responsible jargon but have, nevertheless, been criticized for engaging in questionable and/or unethical practices. More specifically, the authors examine the disconnection between what these business entities say they stand for and what they actually do and its implications for teaching business ethics and principles of corporate social responsibility in business school.

INTRODUCTION

When all is said and done, the marketplace hinges on essentially one time-tested, basic principle: trust-based exchange. One person wants: the other has. They agree to an exchange and some sort of payment or consideration. The latter is made, the former is provided. Each contributes to the equation what each must in order for the transaction to take place. Each is presumed to have control of the property, service or consideration that is to be provided. The process presumes the trustworthiness and good faith of those involved.

This paradigm seems rather absolute or simple. Ideally, it should be. The problem in our society is that the art of the deal now involves much more and even more people and what are perceived as “greater stakes.” So many people are involved in the process that controlling the product or outcome is incredibly difficult. So many compete for relatively so few that caution and integrity seem at times to be thrown to the wind. The end users may meet and exchange in good faith and with integrity but what happens when their suppliers or subcontracted manufacturers have not acted comparably? What happens when consumers or end-users have no idea that they have been deceived somewhere along the line and that their transactions are essentially worthless because what was promised or believed to have been promised, did not exist?

THREE RECENT CASES IN BUSINESS ETHICS

In the case of Toyota, the world’s best selling car just a few short years ago, many models of vehicles were placed into the marketplace in 2009 with mechanical defects in the steering, gas pedal and braking systems. Salespeople did not know this nor did the consumer. Although many service managers deny that they saw owner complaints about such problems, the problems did in fact exist. Then the accidents began: many of them nasty and even fatal. In most cases the drivers were held responsible and insurance companies paid millions of dollars in compensatory damages until investigators started to ask questions, connected the dots, undertook an inquiry and not only discovered the defects but worse, discovered that Toyota engineers, middle and executive management knew of the problems and deliberately withheld the information not only from the consumer public but from their own sales forces out of fear of consumer response and a negative impact on sales/income. After all, there was history. The Audi 5000 and its sudden acceleration nearly killed the marque. A similar situation had occurred with Japanese car manufacturer Mitsubishi. People were literally killed by defective automobiles. Its executives, who it turns out knew and withheld information, were held criminally liable by Japanese courts. Toyota believed itself to be superior to Mitsubishi in all ways and seemed to also believe themselves beyond the pale of legal or ethical scrutiny especially in their quest to

unseat GM as the world's leading automobile manufacturer. Yet, in 2005, Toyota recalled more than 9 million cars worldwide: more than they sold in 2007 (Ingrassia 2010).

Paul Ingrassia, a Pulitzer prize winning reporter and former bureau chief for *The Wall Street Journal* said, "The evidence that Toyota was expanding too much and too quickly started surfacing a couple of years ago. Not on the company's bottom line, but on its car-quality ratings. Even *Consumer Reports*, long a supporter of Toyota products, stopped automatically endorsing their vehicles" (ibid.).

When the smoke cleared in 2010, fingers were pointing all over the place from management clear through to supply chain manufacturers. The common denominator was that the quality control system was broken and there had been a profound failure of personal and corporate ethics. Subsequently, a number of wrongful death verdicts were appealed and overturned. Additionally, many indemnification suits were brought by insurers against Toyota. Executives resigned and Toyota created an ethics oversight board as a standing committee of their corporate board of directors while articulating a commitment to corporate ethics, responsibility to their shareholders and the consumer, and accountability to all for past, present and future actions. This was heavily marketed along with huge international sales promotion efforts. It took a little more than a year but Toyota appeared to have rebounded. Why? Consumers believe that a proper plan was in place, that accountability had been achieved and that a better product was available for sale. Having said that, the affected model years are regularly left in place on used car lots and sell, if at all, for less than they would have been expected to (Tice, 2010; Wallace, 2010).

Ethics lapses were not left to Toyota or to the corporate world. In the apparently pristine groves of academe where much ado is made of academic integrity, the ivy was stripped and institutions as diverse as Emory University, Baylor University and Claremont McKenna College, to name but a few, each found themselves on the wrong ends of reporting audits. These audits unearthed evidence that each of the schools had systematically and improperly tampered with and reported constructed student data to reporting agencies that effect college ranking placements. The improperly reported data covered everything from SAT scores and AP scores of incoming classes, student retention and academic performance figures, graduation rates, and post graduation employment rates. Following this disclosure, in each case, school ratings were downwardly adjusted in the national ratings, the executives responsible for the misreporting were terminated, and the schools were subsequently subject to intense scrutiny by regional and academic specialty accrediting bodies. In each case, applications dropped as did ultimate freshmen admission numbers (Diamond and Schneider, 2012.; Perrotta, 2012). Although the schools mentioned were disparate in size, student demographics and geographic location, the common denominator is that each was driven to access from a fixed cohort of available college age students, to capture the largest, most talented and diverse incoming classes possible. When students look at national and regional rankings as part of the decision matrix there is intense pressure to maximize an institution's appeal even if such appeal has been "buffed." Most consumers expect some buffing but these institutions went way beyond what one might have anticipated as "fluff."

In the final example we turn to sports and particularly the sport of endurance and distance bicycle racing. The Tour de France is the pinnacle of bicycle racing and synonymous with it is the name Lance Armstrong, the winner of this event for many years. Armstrong was a poster boy for success, hard work, effort and determination. A cancer survivor, he fine-tuned his body into a performance machine and won race after race over a course of years ultimately creating his own team with high profile corporate sponsorships ranging from the Discovery Channel to the US Postal Service. High profile wins turned into advertising and endorsement opportunities that generated huge paydays for Armstrong. He created the Livestrong foundation that became, with sponsors such as Nike, ubiquitous. In spite of occasional allegations that he had illegally "doped" to win races, Armstrong consistently denied and, for years, even prevailed over his naysayers. Still, the allegations followed him until such time that the doubters were proven right when his blood and urine tests returned positive findings. Armstrong ultimately capitulated to personal and sports industry pressure to admit that he had cheated. His admission, in a television interview conducted by Oprah Winfrey, caused him to be stripped of his titles, all of them, his medals, records and then, of his endorsements (Bond, 2013). His foundation from which he had distanced himself before the admission but after the spate of allegations, is struggling to survive so identified with it is he and his brand.

No one likes a cheater. No one accepts that cheating is just the way it is in a particular sport. Tolerance for those who deliberately cheat is now explicit and non-existent. No one cares or wants to know why someone cheated or justified their cheating. Too many talented, real athletes are out there to be ignored. Too many athletes can break records without cheating. As to name rebuildingit also appears that most people really don't care whether Armstrong and others like him try to compete in other sports such as

triathlons or marathons to “prove” somehow that they really are made of the athletic stuff of their respective legends. They are forever tainted. Any success, if noticed, is questioned.

In the situations and examples discussed in this paper, we have seen how the fundamental premise of business – trust based exchange – came to be not only ignored and apparently discarded but also flaunted! It would appear that as long as corporations were meeting earnings expectations and shareholders were receiving dividend checks; as long as students were accepted to and processed through elite universities and colleges; as long as athletes won for themselves, their teams, their sponsors and their advertisers, no one, other than losers, seemed to complain or to even raise an objection. We can point to any number of reasons that may have triggered what seems to be a sudden countervailing force and, of course, one clean and clear-cut reason simply does not exist. What we would conjecture has happened here is a backlash to the fall of Enron and to Madoff’s Ponzi schemes that showed the degree to which someone would manipulate anyone and anything for personal gain regardless of collateral damage, to the serial uncoverings of financial and social abuse by individuals and entities believed to be intact, secure, honorable and trustworthy. It’s always easier once the first “giant” has been toppled and is found, on closer inspection, to be no different than the rest of us, to summon the courage to take out the rest of his kind.

IMPACT ON TEACHING BUSINESS ETHICS

Having said all this, how then does one teach ethics/business ethics to contemporary undergraduate and graduate students many of whom have been in university for the past few years in the wake of the aforementioned economic, business and sport debacles? Even in faith-based institutions, unofficial polling of the student body by the first author over the course of the past decade has yielded information that confirms the suspicions of many who teach in such institutions. Simply, the common denominator of secondary education preparation that we assumed and usually derived from traditional “feeder” schools has literally disappeared. At our home university, Iona College, our traditional draw of undergraduate students derived from Catholic or faith based secondary schools. These numbers exceeded 80% of the student body. In the past ten years this number has literally turned upside down. 85% of the business student body no longer derives from a faith-based institution.

What is the upshot of this? It is that there is no common philosophical or moral base that has been taught to these students upon which they can draw to make moral or ethical decisions. Similarly, not only do these students no longer hail from faith-based secondary schools, they also come from families where some sort of religious practice is practiced regularly or at all. Simply put: any faith based education they were the recipients of ended by the time they were about 14!

Since most have not taken courses in philosophy, religion or even ethics in high school, any moral dilemmas they are exposed to come from either English literature or perhaps environmental or nutritional science programs. No one teaches them the foundations of ethics or of ethical decisionmaking. In effect, they come to college in this segment of their overscheduled lives as blank slates. In this particularly important subject matter they “think” they can handle it when the situation presents itself. It soon becomes apparent that they cannot. Nonscientific evidence of this is the use of an Ethics Survey (www.ethicsurvey.com) with students in our institution. The questions posed on the survey are used to trigger discussions, comments, questions and answers. Simply put, their answers are all over the place.

However, it also becomes apparent that students are wired to understand the ethical issues at stake when presented with a media story in which someone acts in a way that defies an expected outcome, whether an athlete acknowledges an illegal move in a golf game that no one else saw and ends up taking a penalty, or a police officer buying a homeless man a pair of shoes on a cold night, or a combat unit releasing civilians knowing fully well that they could be betrayed but this very act of kindness (they were), or someone doing something heroic to rescue someone else with little or no regard for their own safety.

General conversations about cheating in school for example are enlightening and disturbing. These conversations also replicate whether in elite or lesser caliber college environments. This generation has grown up with the internet. They have grown up in smaller families where parents have the time to invest more interest and control in the child’s outcome. The parents also expect “A’s” regardless of how the grade is attained. The students, in turn, can get whatever they want, whenever they want it on the internet. Point, highlight, click and paste and it’s done. Music, art, articles, papers, legal templates, medical diagnostics, you name it, it’s there. “An A, professor, Thank you.”

What is “their” work product and what constitutes someone else’s is a blur. More often than not, the source of the work product seems to not matter. It appears to be fine unless or until one is caught and even then, the attitude is: “what’s the big deal?” Lest the older folk in the room blame everything on the internet, our teachers and professors blamed encyclopedias, whether World Book or Britannica, in the same way. Only the vehicle for the delivery of information has changed.

Other than an occasional high profile individual losing a job (high level German government officials for example who had fake PhDs) or a sports title, cheaters generally seem to get away with it. There are no apparent penalties let alone social stigmata to stop the practice. Just think, for example, of the number of people out there who use fake academic credentials or who use templates and boilerplates. This practice is so common in business or law for example that few consider the fact that the use of such tools is anything but the “customized and customer focused product our company promises to each and every client.” Personal service amounts to filling in the proper blanks on a proprietary form and getting the file onto the conveyor belt.

Many have listened to their own parents brag about how they bent the rules on their income tax statements, or how they use Miracle Grow on their tomatoes or petunias, or how they pop a little blue pill to enhance their intimate performance, or another pill to lift their mood, or how they did 75 on a 50-mile limit road, etc. The media proclaims the joys of more than one partner and seems to denigrate those who live lives of fidelity unless the fidelity lasts 50 or more years and then the couple is held up as a paragon to be emulated. One can’t have it both ways. The media never seem to “get” that point. Hence the confusion that abounds around us.

Unfortunately incidents and practices such as those described earlier in this paper underscore the concept that one does whatever one wants since, in most cases, one can get away with it OR because, since so many other people are “doing it,” no one will “call them out on it.” In addition, we are all painfully aware—regardless of where we come from—that traditional sources of moral authority (religion, politics, intelligentsia) have failed abysmally and deprive us of somewhere to have our compasses point “north.” We are painfully aware that there is no one book with all the answers to which we can turn. Perhaps there never was but we were unaware of that until recently. And what is a proper answer for a professor to say to an international student who, without blinking, states factually “Where I come from, everyone cheats. Cheating is the norm. Everyone knows about it.”

So, how does a business school specifically deal with the issue of integrity and ethics? How does a business professor who struggles with these issues in his/her own life deal with these issues?

These are tough questions however the fact that the professor at least recognizes the conflict provides hope that such can be shared and used as a teaching moment. In addition, there are a few ways to teach such subject matter that range from mandating a specific course in business ethics (probably not THE best way to go) to integrating issues of business ethics throughout the business school curriculum regardless of the topic (probably the best way). In the latter situation, students can face the challenges posed by ethical decisionmaking in various facets of business that account for cross cultural differences in what constitutes proper ethical conduct whether in the disciplines of accounting, marketing, information systems or management. The use of an ethics survey in the class may be of use. Such has certainly been the case in some of our classes. Students can see how their professors, professionals in the field, have dealt with the issues and can learn what the outcomes were. They can read and analyze case studies where people simply were not on the same page and what the outcomes were. The daily news not infrequently is a treasure trove of people on the wrong end of bad ethics, e.g. factory fires in Bangladesh, factory explosions in Texas and Georgia, building and bridge collapses in the US, government economic collapses in Italy, Ireland, etc., the ill-advised or fraudulent use of military force, and so on.

The ethical problem solving becomes real and works particularly well if there is a way to add a consequence to the decision that is made. Specifically, in a case study or in a simulation, someone will win and someone will lose. Specifically, someone will get hurt by another’s actions whether financially or professionally. If a soldier is sent to battle on a fraudulent reason and is killed or maimed for life, he or she pays the price of the lie. Not everyone gets a trophy. In medical and nursing clinical education simulations, for example, someone dies or is permanently disabled as a result of the decision that has been made. The one who makes the decision has to “live with it.”

We propose, finally, that in teaching ethics to business students, that same sort of pass/fail: live/die simulation must take place in the business environment. We need to eliminate the ABCDF mentality and

construct a Pass/Fail and nothing in between reality. Students need to see that there are consequences to their decisions that are real and not something “vague” of the sort not imagined via the internet or in a video game where, when all lie dead or dying, the player simply has to hit the “reset” button to begin anew or someone kind says “it’s OK” because it’s not.

GENERATION Y STUDENTS' ATTITUDES TOWARDS FACEBOOK ADVERTISING: PILOT STUDY RESULTS

Hilda Bongazana Mahlangu
Vaal University of Technology, South Africa

Ayesha Lian Bevan-Dye,
North-West University, South Africa

ABSTRACT

The purpose of this paper is to report on the results of a pilot study conducted on the determinants and inhibitors of Generation Y students' attitudes towards Facebook advertising. The findings suggest that Generation Y students have a positive attitude towards the information value, entertainment value, credibility, self-brand congruity of advertising on Facebook and attitude towards the social interaction value of Facebook. Their attitudes towards trust in the site and trust in the members while positive, was not significant. Results suggests that Generation Y students have negative attitude towards the invasiveness of advertisements placed on Facebook and a negative, but not significant, attitude to the time cost involved in participating on Facebook.

INTRODUCTION

Facebook is one of the fastest growing social networking sites. In January 2013, it was estimated that South Africa had more than 6.1 million Facebook users. Of the 6.1 million users, 2.8 million are over the age of 18. The majority of these users (31%), regarded as heavy users of Facebook (Nicholas, Rowlands, Clark & Williams, 2010), is between 18 and 24 years of age and is referred to as Generation Y. Generation Y is defined as those individual born between 1986 and 2005 (Markert, 2004). This cohort is reported to spend more time on Facebook (Jones, Ramanau, Cross, & Healing, 2010). On Facebook, Generation Y share information and communicate with each other. According to Kilian, Hennigs, & Langner (2012), the quest for information and entertainment drives usage of social media such as Facebook among this cohort. In recent years, the purpose of Facebook has shifted from casual networking with friends to commercial use.

Facebook is increasingly becoming the most popular advertising platform for businesses. Evidence suggests that in 2013, Facebook advertising accounted for 43% of online advertising revenues (Milani, 2013). Of the advertising growth, 30% came from mobile advertising. This phenomenal growth in Facebook advertising has necessitated the authors of the current study to examine the reasons behind the success of this platform by examining Generation's Y attitudes towards Facebook advertising. A review of literature indicates that certain factors impact on the success of advertising. On the online environments like Facebook, factors determining success of advertising include but not limited to information value, entertainment value, credibility, self-brand congruity, trust, and peer influence (McKenzie & Lutz, 1989; Ducoffe, 1995; Taylor, Lewin & Strutton, 2011; Liu, Sinkovics, Pezderka & Haghirian, 2012). However, studies indicate that certain factors such as invasiveness and time cost may impede advertising success in such environments.

The quest for information about the company's products or brands in many instances contributes to whether advertisement does provide consumers with the necessary information they are searching for. Ducoffe (1996) highlights that it is important for advertising to have the ability to inform consumers of

product and brand alternatives so that they make purchases that yield the greatest possible satisfaction. Pollay and Mittal (1993) suggests that consumers' opinion of the informational value of advertising often determines how well they believe the advertising will keep them up to date with products offered.

More often than not, consumers attempt to evaluate a brand by matching the brand image with their self-concept and thereby form an initial favourable attitude toward the brand (Kressmann, Sirgy, Herrmann, Huber, Huber & Lee, 2006). Taylor *et al.* (2011) refers to this effect as self-brand congruity and they found a positive relationship between self-brand congruity and attitude toward advertising.

Studies on technologies like Facebook demonstrate that consumers use such technologies to seek pleasure and to have fun (Wang & Sun, 2010). It is incumbent on marketers utilising these technologies to design advertisements that are entertaining (Petrovici & Paliwoda, 2007; Pollay & Mittal, 1993; Coulter, Zaltman & Coulter, 2001), fun (Wang & Sun, 2010) and providing enjoyment (Coulter, Zaltman & Coulter, 2001). According to McQuail (1983) such advertisements fulfill audience's needs of escapism, diversion, aesthetic enjoyment, or emotional release. Ducoffe (1996) relates the above activities to the entertainment value of advertising.

The development and increasing use of online technologies have raised doubts about credibility of advertisements in such platforms. Usually, consumers do not trust these advertisements. According to MacKenzie and Lutz (1989) advertising is credible when the consumers perceive it as truthful, reliable, trustworthy, and believable. Credible advertisement contributes to the formation of consumers' positive attitudes towards advertising (Lafferty & Goldsmith, 1999).

Engaging with friends is probably the main reason why individuals spend more time on Facebook. Typically, consumers will expect their friends to participate and engage in these technological platforms. During their engagements, for example, they would recommend advertisements they viewed from these sites to their peers (Taylor *et al.*, 2011). Although the motives for using Facebook are often about seeking entertainment, at times consumers use Facebook to alleviate boredom (Taylor *et al.*, 2011). The amount of time spend on the online environment (Ko, Cho & Roberts, 2005) might influence consumer attitudes towards advertising in such an environment (Taylor *et al.*, 2011).

Although there is no doubt that Facebook advertising is growing faster than envisioned and the fact that there are many positive outcomes for using such a platform, there are several inhibitors of advertising in such technological environments. Researchers noted that consumers often complain that advertisements in these media tend to be irritating (Aaker, & Bruzzone, 1985), distracting (Speck, & Elliott, 1997) and intruding (Li, Edwards & Lee, 2002) on their space.

The successful implementation of Facebook as an advertising tool in a developing country like South Africa can only be effective if those using it can have favorable attitudes towards advertisements depicted in that platform. The purpose of this paper is to report on the results of a pilot study conducted on the determinants and inhibitors of Generation Y students' attitudes towards Facebook advertising.

RESEARCH METHODOLOGY

A convenience sample of 50 students was obtained from a South African public higher education institution located in the province of Gauteng in South Africa. Data analysis was done using descriptive statistics and Z-test. A structured self-administered questionnaire was utilised to gather data on the determinants and inhibitors of attitudes towards Facebook advertising. The proposed determinants include information value, entertainment value, credibility, self-brand congruity, trust in site, and trust in members of the site and social interaction. The proposed inhibitors include invasiveness and time cost. The scale items for these dimensions were adapted from scales developed by Taylor, Lewin & Strutton (2011), Ducoffe (1996), Li, Edwards & Lee (2002), Sirgy, Grewal, Mangleburg, Parks, Chon, Clairborne, Johar & Berkman, (1997), and Roman & Cuestas (2008).

RESULTS OF THE STUDY

In order to determine the reliability of the scales in the instrument, the Cronbach alpha and the average inter-item correlation coefficients were calculated for each of the proposed seven determinants and two inhibitors. Typically, a Cronbach alpha of 0.6 is acceptable and one of 0.7 and above preferred. The rule of thumb with

the average inter-item correlation coefficient is a value within the range of 0.15 and 0.50 (Pallant, 2010). Table 1 presents the results of the reliability analysis.

Table 1: Reliability

Construct	Number of items	Cronbach alpha	Average inter-item correlation
Determinants			
Information value	7	0.732	0.281
Entertainment value	5	0.712	0.336
Credibility	3	0.604	0.317
Self-brand congruity	4	0.791	0.482
Trust in site	6	0.917	0.647
Trust in members	6	0.867	0.523
Social interaction	4	0.816	0.541
Inhibitors			
Invasiveness of advertisement	5	0.728	0.362
Time cost	5	0.780	0.432

The Cronbach alphas for both the determinants and the inhibitors were all computed above 0.6, with the majority being above 0.7. This indicates that each of the scales exhibit reliability. An average inter-item correlation coefficient within the recommended range was computed on most of the instrument's scales. This suggests both convergent and divergent validity. While the average inter-item correlation for the trust in site, trust in members and social interaction constructs were slightly above the recommended level, this merely suggests a stronger relationship between the items in those scales.

Table 2: Descriptive statistics

Construct	Means	Standard deviations	Z-scores	P-values
Determinants				
Information value	4.034	0.836	7.624	0.000*
Entertainment value	4.178	0.926	7.838	0.000*
Credibility	3.465	1.103	2.598	0.013*
Self-brand congruity	3.618	1.184	3.221	0.003*
Trust in site	3.333	1.397	1.471	0.150*
Trust in members	3.246	1.259	1.203	0.237*
Social interaction	4.665	0.925	11.092	0.000*
Inhibitors				
Invasiveness of advertisement	3.668	0.883	-4.669	0.000*
Time cost	3.121	1.226	-0.609	0.547*

*Significant at the 0.05 level

P-values of $p < 0.05$ were computed on the five of the seven proposed determinants of attitude towards advertisements in the Facebook environment. This indicates that Generation Y students have a statistically significant positive attitude towards the information value, entertainment value, credibility, self-brand congruity of advertising on Facebook, as well as a statistically significant positive attitude towards the social interaction value of Facebook. Their attitudes towards trust in the site ($p = 0.150 > 0.05$) and trust in the members ($p = 0.237 > 0.05$) while positive, were not significant. Concerning the inhibitors, the evidence in the pilot sample suggests that Generation Y students have a statistically significant negative attitude towards the invasiveness of advertisements placed on Facebook ($p = 0.000 < 0.05$) and a negative, but not statistically significant, attitude to the time cost involved in participating on Facebook ($p = 0.547 > 0.05$).

CONCLUSIONS AND IMPLICATIONS FOR FURTHER RESEARCH

The purpose of this paper was to report on the results of a pilot study conducted on the determinants and inhibitors of Generation Y students' attitudes towards Facebook advertising. It was evident from the findings that Generation Y is embracing Facebook as an advertising platform. These findings provide insights to marketers especially those who are interested in targeting Generation Y cohort. In addition, the findings in this study indicate that Generation Y is receptive of Facebook advertising. However, the findings of the current study have limitations. Due to the small sample size, caution must be made when interpreting these findings. Therefore, the findings cannot be generalised. Future research should consider a larger sample size to permit the use of robust statistical analysis such as factor analysis, regression analysis, and structural equation modelling techniques.

MOBILE PHONE ADDICTION AMONG STUDENTS' AT A SOUTH AFRICAN UNIVERSITY

Hilda Bongazana Mahlangu
Vaal University of Technology, South Africa
Ufuoma Akpojivi
North West University, South Africa

ABSTRACT

The paper presents the results of research carried out to examine mobile phone addiction among students at a South African University. The results suggest that students exhibited addiction tendencies. Of the top sources of addiction were; a feeling of loss when students did not have their mobile phones with them, reduction in sleep patterns, use of mobile phones longer than intended, feeling of restlessness and irritability when not using mobile phone and use of mobile phones to escape from problems. Two main addictive symptoms were extracted and students' behaviour were categorised as ranging from loss of control to withdrawal.

INTRODUCTION

Mobile phones once regarded as an expensive gadget beyond the reach of the common man, has become ubiquitous. South Africa has seen a significant growth in relation to mobile phone access and usage. This growth is further attributed to the implementation of the numerous policies like the 1996 White Paper on Telecommunications. The introduction of such policy opened the mobile phone industry and facilitated the increase in penetration rate. New business opportunities have opened and the digital divide that was prevalence in the country is gradually reducing (UNICEF, 2012). Many businesses are embracing mobile commerce. The importance of mobile phones in businesses especially as an advertising tool has created major opportunities for businesses. Mobile phone penetration not only impacted businesses, but also individuals.

Mobile phones have created opportunities for people to contact family and friends (Chen & Katz, 2007), to relax (Leung & Wei, 2000), to be involved in recreational activities (Gao, Sultan & Rohm, 2010) and access social networking sites (Kabilan, Ahmad & Abidin, 2010). The purpose of mobile phone are further highlighted by Hooper & Zhou (2007) who noted that the motives behind the usage of mobile phones are usually social interaction, dependency, identity, safety, freedom, gossip and job related.

Whilst mobile phones have been hailed for providing benefits to both individuals and businesses, some researchers (James & Drennan, 2005; Chen, 2006; Grant & O'Donohoe, 2007; Zulkefly & Baharudin, 2009) are concerned with the excessive use of these devices and the impact of such to individuals. Evidence suggests that the excessive use of mobile phones may lead to a possible emotional attachment and problematic behaviours (Phillips, Butt & Blaszczyński, 2006). Hence, researchers wonder if excessive mobile phone use can result in

factors such as reduction in sleep patterns and escapism. Thus, there remains a strong belief, for example that users of mobile phone may experience addictive behaviours such as feeling lost, depression, moodiness, restlessness or irritableness when without their mobile phones (Hooper & Zhou, 2007; Zulkefly & Baharudin, 2009; Walsh, White & Young, 2007). Hence, many researchers caution that excessive use of mobile phones may lead to negative behaviours such as compulsion (Hooper & Zhou, 2007), loss of control (Zulkefly & Baharudin, 2009), withdrawal, salience (Walsh, White & Young, 2007), and reduced activities (James and Drennan, 2005). Thus, researchers pointed out that the above behaviours are often classified as addictive (White, Buboltz & Igou, 2011; Hooper & Zhou, 2007).

Addictive behaviour can be likened to be an abnormal behaviour that is outside the expected (Hooper & Zhou, 2007). In order to define addiction, researchers have used Young's (2004) definition who defined addiction as "uncontrollable urge, often accompanied by a loss of control, a preoccupation with use, and continued use despite problems the behavior causes" (p.403). Researchers (James & Drennan, 2005; Chen, 2006; Grant & O'Donohoe, 2007) have used similar definition on mobile phone addiction studies.

Students' mobile phone use

Studies indicate that students have been and continue to be one of the heaviest users of mobile phones (Petrova, 2007). Reasons why students use mobile phones may include creating and sustaining new relationships (Power & Horstmansh, 2004), keeping in touch with their parents (Frissen, 2000) and time management/coordination (Aoki & Downes, 2003). However, Walsh (2009) noticed that teenagers spend too much time on their mobile phones. Spending too much time on mobile phones might be detrimental with negative consequences. Although the responsibility of mobile phone use often rests with the user of such a device, for example, students are reported to use these devices excessively and are more prone to fall victim to addictive behaviours that leads to emotional distress, loneliness, boredom, and moodiness (James & Drennan, 2005) when they do not have their phones in their possession, for example. Unfortunately, as with other forms of addiction, these students may not see the extent of their dependencies to these devices. Hence, there is evidence suggesting that when students are unable to spend time on their phones, they exhibit addictive behaviours manifested by a feeling of frustration and anger (Walsh, White & Young, 2007). Similarly, Chen (2006) found the students in his sample demonstrating addictive behaviours with regards to mobile phone use. In students, high mobile use may lead to even worse problems than these mentioned above. High mobile phone use has been associated with financial problems such as indebtedness (Griffiths & Renwick, 2003). Despite all the problematic uses of mobile phones and concerns about its use, this device is acknowledged to be important for both personal and business use and still remains popular among students.

Despite the prevalence of addictive behaviours among mobile phone users, mobile phone addiction has received less attention from researchers. Much of the research on mobile phone addiction has concentrated in developed countries with scarcity of research on mobile phone addiction in developing countries like South Africa. Therefore, the aim of this study is to critically examine the usage patterns of mobile phones by students in a South African University in order to ascertain if such usage patterns and addictive behavioural tendencies observed by other researchers elsewhere is also evident in South African students.

RESEARCH METHODOLOGY

A non-probability sampling method was used. In order to identify mobile phone addictive tendencies among students, a questionnaire adapted from previous studies on mobile phone addiction (Hong, Chiu & Huang, 2012) and Internet addiction (Armstrong, Phillips & Saling, 2000; Charlton, 2002) was administered to a sample of 300 students from the Vaal University of Technology, Gauteng, South Africa. The data were analysed using descriptive statistics and factor analysis. Factor analysis indicated that three factors influenced mobile addiction among students. One factor was dropped because of low reliability. Only two factors, withdrawal and loss of control explained mobile use addiction among students. Of the 300 distributed questionnaires, 239 were returned. Of the 239 respondents, 46.4% (n=111) were males and 53.6% (n=128) were females. The majority of the respondents (43.5%, n=104) were aged between 22-23years old. Thirty one percent (n=75) of the respondents spent more than six hours per day on mobile phones.

RESULTS OF THE STUDY

<i>Item</i>	<i>F1</i>	<i>F2</i>
<i>Reduced sleep hours</i>	.760	
<i>I feel lost when I don't have my mobile phone everyday</i>	.726	
<i>I use my mobile phone to escape from problems</i>	.713	
<i>I am pre-occupied with my mobile phone everyday</i>	.684	
<i>I feel restless/moody/depressed/irritable when attempting to stop mobile phone use</i>	.554	

<i>I spend less time with my family</i>		.787
<i>I have repeatedly made unsuccessful efforts to cut back</i>		.781
<i>I find it hard to control my usage</i>		.758
<i>I usually use my mobile phone longer than originally intended</i>		.716
<i>I have often lied to family members or others to conceal my excessive</i>		.692
<i>Involvement</i>		
<i>Eigenvalue</i>	3.240	2.309
<i>% of variance explained</i>	27.002	19.242
<i>Cumulative % of variance</i>	27.002	46.244

DISCUSSION

The findings of this study indicate that students in a South African University are heavy users of mobile phones, felt loss when they did not have their mobile phones with them, experienced reduction in sleep patterns, used mobile phones longer than intended, felt restless and irritated when not using mobile phone and used their mobile phones to escape from problems. These findings are consistent with results reported in other studies.

Factor 1, labelled **withdrawal** consisted of five items with an eigenvalue of 3.240 and accounted for 27% of variance. Withdrawal refers to the feelings of panic, anxiety, agitation, or other negative affect when the activity an individual was engaged in does no longer exist (LaRose, Lin & Easton, 2003). Students reported that they: feel lost when they don't have their mobile phone and feel restless/moody/depressed/irritable when attempting to stop mobile phone use. Walsh, White & Young (2007) affirms that this is a common conduct especially among students who tend to show withdrawal symptoms such as feeling lost when without mobile phone and feelings of restlessness, moodiness, depression, and feeling irritable when attempting to stop mobile phone use. This finding is supported by James and Drennan (2005) who reported that students in their study felt insecure, lonely, and depressed when they did not have their phones.

Factor 2 consisting of five items is labelled **loss of control**. In the context of this study loss of control refer to all the mobile phone activities that when students perform takes longer than required or those that they find difficult to discontinue when required doing so. Loss of control has an eigenvalue of 2.309 and accounts for 19% of total explained variance. This factor includes variables which relate to using mobile phone longer than originally intended, finding it hard to control usage and repeatedly making unsuccessful efforts to cut back. In the current study, students indicated that they have made unsuccessful efforts to cut back on mobile phone use, are spending less time with family, are finding it hard to control their usage, usually use their mobile phones longer than originally intended and have often lied to control their excessive use. Previous research (Walsh, White & Young, 2007) also highlighted how excessive use of mobile phones may lead to loss of control.

CONCLUSIONS AND IMPLICATIONS FOR FURTHER RESEARCH

From the results of this study it is evident that respondents demonstrated addictive tendencies such as a feeling of loss when they did not have their mobile phones with them, reduction in sleep patterns, use of mobile phones longer than intended, feeling of restlessness and irritability when not using mobile phone and use of mobile phones to escape from problems. Parents as well as businesses should be mindful of these findings. Recently, businesses are targeting potential consumers on mobile platforms. It will be interesting to find out whether students present similar addictive tendencies when targeted with business offerings on these mobile platforms. Furthermore, what other opportunities should businesses explore in order to take advantage of these addictive tendencies depicted by the respondents of the current study and also evident in similar studies conducted elsewhere?

IMPLEMENTATION OF BASEL III GUIDELINES: A STUDY OF SELECT DOMESTIC AND FOREIGN COMMERCIAL BANKS IN INDIA

Munish Makkad and Pallab Sikdar
Birla Institute of Technology (Noida), India

ABSTRACT

The purpose of this paper is to provide an insight into the latest set of supervisory and capital adequacy recommendations put forward by the Basel Committee on Banking Supervision (BCBS) popularly referred to as Basel-III accord. The present paper attempts to study and track the extent of implementation of Basel-III norms by select domestic and foreign commercial banks operating in India, in accordance with the directives issued by the Indian banking regulator Reserve Bank of India (RBI). The paper reports significant implementation differences observed within the banking groups across categories, based on which suitable corrective recommendations have been proposed. The research for the present paper is based on extensive study of risk management framework put in place by the specific banking groups under focus. A primary survey by the means of a structured questionnaire was conducted within the banks towards understanding their preparedness and progress towards embracing the RBI prescribed Basel-III measures. The research findings are expected to be of value for the stakeholders of major commercial banks towards ascertaining the degree of risk underlying the operations of specific commercial banks. Further, the findings of the present study are expected to be of major value to the concerned banking groups towards making their existing risk management and supervisory framework more robust by plugging the Basel-III implementation gaps identified.

INTRODUCTION

In the recent times banking sector globally had been impacted by the subprime crisis to varying extent. The Indian banking sector too has found the going tough, especially in the light of bad advances and deteriorating asset quality. The central banking authority in India i.e. Reserve Bank of India (RBI) by its prudential norms on 'Asset Classification' and 'Capital-based Provisioning' have ensured that the impact of subprime bubble on the operational efficiency of Indian banking sector is minimized.

Basel accords formulated by the Basel Committee on Banking Supervision (BCBS) proposed a basic grounded framework on capital adequacy towards covering the loans advanced as a part of Basel-I norms. Over a period of time with the complexities of economic environment and inability of the existing regulatory framework to prevent the global financial crisis originating in USA, Basel-I accord was superseded by Basel-II accord in 2009 wherein more stringent capital adequacy, supervisory and market discipline oriented pillars were charted out by BCBS. In convergence with the international practices, Indian commercial banks adopted the framework postulated as a part of Basel- II accord, under active emphasis of banking regulator RBI.

In the chronology of Basel accords the latest version of norms agreed upon by BCBS member nations happens to be Basel-III. RBI in May 2012 had issued directives towards phased implementation of provisions enunciated under Basel-III by the commercial banks in India beginning January 1, 2013 with a cut off time of January 1, 2018. This has been subsequently postponed by three months to April 1, 2013 towards providing additional time to commercial banks that need to enhance their capital base in line with the new norms for strengthening the resilience of the global banking system.

REVIEW OF LITERATURE

Towards facilitating a structured and smooth transition by commercial banks into the Basel-III regime, RBI brought out *draft guidelines on implementation of Basel-III capital regulations in India*. The document serves as a lucid reference guide for the commercial banking entities of the country in terms of key amendments to be incorporated within the operational framework towards achieving Basel-III compliance.

A direct effect of strengthened capital requirements as back up for loan creation happens to be rise in bank's marginal cost of funding, thus ultimately leading to higher lending rates. According to findings by (Cosimano & Hakura, 2011) "The large banks, on an average, would need to increase their equity-to-asset ratio by 1.3 percentage points under the Basel III framework. Further, this would lead large banks to increase their lending rates by 16 basis points, causing loan growth to decline by 1.3 percent in the long run."

The desirability of the Basel III regulations is keenly debated. One strand of literature argues that there are significant macroeconomic benefits from raising bank equity. Higher capital requirement lowers leverage and the risk of bank bankruptcies (Admati *et al.*, 2010). Another strand of literature points out that there could be significant costs of implementing a regime with higher capital requirements (BIS 2010b, Angelini *et al.*, 2011). Higher capital requirements will increase banks' marginal cost of loans if, contrary to the Modigliani-Miller (1958) theorem, the marginal cost of capital is greater than the marginal cost of deposits, i.e. if there is a net cost of raising capital. In such an event, a higher cost of equity financing relative to debt financing, would lead banks to raise the price of their lending and could slow loan growth and hold back the economic recovery.

Under the Basel III implementation guidelines proposed by RBI, towards improving the quality of capital, the Tier-1 capital will predominantly consist of Common Equity, unlike the present framework under Basel II. In addition, the qualifying criteria for instruments to be included in additional Tier-1 capital outside the common equity elements as well as Tier-2 capital had been strengthened (RBI, 2011).

Towards improving the transparency of capital base, all elements of a bank's capital required to be disclosed along with a detailed reconciliation to the published accounts as per the RBI draft guidelines. As per the Basel-II framework the counterparty credit risk in the trading book covers only the risk of default of the counterparty. The reforms initiated under Basel-III includes an additional capital charge for Credit Value Adjustment (CVA) risk which captures risk of mark-to-market losses due to deterioration in the credit worthiness of a counterparty. The risk of interconnectedness amongst larger financial firms (defined as having total assets greater than or equal to \$ 100 billion) will be better captured through a prescription of 25% adjustment to the Asset Value Correlation (AVC) under the Internal Ratings Based (IRB) approach to credit risk. In addition, the guidelines on counterparty credit risk management with regard to collateral, margin period of risk and central counterparties and the counterparty credit risk management requirements have been strengthened (RBI, 2011).

Basel-II had proposed a minimum capital to risk-weighted assets ratio of 8%. Under the new guidelines forwarded under Basel-III, banks will be required to hold a capital conservation buffer of 2.5% of RWAs in the form of Common Equity to withstand future periods of stress bringing the total Common Equity requirement of 7% of RWAs and total capital to RWAs to 10.5%.

Implications of Basel-III Implementation on Commercial Banking Operations and Performance

An important consideration not to be lost sight amidst specific implementation timelines from central banking authorities are the possible operational and performance based implications which such an implementation may result in.

It may be argued that if the pace of implementation is forced regardless of economic and business impact and without thinking through all requisite complementary changes, then the recovery from recession could be unnecessarily slowed down, or worse, there could be a further contraction. If such a scenario results in, the cure would turn out to have been worse than the disease.

- Basel III will force banks to shift their business model from liability management (making business decisions about asset volumes and finding the financing in short-term wholesale markets as necessary) to asset management (asset volumes are constrained by the availability of long term funding).
- Impact of Basel III on the cost and availability of credit is of major consideration. A section of the experts argue that in the long run (once there is full adjustment) the costs of credit to most bank borrowers will be only moderately affected, implying only a modest impact on the level of output (and indeed it is possible that the eventual impact is a small fall in the costs of credit and rise of output); but that there will be a reduction in availability and higher cost at the riskier end of the credit spectrum. Alternative arrangements are needed for financing of risky exposures if a fall in economic growth is to be avoided (Allen B. *et al.*, 2010)
- Securitization process assumes a greater importance in this context. Shortcomings in securitization instruments and processes were key causes of the global financial crisis. But reestablishing securitization markets on a sounder footing appears essential in order to prevent a renewed credit contraction and to help prevent riskier borrowers from being cut off from credit.
- Implementation of Basel III will further require substantial portfolio adjustments amongst long term institutional investors, in order to accommodate the shift in bank balance sheets. Long term investors will need to shift from holding short term to long term bank debt and from debt to equity; and to absorb the securitized exposure of banks. The associated adjustment of both market prices and required returns can be accommodated but this will take time and presents a substantial coordination problem, since individual investors will only be comfortable with these changes if they are confident that other investors will accept them as well.
- The new liquidity rules could create new unintended systemic risks. In particular, the proposed definition of assets eligible to be treated as liquid under the proposed liquidity regulations is dangerously over-concentrated on government debt. The definition of acceptable liquid assets should be broadened to give banks more scope to hold liquidity in the form of commercial claims. The authorities should also clarify how liquidity will be obtained in times of crisis. The bank regulators need to ensure that the rules are flexible enough to allow banks to access market liquidity, either from the sale of assets or through short term borrowing; and the central bank needs to state in what circumstances it would provide emergency liquidity assistance to supplement bank access to market liquidity.

POTENTIAL IMPACT OF BASEL III IMPLEMENTATION ON COMMERCIAL BANKING OPERATIONS IN INDIA

Higher Capital Requirement: Presently, in India, most banks' common equity ratio falls in the range of about 6-10 per cent. Given this fact, banks may be able to comply with the higher capital requirement as per Basel III norms at least till 2014-15. This, without infusing any fresh equity, even while taking into account the marginal increase in capital requirement.

However, the increase in the minimum capital ratio, combined with loan growth outpacing internal capital generation in most government banks, will lead to a shortfall of capital. This will mount mainly between 2015-16 and 2017-18 due to introduction of a Capital Conservation Buffer (CCB). The CCB is designed to ensure that banks build up capital buffers during normal times, which can be drawn down as losses are incurred during a stressed period. The requirement of capital will be less to large private sector banks due to their higher capital ratios and stronger profitability. However, some public sector banks are likely to fall short of the revised core capital adequacy requirement and would therefore depend on government support to augment their core capital. The additional equity capital requirements in the public sector banks, mainly due to Basel III norms in the next five years, work out to around Rs. 1,400-1,500 billion.

If the government holds the existing shareholding, the recapitalization burden borne by it will be to the extent of around Rs. 900 – 1,000 billion. This will contribute to additional government borrowing to the extent of Rs. 1,000 billion. As per the estimates, on account of this extra government borrowing, the

country's fiscal deficit is expected to increase further, by about 25 basis points per annum. This will widen the fiscal deficit, inflation, lower economic growth, credit off-take and thereby bank profitability.

Pressure on Return on Equity: To meet the new norms, apart from government support a significant number of banks have to raise capital from the market. This will push the interest rate up, and in turn, cost of capital will rise while Return on Equity (RoE) will come down. To compensate the RoE loss, banks may look to increase their lending rates. However, this will adversely affect the effective demand for loan and, thereby, interest income. Further, with effective cost of capital rising, the relative immobility displayed by Indian banks with respect to raising fresh capital is also likely to directly affect credit off-take in the long run. All these affect the profitability of the banks.

Pressure on Yield on Assets: On account of higher deployment of funds in liquid assets that give comparatively lower returns, banks' yield on assets, and thereby their profit margins, may be under pressure. Further higher deployment of more funds in liquid assets may crowd out good private sector investments and also effect economic growth.

ACTIONS REQUIRED FROM COMMERCIAL BANKS

To address these issues and to protect their profitability margins, banks need to look beyond regulatory compliance and take proactive actions in the form of assessing their lines of business, level of risk profiles, economizing capital and drawing up funding strategies. Specifically, the banking groups may look forward to adopt the following strategies:

Change in Business Mix: Since retail banking has a comparatively lower risk weight compared to corporate banking (except in the case of clients who are A rated and above), the impact on higher allocation of capital will be less on retail banking. Further, in corporate banking, as chances of default in short-term loans is less, on an average, compared to chances of a default in long-term loans, banks need to shift towards short-term/retail loans, and to take a granular approach to protect their margins under the new Basel-III norms.

Change in Customer Mix: Banks need to review their capital allocation to each client segment and price it in line with the profile to ensure that capital is allocated to segments that generate higher risk-adjusted returns.

Low-Cost Funding: One of the most important factors to meet the new regulations is to have a stable low-cost deposit base. For ensuring this, banks need to focus more on having business correspondents/facilitators to reach customers as adding branches will increase costs and have an impact on the profit margin.

Improvements in Systems and Procedures: Refining the rating model/data cleaning/modernization of systems and procedures may help banks economize their risk-weighted assets, which will help reduce capital requirements to a major extent.

Specific Bank Experiences towards Basel III Implementation

State Bank of India

The State Bank of India and its associates will require around Rs. 1 lakh crore of capital over the next five years towards meeting Basel III norms (in addition to retained earnings). SBI received Rs. 7,900 from the government last fiscal. SBI asserts that they don't need further capital under Basel III all the way up to 2015. Counter Cyclical Buffer introduction may require capital beyond 2015. The extra 2.5% will come up in 4 tranches and the fiscal 2015 is expected to require a little capital.

Punjab and Sind Bank

As per the capital adequacy guidelines Punjab & Sind Bank has consistently achieved the benchmark ratios of 9% from 2010-12. The bank has expressed concerns towards meeting the timeline for achievement of Basel-III liquidity standards in the form of multiple ratios introduced. The provision of Credit Valuation Adjustment (CVA) with respect to counterparties is being duly exercised by the bank in a phased manner.

HDFC Bank

The private sector banks have an inherent advantage towards the phased Basel-III implementation on account of their existing fat capital cushion. As per the estimates of rating agency Fitch, the leading three private sector banks together will require close to ₹ 70,000 crore in fresh capital to meet the stricter norms specified under Basel-III norms. HDFC Bank has maintained a consistent Basel-II compliant capital adequacy ratio over the period 2010-2012 (refer Table 2). Thus, it is evident that HDFC bank is in a position to achieve the phased provisions of Basel-III accords as stipulated by RBI.

ICICI Bank

ICICI bank is second largest lender. The bank has consistently achieved Basel-II compliant capital adequacy ratios above the benchmark rate of 9% during the fiscal years 2010-2012 (refer Table 2). The bank has diversified into various lines of business to neutralize the risk in the existing macro-economic environment. This has parallelly resulted in a multiple counterparties against whom CVA provisions are required to be fulfilled. The bank has geared towards fulfilling this requirement. The bank has indicated specific concerns towards the achievement of higher requirement of core capital in the form of common equity.

Standard Chartered Bank

Standard Chartered Bank is the leading foreign bank operating in India, both in terms of branch presence and business performance. The bank targets an exclusive category of the clients from high net-worth group, rather than catering to the masses. As per the original Basel-III implementation timeline, old style Basel-II capital instruments must be phased out by 10% per year. But given the uncertainty about the pricing of the new instruments, the bank is taking a cautious approach. As Basel-III Tier-1 and 2 securities will be more loss absorptive than under Basel-III, bank raised substantial Basel-III capital during the FY 2012-13 which was the last year they could so. One of the significant reasons behind this had been to cover the redemptions. The bank successfully achieved the benchmark Basel-II compliant adequacy ratio of 9 % during each of the fiscal year, but the ratio has show decline from a healthy 12.41 at FY ending 2010 to 11.05% at FY ending 2012 a trend which the bank looking forward to arrest going ahead towards achieving Basel-III compliance (Refer Table 2).

RECOMMENDATIONS

Among other deficiencies, the recent financial crises demonstrated shortcomings in corporate governance arrangements in the financial services industry, contributing to excessive risk taking. According to the BCBS, in many cases risk oversight by boards was inadequate, often due to insufficient time commitment, inadequate technical knowledge or insufficient diversity in board composition. Boards were often not sufficiently involved in the overall risk strategy or did not spend sufficient time discussing risk issues, as risk management was considered a low priority compared to other concerns. In addition, the risk management function has not been given appropriate weight in the decision making process.

With the proposed Directive the non-binding nature of most of the corporate governance principles which contributed to the lack of compliance with these principles should be transformed into binding regulations. This should help avoid excessive risk taking. The strengthening of corporate governance framework would essentially require:

- Increasing the effectiveness of risk oversight by boards.
- Improving the status of the risk management function, and
- Ensuring effective monitoring by supervisors of risk governance.

Table 3 provides a summarized overview of the options on corporate governance towards ensuring effective results from risk management function in particular and Basel-III implementation specifically.

CONCLUSION

Commercial banks in India have gradually aligned themselves to desired phased implementation of Basel-III compliant regulatory capital ratios, albeit with a delayed initiation from April, 2013. The major elements of Basel-III which are expected to impact banks in terms of capital based operations are the two new mandatory liquidity ratios in the form of Liquidity Coverage Ratio and Net Stable Funding Ratio. The mandatory ratios will cause commercial banks to move away from short-term lending practices with higher prices which will lower the margins available to individual banks. Additionally, the new accords emphasizes on improving the quality of an individual bank's overall capital base. The core capital base of the bank comprising of common equity have been strengthened by raising the minimum proportion of common equity in individual bank's

capital structure. This will tend to limit the specific ability of the individual banks and general ability of the banking sector to create advances.

Post 2008 subprime crisis and the consequent downfall of some of the leading banking entities, the need was felt for more stringent supervisory and capital adequacy framework for the banks. Basel Committee on Banking Supervision (BCBS) in consultation with G-20 nations came out, with a set of global banking supervisory and regulatory norms in the form of Basel-III. The prime objective of bringing out the latest variant in the Basel series of accord was insulate the banking sector round the globe during extended periods of stress.

Given the existing scenario it can be concluded that commercial banks in India are sufficiently equipped to adapt the phased implementation of Basel III capital accord. In India, RBI has released a timeline of initiating Basel-III compliant disclosures by all the banking entities within the country from April, 2013 and by the end of Fiscal Year 2018 all the banking entities are mandated to be fully Basel-III compliant. The banks are confident of achieving the timeline albeit with few hurdles in the initial phases.

Table 1: Original Timeline for Basel-III Implementation in India

	2011	2012	2013	2014	2015	2016	2017	2018	As of Jan 1, 2019

LITHUANIAN EVOLUTION OF GLOBALIZATION

Antanas Makštutis
The General Jonas Žemaitis Military Academy of Lithuania,
The Republic of Lithuania

ABSTRACT

The work provides an analysis of development the factors economic and social environment in Lithuania, the role of environmental factors for development the society at the present moment, presents the future changes in the national economy, describes the private security strengthening tendencies in Lithuania under the conditions of European Union (EU) and the urgent issues in the management of human resources trends of the society of the economic and social environment in Lithuania. The generalized results of theoretical studies and research for strengthening national strategy now and in future are presented; conclusions and recommendations for improving the management of state and society trends of future and human resources trends under the conditions of Lithuania are formulated (Lithuanian experience).

INTRODUCTION

We understand perfectly well today the correctness of our selected road of integration to the European Union (EU) and NATO as the development of national economy and market in the small states under the present factors of globalization in the world is difficult, therefore only in the composition of the EU and NATO (*the cooperation security guarantee*) the favourable circumstances are created for the development of the state and society [*The National*, 2013].

Money takes an important place in the life of people and the development of national economy and market: national currency or the single EU euro monetary system as the currency has its own designation, not only being the expression of price or value but also in terms of the purchasing power, capital accumulation and development [Makštutis, 2010].

A problem is that low-level competitiveness and slow development of the quality of life of people in Lithuania require to evaluate the dependence of the factors for integration into the EU and NATO as well as competitiveness already in the euro space but with the existing ratio of litas which has and will have an impact on the development of the quality of life in separate organizations, society and the state [*Government*, 2013].

At present, by the assertion of Lithuanian specialists one litas is of higher value than it will be after a year, and a year later it will be of higher value than after two years. These statements confirm the problem, even though a question should be answered [Makštutis, 2003, p.p. 6-7]: “How will the situation change in the national economy and market as well as the quality of life after euro introduction in Lithuania?” Why? The reason is that national currency, on the one hand, ensures the national stability in the country and, on the other hand, stops progress and integration to the single EU market.

The objective of research is to analyze the factors for the development of the state and society.

Research tasks: to identify the tendencies in the development of Lithuania, to predict perspectives for work and quality of life of people, to formulate and provide conclusions for improving the country’s development.

Research methods: scientific literature analysis, analysis of legal documents, statistical data analysis, logical analysis, systemic analysis, seeking to determine the principal tendencies of changes.

Methodology of effective management is expressed by management and self-management computations with the application of mathematical model 1 [Makštutis, 2010, p.p. 93-94]: $A = M_A + S_{BC}$, here: A – result of development society in state, the value of which is 100 percent; M_A – management of state; S_{BC} – self-management of organization in region of state.

References and other sources – the authors' published works, the normative acts of the state, national legal acts of regions, and other material of Lithuanian experience.

TATE AND SOCIETY TRENDS OF FUTURE

Tendencies for globalization of the world economy are not promising since research conducted by the EU statistical services already in 2003 showed that of 57 million people from the then twelve EU countries 23 million lived in poverty (*this accounted for 40.35 percent*) and the main reasons for integration were listed, i.e. the increased unemployment, unsafe work, failures of social security systems, housing crisis, debts, family structure, tax systems, and different levels of development [Makštutis, 2003, p.p. 6-7].

Those factors today are characteristic of Lithuania and of the quality of life of our people since analogous problems exist actually in every EU country. It means that individual states cannot or are not able to ensure the interests of national economy and market development in the single EU market [Indriūnas & Makštutis, 2008].

It may be noticed that coordination of developmental processes in geoeconomics and national economy, their political, economic and social factors is complicated, even though the EU institutions and the institutions of its member states are in close collaboration and seek to achieve the better results of their activity.

The already mentioned research performed in 2003 revealed the problem of poverty in the then EU countries, with its peak in Portugal (*26 percent*), and the lowest level in the Scandinavian countries (*5-6 percent*). During research the following factors of the standard of living [Makštutis, 2003, p.p. 6-7] were assessed: income, expenditure, unemployment, migration, employment, social status, health, education, housing, environmental structure, etc.

As at today it may be noticeable that the introduced single monetary system – the EU transnational currency – the euro did not yield sudden positive results that were expected and predicted, but, on the contrary, revealed the negative factors resulting from euro introduction, including the sudden jump in prices, decrease in the purchasing power, tendencies not stimulating wage increase rates, worsening social guarantees, the different level and speed of the economic development in the countries that became highlighted, increase of internal political, economic and social threats in the individual states [Makštutis, 2003, p.p. 6-7].

By the level of economic development already in 2003 the EU member states were subdivided into three levels [Makštutis, 2003, p.p. 6-7]:

1. Scandinavian countries (*poverty up to 6 percent*).
2. Benelux countries, France and Germany (*poverty up to 15 percent*).
3. Mediterranean Sea countries, Great Britain and Ireland (*poverty up to 20 percent*).

The said indicators already in 2003 worried the officers of the EU institutions. At that time the still higher concern was expressed by the institutions from Germany, Great Britain, France, Finland and other Scandinavian countries.

At the present moment in separate EU countries and the single EU market space, measures for facilitating negative factors are being prepared [Global, 2011]. However, forecasts are not very optimistic especially in the countries with the level of economic development higher than the common average. The results of those forecasts are explained by the common microeconomic factors that are expressed in the development of the activity of individual organizations, e.g., product cost-price structure, profit, marginal costs, variable costs, long-term costs and their dependence on the consumption processes that are valued by the balance of demand and supply in separate countries and the EU single market [Makštutis, 2003, p.p. 6-7].

It is therefore important to ensure that each state when implementing the main goals of the state would seek to achieve the main target – to protect the country's society and to create the conditions for the development of the human labour activity at the level of national resources [Makštutis, 2010].

A question therefore arises: “Is Lithuania prepared politically, economically and socially to integrate into the single EU eurozone? The present-day country's economic development results are unfavourable. In Lithuania the annual average wage in business companies in 2009–2010 amounted to 7200 €, whereas the EU average was EUR 28000 € annually [*Lithuania*, 2013]. However, prices for clothing, footwear, fuel and other goods in Lithuania are not by half cheaper of the EU average level [*Lithuania*, 2013]. Gross domestic product (GDP) per capita produced in Lithuania in 2011 accounted for 62 percent of the EU GDP average. According to this data, prices for clothing and footwear, consumer electronics, household appliances, and transport equipment in Lithuania almost coincide with the European prices. Somewhat cheaper prices in our country are for food, furniture and alcoholic beverages (Table 1) [*Lithuania*, 2013].

Table 1. Comparative prices for goods EU – Lithuania in percent

	EU27	Lithuania
1. Clothing and footwear	100	99
2. Consumer electronics	100	97
3. Personal transport equipment	100	92
4. Household appliances	100	91
5. Electricity, gas and other fuels	100	80
6. Alcoholic beverages and tobacco	100	77
7. Furnishing (<i>furniture, carpets, etc.</i>)	100	77
8. Food and non-alcoholic beverages	100	72

Wage growth in Lithuania is extremely slow. For example, the annual wage in manufacturing and services companies in 2009 went up to 7234 €, in Latvia up to 8596 €, in Estonia up to 9712 €, and in Romania up to 5891 € where it is just lower than the Lithuanian indicator [*Lithuania*, 2013].

Within the period of 2007–2009 the average wage in Estonia increased by six times, in Latvia by three times as compared to Lithuania, and in Romania twice.

Lithuania by the average wage is behind the EU average at least four times, whereas the produced GDP per capita is lower just by two times.

According to the EU Statistical Office Eurostat data of January 2013, the minimum wage in Lithuania was 290 € (*1000 Lt*), whereas in Latvia by three euros less, here the minimum wage was 287 € (*990 Lt*). The lowest minimum wage is in Romania and Bulgaria –157 and 159 € (*540 and 550 Lt*), accordingly, the average here is 223 € (*770 Lt*) [*Minimum*, 2013].

The highest minimum wage is in Luxembourg 1874 € (*6465 Lt*), Belgium 1502 € (*5180 Lt*) and Netherlands 1469 € (*5070 Lt*), the average here is 1615 € (*5572 Lt*) [*Minimum*, 2013].

Difference between the highest minimum average wage and the lowest minimum average wage in the EU space makes 7.24 times. This difference calculated for wage indicators describes national market tendencies in the consumer purchasing power and market competitiveness level as at January 2013.

The EU statistical data show the slow rates of development of our economy and market expressed by the national product creation, production, sales, competitiveness, application of progress, purchasing power in the market, demand and supply balance, and other indicators – the development of the quality of life in Lithuania [Bagdanavičius & Makštutis, 2010, p.p. 93-104]. Such overall measures in essence would create the real conditions for the more rapid development of Lithuania's economy.

At present necessity arises to forecast our future and to prepare measures for facilitating negative factors in Lithuania until the integration into the single EU eurozone (*as national security guarantee*) and before the euro introduction and removal from circulation of the national currency – litas in Lithuania in 2015 [*The National*, 2013].

HUMAN RESOURCES TRENDS

Special attention shall be devoted to the development of national business projects, risk evaluation, technical-economic investment justification, and business plan preparation in order to more rationally use all the resources available in Lithuania and thus to form a basis for boosting our country's economy. However, personal initiatives alone are not enough as the present-day negative national market balance (*when import volumes exceed considerably export volumes*) impedes the national product creation, production and sale on the national and international market, therefore the purchasing power of people decreases or the value of the national currency – litas also declines. Demand consists of the consumption of people and of their purchasing power in the market, and when the national product creation, production and sale are not activated, the real conditions become constantly reduced to activate the human labour activity [Bredin & Söderlund, 2011] and to increase the value-added per employed person and capital accumulation function that increase directly the consumption of Lithuania's society and demand on the national market [Makštutis, 2010].

Demand on the national market is a cumulative value of human labour and its value-added at the present moment and in the future. As is known, human labour value-added in Lithuania is low and therefore the number of impoverished people is constantly increasing. Data published by the EU Statistical Office Eurostat in February 2012 show [*The Lithuania*, 2013] that in 2010 in Lithuania poverty or social exclusion threatened to over 33 percent of the population. The relatively higher number of such people was only in Bulgaria (*almost 42 percent*), Romania (*over 41 percent*), and Latvia (*over 38 percent*). In the EU, on the average, this indicator [12] stands at 23.4 percent. Within the EU context the best position in this respect belongs to the Czech Republic (*14 percent*), Sweden and Holland (*15 percent*), Austria, Finland and Luxembourg (*17 percent*) [*The Lithuania*, 2013].

Those statements are underpinned by the real wage of our people in the EU states even in the case when they work illegally as compared to the real average wage in Lithuanian rural and urban areas (*which is not even fixed*).

We should face very difficult economic, social and political consequences while possessing the said economic indicators at integration to the single EU eurozone and upon introduction of euro into Lithuania since euro introduction factors existing today in all EU states should have an impact on our country's economy and market.

As is known, no problems with supply exist in our market, as demand and consumption depend on the supply [Makštutis, 2010]: import of poor quality goods, their low cost-price and price accordingly. As a result Lithuanian people are still more impoverished as the investment environment becomes more unfavourable and the number of our people searching for jobs abroad is increasing. It is also difficult to speak today about the establishment of modern companies in Lithuania due to all above-mentioned economic and market factors as the society permits the organization to operate until it is beneficial to the society [Makštutis, 2010]. Here the due attention and purposeful activity of the Lithuanian institutions is necessary so that the country's system of normative acts would encourage progress creation and application as well as rational integration of all resources into the human labour activity in Lithuania [*Lithuania's*, 2013]. It is only this road that would actually accelerate the development of national economy and demand and supply balance in the national market in the rural and urban localities. The Lithuanian countryside at present is in general "forgotten" in the same way as individual regional towns and townships of the country, even though here our main resources of labour activity are hidden [*The Constitution*, 2006]. Our economy will be further moribund if they will not be used and the standard of living and quality of life of people will not comply even with the poorest EU level ISO 9000 series standards and total quality criteria.

The essence of the national state integration to the EU and NATO and competitiveness in the single market is expressed by the goals coordinated by the state and society and their achievement strategy. We must formulate those goals and justify their achievement strategy by all available national resources: natural, material, financial, and human [*The foundation*, 2013]. The rational use of human resources must be based on the acceleration of labour and labour activity processes which may be ensured only by the payment for work on the basis of competence and skills of people that are foreseen by the modern payment for work tendencies in the economically developed countries of the world [*The National*, 2013].

Scientists in those countries have developed and study the rational model of an organization. This is a new approach to the organization of the future, its vision and mission, since the longevity of the rational model is based as “efficiency” to be ensured by “new public administration” as organizational behavioural theories and application in the development of organizations will depend on them in the future [Makštutis, 2010]. As we notice, the quality of life of people is closely linked with the total quality development in the world, Europe and Lithuania, therefore implementation of ISO 9000 series standards as the quality management system in individual organizations is not sufficient as it will not ensure the long-term competitiveness of the organization in the market. The long-term competitiveness in the national and international market is ensured and will be ensured in the future by the total quality management that is started in the individual organization from the implementation of ISO 9000 series standards as the “foundation” for the development of the total quality management (*experience of Japan, USA, Scandinavia and other countries*).

Theory and practice revealed [Indriūnas & Makštutis, 2008] that the importance of the state under the conditions of integration and globalization in the world and EU is constantly increasing and therefore the Lithuanian institutions should change its activity strategy and tactics in the shortest term [*Lithuania's*, 2013] as in the other case we will be “thrown down” far from the present-day level of the averagely developed EU and world countries.

On the other hand, the main and necessary condition for the national economy acceleration is the permanent optimization of the activity of individual organizations in the private and public sectors. It creates the real conditions at the existence of the available national resources to permanently modernize organizations and to establish new modern organizations in all regions of the country with the use of progress in the creation, production and realization of the national product first of all in the country's market and gradually in the international market [Makštutis, 2010]. However, if the export of poor quality goods into our market is not stopped, we will not be able to create the favourable investment environment for business [*Lithuania's*, 2013] which we have today in the territory of our country.

After generalization of the national state and society present-day results and future tendencies, it is possible to formulate and present the following conclusions.

CONCLUSIONS

With account taken of the Lithuanian economic development results, theoretical and practical provisions of research, conclusions, subjective and intended for practical application, may be formulated and provided:

1. Branch and regional management in the country is of low efficiency, thus impeding the development of national economy and reducing market competitiveness in the single EU market.
2. The system of the statutory acts of the state does not ensure the favourable investment environment for the development in the country's regions, therefore the speed for national product creation, production and realization is slow, and the currency – litas value is constantly decreasing and national product competitiveness is not increasing.
3. In the economic development and public administration system, the strict limits between management and self-management functions are not identified among the subjects, personal responsibility is not determined and regional communities are not involved in the economic development for solution of community problems and their implementation.
4. The road of integration to the EU and NATO is correct even though the implementation of state development strategy and objectives does not ensure the economic development for poverty reduction in the society and these processes worsen the conditions for euro introduction in Lithuania in 2015.
5. Euro introduction in Lithuania in 2015 is untimely. It is necessary to implement the principles of the harmonious development of the state and society in the regions through the activation of their communities using all available national resources for economic development.

THE IMPACT OF ADMINISTRATION ORDERS AS A REDRESS MECHANISM FOR OVER-INDEBTED CONSUMERS: A CRITICAL ANALYSIS

Nkhangweni Jerry Malange
Tshwane University of Technology, South Africa

ABSTRACT

Many consumers across the globe are over-indebted and cannot meet their financial commitments at the end of the month because they are over-indebted. Consumers are over-indebted if they are or will not be able to satisfy in a timely manner all the obligations under all the credit agreements to which they are a party. The majority of these consumers need redress mechanisms to deal with their over-indebtedness. This paper will examine administration orders as a redress mechanism for over-indebtedness. The paper adopts research approach of literature review. It becomes more relevant when one considers that the research opinions of academics have not had much influence on the issue of redress mechanisms for over-indebted consumers. This paper is concluded on the outcome of the research findings that if ever possible to do; section 74 of the Magistrate Act 32 of 1944 court should be amended (South Africa).

INTRODUCTION

It is estimated that the size of the South African credit market is at present R800 billion. Credit plays a significant role in our lives. Unless one has vast amounts of cash and other savings, it is inconceivable that one will not at some point in one's life need to make use of credit. Many will also not have cash to buy clothes or other merchandise, and will have to apply for store cards or accounts to be able to buy them on credit.

Not many people can afford to buy things for cash, particularly expensive items like houses, cars and furniture. The big problem is that people are inclined to over-commit themselves financially. Credit has come so easy to obtain that millions of South Africans are in financial difficulty because they have to pay for their cars, houses, electricity, credit cards and they just don't have enough money to do this. Salaries are just too small and the result is that many people are over-indebted. Now the pressure is on and credit providers need their money because they are in business to make money. They have salaries to pay to their employees who need money to pay their creditors as well just like any other person.

Consumers buy things on credit every day and businesses use credit to buy their stock. People also use credit to pay for their consumables such as clothing, education fees and even food. The affected persons or parties in this thesis are amongst others the micro-lenders, banks, financial institutions, retailers, vehicle financiers, the National Credit Regulator, credit bureaux. Credit providers and consumers are also affected. Over-indebtedness of consumers is always manifesting itself in a consumer credit-driven society. At present it is also reasonable to say that the financial situation of many South Africans is appalling. It constantly remains a question as to how a specific legal system replies and how it should respond to the problem of over-indebtedness by providing debt relief measures that consumers may use in order to address their debt situation. It is significant to note that consumers may use a voluntary debt rearrangement that is based on the contractual principle of consent and some creditors will not be prepared to cooperate in such a voluntary system. The question then arises as to what recognized procedures are provided for by the law.

Where the debtors are insolvent they may apply for the debt relief measure in terms of the Insolvency Act 24 of 1936 and eventually a rehabilitation of the insolvent debtor. Rehabilitation will usually discharge unpaid pre-sequestration debt, but the applicant-debtors must, amongst other requirements,

similarly prove an advantage for creditors before they will succeed with such an application. Sequestration is therefore not readily available as a debt relief mechanism because it remains a drastic procedure.

The National Credit Act 34 of 2005 (hereinafter the “NCA” or “Act”) was introduced and it became effective as from June 2007. The Act must promote a fair and non-discriminatory marketplace for access to consumer credit and for that purpose to provide for the general regulation of consumer credit and improved standards of consumer information; to provide for debt re-organisation in cases of over-indebtedness; to regulate credit information; to provide for registration of credit bureaux, credit providers and debt counselling services, to establish national norms and standards relating to consumer credit; to promote black economic empowerment and ownership within the consumer credit industry; to prohibit certain unfair credit and credit-marketing practices; to promote responsible credit granting and use and for that purpose to prohibit reckless credit granting; to promote a consistent enforcement framework relating to consumer credit; to establish the National Consumer Tribunal and the National Credit Regulator and to provide for related incidental matters.

The NCA introduced debt review as a formal method that could be used by over-indebted consumers to bring about a debt rearrangement regarding credit agreements regulated by the Act. This was done in order to deal with over-indebted consumers and for resolving over-indebtedness based on the principle of satisfaction by the consumer of all responsible financial obligations as one of the purposes of the Act.

The purpose of this article is therefore to compare administration orders with other debt relief measures for assisting over-indebted consumers with specific reference to the debt review procedure and the sequestration process with a view to identify certain positive and negative aspects pertaining to these three procedures and to consider problem areas regarding the co-existence of these three procedures in South African legal practice. Within the ambit of this appropriate discussion, some suggestions are made concerning law reform.

THE CONCEPT OF ADMINISTRATION ORDERS IN TERMS OF THE MAGISTRATES' COURT ACT 32 OF 1944

In terms of section 74 of the Magistrates' Courts Act 32 of 1944, consumers could apply to a magistrate's court for administration orders that would, if successful, compel the creditors to accept a rearrangement of their debts.

The administration order procedure, which has been described as an improved form of insolvency proceedings which provides debt relief for consumers whose debts amount do not exceed R50 000. Administration orders deal with relatively small estates where the costs of sequestration would drain the estate. However, administration proceedings offer incomplete facilities for the examination of consumers' affairs and it may therefore be unsuitable where the consumers' affairs are complex.

The procedure provides for a rearrangement of a consumers' debt without sequestrating their estate. A court will support consumers by appointing an administrator to take control of the consumers' financial affairs and to manage the payment of debts due to creditors. Consumers have responsibilities to make regular payments to the administrator. The administrator, after deducting necessary expenses and a specified fee determined by tariff, will in turn make a regular distribution out of such received payments to all creditors.

As pointed out in the Report on Administration Orders the basic philosophy behind the administration order process is to grant consumers a statutory rearranging of their debts, but without a discharge. It is submitted that the administration order procedure does not provide satisfactory debt relief to consumers because a large number of orders take many years to reach completion. Furthermore, evidence collected on the operation of the administration order procedure indicated that the process is largely ineffective in meeting the objective of providing debt relief to consumers because the majority of orders are unsuccessful.

THE ADMINISTRATION ORDER PROCEDURE

The administration order is designed to afford debt relief to persons with limited or no assets, but with enough income to pay off a limited obligation over a period. Administration orders appear to be a viable debt relief measure for consumers who have a regular income and whose debt burden does not exceed R50 000 and a debt situation which is thus deemed to be reasonably manageable. Consumers may obtain

administration orders from the court of the district in which they reside, carry on business or are employed, where:

- (a) the consumers are unable to pay the amount of any judgment obtained against them in court; or
- (b) the consumers have insufficient funds or assets at hand to meet their financial obligations, even where no judgment has as yet been granted.

Administration orders may also be granted in favour of consumers during a section 65 inquiry into the consumers' financial position. The application for administration orders enjoy preference and the court will suspend the section 65 hearing until the application for an administration order has been disposed of. The process for applying for administration orders is based on an application together with a prescribed statement of affairs in which the consumers affirm on oath that the names of the creditors and the amounts owed to them and all other statements or declarations made in the statement are true. The application is filed with the clerk of the magistrate's court where consumers reside or carry on business or are employed, and is served personally or by registered post to the creditors at least three calendar days before the hearing. The clerk of the court must, help illiterate consumers in preparing the application. In practice it is normal for attorneys to assist consumers in preparing the application.

The true basis for the application is the fact that consumers are unable to pay their debts. The amount of the outstanding debt coupled with the period it will take to pay it off is not a factor, or not the only factor to be taken into account when the court considers an application for administration order. Section 74 does not require that there should be a benefit to creditors and the fact that creditors may have to wait many years for their money should consequently not play a conclusive role in adjudicating an application for administration. Furthermore, section 74 does not make provision for any period within which any debt has to be paid and there is consequently no basis in law for the interpretation that the legislator intended a reasonable time, or a certain time within which consumers should be assisted to get out of their financial embarrassment.

In order for the administration order process coupled with the pre-liquidation composition to afford adequate debt relief to persons, the following are proposed regarding variation of the administration method:

- (a) The court must be empowered to enforce a repayment plan on creditors, which may also reduce consumers' debt to an amount that he can afford to repay. If it appears that consumers do not have enough assets or extra income and there is a likelihood of financial recovery, the court should be enabled to grant a moratorium in terms whereof enforcement action by creditors is barred for a stated time. Creditors' interests should nonetheless be taken into account by provisions that prevent abuse of the procedure;
- (b) Provision should be made for the elapsing of the order as soon as the costs and listed creditors are paid in terms of the repayment plan and the administrator has lodged a certificate to that effect with the clerk of the court. Payment in terms of the administration order should then result in an automatic discharge of all debt forming part of the administration order;
- (c) A discharge must not be excluded where the debtor's failure to complete the plan is due to circumstances out of his control. In such a case the court must be empowered to grant a discharge on application of the consumer;
- (d) The legislator should provide for a maximum period for the duration of the plan. A maximum period of five years, as a longer period can, in our view, negatively disturb the success of the procedure as a debt relief mechanism;
- (e) Since there is no limitation on the scope of the consumer's financial commitments in terms of the pre-liquidation composition, it is submitted that the limitation that currently applies in the case of the administration process should also fall away. Nonetheless, it should be ensured that the administration process will not be implemented in instances where there are enough assets to support implementation of the sequestration procedure or where there are complex transactions that need to be investigated. The court should therefore be empowered to refuse the granting of an administration order where sequestration seems to be a better option. The legislator should also guarantee that the period where after a discharge is granted should not be shorter than in the case of discharge after sequestration; and
- (f) The consumer should be excluded from obtaining further credit during the course of the repayment plan that would prevent him from completing the payments in terms of the plan. It is thus submitted that the current section 74 should be amended. Creditors in respect of debt incurred after granting of the administration order should not be included in the plan.

The debt mediation services should be established in the office of the magistrates' court, debt counselling and financial advice to debtors in general. The officials attached to the office should first attempt to reach an informal settlement before implementing the statutory composition procedure.

The purpose of the NCA is among others, to protect consumers by providing them with education about credit and consumer rights. The Act also provides for the registration of certain individuals as debt counsellors as they play an important role in the debt re-arrangement procedure discussed above. The Report on Administration Orders notes that the administration process is the suitable debt relief measure in cases where consumers do not have adequate realisable assets to comply with the advantage for creditor's requirement. Nevertheless, in order to obtain an administration order consumers should have enough income to make payments to the administrator for distribution amongst creditors. It is submitted that the combined statutory composition and modified administration procedure that we propose, will only be accessible to debtors who have sufficient income to enable them to repay their debt or a part thereof. As noted above South African law currently does not provide any debt relief to consumers who have no assets or income.

HEARING OF APPLICATIONS FOR ADMINISTRATION ORDERS BY THE COURT

The contents of an administration order take a prescribed form and should set out that the consumer's estate has been placed under administration, that an administrator has been appointed, and the amount that the debtor is supposed to pay. The order must precisely state a weekly or monthly amount to be paid over to the administrator by the consumer. This amount is calculated by taking into account the consumer's and his dependants' necessary expenses, certain prescribed periodical payments which the consumer is obliged to make and other payment commitments due in future.

The future debts are obviously excluded from the administration order and the court will exclude a certain amount of money from the weekly or monthly payments made to the administrator for the purpose of allowing the debtor to make periodical payments in terms of a credit instalment agreement or existing maintenance or mortgage bond commitments. Where the administration order provides for the payment of instalments out of future income, the court shall authorise the issue of an emoluments attachment or garnishee order to facilitate payments by the debtor.

The order may specify such conditions as the court may deem fit with regard to security, preservation or disposal of assets, realisation of movables subject to hypothec, or otherwise. It may also authorise the administrator to realise some of the assets of the debtor for the purpose of distributing the proceeds among creditors, but no assets subject to any credit agreement in terms of the NCA may so be realised without the written permission of the seller. Where the court authorises the administrator to realise any asset, it may amend the payments to be made in terms of the administration order accordingly. Hence, in contrast with debt review in terms of the NCA, administration may be regarded as a hybrid form of debt relief as it provides for the possibility that assets may be liquidated in addition to a rearrangement of debts.

THE EXPENSES OF ADMINISTRATION ORDERS

The expenses of administration orders are too high and some administrators collect money and fail to pay it over to creditors. Nevertheless, there are also competent administrators and administration orders are still a useful option in the appropriate circumstances.

The South African Law Reform Commission proposed the insertion of a new section 74X in the Magistrates' Courts Act in an attempt to provide an alternative debt relief measure and it did not specify how the pre-liquidation composition should link with the administration process. The latter is obliged to draw up a list of creditors and should pay them from the amounts received from the consumer. An important issue not addressed by the Law Reform Commission is whether or not the pre-liquidation composition would become a prerequisite in all cases of insolvency. The question also arises whether there will still be a necessity for the administration order procedure in its current form if the pre-liquidation composition is introduced in our system. The proposed composition procedure and a revised administration order process should be combined. The provisions of the administration process and the proposed composition procedure overlap to a great extent. Combination of these procedures will thus result in a great number of the provisions of the current administration order procedure being superfluous. The implementation of the modified administration process should only be probable if the creditors do not accept a pre-liquidation composition.

EXECUTION OF ADMINISTRATION ORDERS

An administrator must be appointed by the court to give effect to the order. The court exercises an independent discretion when appointing an administrator, but any individual may in principle be appointed as an administrator and there are no prescribed qualifications for an administrator as such. A government official may also be appointed as administrator. The appointment becomes effective only when the administrator gets a copy of the order or, where he or she is required to give security, after he or she has given such security and it must be given where the administrator is not a legal practitioner or an officer of the court. The giving of security by the administrator to the satisfaction of the court is meant to help as a guarantee for moneys received and paid into the trust account of the administrator, but the practices surrounding the giving of such security is at times doubted.

The clerk of the court is required to provide the consumer and the administrator with a copy of the administration order whereupon the administrator must send a copy by registered post to each creditor who proved a debt or was mentioned by the debtor in the statement of affairs.

The administrator has a lot of statutory duties but the main duty is to draw up a list of creditors and to distribute moneys collected from the debtor amongst them. The administrator must also distribute such payments pro rata among the creditors at least once every three months. Claims that enjoy preference under insolvency law should be paid out in the prescribed order of preference.

The list of creditors is lodged with the clerk and is open for inspection by creditors during office hours and a creditor may object to the list and should do so within 15 days after receiving a copy of the administration order. Where a specific creditor wishes to prove a debt before the completion of an administration order and which is unlikely to be included in the order, a claim must be lodged with the administrator. The administrator in turn notifies the consumer of the additional claim. Where the consumer admits the claim, and subject to the right of any other creditor who have not received notice of the claim to object to the debt, the administrator will file a notice with the clerk, adding the creditor's claim to the list. Where the consumer denies the claim, the creditor should be notified by the administrator and the creditor may then approach the court for a hearing on the disputed claim.

The court may in certain circumstances refuse the claim or allow it in part or in whole. On the other hand, the court may also require that the claim be supported by evidence, or postpone the hearing on such conditions as it may deem fit. Where the claim is allowed by the court, it is added to the list. A creditor who has sold and delivered goods to a debtor under a credit agreement according to the Magistrate' Court Act before the administration order was granted and who becomes entitled to demand immediate payment of the outstanding purchase price will, after he has notified the administrator that he elects to do so, obtain a hypothec over the goods in terms of which the outstanding amount will be secured. Nevertheless, any term of the agreement with regard to the creditor's right of termination of the agreement or with regard to his right to return the goods shall not in consequence of the consumer's non-compliance with the agreement be enforceable. The court may order that the seller take possession of the goods and sell them by public auction, or, if the seller, buyer and administrator so agree, to sell them by private agreement. The creditor must formerly pay to the administrator the amount of the proceeds of the sale in excess of the amount of his debt and the costs connected with the sale, or, if the net proceeds of the sale are insufficient to pay his debt in full, he may lodge a claim for the outstanding balance for inclusion in the list of creditors.

Where a person becomes a creditor after the granting of an administration order, or where a person sold and delivered goods to the borrower under a credit agreement after the granting of the order such a person may lodge a claim with the administrator, then the administrator shall inform the debtor of the new claim.

The consumer may then either accept or deny the claim, Where the consumer admits or denies the claim and the court allows the claim, the debt will be added to the list in terms of section the Magistrate' Court Act, then the creditor will not be entitled to a dividend in terms of the administration order until all other creditors who were creditors on the date of granting of the order have been paid in full.

CONSEQUENCES OF ADMINISTRATION ORDERS

Even though the estate of a person under administration may still be sequestrated in terms of the Magistrate' Court Act prevents individual creditors from continuing with their individual remedies against the debtor or his property after the administration order has been granted. Then again, remedies with regard to any

mortgage bond or any debt in terms of section 74B(3) are not restricted by an administration order. The court may also grant leave to institute enforcement proceedings. Where proceedings have already been instituted against a debtor in respect of any debt the court must, upon receiving notice of the administration order, suspend such proceedings. The court may grant costs previously incurred by the creditor, which may also be added to the judgment debt. A consumer who incurs additional debts during the currency of an administration order and does not disclose the existence of the order commits an offence. Furthermore, the court may upon application by any interested person, set aside the administration order.

The court under whose supervision an administration order is being executed, may upon application by the consumer or any interested party reopen the proceedings and call upon the debtor to appear for such further examination as the court may deem fit. The court may then on good cause shown suspend, amend or rescind the administration order.

Upon an application for rescission the court may, inter alia, if it appears that the debtor is unable to pay any instalment, suspend the order for such a period and on such condition as the court deems fit. The court may similarly amend the instalments to be paid and make the necessary amendments to any emoluments attachment order or garnishee order issued so as to ensure payment in terms of the administration order.

The administrator must lodge a certificate indicating payment in full with the clerk of the court as soon as the costs of the administration and all the listed creditors have been paid in full and send copies of the certificate to the creditors, whereupon the administration order lapses. The creditors are in principle prevented from continuing with their individual debt enforcement remedies and they receive repayment of the debt on an equal basis in the form of distributions made to them by the administrator. Nevertheless, the debtor must still repay the full amount of the claims plus costs and interest.

The repayment period is not limited in terms of the Magistrates' court Act and there is no provision for a discharge of any portion of the debt as is the case with sequestration followed by rehabilitation. It thus frequently happens that the administration order allows the debt to balloon and may keep the debtor in debt and locked into the process forever. Therefore, debtors often default in terms of the order and it can therefore not be viewed as a lasting debt relief measure.

Debtors who owe more than R50000 are also excluded from this remedy. Nonetheless, despite limitations and problems associated with administration it must be conceded that it may offer some relief in given circumstances. Then again, if the monetary cap was higher it could also have included those who are currently excluded from the relief offered by rehabilitation following sequestration since they cannot prove an advantage to creditors as required by the Insolvency Act. Within this context the impact of debt review in terms of the NCA will next be considered because it does not have monetary limitation.

CONCLUSION

Administration orders are in many instances a failure in practice, since debtors do not maintain regular payments. In addition, even if they do, most of the payments go into the pockets of the administrators as costs and in the end not enough is paid to creditors to reduce the debts.

There are also no set minimum requirements that administrators have to comply with, nor are there any regulatory body governing administrators. Furthermore, the procedure also does not provide for a discharge of debts. An administration order lapses only once the costs of the administration and the listed creditors have been paid in full.

The Magistrates' Court Act does not provide for the repayment of the debt to take place within a fixed time-limit and this leads many consumers to remain trapped by their debts. In the end the procedure thus amounts to nothing more than a formal rescheduling of debt. The industry was and remains largely unregulated and abuses spreading like wild fire despite the existence of the National Association of Administrators. Problems experienced in practice with administration orders have prompted the Department of Justice to implement a reform project. In spite of this, as the debt-restructuring orders and debt counseling provided for in the NCA and its Regulations will have an impact on administration orders. Consumer education programmes and debt counseling are necessary to enable consumers to deal with credit in an accountable way.

The NCA tries to address the problem of over-indebtedness by providing a procedure in terms of which a debtor's credit agreement debt may be reviewed by a debt counselor with a view to maybe obtaining debt relief by means of a consensual or court ordered debt restructuring. At the outset it is important to note that these debt relief mechanisms apply only to credit agreement debt entered into by natural persons. During debt review process, the debt counselor is also tasked with investigating whether credit was granted recklessly. During the period in which a debt review is being conducted, the consumer is protected by a suspension on enforcement by the credit provider of the rights under the credit agreement. Once a consensual debt rearrangement agreement has been filed as a consent order or the court, in the absence of a consensual agreement, grants a court-ordered rearrangement, enforcement of the credit provider's rights under the credit agreement is further stayed pending compliance by the debtor with the rearrangement agreement or restructuring order.

Where credit has been granted recklessly, debt relief is afforded in the form of wholly or partially setting aside the relevant reckless credit agreement or suspending it or by suspending that particular credit agreement and restructuring the debtor's obligations under any other credit agreements. A consumer can access the process voluntarily in accordance with the provisions of the NCA. It also provides that a court has the discretion to refer a credit agreement for debt review in cases where legal proceedings have already commenced. It is concluded that the NCA does not address admin orders directly, but section 130 (3) of the Act has relevance. Debt counseling may be seen as a parallel and hopefully a better route than administration orders.

MANAGEMENT PRACTICES CONTRIBUTING TO EMPLOYEE DISSATISFACTION AT THE INFORMATION AND COMMUNICATIONS TECHNOLOGY BUSINESS UNIT

Molefe Jonathan Maleka
Tshwane University of Technology, South Africa

ABSTRACT

Management practices that contribute to employee dissatisfaction have been the subject of international research since the 1930s but remain an under-researched field in South Africa. This case study replicated findings of international studies such as gender and race under-representation at the top echelons of management; bullying of lower-level employees by managers; non-transparent recruitment practices; managers who lack human resource skills; and a bureaucratic or hostile culture. The main finding of this study is that an affirmative action (AA) policy does not always have the intended effect - employees would prefer appointment and promotion on the basis of meritocracy and with mentoring.

INTRODUCTION

Management practices are the main contributing factors with regard to employee dissatisfaction. This argument is supported by this study's findings and the literature that was reviewed. There is paucity of literature on employee dissatisfaction in South Africa, which indicates that employee dissatisfaction is under-researched in South Africa, particularly in the information and communications technology (ICT) industry.

The consequences of dissatisfied employees are varied and could render workplaces uncompetitive if they are not investigated and reduced. The findings of previous studies suggest that dissatisfied employees are frequently absent from work and that their workplace performance is poor (Nurullah, 2010), and when they feel alienated (Byars & Rue, 2008) they resign (Booyesen, 2007). Still others develop conditions such as coronary thrombosis (Coleman, 2007). These are some of the repercussions of dissatisfied employees, which may be attributed to the job itself, co-workers and management practices.

Problem statement and objectives of the study

International scholars have found that women are dissatisfied at work because they are under-represented at the top management level due to workplaces being patriarchal (Schaefer, 2008), because they are inexperienced and do not have the necessary management qualifications (Alvesson & Due Billing, 2009) and non-transparent recruitment practices (Slocum & Hellriegel, 2007). In some instances, employees are dissatisfied because they work in organizations where politics are rife (Sias, 2009) and managers foster a bureaucratic culture that ostracises employees who are not part of the clique (Townsend, 2007). Some employees are dissatisfied because they work for managers who bully (Watson, 2008) and sexually harass them (Schaefer, 2008), whereas other employees are dissatisfied because they are paid less than others or others are promoted because of their race (Booyesen, 2007). However, before this study was conducted, no scientific study had been conducted yet in the ICT business unit to identify management practices contributing to employee dissatisfaction.

The specific objectives of this study were as follows:

- to identify management practices that perpetuate gender and race under-representation at the top management level;
- to identify appointment and recruitment management practices which promote unfair labor practices;

- to identify workplace culture management practices which undermine workplace relations; and
- to identify workplace structure management practices which undermine workplace relations.

In the next section, management practices will be discussed.

MANAGEMENT PRACTICES

Human relations and Maslow's theory

Even though, in the late 1930s, human relations managers were more approachable and encouraged group or team work, evidence suggests that they lacked psychological skills (Haralambos & Holborn, 2004). Managers who embraced Maslow's theory of needs in the 1950s were criticised for failing to acknowledge that employees can be motivated by religion (Noon & Blyton, 2007) and climbing the corporate ladder (Bratton, Sawchuk, Forshaw, Callinan & Corbett, 2010).

Bureaucracy

In the 1950s, literature shows that some employees were satisfied working for bureaucratic managers because they used merit-based promotion criteria (Watson, 2008). However, this led to employee dissatisfaction because it created race and gender imbalances, as well as a platform for remuneration gaps between managers at the highest and lowest echelons (Babbie, 2007).

Perpetuating gender and race imbalances

Globally, females are insufficiently represented in top management positions (Jacobsen, 2007) because workplaces are mostly patriarchal. A study conducted in the USA in 2007 revealed that only 32% of computer system analysts were females (Schaefer, 2008). The USA's Department of Commerce, Telecommunications and Information Administration's 2002 report indicates that black women do not have the money to enroll for ICT programmes (Warschauer, 2004). Alvesson and Due Billing (2009) believe that another reason for women not occupying top management positions is because they are inexperienced and do not have the necessary management qualifications. In addition, non-transparent recruitment practices often prevent women from being appointed into senior or top management positions (Slocum & Hellriegel, 2007). The non-promotion of women to top positions makes them susceptible to unfair labour practices such as bullying (Watson, 2008) and sexual harassment (Schaefer, 2008).

Workplace culture

Managers who encourage culture of respect enhance employee satisfaction, whereas bureaucratic managers foster a bureaucratic culture. In terms of the former, managers and employees respect one another, are united and work harmoniously towards achieving organizational goals and objectives (Hostede, 1991). In terms of the later, employees are dissatisfied when they work for bureaucratic managers who do not trust them and therefore supervise them closely (Townsend, 2007). Furthermore, these managers do not share valuable and updated information with employees (McShane & von Glinow, 2005).

Workplace structure

Managers who play workplace politics undermine teamwork (Sias, 2009) and staff morale, frustrate those who are outside the group and promote their group members (Kotter, 1996). Managers who practice workplace politics adhere to workplace deliverables and labor policies (e.g. sexual harassment). It is thus difficult for senior or top managers to dismiss or discipline them, because their actions are not work-related or in breach of any workplace policies (Townsend, 2007).

Besides workplace politics, there are other reasons for managers behaving in a hostile manner towards employees. They are often bellicose because they fear losing their jobs (Booysen, 2007). Others get upset when employees question their decisions (Clegg, Courpasson & Phillips, 2006) and do not follow certain procedures when they execute their tasks (Ritzer, 2004). Furthermore, managers who are incompetent and emotional are usually hostile to their employees (Schaefer, 2008).

Human resource management

Despite the managerial practices mentioned in the previous section, there are certain types of managers who increase employees' satisfaction. They give employees an opportunity to be creative and develop themselves (Slocum & Hellriegel, 2007), as well as to use their own initiative (Prilleltensky & Prilleltensky, 2006), are charismatic (Bratton et al., 2010), encourage their employees to work together and do not alienate them (Haralambos & Holborn, 2004). In addition, they do not intimidate employees (Odih, 2007) and do not discriminate against employees based on gender, race or disability (Bratton et al., 2010).

In conclusion, the literature review has provided a broader understanding of how management practices such as bureaucracy, gender and race imbalances in top echelons of the organization and non-merit-based recruitment cause employee dissatisfaction. On the other hand, literature also shows that managers with HRM skills enhance employee satisfaction.

RESEARCH METHODOLOGY

Research design

The research approach for this study was both qualitative and exploratory. An ICT business unit was chosen as a case study because the researcher wanted to get an in-depth and subjective understanding management practices that cause employee dissatisfaction. Despite the limitations inherent to the qualitative research design, the researcher chose this design for the following reasons: it enabled him to solicit rich and credible data, and the researcher was trained to use this type of design.

Population and sampling

The population size of the workplace was 306. One of the definitions of a population is the entire "group of people" investigated or researched (Babbie & Mouton, 2007, p.100). All 306 employees, with the exception of those who participated in the face-to-face interviews and focus group, were invited to participate in the online survey. The researcher was influenced by Leedy and Ormrod (2010), who suggest that if the population is below 500, the researcher should "survey the entire population" (p. 213). According to the report that the researcher received from Bytes Technology, 154 employees clicked on the link, but only 121 ultimately completed the questionnaire. This means that the response rate was 39.54 %. The benefits of using the online survey were that it had an element of immediacy and that confidentiality was guaranteed.

Purposive sampling is a non-probability sampling technique in which respondents are chosen based on the "researcher's judgment" concerning how they can add value to the research problem (Babbie, 2007, p.193). Nine employees were purposely selected to participate in the face-to-face interviews; eight were selected to participate in the focus group. However, on the day of the focus group interviews, only three were present, because they feared reprisal from management or had urgent work commitments.

Data collection

Face-to-face interviews were chosen as one of the data collection techniques because, according to Neuman (2006), they have the highest participation rate. A semi-structured interview schedule was drawn up, and it began with a focus on the demographics of the sample (Berg, 2004). The other questions included aspects pertaining to gender, race, appointment, recruitment, workplace structure and culture, and were developed from the literature reviewed. Using face-to-face interviews also gave the researcher an opportunity to "probe" when respondents were not providing sufficient information (Neuman, 2006, p.73).

The researcher contacted Bytes Technology and asked them to host the online survey on their server. Since the questions had already been developed using the Question Mark Perceptions (QMP) software, they were Qparked and sent to Bytes Technology. To Qpark the questions, the researcher zipped questions together and sent them to Bytes Technology. Data collection took place from July 2010 until October 2010.

Data analysis

In order to analyze data (i.e. face-to-face interviews, focus group session and online, open-ended questions), the researcher manually grouped themes together. The reason for not using research coding software was because the researcher had prior experience of coding qualitative data without technological assistance. Since the respondents spoke English, it was not necessary for the researcher to translate data during transcription, and this saved time during data analysis.

Validity and reliability

The researcher piloted the online survey and paper-based interview framework. Piloting the online survey made the researcher confident that if the same instrument is used in other workplaces, it will yield similar results. Furthermore, the usage of triangulation also assisted the researcher to validate data through cross-verification from two or more sources (Leedy & Ormrod, 2010).

Ethical considerations

The researcher was careful when asking respondents questions regarding racial and gender issues, and it was made clear that their responses did not necessarily mean that they were racist or sexist. The results of this study were made available to all the stakeholders before they were published. In order to safeguard the identities of the respondents, only what they said was recorded, and no-one was forced to participate in this study.

RESULTS

In this section, the results of the study are presented. Firstly, the profile of the research respondents is outlined in terms of their demographic characteristics and employee grades. Thereafter, the results are organized thematically according to the research questions in this study.

Racial profile of respondents

In terms of labor legislation, workplaces in South Africa are compelled to appoint previously disadvantaged males and females. The racial percentages of the respondents were as follows: 72% were Black, 16% were White, 8% were Indian, and 6 % were Colored. Sixty-three percent of the managers were female and 37 % were male. The predominance of female middle managers in the ICT business unit was contrary to both international and other South African findings, which indicate that only a few black women are appointed as managers in ICT workplaces.

Employees' grades

In the nine face-to-face interviews that were conducted in this study, four respondents were G-graded specialists or managerial employees who did not have employees reporting to them (1 Black female, 2 Black males, 1 Indian male), and three were M-graded middle managers (1 Black female, 1 White male, 1 Black male) who did have employees reporting to them. Two of the respondents were T-graded employees (1 White female, 1 Coloured female) - these were non-managerial employees. The focus group comprised two G-graded employees (2 Black females) and one T-graded employee (1 Black female). The majority of the respondents (51 out of 121) in the online survey were G-graded. There were no EEE-graded employees who responded to the online survey – these were top management employees. The reality was that there were 2 White males, 1 Indian male and 1 Indian female.

Respondents' qualifications

The respondents had a range of tertiary qualifications. One respondent reported that he had a Master's in Business Administration (MBA), while one was a second-year MBA student. The others had national diplomas in ICT and/or project management. A diploma in ICT was the minimum requirement for any position in the ICT business unit.

APPOINTMENT AND RECRUITMENT

It was found that the following were management practices that dissatisfied respondents: lack of merit recruitment practices, lack of mentoring and appointing AA candidates.

Respondents stressed that they would be dissatisfied if employees were not appointed on merit, even when they were AA candidates. A black project manager said that women would be dissatisfied if they were not appointed on merit: “I think really if you are a candidate you would want the confidence, of saying that I have been chosen on merit.” The futility of applying for a position was expressed by one respondent as follows: “They are just following the process as a formality, but they have already decided.”

The majority of the respondents said that they would be dissatisfied if experience, skill, AA policy and other selection tools were not used to appoint and recruit managers. One respondent suggested that: “Some of the white males have experience but they do not have qualifications, and this experience is very valuable, and some will be retiring soon. So they should not retire with that knowledge, they should mentor AA candidates.” Another respondent added that: “Well, there are people who are more management material than others. So there must be assessments of some kind to find out what kind of a person you are - like personality assessments.”

Even though the management of the ICT business unit implemented AA, there were respondents who were dissatisfied with its implementation: “People should be appointed based on their experience. It is not fair to be held back because of affirmative action and statistics not being met; be fair to all. Treat all equal. All mechanisms do exist but are biased by AA policy;” “People must be appointed on the basis of their abilities. Race and gender should not be priorities, as this promotes nepotism and racism.”

WORKPLACE CULTURE

Managers who created a culture of respect enhanced employees satisfaction, whereas bellicose managers fostered a bureaucratic culture. The majority of satisfied respondents said that a culture of respect enabled them to achieve their work objectives and create a good working environment. One respondent said the following: “That manager believes in me. I do not know if it is because I am a woman and he is an Indian man and it is part of his culture.” However, dissatisfied respondents strongly believed that the culture in the ICT business unit was bureaucratic. Here are some of the phrases used by respondents to describe these management practices: “micro-management” and “culture of fear which stifles innovation and creativity.”

WORKPLACE STRUCTURE

It was found that a lack of career-pathing; workplace politics; managers who lacked managerial competencies; unequal payment on the same grade; bullying either by managers or co-workers were the managerial practices that resulted in a hostile working relationship between managers and employees.

Lack of career-pathing

Limited opportunities to develop skills for career advancement emerged as one of the major sources of dissatisfaction. One female respondent expressed her dissatisfaction with the fact that females tended to be given mundane tasks, rather than opportunities to work on core tasks: “I do feel at certain times when there are technical projects, which means that there is a new capability application that the company has bought, I do feel that normally, it tends to go to the guys and not the ladies to do the implementation.”

Workplace politics

The majority of the respondents said that politics was not beneficial for the business unit. In order for the organisation to be effective, respondents suggested the following management practices to prevent managers from engaging in workplace politics: “Eliminate or close the gap of giving middle management powers to employ their preferred candidates”; “We need to remove some level of power from whites;” and “Blacks still need to remove greed within themselves and grow sound leadership skills to run a giant organization.”

Managers who lack human resource management skills

In the online survey, the respondents described emotional managers as follows: “Emotional and she is very temperamental; so-so depending on her mood and her problems.” Since these responses were from the online survey, the researcher could not determine the gender of those respondents who perceived female managers as being emotional. Other respondents added: “It sucks. They [managers] all have a bossy attitude. It is either their way or no way. Shame, I pity them because they are losing the most valuable employees. Half the department is looking to leave our department; and “I think my manager should improve on the human side.”

Bullying in the workplace

The other management practice experienced by a few respondents was bullying. One respondent reported that he had been bullied during a performance appraisal. With further probing, the respondent explained this as follows: “The issue with the performance appraisal it was like, eh, my manager did not check what I have done, she just came and said when I look at you I see 2.6. She just gave me the mark.” It was indicated that bullies are “same level employees.” It was also found that bullying was done by female employees. One respondent reported that bullying was done by “females over 40.”

Remuneration disparities

Another management practice that dissatisfied respondents was remuneration disparities. One responded by saying: “It is very painful, we are experiencing this currently, the morale is down, and it’s a serious stress to us.” This study also revealed that a manager earned less than an employee. When responding to the online survey, one respondent said the following: “This is currently the situation where individuals reporting to me with fewer years’ experience are earning more than I do.” Another respondent felt that racial disparities still existed: “Our country has to look into this problem of one race earning on average five times than the other races.”

DISCUSSION

Interpretation

The main aim of this study was to investigate the management practices which contributed to employee dissatisfaction by means of a case study. This study replicated the findings of international studies that some of the management practices which cause employee dissatisfaction are the following: race and gender under-representation at the top echelons of management (Schaefer, 2008); bullying of lower-level employees by managers (Watson, 2008); non-transparent recruitment practices (Slocum & Hellriegel, 2007); managers who lack human resource skills (Bratton et al., 2010); a bureaucratic or hostile culture (Townsend, 2007) and workplace politics (Sias, 2009).

Limitations

Since top managers did not participate in this study, the researcher could not determine which management practices contributed to their dissatisfaction. While this study was restricted to an ICT business unit and the findings cannot be generalized, it can be argued that the findings can be applied to situations beyond that of the actual case study. This study’s findings provide an in-depth insight into the management practices contributing to employee dissatisfaction in the multi-cultural workplace and how they can be addressed, especially in South Africa, where this area is under-researched.

Implications for practitioners, future research and recommendations

This study raised awareness among ICT managers, other line managers and human resources managers of the fact that if they do not address management practices that contribute to employee dissatisfaction, they might have difficulty in retaining and keeping employees satisfied. In addition, it showed that AA policy

does not always have the intended effect, and that employees would prefer appointment and promotion to be done on the basis of meritocracy and with mentoring.

Some implications for further research became apparent during the course of this study. Similar studies on employee dissatisfaction should be conducted with top managers and follow-up studies on employee dissatisfaction should be conducted as causes are addressed and relevant interventions are implemented.

This study points to the following findings, and this suggests that in similar contexts, management practices contributing to employees dissatisfaction could be addressed in the following ways: when top management positions are advertised, competent black managers and females should be considered; the selection process for managerial posts should not be solely based on interviews, but should include other tools such as psychometric testing; a mentorship program should be put in place to assist managers who have been appointed and lack experience; a salary audit should be conducted; the current appointment and recruitment processes should be implemented in a participatory, transparent and fair manner; awareness should be raised with regard to bullying and a workplace policy and procedure, as well as change management interventions, should be implemented to instill a sense of unity and teamwork in order to achieve organizational objectives.

THE CONTRIBUTION OF SMMEs TOWARDS LOCAL ECONOMIC DEVELOPMENT IN MANKWENG TOWNSHIP, LIMPOPO PROVINCE, SOUTH AFRICA

**Caswell Maloka and Mokoko Sebola
University of Limpopo, South Africa**

ABSTRACT

Poverty, unemployment and inequality are regarded as the triple challenges facing the majority of local communities in developing countries including that of South Africa. Small, Medium and Micro Enterprises (SMMEs) are seen as having the potential to contribute positively towards achieving greater socio-economic transformation within poor and disadvantaged communities. These enterprises are purported to have the ability to create jobs for the poor and enables them to earn an income required to purchase goods and services. As a result, SMMEs become a focal point of considerable attention to many government and private institutions in South Africa with the aim of achieving the overall economic development and job creation. In an attempt to enable the sector to perform effectively and efficiently, a number of support initiatives were introduced since 1995. However, there are a number of SMMEs in South Africa's localities such as Mankweng Township of Limpopo Province, yet many people continue to be unemployed, resulting in conditions of poverty. The latter is despite the implementation of various support initiatives for SMMEs in South Africa. The purpose of this paper is to investigate the contribution of SMMEs towards local economic development (LED) in South Africa with specific reference to Mankweng Township of Limpopo Province. In order to investigate the contribution of SMMEs towards LED, a variety of data collection methods were used which included the literature review and semi-structured questionnaire. The paper concludes that SMMEs form an important component in LED process given the provision of appropriate support for SMMEs and their accessibility thereafter.

INTRODUCTION

Globally, SMMEs are considered as a mechanism through which poverty, unemployment and inequality can be resolved (Ndabeni, 2006; Mensah and Benedict, 2010; Okpara, 2011). These enterprises are viewed as the strategy by which economically disadvantaged groups in local communities can have access to economic activities through the creation of jobs and generation of income (Ihua, 2009; Egana, 2009; Kongolo, 2010). Thus, the income generated through SMMEs allows marginalised groups such as the unskilled and uneducated people, female, disabled and rural families to access basic needs. Therefore, governments of various countries have instituted a number of interventions that are aimed at promoting and creating an environment that would enable this sector to perform. Studies show that SMMEs form an integral part of LED and are purported to resolve socio-economic problems in the majority of leading economies in the world (Kongolo, 2010; Okpara, 2011). They are regarded as the first and primary source of direct employment, income, tax revenue, innovation and economic redistribution in their area of establishment. The experience of prospering localities in developed countries, particularly in the Western Europe and Japan indicate that the SMMEs are at the centre of LED processes (Chew and Chew, 2008; Ihua, 2009; Kongolo, 2010). Simultaneously, studies conducted in developing countries such as South Africa demonstrates that SMMEs serve as significant mechanism towards socio-economic transformation (Ndabeni, 2001). The purpose of this paper is to investigate the contribution of SMMEs to LED with specific reference to Mankweng Township in Limpopo Province, South Africa. This paper reviews relevant literature on the contribution of SMMEs to LED and discussion of the empirical finding in Mankweng Township.

Classification and the Characteristics of SMMEs in South Africa

SMMEs represent diverse groups with differences relating to the economic sectors such as mining, construction, manufacturing, trade, retail and services (Ndabeni, 2006). These enterprises are to be found in both the formal and informal sectors of the economy. Generally, different countries and institutions classify SMMEs according to the number of employees, total turnover and/or the total value of capital assets. The *National Small Business Act* 102 of 1996 and its amendments in South Africa classify SMMEs on conditions of quantitative and qualitative standards. The quantitative standard provides for minimum level of total number of employees, annual turnover and value of capital assets in the enterprise. Qualitative standard would include enterprises that are being privately owned by individuals or groups which does not exceed quantitative criteria. The *National Small Business Act* 102 of 1996 categorise SMMEs into four groups of enterprises. The first group consist of informal survivalist enterprises, which are defined as a set of activities carried out by unemployed people unable to find permanent employment. In this group of enterprises the income is below the minimum standards, little capital investment, minimal skills training, low level of productivity and there is a little chance of these businesses to grow into larger enterprises (Perks, 2010). The majority of enterprises in this category are in service and, specifically the retail or trade sector. Additionally, the size of this group of enterprises tends to increase when the economy declines and decreases as the economy grows. Therefore, this category serves as a safeguard that provides a means of survival during economic difficulties. However, sustained employment growth and production are not likely to be attained in this group. This does not suggest that this group is not important since it represents between 70% and 80% of all SMMEs in South Africa (Dockel, 2005). Examples of such enterprises include hawkers, street vendors and spaza shops. The second group is the micro enterprises which are very small businesses involving the owner, some family members and at most micro enterprises have more than four regular workers. These types of enterprises still lack formality in terms of license or formal business premises. However, an entrepreneur has basic business skills, though not entirely, micro-enterprises will make transition into the formal small business.

Small enterprises comprise of employees fewer than 50 regular workers and medium enterprises employ up to 200 workers (Ndabeni, 2006). These groups of enterprises are owner-managed and are operated from fixed business premises and fulfil all the essentials associated with formality, including registration with taxation authorities. Medium enterprises, although still owner-controlled, have complex ownership and management structures with an increase in the division of labour (Mbonyane and Ladzani, 2011). Small and Medium enterprises operate within the formal sector and have access to technological devices such as computers, internet, telephone and other devices. This group of enterprises maintain a sustainable employment growth. Therefore, labour productivity is sufficient for workers in this group and income is above the poverty line. The categories of SMMEs can include different types of enterprises and can embrace a variety of firms from village handicraft maker, shoe maker, general dealer, spaza shop, mini bus taxi, hair salon, dress maker, small tourism, textiles, supermarkets, restaurants, wholesaler, vehicle repairs, metal working, brick making, electronic stores, internet café and public phone (Netswera, 2001). Some of these enterprises are dynamic, innovative and growing while others have little chance of growing into larger enterprises, able to access bank finance and becoming internationally competitive (Rogerson, 2006). Additionally, SMMEs could be characterised as, among other things, having ease of entry, small scale of the activity, use of labour intensive technology, high level of self-employment with high percentage of family workers. Thus, the contribution made by SMMEs to LED will differ according to their classes and sizes. The following section provides a discussion on the concept of LED in South Africa.

The Concept of Local Economic Development

The concept of LED has been accepted as a locality-based planning to respond to poverty, inequality and unemployment challenges in South Africa. The World Bank (2002) defines LED as the process by which the public, business and non-governmental sectors work collaboratively to create better conditions for economic growth and employment creation within local communities. The Department of Cooperate Governance and Traditional Affairs (COGTA) in South Africa refers to LED as an outcome based on local initiatives driven by local stakeholders. It involves identifying and using local resources, skills and ideas to promote economic growth and development. LED emphasis on the needs of communities and creating an environment for private sector investment through public sector investment and by supporting the retention, growth and development of enterprises (Malefane, 2008). The growth of businesses that use local resources, including labour and materials for production, will generate local wealth and jobs. According to Tsheola and Mokgokong (2012), LED includes the process of gradual improvement of a combination of job creation, income generation, formation of business partnerships, improvement of entrepreneurship, as well as increased economic output and enhanced market opportunities with localities. Therefore, LED recognises that people, business and government are best positioned to promote networks and partnerships within

municipalities in order to improve economic conditions that will stimulate growth, which is required to create jobs and ultimately reduce poverty (Tomlison, 2003; Kanyane, 2008; Phago and Tsoabisi, 2010). The following section discusses the contribution of SMMEs towards LED in South Africa.

The Contribution of SMMEs towards LED in South Africa

Since the national economies experience the predominance of SMMEs, this predominance is even more evident at the local economies (Ndabeni, 2006). SMMEs, rather than large enterprises, are seen as the engine to the South Africa's national economy and LED (Chew and Chew, 2008). They are regarded as the first and primary source of employment, income and innovation in the majority of rural communities and townships in South Africa. Pragmatically, SMMEs in South Africa generate about 35% of the GDP; contribute 54% of employment and 43% of the total salaries and wages of all private sector employees (Urban and Naidoo, 2010). These enterprises are purported to have the ability to resolve the growing levels of poverty, unemployment and inequality. According to Kesper (2001), the number of jobs created could influence a range of other standard of living conditions such as disposable income, home foreclosure rates and new small business start-ups. Additionally, SMMEs contribute to a significant proportion of all taxes in the local economy such as income tax, property tax and employment tax. Therefore, having more businesses in the local economy can enhance tax revenue for municipalities, bringing in more money to improve the provision of public services such as roads, electricity and water (Ihua, 2009; Egana, 2009; Kongolo, 2010). Mensah and Benedict (2010) add that SMMEs play a crucial role in poverty reduction. These enterprises create and sustain the jobs necessary for poor people to work and earn the income needed to purchase goods and services. SMMEs contribute to poverty reduction by creating employment either through the start-up of new enterprises or the expansion of existing ones and providing income to the poor. The poor in this regard refers to individuals who own micro and small enterprises, employees, the dependents of such poor employees or owners, the unemployed who may obtain employment from these enterprises and poor people who purchase goods and services from small enterprises in the community. In most cases, poor people opt for such enterprises because they have little choice, or adequate paid employment is not available.

RESEARCH METHODOLOGY

The study used qualitative research approach. Stratified sampling design was used to select SMMEs which represented the entire population in Mankweng Township. The researcher first identified the relevant strata and their actual representation in the population. The stratum was based on the size and types of SMMEs. Therefore, a total sample of 80 SMMEs was used for the study. A total of 80 semi-structured questionnaires were administered to SMMEs in the area to collect data on the classification and types of SMMEs as well as the perceptions of SMMEs owners/managers on the contribution of SMMEs towards LED in Mankweng Township.

EMPIRICAL FINDINGS

This section presents an analysis and interpretation of the empirical findings of the study. The findings are presented in tables and figures, and are further deduced to provide a clear understanding of the relationship between SMMEs and LED in Mankweng Township. The data collected in this section includes the types and the number of employees employed in SMMEs and a discussion on the contribution of SMMEs towards LED. The contribution of SMMEs towards LED was based on the perceptions of the SMMEs owners/managers on their ability to create jobs, generate income and reduce poverty in Mankweng Township.

SMMEs in Mankweng Township

Table 1: the types of SMMEs in Mankweng Township

Types of Enterprises		Frequency	Percent	Valid Percent	Cumulative Percent
	Spaza shops	11	14.5	14.5	14.5
	Taverns	5	6.6	6.6	21.1
	Carpentry	5	6.6	6.6	27.6
	Restaurants	4	5.3	5.3	32.9

Hair salons	10	13.2	13.2	55.3
Hawkers/street vendors	11	14.5	14.5	69.7
Shoe makers	3	3.9	3.9	73.7
Welding	4	5.3	5.3	78.9
Dress makers	6	7.9	7.9	86.8
General dealers	4	5.3	5.3	92.1
Vehicle repairs	3	3.9	3.9	96.1
Bricklaying	3	3.9	3.9	100.0
Others	7	9.2	9.2	42.1
Total	76	100.0	100.0	

Table 1 above illustrates the different types of enterprises that are found in Mankweng Township. It is evident that spaza shops and hawkers/street vendors are dominant business activities in Mankweng Township, with shared 14.5% each, and followed by hair salons which constitute 13.2%. Dress makers constitute 7.8% of the total sample, while taverns and carpentries constitute 6.6%. Restaurants, weldings and general dealers share the same percentage of the total sample with 5.3%. Shoe makers, vehicle repairs and bricklaying constitute the least section of the sample with 3.9%. Other business activities include car wash, public phones, electronics and mini bus taxis which constitute 9.2%. Therefore, it can be concluded that SMMEs in Mankweng Township falls into different types of sectors.

Figure 1: The employees employed in the enterprise

Figure 1 above demonstrates the number of employees employed in different classes of SMMEs. Most employees are employed in the micro or survivalist enterprises as opposed to small and medium enterprises. The majority of the enterprises employed 0 to 5 employees (micro and/or survivalists enterprises). This group of enterprises represents the highest proportion of the total sample and accounts for 78.9% of SMMEs. The other group of enterprises employed 6 to 49 employees (small enterprises) and account for 14.55 of the total sample. The last group of enterprises comprise 50 to 200 employees (medium enterprises) and accounts for 6.6 5 of the total sample. Therefore, it can be concluded that most employees are employed in micro and/or survivalist enterprises which employ 0 to 5 employees, particularly family members.

The Contribution of SMMEs towards LED in Mankweng Township

This section provides an analysis on the perception of SMMEs owners/managers on the contribution made by SMMEs towards LED in Mankweng Township. This was measured through the ability of SMMEs to create employment, generate income and reduce poverty.

Table .2 Perceptions of the SMMEs owners/managers on the contribution of SMMEs to employment creation

The level of satisfaction		Frequency	Percent	Valid Percent	Cumulative Percent
	Adequate	25	32.9	32.9	32.9
	Neutral	27	35.5	35.5	68.4
	Inadequate	24	31.6	31.6	100.0
	Total	76	100.0	100.0	

Table 2 above demonstrate SMMEs owners/managers' perceptions on the contribution made by SMMEs towards employment creation in Mankweng Township. The majority of the SMMEs owners/managers indicated the contribution made by SMMEs to job creation as neutral, this group of owners/managers account for 35.5% of the total sample. However, a slightly different group of SMMEs owners/managers (32.9%) indicated that SMMEs contribute adequately towards employment creation. About 31.6% of SMMEs owners/managers indicated that the contribution made by SMMEs toward employment creation is inadequate. This suggests that the majority of the SMMEs owners/managers view SMMEs as having potential to create jobs. This group of people venture into the SMMEs sector in order to create jobs for themselves. However, a different group of owners/managers stated that the quality of jobs created in terms of wage and work conditions are not as good as the larger enterprises.

Table 3: Perceptions of the SMMEs owners/managers on the contribution of SMMEs to income generation

The level of satisfaction		Frequency	Percent	Valid Percent	Cumulative Percent
	Adequate	21	27.6	27.6	27.6
	Neural	35	46.1	46.1	73.7
	Inadequate	20	26.3	26.3	100.0
	Total	76	100.0	100.0	

Table 3 above illustrates the perceptions of SMMEs owners/managers with regard to the contribution of SMMEs towards income generation. The largest percentage of the SMMEs owners/managers indicated the contribution made by SMMEs towards income generation as neural, this group constitutes 46.1%. Only 27.6% and 26.3% of the SMMEs owners/managers respectively indicated that the contribution made by SMMEs towards income generation is adequate and inadequate. This basically suggests that SMMEs in Mankweng Township are viewed as a mean to income generation for those who do not have any other forms of income generation activities. However, the income generated by these SMMEs is low because most of the enterprises in the area are micro and/or survivalist enterprises which make minimal amount of income.

Table 4: Perceptions of the SMMEs owners/managers on the contribution of SMMEs to poverty reduction

The level of satisfaction		Frequency	Percent	Valid Percent	Cumulative Percent
	Adequate	24	31.6	31.6	31.6
	Neutral	34	44.7	44.7	76.3
	Inadequate	18	23.7	23.7	100.0
	Total	76	100.0	100.0	

Table 4 above indicates the perceptions of SMMEs owners/managers on the contribution of SMMEs towards poverty reduction in Mankweng area. The majority of the SMMEs owners/managers (44.7%) indicated that the contribution made by SMMEs towards poverty reduction is neutral and 31.6% of the SMMEs owners/managers indicated that SMMEs contribute adequately to poverty reduction. However, the smallest proportion of the SMMEs owners/managers indicated that SMMEs contribute inadequately towards poverty reduction. This basically suggests that SMMEs plays an important role in improving the living standard of the majority of people. Many people in the area make survival out of these entrepreneurial activities. One of the SMMEs owners/managers indicated that “if it was not for the business they are operating they would be unemployed and having no income for their sustenance”.

CONCLUSION

The purpose of this study was to investigate the contribution made by SMMEs towards LED in Mankweng Township. The study revealed that SMMEs form a vital element of the LED process, and their contributions in terms of employment, income and poverty reduction is commonly acknowledged. However, the study also demonstrates that most of the SMMEs in Mankweng Township operate within the categories of micro and/or survivalist enterprise of the informal sector. Therefore, their contributions towards LED are limited. Based on the research findings, the study recommends that information about SMMEs support programmes offered by national, provincial and local government should be disseminated to the local enterprises in Mankweng Township. These would include information on financial and non-financial support that would assist small business owners/managers to be aware of the support programmes offered. Access to this information and support to SMMEs would allow these SMMEs, particular the micro enterprises to make transition into small and medium enterprises and will improve their contribution to the local economy.

THE EFFECTS OF LABOUR LAWS ON THE SOUTH AFRICAN AGRICULTURAL SECTOR

Angelina Mamabolo
University of Limpopo, South Africa

ABSTRACT

The purpose of this paper is to investigate the causes of labour unrest in the agricultural sector of South Africa. South Africa's increasing number of labour unrest is a threat to economic stability. Democracy and labour laws was an attempt to bring about a better life for all South African citizens. In 1994 the South African government reinforced reformed labour laws frameworks to ensure a non-sexist, non-racial and equality based democratic society as a way of protecting labourers from exploitation and abuse. The legislative frameworks such as Basic Conditions of Employment Act of 1997, Labour Relations Act No 66 of 1996 and Employment Equity Act No 55 of 1998 regulate the relationship between the employers, employees and trade unions in the country. Despite the existence of these legislative frameworks, labour unrest continues unabated in the agricultural sector with unfavourable consequences on employees. These unfavourable consequences include unfair wages, unfair treatment and worker's conditions. The government's intent to reduce poverty through private sector employers such as the Agri South Africa (AgriSA) therefore continues to be a recurring problem. The Agricultural sector in South Africa creates jobs through agricultural projects in rural areas and also helps in improving the living conditions of the people. This paper uses the available literature to argue that labour unrest in the agricultural sector of South Africa is one of the major causes of unemployment.

INTRODUCTION

South Africa's democracy has brought changes to the lives of all South African citizens, specifically with the focus on improving the living conditions of its citizens and job creation in the country. Since 1994 many policies were drawn to target poverty and unemployment. It is acknowledged that such policies have brought change to the country; however the implementation process of such policies is still questionable evidence. The agricultural sector is one of the sectors that also play a major role in socio-economic development which could be used to address these anomalies. Currently, the sector provides employment to people who are disadvantaged in rural areas and has a significant contribution to the country's Gross Domestic Products (GDP) of about 7 % in the year 2007 and there is an increase of 3 % contribution in the year 2013 which then amount to 10% of the current GDP.

The Department of Agriculture also estimates that the agricultural sector accounts for 29.9 % of jobs in rural areas. Despite its major role and contribution, the sector is also faced with many critical challenges similar to mining and energy development sectors. The increasing number of social unrest in the sector is a current example whereby during 2012-2013 financial year, the agricultural sector experienced a major financial losses after the farm workers went on a minimum wage strike in the Western Cape Province. Therefore, this paper seeks to investigate the causes of labour unrest in the agricultural sector of South Africa. In addressing this, the paper undertakes a critique of the Basic Conditions of Employment Act of 1997 which considers employees' rights (in the economy and in particular the agricultural sector). Furthermore the study discusses the causes of labour unrest in the agricultural sector and the effects of labour unrest in the sector. This is necessary because employers must protect and respect the rights of their employees and that will also help in reducing the increasing number of labour protests that are emerging in the country daily.

THE SOUTH AFRICAN LABOUR LAWS AND EMPLOYEES RIGHTS

South Africa is listed among first countries of the world to regulate the employees' rights in the informal sector. This is also recognised by the *Constitution of the Republic of South Africa*, 1996 section 23, which states that every employee has the right to fair labour practices, including the right to strike, form and join a union, participate in their activities and programmes and bargain collectively (Fourie, 2008:126). The *Basic Conditions of Employment Act of 1997* is one of the legislation that regulates the concern of the workers in the country. Fourie, (2008) however noted that framework is not fair because it does not protect all workers, but discriminates against part-time employees. The exclusion of employees based on this legislation brings about the issue of unfair treatment in the labour industry.

Thus the *Employment Equity Act* of 1998 was also established to promote equal opportunity and fair labour practice. Therefore the issue of unfair labour practice in the sector is not expected because the country has created democratic labour laws. This includes issues of rights to fair minimum wages, leaves and normal working hours. It is therefore arguable that the application or lack of appropriate application of adopted labour laws might create labour unrest. Therefore for the purpose of efficiency and effectiveness in the labour sector, all labour laws must be applied fairly to employees so as to decrease the number of labour protest in the country. The major issues addressed by the, *Basic Conditions of Employment Act*, 1997, includes among others the issue of work times and rules based on ordinary hours of work and overtime and the issue of children and forced labour South Africa does have good labour laws, but employers in the agricultural sector and in other sectors continue to abuse employees and children. According to Fourie (2008:112) employers faced with globalisation challenges, employ unskilled and non-standard workers to address their demands and avoid the country's labour laws. It is therefore evident that there is no protection of the employees in the agricultural sector and thus contributes to the unrest situations.

AGRICULTURE AND THE SOUTH AFRICAN ECONOMY

South African agricultural sector plays a major role in job creation and also contributes to the country's Gross Domestic Products (GDP) of almost 10 % in the year 2012 (Department of Agriculture, Forestry and Fisheries, 2012). Sandrey, Punt, Jensen & Vink (2011:8) acknowledge that South Africa's agricultural sector represents and promotes a good trade relationship with other countries and create employment to the rural people. Agriculture is seen as a sector that contributes to government's initiative to create jobs to all the South African citizens. Despite its contribution to employment the sector also trade products to foreign countries.

South Africa is a well-known country that specialises in agricultural products such as wheat, seeds, sugar cane, grain and vegetables such as tomatoes, potatoes, maize and fruits such as tomatoes, grapes and to other countries. An economic review of South African agriculture estimated that the agricultural products for the financial year 2012 amounted to 161 131 million which is higher than the previous years. Oettle, Fakir, Wentze, Gidding & Whiteside (1998:21) emphasise that despite job creation agriculture also plays a major role in poverty alleviation by distributing its products to the livelihoods of the poorest households in rural areas. Bryerlee, De Janvry & Sadoule (2010: 1) indicated that the agricultural sector should be recognised as the important role player in development. The agricultural projects in most rural areas are example of development in the agricultural sector.

Agricultural products such as vegetables produced through poverty alleviation projects in rural areas helps to meet food security of the local people, because South Africa still has rural people who cannot access the agricultural markets. If people cannot access their nearest markets they can buy vegetables from the agricultural projects within their community at a reasonable selling price without going to the market. However Nel & Davies (1999: 4) indicated that the agricultural sectors are likely to be faced with environmental constraints such as lack of rainfall and drought which contributes to the collapse of agricultural projects. This will then force the local communities to go to their nearest market to access agricultural products. However that will also cause financial constraints to the local communities, because they are to spend more money on transport going to the market to access agricultural products.

AGRICULTURE AND EMPLOYMENT IN SOUTH AFRICA

According to Sandrey *et.al* (2011: 16) it is difficult to estimate South Africa's level of employment in the agricultural sector. But it is believed that the sector employed more than millions of job opportunities in the past four decades. The seasonal and casual workers in South Africa contribute to such difficulties. However

the Department of Agriculture, Forestry & Fisheries (2010) estimates that the number of workers employed in the agricultural sector decreased from 1.1 million in the year 1992 to 914 000 in the year 1996 of which 67% were employed on permanent basis. The agricultural sector has generated employment in most rural areas in the country through the agricultural projects. The type of employment in the sector however differs. There are permanent and casual/seasonal workers within the agricultural sector. The reason behind this is that farmers are looking at saving their market costs by employing casual workers who would perform other duties seasonally rather than employing more people within the sector. However Sandrey *et.al*, (2011:17) argue that agricultural sectors employ casual/seasonal workers because they harvest quarterly.

Based on the global demand challenges, the agricultural sectors employ more casual workers rather than permanent workers. It is argued that most employers prefer to employ the unskilled labours to meet their demands for costs saving purposes. This includes both African men and women from rural areas. Cohen & Moodley (2012:321) emphasise that the problem in this case is that, most employers take advantage of the people who are unskilled in rural areas and pay them a low wages. Simbi & Aliber (2000:10) emphasise that, there should be good application of labour laws such as *Basic Conditions of Employment Act* and the *Labour Relations Act* that regulates and protect the employees' rights within the sector. Again these acts must also intend to improve the working conditions and regulate the workers working hours. Therefore failure to apply these labour laws contributes to labour unrest problems in the agricultural sector. The working conditions of workers in the agricultural sector should be equal irrespective of their type of employment. Therefore there should be a fair treatment of workers in order to resolve conflict between the employers and employees.

CAUSES OF LABOUR UNREST IN THE AGRICULTURAL SECTOR

The issue of social labour unrest in the agricultural sector is considered to be a challenge in the labour market. Employees can only strike if there are social labour issues that affect them in their working environment and other strike can either be influenced by political and economic issues. Most farmworkers in South Africa specifically in the Western Cape Province work very hard, to produce food and wine for all South African citizens and to other foreign countries, but yet they are forced to work under unsafe and unhealthy conditions. Hence Fourie (2008:112) argue that the working conditions of the workers in South Africa have drastically changed because of the legislation that governs all workers in the country. They live without electricity, without toilet facilities and they also live on poverty wages of R150 per day, however the *Constitution of the Republic of South Africa*, 1996 states that people are entitled to safe and clean environment. It is therefore evident that workers' rights in the agricultural sector are violated in a way that can be compared to slavery at times. Particularly social labour issues such as minimum wages and the conditions of workers in the agricultural sector contribute to labour unrest in the South African agricultural sector. Employers in the agricultural sector and other sectors such as the mining industry should consider wage issues when looking for employment of both permanent and casual workers. Vink & Kristen (1999:208) argue that the introduction of advanced resources such as tractors in the agricultural sector caused a decline in structural shifts of employees. Employees were then employed either on permanent, casual or on seasonal basis. The introduction of new advanced machinery such as tractors in the agricultural sector also contribute to unemployment in the country, because machinery can only be operated by skilled labours in the sector and that will lead to unskilled labourers losing their jobs. That will have an effect on failed job creation by the private sector. The most important issue to consider in terms of wages is that employers should conform to the legislated minimum wage of employees based on their type of employment to eliminate the increasing number of labour unrest within their sectors.

The issue of minimum wage increase in the agricultural sector will impact negatively to employment crisis. The minimum wage may exclude casual workers, because the main reason for the sector to employ casual workers is to meet their demands by employing people who are unskilled and pay them low wages. The most disadvantaged will be women, because the Department of Agriculture (2010) estimate that women employees in the agricultural are unskilled and they are likely to be vulnerable because they have no education at all and they accept any working condition for a living and to provide for their children. Hence Cohen & Moodley (2012:323) adds that women should be paid minimum wage salary to decrease feminisation poverty. Most women-headed households will also be affected because they are said to be prone to poverty than men-headed households. Stanwix (2013: 2) further acknowledge that the introduction of minimum wage policy in the post-apartheid South Africa aimed at improving the living conditions of the workers; however that will vary according to the types of employment in the sector and employees' working

hours. There is a need for effective enforcement of minimum wage policy to resolve labour unrest problems between farmers and farm-workers in the sector.

The Department of Agriculture in South Africa estimated that blacks are likely to lose their jobs because of their poor level of education and lack of adequate skills to perform other duties. It is also estimated that almost 41 % of workers in the agricultural sector are men and they have no formal education while 40 % of women in the sector have no education at all. Therefore employers employ African workers based on their poor level of understanding and ignore the legislative frameworks that govern employees and their rights. Thus the realities of the Western Cape minimum wage farmers strike have shown that workers are poorly paid in the South African agricultural sector. However all workers need a living wage to improve their personal living conditions while on the other hand sustaining their impoverished households.

THE EFFECTS OF LABOUR UNREST IN SOUTH AFRICA

It is argued that poor payment of labourers in the agricultural sector and other sectors such as mining industry contributes to the emergence of labour unrest in the country. The issue of minimum wage increase in the agricultural sector could lead to possible effects that will affect the employees. *Firstly* possible effect is loss of employment. When employers consider an increase of wages, they will be forced to retrench other employees to meet the requested increase of wages. However retrenchment in the agricultural sector can be in different ways, it can either be pushed by the environmental constraints such as lack heavy rainfall and drought can contribute to poor harvest in the agricultural sector. Hence Nel & Davies (1999:2) acknowledge that floods can also cause an impact on the agricultural produce and result to job loss.

Secondly, labour unrest can cause possible economic decline in the country. The agricultural sector is the sector that produces vegetables, fruits seeds and trade with other foreign countries (Sandrey *et.al*, 2011:23). Most people depend on the agricultural products for their business and due to labour unrest they are likely to have challenges in receiving the agricultural products for their business. According to Nel & Davies (1999:2) almost half of Africa's population looks at agriculture as a means of living. Therefore labour unrest in the agricultural sector can cause market constraints and that will affect the lives of the South African citizens as they look at agriculture for a living. Again loss of employment due to unrest situations can also affect the life of the South African because there will be an increase number of unemployment in the country. Therefore it is evident that labour unrest also contributed to the current number of unemployment in the country and Cohen and Moodley (2012: 324) estimated that in 2012 South Africa had 68% unemployment rate.

Thirdly, labour unrest also contributes to profit and loss of employers in the agricultural sector. Since agriculture is regarded as the foundation of developing economies, there is also a need to consider the profit that it generates in improving the well-being of both the farmers and the farmworkers. The more profit they lose, the more they will retrench more workers in incurring the profit they lose during the unrest. However one can argue that a loss in the agricultural sector is not only caused by labour unrest. The other contributor of profit losses in the sector can be a decline of agricultural share of GDP in the country. South Africa is said to be one of the largest producer of vegetables and fruit seeds in the world. Therefore when the agricultural exports decline, the agricultural imports will remain stable and that will contribute to a decline in the GDP of the country. Lack of adequate resources such as machinery and quality water supply in most agricultural farmers also lead to a decline in the sector. Farmers rely mostly on adequate infrastructure to produce quality products to exports markets. Infrastructure such as roads and transport also play a vital role in agriculture, therefore poor infrastructure provision can also contribute to a loss in the agricultural sector because farmers use sea and air and land transport as their means of transportation. Hence Khadaroo and Seetanah (2007:2) argue that good infrastructure condition may open a pool for other investors to operate successfully, while poor infrastructure will increase costs to firms. Thus despite the labour unrest, poor infrastructure can also contribute to losses in the sector.

The *last* effect is cost recovery of the employers. It is well known that most employees when they strike they vandalise the existing infrastructure and the available resources during their reactions. This means that the employers will firstly have to look at the financial losses they suffered during the striking process and therefore employers will be forced to retrench other employees as a means of cost recovery. However Nel & Davies (1999: 4) argue that the agricultural sector can also experience possible natural disasters such as floods that will have a negative impact on their export products but causes of damage during farmers strike can also contribute to the export constraints of crops, vegetables, fruits and seeds.

CONCLUSION

This paper argued that South Africa has good legislative frameworks such as the Basic Conditions of Employment Act of 1997, Employment Equity Act of 1998 and the Labour Relations Act of 1996 that regulates the concern of the employees in the country. The acts were established to ensure fair labour practice in the country. Despite the existence of this legislative frameworks labour unrest in South Africa is still continuing and the employees' rights are still violated by the employers specifically in the agricultural sectors. And the agricultural sector plays a potential role in development by promoting growth and reducing poverty in most African countries whose economies are based on agriculture. It also supports livelihoods activities in most rural areas and it does provide employment to the poorest people in the country. It is therefore evident that South Africa's initiative to ensure good labour practice still remains a critical challenge as it does contribute to the increasing number of unemployment in the country. The current increasing number of unemployment and inequality in South Africa are considered by the government as the most salient economic problems facing the country. Thus South Africa should focus more on improving those existing frameworks that regulate the concern of employees and ensure proper implementation of those policies to resolve labour unrest not only in the agricultural sector but also in other sectors in the country. South Africa should look at the agricultural sector as a means to end poverty, because it does generate employment more than other sectors in the economy through its linkages with other economic sectors in the country.

REINFORCING ACCOUNTABILITY IN THE SOUTH AFRICAN PUBLIC SERVICE

Khutso Manyaka and Lucas Nemutanzhela
University of Limpopo, South Africa

ABSTRACT

The Constitution of the Republic of South Africa of 1996 provides for the values and principles guiding public administration in the country. It stipulates in section 195 that public administration must be governed by the democratic values and principles as enshrined in the Constitution. One of the principles is that of an accountable public administration. Accountability is one of the major concerns of governance in public administration in South Africa which become one of the dominant concerns of governance because in the absence of accountability, unethical conduct finds a fertile ground to thrive. The legislative institutions play a crucial role in reinforcing and entrenching the culture of accountability in South Africa in line with section 43 of the Constitution of 1996. The purpose of this paper is to describe how the reinforcing of accountability mechanism in the legislative authorities could strengthen the management of public service. In order to address this, this paper considers the accountability model in South Africa and further uses some evidence from the literature which has argued that in spite of the crucial role that legislative institutions play in reinforcing and entrenching the culture of accountability, it is still a major challenge in the South African public service. This paper further examines the exercise of the legislative oversight over the public service in order to identify challenges facing the legislative institutions in reinforcing accountability in the South African public service. The paper concludes by proposing strategies for dealing with the challenges that these institutions face, in order to enhance their role in cultivating the culture of accountability in South Africa.

INTRODUCTION

There has been a considerable interest, among policy makers, members of civil society and academics from across various academic disciplines to study the oversight role of the legislature (Pelizzo & Stapenhurst, 2006; Nsingo, 2007). Public institutions operate within political environments. For this reason, Thornhill (2005) argues that the representative nature of democracy requires that political representatives, who are elected by the electorate, to make decisions on behalf of the members of the society. Accountability is one of the salient features of a democracy. Consequently, accountability of public officials, both elected political representatives and appointed professional officials, is among the central concerns of governance in a modern society. Hence, it is often argued that accountability deficit leads to poor governance thereby undermining the provision of public services. It is within this context that the paper attempts to make a contribution regarding the notion of accountability with a view of how this can be strengthened in the South African public service. To realise this objective, the paper analyses the oversight role of the legislature in reinforcing the culture of accountability. The paper commences with the conceptualisation of the notion of accountability, the oversight role of the legislative institutions as well as the challenges that these institutions encounters when they exercise their oversight functions. The paper recognises undoubtedly that the legislative institutions in South Africa face numerous and monumental challenges relating to their oversight functions. Among these challenges are capacity constraints and the complex politics-power play inherent in the South African public service. The paper concludes that any attempt of reinforcing accountability in the public service, should be centred on the creation of active and autonomous legislative institutions capable of effectively exercising their oversight role over the executive.

CONCEPTUALISING ACCOUNTABILITY

The notion of accountability became the subject of considerable attention in post-apartheid South Africa. Kalema (2007) argues that in spite of its popularity, the concept is still poorly understood and ineffectively

applied in South Africa and indeed in many countries throughout the world. The term accountability is used to imply the obligation to answer for a responsibility that has been conferred to a subordinate by a superior (Van Zyl, 1994: 6). This view is shared by Kalema (2007) who defines the concept of accountability to refer to obligations on part of government officials to answer for the discharge of the responsibilities entrusted to them by those who are authorised to scrutinise them. Public officials, both political office bearers and appointed officials, are considered to be accountable to the extent that they are largely required for their actions (Sindane 2009: 495). This obligation applies not only to political office bearers, namely ministers, deputy ministers as well as members of the executive councils (MECs) respectively at national levels and provincial sphere of government. It is also applicable to professional officials, from accounting officers (Director Generals at the national sphere of government and Heads of Department's at a provincial sphere of government) to employees at lowest levels in the public service. The concept of the public service in the context of this paper is used narrowly to refer to government departments at the national sphere of government as well as the provincial departments in provincial sphere of government. This clarification is essential because it delineates the context and scope of this paper. To this end, readers are advised not to use the term to include public institutions in local sphere of government although these may be of some relevance.

South African Legislative Sector (2012), accountability as the hallmark of modern democratic governance. Democracy remains clichéd if those in power cannot be held accountable in public for their acts or omissions, for their decisions, their expenditure or policies. South African Legislative Sector (2012) describes the functions of accountability as follows

- To enhance the integrity of public governance in order to safeguard government against corruption, nepotism, abuse of power and other forms of inappropriate behaviour.
- As an institutional arrangement, to effect democratic control.
- To improve performance, this will foster institutional learning and service delivery.
- In regard to transparency, responsiveness and answerability, to assure public confidence in government and bridge the gap between the governed and the government and ensure public confidence in government and
- To enable the public to judge the performance of the government by the government, giving account in public

The above functions are essential in the context of this article as they serve the purpose providing a thorough clarification regarding the meaning of the term accountability in terms of its functions as it applies to the South African public service. These functions describe the nature and purpose of accountability. The former describe how the notion ought to be applied while the latter deals with the question of the objective of such application. These functions should be read concurrently with the various definitions of the concept of accountability as provided for in this paper in order to gather a thorough understanding of the concept. The section that follows explains the oversight role of the legislative institutions in South Africa. This is important because it serves to explain oversight mechanism through which, the legislative institutions are able to hold the executive (in the context of this paper, the national and provincial government departments) accountable for the performance of functions assigned to them in terms of the constitution in a manner that satisfies the interest of the members of the public.

THE OVERSIGHT ROLE OF THE LEGISLATIVE INSTITUTIONS

The Constitution of Republic of South Africa 1996, spells out the three spheres of government as national, provincial and local (Black, Calitz & Steenkamp, 2008; Kahn, Madue & Kalema, 2011). It further assigns to each of the three spheres of government certain powers and functions. Democratic governments, throughout the world, have legislatures that act as supreme institutions of social representatives (Nsingo, 2007). The most salient feature of the democratic system of governance is that government is answerable to elected political representatives in legislative institutions for the performance of its functions. The surest way to hold government accountable is to ensure that those who are entrusted by the society with the societal resources remain accountable to the legislative institutions, which are in turn accountable to the electorate. Nsingo (2007) further explains that in South Africa, legislative institutions are made up of representatives of people collectively known as Members of Parliament (MPs) at the national sphere of government and Members of provincial Legislature (MPL's) at the provincial sphere of government. The process through which the legislative institutions hold the executive accountable is referred to as oversight. Oversight is one of the major functions of the activities of modern legislatures throughout the world (Fashagba, 2009). Manzetti & Morgenstern (2000: 132) explain that "the concept of oversight is based upon the notion that while

government is necessary for democracy to prosper in an orderly fashion, its institutions and people who staff them must be accountable for their actions". Oversight refers to the exercise of constitutional powers of the legislature to check or control the exercise of constitutional powers of the executive arm of government and more specifically to check or control the exercise of the executive powers in order to make it accountable and responsible to the electorate. The development of "active and autonomous legislative institutions" (Olson, 2004) is the foremost prerequisite for effective and efficient exercise of the oversight functions of legislative institutions. The concept of oversight contains many aspects which include political, administrative, financial, ethical, legal and strategic elements. South African Legislative Sector (2012) describes the oversight functions of the legislative institutions in the South African public service as follows:

- To detect and prevent abuse, arbitrary behaviour or illegal and unconstitutional conduct on the part of the government and public agencies. At the core of this function is the protection of the rights and liberties of citizens.
- To hold the government to account in respect of how the taxpayers' money is used. It detects waste within the machinery of government and public agencies. Thus it can improve the efficiency, economy and effectiveness of government operations.
- Provincial Legislatures are actually delivered. This function includes monitoring the achievement of goals set by legislation and the government's own programmes.
- To improve the transparency of government operations and enhance public trust in the government, which is itself a condition for effective policy delivery.

Democratic government puts more emphasis on the oversight role of the legislative institutions in the promotion and protection of public interests. One of the Parliaments' roles is to exercise oversight over the executive (Ahmed & Khan, 1995: 573). In South African public service, oversight is the mandate of both the Parliament and Provincial Legislatures. Legislative institutions exercise an oversight role over the public service by holding it accountable for the performance of its service delivery functions (February, 2006). This oversight role entails the informal and formal, watchful, strategic and structured scrutiny exercised by legislatures in respect of the implementation of laws, the application of the budget, and the strict observance of statutes guiding the functions of public institutions in line with the Constitution of the Republic of South Africa 1996. The oversight role of the legislative institutions is premised on the idea that the legislature as a law making body can, through such laws, create administrative agencies. These administrative agencies will in turn be assigned certain functions and responsibilities through such promulgated laws. In practice, this entails overseeing the effective management of government departments by individual members of the relevant executive authority in pursuit of improved service delivery for the achievement of a better quality of life for all people. To this end, it can be argued that the effectiveness with which the legislative institutions execute their roles serve as the crucial component for the achievement of government functions.

At a national sphere of government, Parliament is vested with the legislative powers. The composition of Parliament in South Africa is such that it consists of two houses namely, the National Assembly and the National Council of Provinces. To effectively discharge its oversight responsibilities, Parliament (both house) created parliamentary committees. Committees of the legislative institutions in South Africa execute their functions as intermediary bodies between community members and the legislative institutions. Committees in the National Assembly are called the portfolio committees and those in the NCOP are called select committees. The portfolio committees are portfolio based while the select committees are cluster based. The fundamental difference between these two broad categories of parliamentary committees is that portfolio committees are reflective of the various portfolios in the national government whereas the select committees are established to deal with shared areas of interest in clusters of government. There are about 34 national government departments. There are also corresponding portfolio committees that have been established to oversee each of these departments with the exception of the Presidency, which by the way has got two departments namely the Monitoring and Evaluation and National Planning Commission. So in practice, this means that while there are parliamentary portfolio committees that have been established with the express purpose of strengthening the oversight capacity of the National Assembly, the absence of the parliamentary committee, make it difficult if not impossible to hold the presidency as government institution accountable for the performance of its functions. In addition to these categories of parliamentary committees, there are joint committees, ad hoc committees and joint standing committees as well as specialised committees. There are various institutions that have been created in terms of the Constitution to support the legislative institutions in performing their oversight responsibilities. In the context of the South African public service, these institutions include but not restricted to the office of the Public Protector, office of the Auditor General and the Public Service Commission. These institutions support the legislative institutions in executing their oversight roles in different ways. In spite of the crucial

role that legislative institutions play in enhancing accountability, these institutions faces numerous challenges when undertaking their oversight functions.

CHALLENGES OF LEGISLATIVE OVERSIGHT IN SOUTH AFRICA

The major problem in regard to the oversight role of the legislative institutions is often framed in conventional principal-agent terms (Franchino & Hoyland, 2008). According to Masehela, Mamogale & Makhado (2012: 346), Public Administration discourse in South Africa shows that the principal-agent theory is used to characterise the relationship between the elected political principals and the agency officials. Masehela *et al.* (2012: 346-347) further argues that according to this theory, “political principals are perceived to be very powerful people with authority and power to influence public policy making process and direction, oversee and monitor the activities of government and also to sanction the behaviour of self-interested agency officials”. The source of this enormous power and authority result from the influential positions they hold either in their political parties or in government. This politics-power play introduces another dimension relating to the challenges faced by legislative institutions in performing their oversight responsibilities over the executive. For example, in South Africa, the State president is also the head or president of the ruling party. Majority of members of cabinet (in which the executive authority is vested) occupy highly influential positions in the National Executive Committee (NEC) of the ruling party. The NEC as the highest decision making body between conferences, consists of senior members of the ANC. A great majority of Members of Parliament (MPs) who are from within the ranks of the ruling party are mostly junior to those in the executive. As the result, they are most likely to be lenient or submissive to the whims of their political masters or seniors. Any act of independence on their part may risk their future deployment (job security) because in South Africa, the electoral system does not allow for the direct election of MPs by the electorate. These MPs are to a large extent seen to be implementing the mandate or instructions from party bosses than from members of the public. They are beholden to the authority of party bosses majority of whom are members of the cabinet.

At a provincial level, the legislative authority is vested within the provincial legislatures in terms of section 104 (1) of the Constitution of the Republic of South Africa. There is a Provincial legislature established for each of the nine (9) provinces of South Africa. The composition of these provincial legislatures is different from one province to another because they do not have the same number of seats for MPLs. In terms of the legislative requirements, the composition of a provincial legislature must consist of at least minimum of 30 and the maximum of 80 members. Such a determination is made up by the Independent Electoral Commission (IEC) based on the province’s segment of the national common voters roll (Republic of South Africa 1996). In the same way that Parliament plays an oversight role on the cabinet (executive) at the national sphere of government, the Provincial Legislatures are also expected to exercise an oversight role over the provincial executive. Similarly, they have subcommittees that have been established in congruent to the number of provincial departments. The roles of these committees are not different from those of the parliamentary portfolio committees at the national sphere of government. These committees (parliamentary committees or more specifically portfolio committees and standing committees and the committees of the provincial legislature) have got powers to summon Ministers and Director Generals (DGs) as accounting officers of national departments and Members of the Executive Council (MECs) and Heads of provincial departments (HoDs) as accounting officers of the provincial departments, to account on any matter pertaining to their functions.

Through all these various committees as described above, legislative institutions are able to effectively carry out their functions. This therefore means that the extent to which legislative institutions in the public service (Parliament and Provincial legislatures) carry out their functions depends primarily on the efficiency and effectiveness with which these committees carry out their functions. Whereas the parliamentary committees are regarded as engine rooms of the legislative institutions, for the simple reason that they conduct their operations on behalf of such institutions, it is worth noting that their ability to carry out their functions is constrained by numerous shortcomings. These include, but not restricted to, the following: capacity constraints and complex politics-power plays. The former can be attributed to inexperience and inadequate training of committee members while the latter refers to inability of MPs and MPLs to hold their party political superiors in the executive accountable. This politics-power play often times than not result in the interference, wittingly or unwittingly, of the legislative functions by the executive or the ruling party. As a result of these shortcomings, the legislative institutions in South Africa are to a certain extent incapable of effectively and efficiently performing their oversight roles as a legislative

requirement. This according to Schneier (2004: 202), result in the conflation and blending of the executive and legislative powers and functions making it difficult to trace and locate the legislative powers. This is a major weakness which might cripple the country's democratic system in the long run because it systematically weakens the ability of the legislative institutions to execute their duties without hindrance.

CONCLUSION

The purpose of this paper was to demonstrate that the reinforcement of accountability could be achieved through the strengthening of oversight role of legislative. To realise this objective, the paper has comprehensively conceptualised the notion of accountability, the oversight role of the legislative institutions as well as the challenges faced by these legislative institutions in executing their oversight functions in the South African public service. To this end, it can be argued that apart from its role as law making bodies, legislative institutions have a crucial role to play in reinforcing accountability through performing its oversight functions. The paper concludes that the efficiency and effectiveness with which the public service (national & provincial departments) performs their functions depend primarily on the capacity of the legislative institutions to execute their oversight roles. This could be achieved through the building of active and autonomous legislative institutions whose members are not being micro-managed by party bosses.

MANAGEMENT OF EMPLOYEES' PERFORMANCE IN THE SOUTH AFRICAN PUBLIC SERVICE: A CASE OF THE DEPARTMENT OF ROADS AND TRANSPORT, LIMPOPO PROVINCE

Khutso Manyaka and Mokoko Sebola
University of Limpopo, South Africa

ABSTRACT

The public service is the primary service delivery arm of the developmental state. It is for this reason that the performance of the public service be continuously examined in order to ensure that its performance is optimal. Performance management as a tool for improving public service delivery in South Africa is a subject of immense debate. It has featured predominantly in public administration discourse. While it is meant to enhance the performance of the public service, its end results are viewed differently by those affected by its implementation. Literature on performance management in South Africa suggests that the system is inconsistently and erroneously applied to individual employees. There is a substantial literature on the subject performance management; however, there is no substantive performance culture within the South African Public Service. In fact, performance management is still a major challenge in the Republic of South Africa. This study therefore investigated the manner in which employees' performance is managed in the Limpopo Department of Roads and Transport in South Africa. Qualitative research methodologies were followed in collection and analysis of data in which interviews were held with employees on salary levels 4-12. One of the major findings of this research is that whilst there is acceptable understanding of the purpose of Performance Management System PMS, this has not been reflected in the actual implementation of the system. Lack of managerial commitment, poor understanding of the work plan, as well as the lack of resources to perform has been identified as the central challenges with regards to the successful implementation of PMS in the Limpopo department of Roads and Transport (LDRT).

INTRODUCTION

Countries throughout the world have since the 1980s been embarking on public sector management reforms. These reforms emanated from the fact that the traditional role and institutional character of the State has been questioned as the results of its inefficiencies. Thus, since the introduction of global public sector reforms, the public sector institutions have been under tremendous pressure to adopt private sector orientations in their quest to maximise efficiency. Most of the public sector reform programmes that have taken place in developing countries during the period 1980-1990 were introduced as part of the Structural Adjustment Programmes (SAPs) of the World Bank in the 1980s. However, most of the more recent reforms, under the influence of the New Public Management (NPM), have been driven by a combination of economic, social, political and technological factors, which have triggered the quest for efficiency and for ways to cut the cost of delivering public services. Since the early 1990s, performance management as an important element of public service reform has been gaining momentum throughout the world. According to Letsoalo (2007:3), performance culture dominated the public service in Europe, New Zealand and Australia during the 1990s. Anderson, Leech & Teicher (2004:2) argued that since the 1990s, Australian Public Service (APS) strived to become performance focused and one of the key components of this drive was to improve the performance of individual employees in their public institutions. McAdam, Hazlette & Casey (2005:261) state that prior to the introduction of a multi stakeholder and balanced scorecard approach as part of the reform agenda, government departments in the United Kingdom (UK) were subjected to a range of external peer reviews. The pitfalls of these reviews pointed to a need for public institutions to develop and apply a more integrated approach to performance management. The model of public sector reforms which emanated from a new public management approach theoretically formed the basis for the introduction of

performance management in the South African public sector. It has since become crucial for performance in the public service to be continuously examined in order to ensure that its performance is optimal. It is therefore not surprising that performance management as a system for improving public service delivery in South Africa is a subject of immense debate featuring predominantly in public administration discourse. While it is meant to enhance the performance of the public service, its end results are viewed differently by those affected by its implementation. It is within this context that study sought to investigate the implementation of performance management system in the South African public service. The study was guided by the following objectives:

- To investigate the extent of the implementation of PMS in the LDRT.
- To determine measures used to identify and manage poor performance.
- To determine measures used to identify and maintain satisfactory performance.
- To identify the challenges relating to management of employees' performance for employees on salary levels 4-12.
- To recommend solutions for improving the management of employees' performance through the implementation of PMS in the department.

THEORETICAL PERSPECTIVE OF PERFORMANCE MANAGEMENT

African public services should adopt NPM, which includes; performance- oriented civil. Performance management is one of the various NPM-inspired measures to address some of the accountability problems mentioned in the previous section. In pursuit of the goal of performance improvement, performance management advocates for the “empowerment” of managers (Economic Commission for Africa, 2003). The term ‘performance management’ is commonly used to describe a range of managerial activities designed to monitor, measure and adjust aspects of individual and organisational performance. It integrates management of performance of organisation with the management of individual performance. In the quest for efficiency and effectiveness in government, not only reforms were necessary, the adoption of private sector management techniques and practices was also advocated to deal with the problems associated with the old public administration. For example, private sector solutions were sought for public sector problems (Larbi, 1999:4). It was within this context that improved organisational performance became a consistent feature of the NPM model. Performance management in the public sector is the managerial activity necessary to promote well-performing organisations and service delivery. Performance management in an organisation has got the potential to enhance the effectiveness of public policy implementation but still it succeed only where it is effectively implemented and applied holistically. It is said that performance management is also expected to increase accountability because “clear and explicit managerial targets”, combined with “managerial autonomy and incentives to perform”, make it easier to establish the basis for managerial accountability and to achieve outputs (Hills and Gillespie, 1996). Performance management is a process concerned with the effectiveness of the individual employees, the team and the organisation. Williams (2002) & Manyaka & Sebola (2012) maintain that the purpose of performance management in organisations is to improve organisational effectiveness, motivate employees and improve training and development. It seeks to find ways to get the best performance from all and to motivate them to achieve organisational objectives (Foot & Hook, 1996). Holbeche (2005) concurs by stating that when a performance management system is working, it should enhance the overall performance of groups, individuals and the organisation and it should be able to help individual employees see how their own role contributes the organisational goals and success. Performance management provides the system and processes to plan work and set performance expectations (Limpopo Provincial Administration, 2004). It sets out to communicate the link between an organisational mission, strategic direction and the required employee performance. Letsoalo (2007) argued that the significance of performance management is to establish organisational culture in which the individual employees and groups within the organisation take full responsibility for continuous improvement of their performance for effective achievement of organisational goals. Performance management according the Public Service Regulations (2001) enhances organisational efficiency and effectiveness, accountability for the use of resources and achievement of results. From the foregoing, it can be argued that the purpose of performance management system is twofold namely: to develop and to reward. The former ensures that government through its employees operates effectively and efficiently by identifying and providing adequate training to those employees whose performance is below the expected standard, whilst the latter ensures that employees who perform well are satisfactorily rewarded in order to ensure that they maintain a high level of performance. Employees' performance in the South African public service is managed in accordance with the various components discussed below.

COMPONENTS OF PERFORMANCE MANAGEMENT

Performance management entails a strategic and integrated approach to delivering sustained success to the organisation by identifying performance of the people who work in them and by developing the capabilities of teams and individual contributions (Armstrong 2001; Manyaka & Sebola 2012). The following can be identified as the major components of performance management, namely: performance contracting or agreement; performance monitoring; review; feedback; appeal; annual performance evaluations and ratings (Armstrong and Murlis, 1998, Williams, 2002; and Visser, 2006; Manyaka & Sebola 2012).

Performance contracting or agreement: One of the aspects that need to receive more attention with regard to performance management is arguably, performance agreements or contracts of public officials at all levels within the institution (Armstrong, 1994; Visser, 2006). According to Larbi (1999), performance contracting is a written or negotiated agreement between government and managers in which quantifiable targets are explicitly specified for a given period and performance is measured against such targets at the end of that period. Performance plans, agreements or contracts serve as the basis upon which employee performance is measured, reviewed and evaluated, thus, it is highly imperative that it must always be informed by and drawn from directorate and departmental plans or scorecard (Limpopo Provincial Government, 2004).

Performance monitoring: Performance should be monitored and assessed on an on-going basis against performance goals (Meyer & Kirsten, 2005). Performance monitoring includes the gathering information about work activities and checking on the progress and quality of work (Williams, 2002). According to the Limpopo Provincial Government (2004), monitoring individual or team performance is crucial to ensure that employees work towards their set and desired strategic objectives and performance targets as stated in their business plans and instruments.

Performance review: According to Meyer & Kirsten (2005), performance review entails the assessment of employee's performance according to specific standards. Performance review is an essential element in performance management that requires some sort of performance measurement or at least monitoring performance and giving feedback to the jobholder (Williams, 2002). Effective performance management system typically has a number of frequent formal reviews of employees' performance (Holbeche, 2005). Performance review in Limpopo Provincial government departments is conducted through a process called Progress Review Discussions (PRDs). To this end, the three components of PRD's can be identified, namely: self-assessments, peer or managerial reviews and customer reviews (the Limpopo Provincial Government, 2004). Performance reviews provides a formal opportunity to discuss the overall performance results and these are vital to managing performance. The purpose of a progress review is to allow the supervisor or the line manager and the employee whose performance is under review, to discuss needed changes, revisions or additions to the performance and development plan, and to make plans, in the event that employees' performance is sufficient, the line manager must determine what the problems are, solicit the employees' perspective, suggest solutions and utilise appropriate coaching skills to allow the affected employees to improve their performance (Costello, 1994). Progress reviews provide regular and specific feedback to employees' and ensure follow-up so that the data can be used to inform better decision making about who is performing well as well as who should be promoted, trained and paid more.

Performance feedback: As soon as progress reviews or quarterly reviews have been completed, the results should be discussed with the employee. This process is called feedback. In performance management, feedback entails the provision of information to be presented to people on their performance, which helps them to understand how well they have performed and how effective their behaviour has been; with the aim of promoting this understanding so that appropriate actions can be taken (Armstrong, 2000). Feedback is a vital part of performance management process (Holbeche, 2005; Harvard Business Essentials, 2006). It is given to address competency gaps and poor performance, recognise good performance and revise performance goals (Meyer & Kirsten, 2005). Provision of feedback on employees' performance should be timely (Williams, 2002:154). Managers should continuously provide the employees with frank and honest feedback about their performance since it gives each party an opportunity to tell his or her side of the story and also to hear from the other (Harvard Business Essentials, 2006). According to Armstrong & Murlis (1998: 250), performance management system that relies on regular feedback and review allows the annual evaluations to be a lighter process and "no surprise" summary of achievements over the next year and the beginning of a new performance agreement or contract. It is important that feedback should be provided constructively, tactfully; honestly, respectfully and always maintain focus on performance (Meyer & Kirsten, 2005).

Performance appeal: Although it is a requirement that a system of performance management to be applied should be designed in consultation with the affected employees, individual employees should nevertheless be granted the opportunity to appeal against their performance (Cloete, 1985). There must be a procedure for dealing with complaints and grievances regarding employees' performance rating (Holbeche, 2005).

Annual performance evaluations: A fundamental requirement of personnel administration is that every worker or employee should be utilised to his fullest capacity and in order to meet this requirement, an evaluation of employees' performance must be undertaken continuously (Cloete, 1985). According to the Limpopo Provincial Government (2004), performance evaluation determines the overall level of performance of employees, teams, directorates or for that matter the whole department for the whole financial year. These evaluations are based on the assessment of stated objectives and related outputs for the entire year, usually at the end of the financial year. Performance evaluations amount to the summative evaluation of performance. According to Cloete (1985), performance evaluations aid managers to ensure that effectiveness of their subordinate, individually or as a group, remains accountable. Hence, it is through performance evaluation that line managers are able to differentiate between poor or unsatisfactory performance. Self-evaluation may serve a useful purpose. The utilisation of self-evaluation system does not only enable managers and supervisors to discover shortcomings in their own conduct, it could also lead to the legitimisation and acceptance by employees since the assessment process is a shared responsibility between subordinates and their supervisors and managers (Cloete, 1985). A rating is used to represent the performance of individual employees over time (Land & Farr, 1983). Performance rating is the process of scoring summative performance of individual staff members taking each key result area or required competence one at the time. It takes the combination of numerical scale of 1 to 5. This scale should be accompanied by narrative comments such as outstanding, commendable, marginal and unsatisfactory performance depending on performance scale of a staff member whose performance is under evaluation. Rating received as an outcome of the raters' evaluation of performance is likely to have financial implications for the ratee as well as the organisation. In the past, this process was manipulated and rating administered subjectively in order to benefit those employees who were too close to the raters or managers.

The analysis of each of these components of performance management should have no doubt in the minds of public managers that it boils down to sound management practices that should be applied as the matter of principle (Visser, 2006). Proper implementation of these components would surely yield enormous benefits for public institutions.

RESEARCH DESIGN AND METHODOLOGY

The study utilised the qualitative research design in order to investigate the management of employees' performance in the Limpopo Department of Roads and Transport. The qualitative research methodology was used in this study because it enabled the researcher to be fully involved throughout the entire research process, thereby making sure that all research questions are addressed accordingly. The qualitative research method allows an intense interaction between and participation by the researcher and research respondents. In order to enable the researcher to obtain a sample suitable for the study, the researcher used purposive sampling procedure to select the respondents. Purposive sampling procedure was chosen as the most suitable method of selecting research respondents because it is less complicated and more economical in terms of both time and budget. Semi-structured interviews in particular with employees of the LDRT were conducted. The interviewees were categorised into three main categories, namely; - Category A (which comprised of employees from salary level 4 to 7); Category B (which comprised of Managers and Deputy Managers i.e. employees from salary level 8 to 12 and Category C (Which comprised of employees on salary level 13). Data obtained from research respondents was summarised and categorised into key themes which are more useful in terms of providing a more detailed analysis of the research problem. The data was thereafter reduced into separate data points collected by the researcher into simplified statements that enabled the researcher to analyse the research problem.

PRESENTATION OF THE RESEARCH FINDINGS

Implementation of performance management system in the department: The research had revealed an uninspiring picture about how PMS is implemented in the department. Whilst there is an overall understanding of the purpose of PMS and what it should entail, this is not eventually reflected in the actual implementation of the system in the department.

Performance reviews: The research reveals that employees that were interviewed are of the view that performance reviews do not help them to improve their performance but serve as a source of their rewards at the end of the financial year. Quarterly reviews are not necessarily ‘reviews’ in the real sense of the word. In fact some employees view them as quarterly reports of their work. Employees in category A indicated that their supervisors do rarely, if ever, review their performance. Employees in category A indicated that their managers do not take responsibility and are not enthusiastic about reviewing the performance of their subordinates. The research revealed that most employees still do not regard self-assessments as the crucial component of PMS in the department. They indicated that in the event that they have rated their performance high, their supervisors reduce their ratings without justifying or providing reasons for doing so. It appears that the reason for reducing such reviews lies not so much on the fact that these employees do not deserve such ratings, but rather much on the inability of their supervisors to write motivation for such ratings as required by the provincial policy framework and the departmental procedure manual on PMS. One employee who was interviewed in this study argued that:-

“the reduction of our self-assessments scores without providing reasons for doing so shows that our managers do not value what we do and more so reflects lack of commitment on their part to objectively implement the PMS”.

The utilisation of self-evaluation system does not only enable managers and supervisors to discover shortcomings in their own conduct, it could also lead to the legitimisation and acceptance by employees since the assessment process is a shared responsibility between subordinates and their supervisors and managers. The research has further revealed that *self-ratings* are not taken seriously in the department. Instead, supervisors prefer to give average ratings across the board. This tendency has got the potential to mask the root causes of poor performance in the department because if average is given to all employees irrespective of how they have actually performed; the poor performers will not be effectively identified and corrected. As it has been indicated in the literature review, managerial reviews are conducted by the most immediate supervisors of employees. PMS puts the responsibility on managers to communicate and work effectively with their employees in order to achieve organisational goals and objectives (Weiss and Hartie, 1997; Dixon, 2004). This responsibility emanates from the traditional assumption that the ratings of employees by their supervisors is the most realistic, objective and fair (Murthis and Jackson, 2000). These types of reviews are particularly appropriate where reward is linked to performance and where control and development are one of the aims (Marchington and Wilkinson, 2008). In the department, managerial reviews are conducted by employees in category B (supervisors and managers). Their reviews represent the formal and final review that serve as the basis for making decisions on whether or not to reward employee’s performance. The research however reveals that most of the respondents in category A (operational staff members) expressed dissatisfaction with the manner in which reviews are conducted in the department. There is a tendency by some managers to apply a ‘*pass-one-pass-all*’ approach when conducting performance reviews of their employees in the department. Some employees complained about doing reviews for their fellow colleagues because when they submit their individual reviews, their managers and/or supervisors tell them to submit with all employees. This tendency results in the late submission of the performance reviews.

Management of poor performance in the department: The research revealed that most managers do not confront poor performance in order to systematically address the root causes of the problem. Various variables have been identified as the contributing causes of poor performance. Issues such as the poor understanding, lack of resources to perform as well as lack of managerial commitment has been highlighted as the causes of poor performance in the department. It can be argued that poor understanding of the work plan by most employees emanates mostly from the ‘*cut and paste*’ approach of the work plans of their supervisors’. Some employees indicated that their supervisors rejects or refuse to sign individual work plans which are not the same as theirs. Managers need to appreciate the fact that the work they perform will not necessarily be the same as the work to be performed by their subordinated.

Motivating employees to improve performance: Most employees have identified satisfactory performance as achieving more than what an employee has planned for. This implies that to successfully identify satisfactory performance, supervisors should compare the actual work done with the work plans of their employees. Every financial year, there will be those employees who perform well and those who do not. Consequently, similar strategies cannot be utilised to motivate these employees. Most of employees in category B: (Managers and supervisors), pointed out to the fact that it is difficult to motivate employees to perform well. One of the supervisors argued that:

“because there is no clear or ready-made solution for improving performance of those employees who perform below expected standards and targets, it therefore becomes difficult for managers to continuously motivate their employees to carry out their tasks with relative efficiency and effectiveness. The same can be said about the difficulties involved in maintaining the performance of those whose performance was outstanding”

Rewarding employee's performance: Performance rewards are usually used with the express purpose of encouraging or motivating employees to continuously perform as expected. Many managers and their subordinates are of the opinion that the use of both intrinsic and extrinsic rewards has got positive effects on employee's motivation. Whilst both these rewards are crucial for increasing individual performance levels, there is however visible evidence of poor linkage of these types of rewards in the Limpopo Department of Roads & Transport. This finding affirms Benfield and Kay's argument that the difficulty faced by managers in determining the most appropriate and effective reward strategy for their organisation is not only highlighted in the academic literature but also in the realities of an organisational life (Benfield and Kay, 2008). All employees interviewed in this study agreed that extrinsic rewards or monetary rewards help to lubricate and encourage satisfactory performance. Some employees have however expressed concerns with regards to the delays in as far as the payment of performance bonuses is concerned. One employee in Category A stated that:-

“We receive our performance bonuses when it is no longer necessary. It mostly takes about a year without us getting our performance bonuses. Monetary rewards exist to motivate us to continuously put extra efforts in the execution of our responsibilities. However, the delays with regards to the PMS bonuses undermine the basic reason for the existence of such rewards”

Although this is a legitimate concern, it also points out to the weaknesses of relying on monetary rewards for motivating high levels of performance in an organisation. It serves as an important pointer to the fact that extrinsic rewards are not 'entirely' successful in terms of motivating employee's performance.

Challenges of implementing performance management system: The following challenges have been identified in as far as the implementation of PMS in the department is concerned: - late submission of quarterly reports; lack of managerial commitment; little or no feedback on performance; pass-one-pass all approach as well as the poor understanding of the work plan.

RECOMMENDATIONS

Implementation of performance management system: The research had revealed an uninspiring picture about how performance management system is implemented in the LDRT. This can partly be seen in the manner in which performance reviews are conducted as discussed earlier. Accordingly, the researcher recommends that it should be the responsibility of the top management of the department to institutionalise performance culture for effective implementation PMS in the department. For this reason, they need to continuously, hold by-monthly or monthly meetings with their sub-ordinates that focuses squarely on performance management. This will go a long way in timeously identifying the performance gaps and implementation of the corrective action. This will assist line managers in understanding the various components of PMS and such an understanding might help them to effectively implement the system.

Integration of intrinsic and extrinsic rewards: It has been highlighted as part of the findings of the study that when used separately, both extrinsic and intrinsic rewards are not entirely successful in terms of motivating employees to improve on their substandard performance or to maintain satisfactory performance. The use of these two methods separately yields unsustainable short-term benefits. It is against this background that the research recommends for the integration of both intrinsic and extrinsic reward approaches. The institutionalisation of these two types of approaches in the department is envisaged to play a significant role in terms of timeously communicating the message that the employee's performance is highly valued and appreciated by those responsible for managing or overseeing employee's performance. It is against this background that the integration of intrinsic and extrinsic of rewards methodologies in the department is crucial and inevitable.

Quarterly reviews: Quarterly performance reviews are extremely important for managing employee's performance in an organisation. Managers and supervisors need to take them seriously. These

reviews are tools which they can use to monitor whether employees perform well according to their performance plan.

Responsibility of managers in performance management system: It is generally accepted that managers and supervisors play a crucial role in directing employee efforts for improved performance. It is worth noting that the research has revealed that some supervisors and managers are still unable to differentiate between employees who perform well and those whose performance is far below performance targets and standards. This is reflected in their continued application of *pass-one-pass-all approach* when rating the performance of their subordinates. This can also be attributed to the apparent reality that some managers do not view management of employees' performance as the crucial component of their daily responsibilities. Management of performance is in most cases relegated to the bottom of the priorities of the managers and supervisors. It is for this reason that the researcher recommends for the prioritisation of PMS as a central responsibilities of managers. This should be rooted in the understanding that an effectively implemented PMS can serve as a very critical tool for monitoring and understanding employees' individual performance. For this to happen, managers should be compelled to convene a meeting, at least once a month, to reflect and discuss performance of their employees. These meetings could assist managers and supervisors to timeously identify poor performers and agreeing on a corrective action to be employed as soon as possible.

CONCLUSION

The study has revealed an uninspiring picture in terms of how PMS is implemented in the South African public service. Lack of managerial commitment for managing employees' performance, lack of resources to perform, lack submission of quarterly reports were identified as the major challenges related to the implementation of PMS in the LDRT. In many countries across the globe, performance management was introduced essentially to modernize, transform and accelerate public service delivery. To this end, performance management as an important component of public sector reform can be understood as an integrated strategy which seeks to improve the performance of organisations and the individuals in them. As a management tool performance management system provides a means to recognise and reward good performance as well as to manage any identified performance gaps. Performance management is increasingly seen as a tool for managing results rather than inputs. Thus, it should be understood as a process which allows everyone to get the sense of what is the relationship between their directorates, sub-directorates, divisions, teams, individual and the whole organisational goals and objectives. To this end, it is important that management of employees' performance be closely scrutinised in order to point out any inconsistencies and errors associated with the implementation of the system.

RURAL ECONOMIC DEVELOPMENT AND POVERTY ALLEVIATION THROUGH LAND REFORM IN SOUTH AFRICA

**Antoinette Marais
Tshwane University of Technology, South Africa**

ABSTRACT

Over the course of hundreds of years the indigenous people of South Africa have been the victims of land disposition. After the birth of the South African democracy, government prioritised land reform in the country to address these past injustices. Apart from attempting to distribute land fairly to all the people of the country through various land reform policies, land reform also aims to alleviate the extreme circumstances of poverty in which a large part of the population of South Africa lives, as a result of apartheid. This paper will make use of literature studies to discuss the very relevant issues surrounding rural economic development and poverty alleviation through land reform in South Africa, as well as make recommendations on how land reform can be implemented effectively.

INTRODUCTION

From as early as the early 1600's the indigenous people of South Africa were the victims of land disposition through various methods. This was formalised with the passing of the Natives Land Act of 1913, which confined the indigenous people of the country to reserves, called homelands, in the marginalised areas of the country. Africans confined to these reserves had communal land tenure, which was administered by traditional leaders.

Through colonisation and disposition approximately 90% of the land surface became the property of the white minority, which led to the majority of the population of the country living in poverty, especially in the rural areas of South Africa and the homelands. It is estimated that more than 3.5 million people and their descendants have been victims of racially based disposessions and forced removals during the years of segregation and apartheid. Close to 50% of the South African population lives in poverty, of which the majority is situated in rural areas. Land reform seeks to change this situation.

THE IMPACT OF THE CONSTITUTION ON LAND REFORM

After the death of apartheid and the first democratic elections in 1994, the ruling party, the African National Congress (ANC), made it a priority to bring about land reform in South Africa through various policies and programmes, as well as legislation. The Constitution of the Republic of South Africa (Act 108 of 1996) took effect on 4 February 1997 as the supreme law of the country (as stated in the Preamble and sections 1(c) and 2 of the Constitution).

The Preamble of the Constitution clearly states that it aims to heal the divisions of the country's past by establishing a society based on democratic values, social justice and fundamental human rights, as well as to improve the quality of life of all citizens and to free the potential of each person.

Chapter 2 of the Constitution contains the Bill of Rights which identifies the various rights the people of South Africa are entitled to, including both civil-political rights as well as socio-economic rights. The socio-

economic rights contained in Chapter 2 are justiciable and can therefore be enforced by the courts. Sections 25 and 26 of the Bill of Rights pertain directly to property rights and security of tenure. The sections read as follows:

“25. Property

1. *No one may be deprived of property except in terms of law of general application, and no law may permit arbitrary deprivation of property.*
2. *Property may be expropriated only in terms of law of general application*
 - a. *for a public purpose or in the public interest; and*
 - b. *subject to compensation, the amount of which and the time and manner of payment of which have either been agreed to by those affected or decided or approved by a court.*
3. *The amount of the compensation and the time and manner of payment must be just and equitable, reflecting an equitable balance between the public interest and the interests of those affected, having regard to all relevant circumstances, including*
 - a. *the current use of the property;*
 - b. *the history of the acquisition and use of the property;*
 - c. *the market value of the property;*
 - d. *the extent of direct state investment and subsidy in the acquisition and beneficial capital improvement of the property; and*
 - e. *the purpose of the expropriation.*
4. *For the purposes of this section*
 - a. *the public interest includes the nation's commitment to land reform, and to reforms to bring about equitable access to all South Africa's natural resources; and*
 - b. *property is not limited to land.*
5. *The state must take reasonable legislative and other measures, within its available resources, to foster conditions which enable citizens to gain access to land on an equitable basis.*
6. *A person or community whose tenure of land is legally insecure as a result of past racially discriminatory laws or practices is entitled, to the extent provided by an Act of Parliament, either to tenure which is legally secure or to comparable redress.*
7. *A person or community dispossessed of property after 19 June 1913 as a result of past racially discriminatory laws or practices is entitled, to the extent provided by an Act of Parliament, either to restitution of that property or to equitable redress.*
8. *No provision of this section may impede the state from taking legislative and other measures to achieve land, water and related reform, in order to redress the results of past racial discrimination, provided that any departure from the provisions of this section is in accordance with the provisions of section 36(1).*
9. *Parliament must enact the legislation referred to in subsection (6).*

26. Housing

1. *Everyone has the right to have access to adequate housing.*
2. *The state must take reasonable legislative and other measures, within its available resources, to achieve the progressive realisation of this right.*
3. *No one may be evicted from their home, or have their home demolished, without an order of court made after considering all the relevant circumstances. No legislation may permit arbitrary evictions.”*

It is clear from the above extract of s25 of the Constitution that South Africans who were previously disadvantaged by land disposition in terms of the Natives Land Act have the constitutional right to gain access to this disposed land, or to other forms of access to land, or financial compensation as equitable redress. This section further protects current land owners against arbitrary deprivation of their property and eviction.

LAND REFORM IN SOUTH AFRICA

To meet the obligation placed on them by the Constitution and their election promises, the ANC set themselves, as the national government, a target that by 2014 at least 30% of commercial agricultural land must be transferred to black owners through the implementation of land reform-legislation, -programmes and -policies, which amounts to 24.5 million hectares of land. These policies, programmes and statutes are based on three pillars: land restitution, land redistribution and land tenure reform.

Land Restitution

Land restitution aims to rectify the injustices of the disposition of land through the Native's Land Act. The Restitution of Land Act 22 of 1994 was implemented to afford victims, and their descendants, the opportunity to submit claims for the restitution of disposed land, to the Land Claims Commission before 31 December 1998. If land cannot be returned to the original owners, the Act makes provision for the provision of alternative land, or compensation to the claimants. This is an ongoing process as all claims received have not been finalised yet.

Land Redistribution

Land redistribution seeks to address the inequality that exists in land ownership in the country. The majority of land in South Africa is still owned by a minority of the population. The main purpose of land redistribution is to make land available to previously disadvantaged individuals and communities for agricultural production, settlement purposes and non-agricultural enterprises. Land redistribution can play a major role in alleviating the dire circumstances of poverty a large part of the South African community lives in, in both rural and urban areas through job creation in a country with a 25.2% unemployment rate.

Legislation implemented, as a result of s25(5) and s26(2) of the Constitution, to give effect to land redistribution includes the Provision of Land and Assistance Act 126 of 1993, the Housing Act 107 of 1997, the Land Reform Act 3 of 1996, the Development Facilitation Act 67 of 1995 and the Rental Housing Act 50 of 1999.

Land Tenure Reform

Land tenure reform addresses the security of occupiers against eviction, over houses and land where they stay or work, especially if these rights were previously undermined or prevented by apartheid policies. Different kinds of tenure fall under land tenure reform, namely private ownership over property, communal ownership and the tenure of lessees in terms of a lease agreement. The security of tenure is protected by various statutes, including the Land Reform (Labour Tenants) Act 3 of 1996, the Prevention of Illegal Eviction from and Unlawful Occupation of Land Act 19 of 1998 (PIE Act) and the Extension of Security and Tenure Act 62 of 1997.

IMPLEMENTATION OF LAND REFORM

The Department of Rural Development and Land Reform (DRDLR) was established to implement land reform in South Africa. The Department developed two programmes to achieve its goals, namely the Comprehensive Rural Development Programme (CRDP) and the Recapitalisation and Development Programme (RADP).

The vision of the CRDP is to create vibrant, equitable and sustainable rural communities which will improve food security of the poor and create business opportunities, especially for women, youth, people with disabilities and the elderly in rural areas. The Department wants to achieve this through coordinated and integrated broad-based agrarian transformation, increased rural development and the Land Redistribution for Agricultural Development Programme (LRAD). The LRAD-programme aims to provide previously disadvantaged individuals with improved opportunities to own agricultural land, to assist rural people in improving their living conditions and to ensure that available agricultural land is used more effectively. Even though the South African government has land reform as one of its fundamental policies, reality has necessitated a changed approach to this reform, because land reform in itself, as a means of equal distribution of land, does not deliver on food security. There exists an urgent need to measure land reform in terms of productivity, which will lead to increased food security, job creation and skills development amongst the envisioned beneficiaries of land reform.

The RADP is an initiative by the DRDLR to revive farms which are in distress to increase agricultural production, guarantee food security and job creation. The RADP also aims to assist small scale farmers to gradually become commercial farmers contributing to the country's economic development and food security, which will assist in the fight against poverty in the country. The RADP was established in

2010 after it was determined that 90% of farms, totaling 5.9 million hectares, which were redistributed to land reform beneficiaries had collapsed.

The Restitution of Lands Act, as amended, makes provision for the establishing of the Commission on the Restitution of Land Rights (CRLR). The role of the CRLR is to access claims of people claiming to be victims of land disposition after June 1913, and to provide redress to those victims. This redress can take the form of access to land, or financial compensation.

Rural Development and Land Reform Minister Gugile Nkwitini stated, during the debate on President Jacob Zuma's 2013-State of the Nation Address in Parliament, that 4 813 farms were redistributed to black people from 1994 to January 2013. This amounts to 4.123 million hectares, with 230 886 people benefitting from this process of which 50 440 were women, 32 563 young people and 674 disabled persons.

During the same debate the Minister stated that 1.443 million hectares of land, in the form of 4 001 land parcels, were acquired by government for the restitution of land rights at a cost of R10 billion. This restored land was utilised to settle 5 856 claims for land restitution. Minister Nkwitini also stated that R6 billion were spent by the Department on financial compensation to claimants who preferred monetary compensation instead of land. 71 292 claims were settled through the payment of financial compensation out of a total of 77 148 claims. The Minister explained the fact that the vast majority of claimants preferred financial compensation instead of land restoration, as a reflection of poverty and unemployment which plagues the country.

THE CURRENT LAND REFORM PROCESS

South Africans who were the victims of land disposition during the apartheid-era had the opportunity to claim for land restitution in terms of the Restitution of Land Rights Act from 1995 to 31 December 1998. The Act determined that these claims will be investigated if:

- (a) the claimant was dispossessed
 - of a right in land;
 - after 19 June 1913;
 - as a result of past racially discriminatory laws or practices;
- (b) the claimant was not paid just and equitable compensation; and
- (c) the claim was lodged not later than 31 December 1998.

Claims which met the above requirements are referred to the CRLR for investigation. The CRLR investigates the merits of each claim. If a claim is found to have merit the CRLR will then continue to mediate disputes and negotiate settlements arising from such claims. Following the provisions of s25 of the Constitution, these settlements are currently through the willing buyer, willing seller-model. In instances where no amicable settlement is possible, claims are referred to the Land Claims Court, a specialist court with the same power as the High Courts in South Africa. The role of the Land Claims Court is to determine compensation payable in respect of land owned upon expropriation or acquisition of such land, and to determine a person entitled to title in land. Appeals to the Land Claims Court may be lodged with the Supreme Court of Appeal or with the Constitutional Court.

The Restitution of Land Rights Act determines that a person will qualify for restitution if he/she falls within one of the following categories:

- people who lost a right in land as the result of racially based laws and practices since 1913;
- descendants of people who lost a right in land as the result of racially based laws and practices since 1913; and
- communities and deceased estates who lost a right in land as the result of racially based laws and practices since 1913.

Successful claimants are entitled to one of the following forms of restitution:

- restoration of the land from which claimants were dispossessed;
- provision of alternative land;
- payment of compensation;
- alternative relief including a combination of the above-mentioned, sharing of the land, or budgetary assistance such as services and infrastructure development; or
- priority access to state resources with regard to housing and land development programmes.

PROTECTION OF THE CURRENT PROPERTY OWNER

In terms of s25 and s26 of the Constitution the current owner of land is protected against arbitrary eviction from the land. This means that a situation of 'land grab', as was experienced in neighboring Zimbabwe, will not be tolerated in South Africa. Specific individuals also cannot be identified for land expropriation, as the Constitution clearly states that land reform can only take place through laws of general application. Even though some politicians propagate for the nationalization of land in the country, this is not a reality in the current South African context, as the Constitution needs to be amended for this policy to be legitimate. The South African government has also, on a number of occasions, stated that this is not part of their land reform plans.

THE REALITY OF LAND REFORM IN SOUTH AFRICA – THE IMPENJATHI COMMUNITY

In 2009, the DRDLR purchased a thriving 47 hectare banana farm for R3.2 million in KwaZulu-Natal, after the Impenjathi Community won their land claim. Prior to the purchase of the land, the farm produced more than 400 tons of bananas on an annual basis. 400 families benefited from this land claim, many of whom were unemployed.

Three years after the transfer of the farm has been completed, the land now lies in ruins, taken over by weeds and alien bushes. The irrigation system has been stolen, together with anything else of value on the farm. Even the farmhouse was stripped bare. A neighboring farm owner estimates that it will cost at least R2.3 million to rehabilitate the soil and to restore the farm to be productive once again.

The community blames the Department for the demise of the farm. They claim that they were led to believe that government will supply them with farming implements, such as tractors, and financial assistance to keep the farm operational. They have not received this promised assistance. Many of the families have given up hope, and abandoned the farm.

A spokesperson for DRDLR, Mtobeli Mxotwa, responded that the community should have approached the RADP for assistance, as this is the reason why this programme was established. Unfortunately the example of the Impenjathi Community is one of many with the same results.

CHALLENGES FACED BY THE LAND REFORM PROCESS

Even though the legislation, programmes and policies are in place, nearly half of the South African population still lives in poverty, as is evident in the above case study. The reason for this is that the land reform process in South Africa faces many challenges. The first issue which needs to be dealt with is the slow progress of land reform by the DRDLR. All claims should have been processed already by 2005. This deadline was extended to 2011, but it is still not finalised. Government also set themselves a deadline, as mentioned above, that 30% of all commercial land in South Africa should be transferred to black owners by 2014, but this has also not materialised, as only approximately 8% of the target has been met up to now. Land redistribution and –restitution is also a very lengthy and costly exercise.

The willing buyer, willing seller model used to obtain land to redistribute in terms of the land reform process, is also not successful. As a result of this model, the current owner oftentimes ask for a price above the market value, which results in unnecessary resources spent on acquiring farms.

Victims of land disposition which took place prior to 1913 were not allowed to submit land claims under the current land reform process. This excluded members of the Khoi and San, whose land were expropriated prior to the Natives Land Act.

Many of the beneficiaries of land forsake the idea of commercial farming in favour of subsistence farming, where the land is utilised to sustain the household and the immediate community. This is also the case where a community wins their land claim and decides to use the farm for communal farming instead of commercial farming. This leads to a decrease in food production, which in turn leads to a decrease in food security.

A lack of post-settlement support also impacts negatively on the land reform process. The fact that beneficiaries do not receive adequate financial and advisory support after receiving farms leads to a myriad of problems, of which the most severe one is the decline in productivity of the farms. The majority of new farm owners have never been in the position of land owners, and therefore does not have the experienced to run a successful commercial farm. The beneficiaries do not have the knowledge on how to establish a market for their produce, or how to enter existing markets on a competitive level.

The Settlement and Land Acquisition Grant (SLAG), currently available to beneficiaries of the land reform process, currently amounts to R16 000 per beneficiary household. This grant can be utilised to purchase moveable- or immovable property to assist with the running of the farm. This amount is not sufficient for emerging farmers to establish a successful farming enterprise.

The final challenge which hampers the success of the land reform process in South Africa is the lack of skills, and the subsequent skills development necessary, of the beneficiaries of successful land claims. Many beneficiaries have limited farming skills, but no, or very little, management and financial skills. If no-one is available to assist them in developing the necessary skills to manage commercial farms, it can never be successful.

RECOMMENDATIONS AND CONCLUSION

Land reform in South Africa is unarguably very necessary. People measure their self-worth on the basis of land ownership. Unfortunately the current process is flawed, which leads to a failure in reaching the goals of land reform, which is rural economic development and social uplifting of the most vulnerable members of our society, those people living in desperate circumstances of poverty. Although the South African government is making all the right noises, the reality is that the chosen road is leading to nowhere. Government needs to seriously reconsider the land reform process in the country.

The policy makers need to consider the following possible solution in an effort to redress the injustices of the past, especially the issue of land disposition during the apartheid-era:

- Available resources, such as human- and financial resources should be utilised more effectively. The stakeholders in government, especially those working for the Department of Rural Development and Land Reform, should work more efficiently to reach the targets set for them, and to process claims faster.
- Instead of paying above market value prices for land in terms of the willing buyer, willing seller-model, government must make the move to the 'just and equitable'-principle, as described in s25 of the Constitution. Although President Zuma alluded to this in his 2013-State of the Nation Address, this principle must be implemented as a matter of urgency. Current property owners must not be disadvantaged by the land reform process, but they should also not profit unnecessarily by asking exorbitant prices for the land just because government is a willing buyer.
- Land claim submissions should be opened for the victims of land disposition which took place prior to the implementation of the Natives Land Act of 1913.
- Government, through the DRDLR, must implement incentives for beneficiaries of land reform that continues with commercial farming. This will motivate the new land owners not to turn a successful enterprise into communal farming lots. This, in turn, will lead to higher food security at more affordable prices for all the people living in the country. The burden on a few people to provide food for the masses will also be alleviated. More food producers will also lead to more competitive food prices, which will benefit all consumers.
- The most important changes necessary to make land reform successful in South Africa is better post-settlement support from all stakeholders involved. This support includes government support in terms of:
 - Skills development and training in diverse areas, such as financial management, human resource management, marketing and obviously agricultural training.
 - Financial support to the beneficiaries of land reform in order to assist them in acquiring the necessary farming equipment needed to be successful on a commercial level.
 - Assisting in establishing a mentorship programme where willing mentors takes on the responsibility of assisting and guiding emerging farmers who are keen to make a success of this endeavour.
- The private sector also needs to take responsibility for making land reform work in the country. In many instances where the previous owner of the farm took the responsibility of acting as a mentor to the new owner, success was achieved. Acting as a mentor does not mean that the previous owner

takes on the responsibility of managing the farm to ensure its successful running, but it means that the mentor assists the new owner in running the farm by giving advice and guidance to the new farmer.

This paper is an introductory paper to a planned series on papers discussing the land reform process in South Africa in detail. Future papers will focus on the rights of the current property owner against the rights of victims of racially based land disposition, case studies to compare successful examples of land reform in the country against failures, as well as a comparative study on land reform in the international arena. Challenges faced by the land reform process with more detailed recommendations will be discussed in future papers as well.

POSITIONING GREECE AT THE INTERNATIONAL INNOVATION ENVIRONMENT: AN ANALYSIS BASED ON PATENT RECORDS

Maria Markatou and Yannis Stournaras
Ministry of Finance, National University of Athens, Greece

ABSTRACT

Both theoretical evidence and empirical research argue that it is very important for a country to produce innovations, and more specific, innovations, which could be competitive at the international level. In this context this paper aims at studying the production of innovation in Greece by positioning and classifying it at the international innovation environment, comparing its innovation performance with the respective of other countries, based on the patent records issued at the three most important patent offices. Results aspire to provide an answer to a very important 'national' question: Is Greece a part of the international pattern of innovation production?

INTRODUCTION

Firm success, economic and technological leadership and growth at national and regional level, all rely more or less on innovation (Buswell, 1987; Malecki, 1991). Schumpeter (1934), with his "gales of creative destruction", gave a vivid description of the effects of the introduction and diffusion of major technological discoveries and inventions in industry and in the world economy and Romer (1994) emphasized on the role of innovation. Innovation can be found in processes, involve new products and affect larger or smaller organizations, as was pointed out by Porter (1990). Whatever its form and structure, innovation contributes to the competitiveness of a nation, which depends on how intensively its firms produce innovations.

Since the pioneering study on the nature of innovation in the 1970s of both Gibbons and Johnston (1974) and Freeman (1974), many research works have been presented regarding the analysis of innovation. Innovation is the output of the innovation process, being considered to be a highly systemic and complex process, which varies across industries, technologies and firm size. Particularly for firms, firms develop innovations responding to their market needs and technological challenges. All these factors make innovation difficult to be measured in complete and standardized ways. However, given the importance of innovation for national and firm wealth and welfare, the issue of measurement has become even more demanding. Nowadays, the literature on the measurement of innovation is abundant, every day being improved and increased, while has already succeeded in measuring innovation at firm, sector, regional and national level, as well as in combination to other economic and managerial variables and parameters. The main methodological conclusion that can be derived from the study of the literature on innovation measurement is that innovation can be measured only through its products and results and only indirectly, through the contribution of relative indicators. One very important category of indicators is patent indicators.

Therefore, producing innovations is very important, but even more important than that is the production of innovations, which could be competitive at the international level. A country which develops competitive innovations has a relative placement at the international innovation landscape, confirming this way its international position, reinforcing its leadership or good performance and putting the base for its further development. In this context the main objective of this paper is the study of the production of innovation in Greece but from a global perspective, through its positioning and classification at the international innovation environment. More analytically, the paper examines the Greek innovation performance in relation to the respective of other countries, based on patent records, which have been issued at the three most important patent offices, namely those of the EPO, the USPTO and the PCT procedure. The main research question that the analysis attempts to answer is the following: Is Greece a part of the international pattern of innovation production developing similar and compatible innovations to the

respective of other countries? Such an answer is of particularly national interest, for paper results could stimulate a wider discussion on the ‘future’ of the Greek competitiveness and on its agenda for innovation policy.

The rest of the paper is structured as follows: Section two discusses the theoretical and empirical framework of innovation in relation to both growth and patent records, which ends up to the construction of relevant indicators. Section three focuses on some methodological issues, while also describing the data. Section four presents the main empirical results based on the Greek case. Results focus on first locating technological fields of better absolute and relative performance, second highlighting the importance of new and emerging technological fields, such as those of environment, ICTs, biotechnology and nanotechnology and third positioning Greece at the international innovation landscape. Section five presents some concluding remarks, commenting on results, also integrating all the above in a policy context for further development.

THEORETICAL AND EMPIRICAL EVIDENCE

Joseph Schumpeter is considered to be the first economist to focus on innovation and its importance. According to his theory, innovation could involve a product (new one or a change in an existing), a process new to an industry, an opening to a new market or the development of new sources of supply for raw materials or other inputs and changes in industrial organization (OECD, 2009). Thus, innovation involves many and different elements and parameters and this means that its measurement is difficult due to the broad nature, scope and products of innovation activities. This is the reason that innovation can only be measured indirectly and mainly through the use of indicators.

Empirical research so far has proposed several indicators for the description and measurement of innovation. The most common among them are the indicators that derive from R&D, patents and new products (Basberg, 1987; Pavitt, 1988; Griliches, 1990; Archibugi, 1992). Data derived from patent documents has been extensively used in the measurement of innovation. Their advantages and disadvantages have been extensively analysed and discussed with arguments for their use, mainly focusing on their proximity to both inventive and innovative activities, their easy accessibility, high reliability, precise definition (Ernst, 2001; Debackere et al., 2002) and their easy elaboration and study at different levels and kinds of analysis. On the other hand arguments against their use point out the existence of other, and often, more effective mechanisms of protection, the differences in the relative legal procedures and patent regimes among countries and the issue of value. Particularly for the latter, patents have been accused for being treated equally, like all exerting the same economic and technological impact (Jaffe et al., 1998; Gay & Le Bas, 2005; Wang, 2007; Lee, 2009).

The bibliography on innovation measurement through patent data is abundant. Any reference to them could only be indicative and rather informative, simply showing that on the one hand the description and measurement of innovation concerns all countries, both developing and developed, and on the other hand that patent records have been used to investigate different aspects of innovation and related parameters at different levels of scale and aggregation. In fact the recorded research works could be classified into three groups: The first group of works studies different aspects of technology and innovation at national or sectoral level (e.g. environment, biotechnology, nanotechnology), but as a case study for one country. For example, the Norwegian technological changes were analysed through patents (Basberg, 1984). The Germany’s long term evolution in chemistry was examined by patent statistics (Grupp et al., 2003). Patent growth was also used to evaluate the India’s patent policy during 1979-2002 (Ganguli, 2004). The Taiwan’s innovative potential between 1998- 2002 was reviewed based on the number of patents (Chen et al. 2005). The second group of works contains empirical research, which studies the performance of a small group of countries, usually the most developed (e.g. USA, Germany) or a group of countries that belong to a specific geographical area (e.g. Asian countries like Korea, China and Japan) or an administrative area (e.g. EU countries). For example, Characteristics of patent application have been used to compare France, Germany, and England in the arena of biotechnology (Ramani & Looze, 2002). The third group of works examines parameters and aspects of the total patent activity, such as patent trends (Frietsch et al., 2011; 2012), patent families (Dernis & Khan, 2004) or technological patent fields. In addition, looking at the research direction and focus of the above works most of them focus on aspects of national specialization (e.g. Andersson & Ejermo, 2008; Urraca, 2008), national or sectoral technological capability (e.g. Archibugi & Coco 2005, Ma et al. 2009) and national or sectoral strengths and weaknesses (e.g. Marinova & Mc Aleer, 2006).

The issue of positioning a country at the international level, however, can’t be easily found in the existing bibliography. Thus, bibliography in this field is rather problematic, as it seems that there is no

research interest for this or very few research works have dealt with the study of countries, which aren't technologically advanced or for those which are slowly trying to catch up. Such a case could be the case of Greece. In this context this paper uses patent data as a proxy and measurement indicator of innovation in an attempt to first assess its performance in relation to the respective of other countries, second position the country at the international innovation environment and third group Greece with other European or World countries based on their total performance. Thus the analysis has a global perspective and for this purpose uses patent data records being protected abroad, taking into consideration both their positives and negatives. To the best of the knowledge, this paper is the first empirical work for Greece, especially studying this particular research field.

METHODOLOGY AND DATA ANALYSIS

The data for this study is based on patent records and documents. Methodology as well as data elaboration and analysis respond to the four main research aims, which are the following: First, locate important technological fields based on their absolute and relative performance, second highlight the importance of new and emerging technological fields, third positioning Greece at the international technological environment and forth classify and group the country with other countries of similar performance.

In this context patent data from an international patent office has been selected and collected. The rationale behind the construction of the patent database and its elaboration is the result of two methodological choices: First, it has been chosen to work with data from the three most important patent offices, namely those of the European Patent Office (EPO), the USA Patent Office (USPTO) and the International Patent office (PCT procedure). Second, it has been chosen to select patent grants, where it was possible, instead of using simple data of patent applications. Thus, patent grants owned by Greeks from the European and the USA Patent Office have been used while for the case of patents issued at the International Patent office (PCT procedure) patent applications have been collected, for only patent applications data from this patent office is available. In this context the patent database contains all Greek patents protected abroad (Greek external patent activity), which is based on patent grants for the case of both the European and the USA Patent Offices and patent applications for the part of the International Patent office (PCT procedure) for a total period of time of 13 years (1999-2011). In addition and in order to compare the Greek performance with the respective of other countries, as well as with the respective total at the European Union (27 members), OECD and World level (a total of 100 countries) patent data from the OECD patent database has also been used for the same period time and with the same methodological rationale.

Three more issues on methodology have to be clarified, the first referring to the chosen system of patent classification, the second relating to the level of aggregation and the third identifying the existence of new and emerging technical fields. Regarding the first methodological issue, the analysis is based on classifying patents according to the IPC system of patent classification, for it is application-based and thus facilitates both the identification of innovations and their assignment to different industrial sectors. Concerning the second methodological issue, results rely on the sub-class level of examination (630 subclasses in total), which is the only level that allows linking patents to one or more economic areas. This is due to the fact that there is no natural or perfect correspondence between technological classifications and economic areas. In relation to the third methodological issue, new and emerging technical fields are defined through the combination of two kinds of methods, the first examining all patent codes classified to each patent according to the international technology classification (IPC) (method-focus on the technological content of each patent), while the second scanning every patent and searching for related keywords (method-focus on keywords which 'read' both the short description and the interpretation of the technological content of each patent).

Based on the above methodological choices, a patent database has been constructed and elaborated especially for this study and according to the following steps: Step one, Greek patent data granted by both the European and the USA Patent Offices and applied to the International Patent office (PCT procedure) from 1999-2001 have been collected. Step two, total patent data granted by both the European and the USA Patent Offices and applied to the International Patent office (PCT procedure) at EU-27 (European Union- 27 members), OECD and World (100 countries in total) have also been collected for the same period of time. Step three, both Greek and total patent data have been classified to one or more technological subclasses and then related and corresponded to one or more industrial sectors, indicating this way its potential application or industrial use. Step four, countries are positioned at the international innovation landscape and then grouped according to the total international taxonomy based on their total performance, which is measured by their absolute and relative external patent activity at the three most important patent offices.

MAIN RESULTS

Results show that the total Greek external patent activity is very low accounting for 0.038% in Europe (European patent office), 0.009% at the respective of the USA and 0.056% at the International level (PCT procedure). Therefore Greece performs better internationally at application based-level, while its worst performance is recorded at the USA patent office. Table 1 presents some main statistical figures on the Greek external patent activity, as well as the country's positioning at the European, USA and international level. The last column of table 1 presents other countries with similar performance to Greece. Greece is classified between the 36th and the 43rd position according to the total technological taxonomy. In comparison to other countries (100 in total), Greece is grouped into the class '30-40' in both the European patent office and the PCT procedure and in '40-50' for the USA patent office. Greece presents a similar performance and thus can be grouped together with certain countries of the European Union, such as those of Cyprus, Czech Republic, Hungary, Poland, Portugal and Slovenia, some countries of the American geographical continent (e.g. Chile, Venezuela and Mexico), some East Asian countries (e.g. Hong Kong, Thailand, Chinese Taipei and Malaysia), with Turkey for both the European patent office and the USA and with some other very small countries (e.g. Bermuda, Cayman Islands and Liechtenstein). Combining the Greek performance at the three patent offices with the respective of the European Union (27 members), the OECD members and the World-100 countries (table 1, column three), it can be shown that the Greek best performance is found in the PCT patent procedure and as part of the European Union of 27 members share, following by the respective of the European patent office for the same group of countries. On the contrary the worst performance for Greece can be seen in the number of patents granted by the USA patent office for both Greece as a member of the OECD and the World-100 countries.

Focusing on new and emerging technical fields, Greece is classified between the 28th and 45th position. Its best position and, therefore, best relative performance is recorded in 'nanotechnology' based on its patent grants to the European patent office. However, this result may be of little importance, as the share of 'nanotechnology' is very low. Its worst position and, therefore, worst performance is recorded in 'biotechnology' based on its patent grants to the USA patent office. In general Greece performs better at the European Patent Office and the PCT procedure based on all technical fields and better in 'environment' than all other new and emerging technical fields. However, Greece's share in relation to the total EU-27 members, OECD-members and World (all countries) is higher in the PCT procedure, followed by the European and then the USA Patent Office. At the new and emerging technical fields' level, Greece performs better than the total of EU-27 members, OECD-members and World (all countries) in 'environment' and worse in 'ICT's' comparing its shares at the three patent procedures. Greece also performs better in 'biotechnology' in 2 out of 3 patent procedures, with the exception of the PCT one. As for the grouping of Greece with other countries, the same and all ready mentioned countries, as well as some other countries appear to have similar performance with Greece. The group of these some other countries includes Argentina, Singapore and Ukraine for the field 'environment', Iceland and Iran for the case of ICT's, Estonia for 'biotechnology' and three other countries for 'nanotechnology' (e.g. Korea, Romania and South Africa).

Table 1: Patent activity shares for Greece, EU- 27, OECD and World in different Patent Offices based on total technologies

Patent Office	Technologies	Greece	Countries with similar performance to Greece
Patent Grants to EPO	Total Technologies	229,333	Positions 30-40: Cayman Islands, Cyprus, Czech Republic, Hong Kong, Hungary, New Zealand, Poland, Portugal, Slovenia, Turkey
	%	0,038	
	Taxonomy	36	
	% EU- 27 members	0,078	
	% OECD	0,012	
	% World	0,038	
Patent Grants to USPTO	Total Technologies	170,475	Positions 40-50: Chile, Cyprus, Czech Republic, Kuwait, Poland, Portugal, Slovenia, Thailand, Turkey, Venezuela
	%	0,009	
	Taxonomy	43	
	% EU- 27 members	0,063	
	% OECD	0,009	
	% World	0,009	
Patent Applications	Total	749,495	Positions 30-40: Bermuda, Cayman

to PCT	%	0,056	Islands, Chinese Taipei, Czech Republic, Hungary, Liechtenstein, Malaysia, Mexico, Poland, Slovenia
	Taxonomy	38	
	% EU- 27 members	0,167	
	% OECD	0,040	
	% World	0,055	

Source: Own elaboration of OECD Patent database.

Table 2 presents the 15 most important technological fields for Greece at the three patent offices (columns 3-5) and or the mean from the three patent offices for each group of countries (e.g. column 6 presents the ranking of the group EU-27 members, after calculating the mean value based on the technological taxonomies of all three patent offices). The list of technological fields and the comparison between the rankings highlight the differences between Greece and all three groups of countries. The only absolute similarity between Greece and all three groups of countries in all patent offices is the technological field 'preparations for medical, dental or toilet purposes', which ranks between being first and second. This field is related to the industrial sector of 'pharmaceuticals'. On the contrary the different innovation direction of Greece is obvious, in which a large part of patents is concentrated in innovations relating to the agricultural sector and the construction industry. In addition there are technological fields that are much more important for Greece according to their placement in the total ranking than in the EU-27 members, OECD-members and World-100 (technological fields 1, 9, 10, 13, 21 and 22). Technological field 1 is related to the 'agricultural sector' (e.g. agricultural and forestry machinery), fields 9 and 10 are linked to 'machine tools' and 'fabricated metal products' respectively, while field 21 to 'non-metallic mineral products'. Contrary to the above pattern there are technological fields that are much more important internationally for all three groups of countries according to their placement in the total ranking than in Greece. These technological fields aren't placed high in the Greek taxonomy or they don't even appear in it. Among them the most important cases are the following: First 'semiconductor devices; electric solid state devices not otherwise provided for', second 'transmission of digital information' (e.g. telegraphic communication) and third 'pictorial communication (e.g. television). The second field is related to the sector of 'electricity'. The Greek performance in these fields is very low. In contradiction, Greece relatively outperforms in the fields of first 'containers for storage or transport of articles or materials', second 'horticulture; cultivation of vegetables, flowers, rice, fruit, vines, hops or seaweed; forestry; watering' and generally in all fields related to the construction industry (e.g. fixed or movable closures for openings in buildings, general building constructions; walls).

If technological fields based on patents at the three patent offices and for the above three groups of countries reveal the fields that dominate or will dominate in the world, then results show that 'chemicals (especially 'pharmaceuticals'), 'office machinery and computers', 'signal transmission and telecommunications' and 'motor vehicles' are and will be those dominant and important fields with shares of nearly 20%, 10%, 7.5% and 6.3% respectively. In addition to the above 'priority' technological fields, the OECD-members as well as the World-100 countries put also emphasis on 'medical equipment', while for the latter group of countries 'electronic components are also placed high in the overall taxonomy. The respective figures for Greece show both similarities to the above patterns and major differences: 'Chemicals' and its sub-sectors are very important, accounting for 21.7%, 'medical equipment' is 3rd, while 'basic chemicals' 5th. On the contrary both 'office machinery and computers' and 'signal transmission and telecommunications' are placed low, representing 3.4% and 1.4% respectively, with the latter technological field exhibiting one of the worst performances (20th in the total ranking). However, figures for Greece also show that two industrial sectors of application and use are very important, namely those of 'fabricated metal products' (10.4%) and 'rubber and plastic products' (6.3%), being placed at the 2nd and 3rd positions respectively. Generally and comparing Greece with all the three groups of countries along the three patent offices, the Greek shares are above all averages in 17 industrial sectors in total and among them in 'non-metallic mineral products' and 'agricultural and forestry machinery as well as in all already mentioned ones. Below all averages are Greek shares in 26 industrial sectors in total and among them in 'electronic components', 'special purpose machinery' and 'motor vehicles'. In addition, the performance of Greece is also much lower in all important and already mentioned technological fields and thus their related industrial sectors. Therefore, Greece comparatively performs better in rather 'traditional' technological fields, which are linked to 'traditional' industrial sectors and underperforms in those, which have been characterized as technologically advanced, such as those of the 'electricity', 'ICTs', 'nuclear energy' and 'nanotechnology'.

Table 2: The 15 most important Greek technological fields based on its external patent activity at the EPO, USPTO and the PCT procedure

	Main technological fields	Greece			EU-27 ¹	OECD ²	World (100) ³
		EPO	USPTO	PCT			
1	Horticulture; cultivations of vegetables, flowers, rice, fruit, vines, hops or seaweed; forestry; watering	4	20	7	>100	>100	>100
2	Foods, foodstuffs or non- alcoholic beverages, not covered elsewhere, preparation or treatment	11	34	31	44	34	47
3	Diagnosis; Surgery; Identification	3	4	5	9	6	6
4	Filters implantable into blood vessels; prostheses; devices providing patency, tubular structures of the body, fomentation, treatment or protection of eyes or ears; bandages	17	14	6	21	12	14
5	Preparations for medical, dental or toilet purposes	1	1	1	1	2	2
6	Devices for introducing media into or onto the body; devices for transducing body media or for taking media from the body;	10	27	12	26	20	23
7	Therapeutic activity of chemical compounds or medicinal preparations	8	9	11	9	22	22
8	Working or processing of sheet metal or metal tubes, rods or profiles without essentially removing material; Punching	24	13	58	48	59	53
9	Working or processing of wire	6	51	13	>100	>100	>100
10	Hand-held cutting tools	2	2	2	>100	>100	>100
11	Shaping or joining of plastics; Shaping of substances in a plastic state, in general; After treatment of the shaped products, e.g. repairing	7	33	26	13	21	22
12	Layered products, i.e. products built-up of strata of flat or non-flat	38	10	42	57	39	46
13	Ships or other vessels; Equipment for shipping	19	34	8	>100	33	>100
14	Containers for storage or transport or articles or materials; accessories, closures or fittings therefore; packaging elements; packages	12	3	4	12	15	15
15	Treatment of water, waste, sewage or sludge	13	41	9	80	72	89
16	Heterocyclic compounds	18	16	10	7	9	10
17	Macromolecular compounds obtained otherwise	30	12	22	31	34	34
18	Micro-organisms or enzymes; Propagating, preserving, or maintaining micro-organisms; Mutation or genetic engineering; Culture media	23	6	18	13	14	18
19	Measuring or testing processes involving enzymes or micro-organisms; Compositions or test papers; Processes of preparing such compositions; Condition-responsive control in microbiological or enzymological processes	14	45	21	55	44	59
20	General building constructions; Walls	15	11	23	52	27	>100
21	Structural elements; Building materials	28	8	41	>100	>100	>100
22	Cyclically operating valves for machines or engines	17	7	30	25	>100	>100
23	Investigating, analysing materials by determining their chemical- physical properties	5	17	3	4	5	6
24	Electric digital data processing	46	5	14	4	2	2

CONCLUSIONS

Relying on the theoretical and empirical evidence that innovation greatly contributes to corporate success, technological leadership and growth, this paper dealt with the Greek case analyzing its production of innovation, but from a more global perspective. More specifically the paper focuses on the Greek external patent activity and therefore on the Greek innovation which is protected abroad (offices: EPO, USPTO and the PCT). In this context the analysis and, therefore, results aimed at the following: First, present the Greek performance in comparison to other countries, both separately and as members of the groups of the EU-27, OECD and the World-100 countries. Second locate important technological fields, also highlighting the contribution of new and emerging technological fields in the overall pattern. Third, integrate all the above in an attempt to respond to a very significant issue of national interest: If and how Greece participates at the international production of innovation, developing similar and compatible innovations to the respective of other countries?

Results show that Greece participates at international production of innovation, being a member of this global innovation family, but with very low shares. Greece is classified in the same group with many small and more peripheral countries of the European continent (e.g. Portugal, Czech Republic, Poland, Slovenia), certain Latin American countries, with countries-islands well known as vacation destinations and with some emerging economies located in the Eastern Asian region. Results also show that the Greek production of innovation is concentrated in certain technological fields related to 'medical preparations', the 'agricultural sector', 'basic and consumer goods', 'elements of transporting and package', 'machinery' and different as well as complementary technologies of 'building and construction'. The industrial sectors of application and use for the above fields are those of 'chemicals', 'metal products', 'rubber-plastic products' and 'medical equipment'. The comparison between Greece and the three groups of countries show that Greece performs better in technological fields, which are linked to 'traditional' industrial activities. On the contrary the same comparison show that the performance of Greece is to a great extent inferior to the respective in all important technological fields at the international level, with the exception of 'chemicals' and 'medical equipment'. Especially at fields related to electricity and more generally to ICTs this innovation gap is even larger.

Summarizing, a large part of the production of Greek innovation is directly or indirectly linked to the construction industry and the agricultural sector. Regarding the first case, the construction industry has a long tradition in Greece. It started to solve the growing problem of housing because of the needs arising after the two world wars and the wave of immigrants entering the country after 1922. It then became a policy, being promoted by specific measures and financial incentives, while also made use of some natural resources and national raw materials. During the last years and before the economic crisis the construction industry was the only sector to continuous and sustainable development in two axes, first public works and second housing (private residences), taking advantage of the European funds, the organization of the Olympic games and the increasing income of the Greek citizens, which has been almost entirely directed to a second residence, either permanent or for holiday. In relation to the second case, namely that of the agricultural sector, Greece has still one of highest agricultural shares compared to both the EU of 27 and the other south European countries, such as France, Italy and Spain. At the same time, among its most important exports are the agricultural products and those of food and beverages, which however is an industry closely related to the agricultural sector. Particularly for the food and beverage industry, it has to be mentioned that it is the most dynamic and high growth sector inside the Greek manufacturing sector. The 25% of the most profitable Greek companies are food and beverage companies. The local food and drink industry is one of the main contributors to the country's GNP and —despite the crisis— is maintaining its strength. Finally, the case of chemicals is different, as most patents and innovations of this kind of products are mainly protected through a national or international patent office.

Therefore, Greek innovation and production have been developed in parallel paths, both expressing their traditional nature and orientation, with innovation serving production and production re-orientating innovation. The Greek external innovation pattern is different than the respective internal, which is recorded at the European and international level. If the aim of competitiveness is the main issue for Greece, then this aim can't be achieved through this kind of mixture for innovation development. Results have highlighted the innovation gap that Greece has to cover or better the technological direction that Greece has to follow in order to become more competitive at the international level. Further and deeper research in this field could provide more answers on how Greece could structure it.

ITALY'S 2013 POLITICAL CRISIS: RESPONSE TO PROTEST ELECTIONS - BUSINESS, THE MARKETS AND EUROPE

Bruno Mascitelli
Swinburne University of Technology, Australia

ABSTRACT

The Italian elections of February 2013 initially resulted in a stalemate. There was no winner. On the one hand the traditional parties suffered electorally while the social media protest group the Five Star Movement became Italy's largest party. Mario Monti who represented austerity received low support and Berlusconi feared by the markets clawed his way back. Most concerning with the elections was that it failed to produce a majority and forced Italy to seek out a "grand coalition". Surprisingly the finance, stock and bond markets were "understanding" and did not engage in frenzied actions or speculation against the Italian economy as had occurred in other Eurozone countries. Why was this the case and how will these markets treat an emergency "grand coalition?"

INTRODUCTION

The Italian elections of February 2013 provided an outcome few wished to see. It produced a political stalemate with little prospect of a stable majority government and an extended constitutional process delaying a partial solution for months. But it was also an election which sent powerful European and Italian messages on a rejection of austerity, questioning the Eurozone and even the concept of the European Union. For internal purposes it was also an election which denounced the traditional Italian cosy self serving political system most eloquently represented by the strong performance of the social media organisation Five Star Movement which in party terms received the biggest vote of any party. Moreover the election failed to provide a government provoking concern and raising alarm bells for the markets, bond investors, the stock markets and the business communities.

The election result was also a step into uncharted political waters providing even newer and complex scenarios as experienced in other Eurozone countries. Because Italy failed to achieve a clear and decisive outcome in the elections, and the hypothesis of going back to the polls was posed, many feared whether they were in government, in the markets or in Europe was the possibility of a "Greek Outcome". This eventuality was the chaotic time frame of having no decisive outcome from an election and having to return to the polls. In the time frame between these elections, as in Greece, markets can engage in economic punishment of the country, in raising interest of government debt financing, bond markets can become nervous, stock markets can start selling and credit ratings can be negatively assessed. This was a serious possibility, and with Italy a larger economy than Greece with more catastrophic consequences and domino effects on other Eurozone countries many were nervously waiting how events would unfold. Yet at the close of the political process which eventually brought about a "grand coalition" of centre-left and centre-right parties into the one government, surprisingly the markets, financial, bond and stock markets all watched on calmly and with little panic or nervousness. The new Italian government lead by Democratic Party Deputy Enrico Letta was inaugurated by the Italian President Giorgio Napolitano to embark on what is another unexplored option of a "grand coalition".

The aim of this paper is to understand why the response to the Italian election impasse, while certainly not one of satisfaction, at the same time did not create panic responses within Europe and most especially with the financial and stock markets. In late 2011 in the last dying days of Berlusconi's centre-right government, the

markets went into frenzied behaviour and pushed bond rates almost to default levels making the duration of the Berlusconi government untenable. As Reuters noted:

Italy, the euro zone's third largest economy, came close to disaster this week when yields on 10-year bonds soared over 7.6 per cent, the kind of level which forced Ireland, Portugal and Greece to seek international bailouts (Reuters 2013).

The markets de facto removed Berlusconi from government and the sense of instability and uncertainty created tremendous bouts of frenzy on the bond markets, stock and finance markets. Equally the Greek scenario of inconclusive elections in March 2012 followed by new elections in June 2012, the state of the Greek economy went from bad to worse. Yet the Italian two month interregnum between the election in late February and the arrival of a government in mid-April, seemed to have been experienced with calm, patience if not understanding. This paper explores the prospects of why the markets failed to respond in the “panicked” state in which it did in 2011 in Italy and elsewhere. Why have the bond rates remained substantially unchanged and why has Italy’s notorious state of non-government failed to raise the concern that it might have in the past.

The background to 2013 election impasse

The warnings of the 1990s about the Italian economy went unheeded within Italy. Entry into the Eurozone by Italy in 1998 under the Prodi government at the time was the product of a political decision rather than Italy fully qualifying for entry. Its public debt at the time of 120 per cent of GDP was twice the permitted level agreed as part of the Maastricht Criteria. According to one observer the then German Chancellor Kohl was of the view that there could be no Euro without Italy inside. In documents obtained by *Der Spiegel* it was revealed that “The decision to invite Rome to join was based almost exclusively on political considerations at the expense of economic criteria” (*The Times* 2012).

The 2000s saw Berlusconi and his centre-right coalition for the most part at the helm. From 2001-2006 and again 2008 until 2011 Berlusconi presided over a government which made little impact on the key negative economic indicators. Budget deficits on a number of occasions went beyond the minus three per cent band and most importantly public debt did not decrease. But these fragile economic indicators then faced the wrath of the global financial crisis in 2008 which only exacerbated a stalled economy. Italian economic growth never went beyond one percent growth level often placing Italy as one of the worst economic performers of the European Union. Berlusconi even tried to introduce tax cuts for the rich which made no sense to the Brussels pundits in the Commission who could not work out how the Italian government could cut government debt by bringing in less income! Brussels promptly put a stop to this economically suicidal budget. In response Berlusconi took his anger out at Europe by blaming the Euro which he argued was crippling Italy and Italian competitiveness and even hinted at a return to the Lira (Mascitelli 2010). Berlusconi’s governance also suffered from his judicial and personal distractions arising almost on a daily basis which created periods of debate and attention which were almost entirely focused on his persona. This was without doubt to the detriment of attention required for the Italian economy.

When the Berlusconi government in late 2011 was forced to reduce its growth forecast, and still commit to refinancing its huge public debt, the bond markets went into frenzy and the credit agencies subsequently downgraded Italy’s economy. The bond market struck like a tornado in late 2011, and Italy was defenceless as the bond rates escalated to default levels in a country “too big to fail, too big to bail”. The Berlusconi government lay prostrate before this financial tsunami as Berlusconi was forced to resign by the markets and his very presence in the government which sent shivers to investors, financial institutions and stock markets alike (Kington & Hooper 2011).

For the last six years the global economy has experienced ongoing economic crisis which continues in Europe and to lesser extent outside. Starting in 2008 with the Global Financial Crisis (GFC) triggered in the United States by out of control private debt, in Europe, it continued in 2010 with out of control public debt. The manifestation of this crisis was most savagely reflected and continues to do so, on a number of European economies within the European Union (EU) and members of the 17 member Eurozone group of countries. Those most affected by the sovereign debt concerns related to bond markets in particularly included Portugal, Ireland,

Spain, Greece and the comparative economic giant in Europe, Italy (PIIGS). Such were the concerns that emphasis also shifted to whether cohesion and integrity of the Eurozone was at stake.

The appointment of a technical government lead by Mario Monti in place of the Berlusconi government in late 2011 had the initial effect of seeking to calm the markets down. The Monti technical government was an emergency measure which was a holding operation and not a term solution. In addition Monti, as a former Commissioner of the European Union, was strongly appreciated as an Italian Euro supporter different from his predecessor. While the markets had calmed down and Monti's reputation outside Italy was appreciated, his austerity and oppressive economic program caused widespread dissatisfaction and economic *malais*. Monti's reforms, while they corrected certain features of the Italian economy were quite extreme and failed to produce the economic growth that were anticipated. The difficulties were such that even Berlusconi could ridicule Monti on his obsession with tax hikes and the halt on all forms of government spending. While the European Union felt that there was a safe pair of hands in Italy, this austerity approach could not be popularly accepted by the Italian electorate. The February 2013 election results saw the response of the Italian electorate towards austerity and the Monti movement which performed poorly and way below expectations (Wearden & Fletcher 2013).

The protest election results of 2013 and the initial view of the markets

As the election in Italy approached the markets had initially soared on hopes of a clear-cut outcome. This result would have created scope to push through reforms to revive Italy's recession-hit economy. The expectation coming from many observers was either a Democratic Party (PD) win in both the House and the Senate, or at worst a coalition of PD and the Monti movement. As the elections approach, so too did concern and especially noted was a comeback of Berlusconi's coalition which was inching back support right through to the eve of the election. When the results arrived indicating a majority for the PD in the House but an open contest in the senate many hearts sank. One market analyst commented:

"The market's initial reaction was too optimistic. We thought the PD would have won a majority in the lower house, and that's a given. But the Senate is still up in the air, region by region...If the PD gets 156 seats in the Senate but Monti in several regions doesn't win the minimum 8 per cent of the vote then even a PD-Monti alliance would have a very thin majority, something which the market would not like" (Jucca & Jewkes 2013).

It is common thinking that the markets normally dislike uncertainty. The Italian elections of 2013 certainly provided this undesired uncertainty. As one market analysts stated;
We simply don't know the state of play with Italian politics, and markets find sellers in times of instability. The President will take centre stage now and either form a 'grand coalition', although this seems unlikely. It has been speculated that Mr Bersani may look to team up with Beppe Grillo's Five Star movement (again unlikely), or ultimately fresh elections will be called down the track...This is a story of anti-austerity and one where most hadn't expected the anti-austerity/anti-European parties to do anywhere near as well as they have. The Italian voter has spoken out and this has thrown up political instability as perhaps the number one issue facing Europe in 2013 (Weston cited in Wearden & Fletcher 2013).

At the close of the elections, not only was there no clear winner, but Italy had just rejected austerity, possibly even Europe and saw the emergence of the protest movement Five Star Movement lead by Beppe Grillo. This had the makings of an outcome which would bring the markets crashing down with little mercy shown. No group emerged as a clear winner after the vote, which saw a populist anti-austerity party make a stunning debut.

How did the markets respond? Initially the Italian stock market in Milan fell 5 per cent on opening and state borrowing costs rose. At the close of trading on the day after the elections the FTSE 100 was down 1.34 per cent, Spain's Ibex off 3.2 per cent, Germany's Dax down 2.27 per cent and France's Cac reduced by 2.67 per cent. Banking stocks were particularly badly hit with the Royal Bank of Scotland and Barclays the biggest fallers on the FTSE 100, losing more than 4% of value. The euro also fell to an almost seven-week low against the dollar in Asia on fears about the eurozone debt crisis. While other European stock markets declined initially the Dow Jones opened positively on Wall Street following a 1.6 per cent loss immediately after the election (Skynews 2013).

New equilibriums in Italian politics

The Italian elections of 2013 in retrospect could be considered to have had the historical importance of the elections of 1994 when political parties of the post war generation like the Christian Democrats and the Italian Socialist Party almost disappeared over night. In 2013 we witnessed the centre-left, lead by the Democratic Party failing to achieve more than one third of the seats and almost neck and neck with Berlusconi's centre-right, People's Freedom party. The Northern League recorded its lowest vote in decades (four per cent) and Mario Monti's Civic Movement failed to acquire more than 10 per cent of the vote and unable to provide the support for a coalition even in the Senate. However the novelty of these elections was without doubt the bursting onto the political stage of the Five Star Movement which acquired 25 per cent of the national vote. It was in effect the largest single party in terms of electoral support. Lead by its well known celebrity Beppe Grillo, this social media movement began calling the shots on a fresh and new approach towards politics. While full of protest it was very short on proposals. It rejected being caught up in murky political dealings but at the same time refused to compromise on a range of political outcomes. Its policies, in so far as there were any, was for opposition to political trickery, party financing, and for underhanded deals between the traditional political parties. Economically while it had a five star approach towards sustainability, the environment and other areas, it was limited to mostly a rejection of the status quo rather than proposing sound ideas. It recommended a referendum on Italy's membership of the Euro (like the recent Cameron/UK referendum proposal on Britain's membership of the European Union), and it rejected the austerity policies and refused to be moved by the response of the markets.

This was an extremely fragmented and equally divided electorate which would inevitably make the formation of any clear and stable coalition difficult and almost impossible. As the negotiations began, the contending parties found themselves and not surprisingly unable to find working alliances. While the PD would have agreed to an alliance with the Monti movement, this combination was insufficient in number terms and therefore was not an option. The Five Star Movement had made clear it intended to not enter into any coalition or alliance with either side of politics. The scene was set for total paralysis. This was compounded by the closing mandate of the Italian Presidency of Giorgio Napolitano who constitutionally was not permitted to dissolve the parliament and whose position needed to be filled before any political solution could be found. The matters were becoming more complex and taking more time. World markets have been initially rocked after the Italian elections which were seen as crucial for the Eurozone and for not exacerbating the Eurozone woes. The Italian election was a clear deadlock and there seemed to be little light at the end of the tunnel. No group emerged as a clear winner after the vote, which even saw the emergence of a populist anti-austerity party make its stunning debut. The Italian stock market in Milan fell 5 per cent on opening and state borrowing costs rose as investors took fright at the political stalemate. Everyone looked at the markets to ask whether they would respond against Italy and the Italian economy?

Why the markets remained calm during the election paralysis?

Different from the economic response in late 2011 or with Greece in 2012, the markets, the bond rates and the financial institutions in the aftermath of the February 2013 elections, waited out the crisis and did not indulge in any speculation or destructive approach. Yet on the day after the elections there were only small downward shifts but none of the market reaction expected with such an inconclusive election as this one was. The market favourite, Mario Monti failed to acquire the electoral support required. Once it was clear that Monti stood no chance of returning to government with political support and legitimacy, what seemed of most concern to the markets was that of a possible return of Berlusconi. Even Berlusconi, the person many had declared "dead and gone" inched his way back into the political arena. In the case of the February 2013 election any possible return of Berlusconi was, it seemed for the markets, unacceptable. While Berlusconi was not returning an equally unsatisfactory solution was emerging – no result! Testing the market's patience even more was the rise of the social media Five Star Movement which openly defied the markets, talked down Europe and austerity and refused to be "blackmailed" into predictable responses of caution and restraint in front of the markets. As Italy's largest party they were sending out messages which wanted to stand up to the markets and not allow them to set the agenda for Italy. Is all this a sign that markets had become less stressed, less bewitched by the "risk on, risk off" herd mentality of the past few years. Yet the markets seemed patient enough to allow the political process to

find its new equilibrium as long as it was clear that austerity could not be entirely abandoned. The big question is why were the markets so “understanding”?

In some respects the markets read the Italian political situation better than the pundits. Notwithstanding Italy’s rejection of austerity and some anti-Euro demagoguery in a country with the second largest public debt, the election results should have sent gyrations in the markets as was evidenced by similar events in Greece in 2012. Surprisingly the markets were not spooked and were relatively gentle with the Italian state of un-governability. But the markets were motivated aware of certain circumstances which characterised Italy different from other Eurozone nations. First Italy’s debt risk factor was not as alarming as it had been prior. Its bond rates of interest had declined from highs of 7 per cent to sustainable levels of 4 per cent and into the new Letta government of even lower levels. This was a positive result. Moreover it became clear that Italy had managed in 2012 to keep its budget deficit below the minus three per cent which most Eurozone countries did not. In addition much of its debt was long term ten year refinancing debt and therefore less prone to fluctuations. These were all positive indicators which gave the markets some sense of improvement and less fear of a country at risk than it had been previously.

Some thanks are also owed to the European Central Bank (ECB) changes to debt restructuring with the introduction of the Outright Monetary Transactions (OMT). This measure announced by ECB Governor Mario Draghi, removed the “tail risk” of a Eurozone blow-up in allowing the ECB to purchase distressed Eurozone countries’ bonds thereby reducing the speculative nature of bond markets and acting as a soother. Undoubtedly, these policy changes have limited the impact Italy’s election has had on financial markets but the economic paralysis remains. Levels of unemployment will rise, business investment declining, job prospects few and far between and a youth that is beginning to abandon its country.

Many in Europe and abroad were anxious to see changes in Italy through this election. One of the expectations was to see the end of Berlusconi and hopefully the return and confirmation of Mario Monti. In both cases neither of these wishes was entirely achieved. Berlusconi was not gone and Monti suffered a significant rebuttal from the Italian electorate. Mario Monti had become the Italian symbol of change but his popularity in Italy was determined by the severity of his austerity measures. What has possibly surprised most external observers has been the success of the Five Star protest movement. In some respects the Five Star Movement is also a warning to many in Europe and beyond. A protest movement received a hearing and sent many in traditional style politics packing. Moreover the austerity message which Europe so fondly wished to promote received a major setback. Could similar movements emerge in other European states and what repercussions could there be in the upcoming elections in the UK, and in Germany scheduled for September 2013.

While the aggressive bond and finance markets were not spooked like they were in Greece as a result of the inconclusive elections of 2013, the economic *malais* in Italy remains. Little economic growth, struggling export industries, little prospect for youth and an unemployment level which is conservatively placed at 12-13 per cent. What kind of investment and business decisions will be implemented and most importantly how can the plight of high unemployment and low economic opportunities be countered in an election result which promised much more and delivered much less.

A “national coalition” takes the rein of government

Over the months that followed the February election, Italian constitutional process compounded the complexity of the establishment of a government. Initially political consultations seeking a political agreement was exhausted and resulted in no agreement. The PD leader Bersani met with Monti, with Grillo and even Berlusconi and none of these discussions produced any acceptable solution. In the meantime procedures were set in motion for the new Presidential elections which both delayed the formation of a government and unexpectedly placed the PD party in crisis.

The President’s election required a combined parliament vote of 66 per cent of the total parliamentarians at least for the first three ballots. This was later reduced to 50.1 per cent from the fourth ballot onwards. Numerous names were put on the table and in the middle of this process Bersani found that almost 30 per cent of his parliamentary party had broken ranks and gone for their own candidate and not that presented by

the PD leader. Bersani realising he did not command the support of his party indicated his intention to resign after the complex government negotiations and the first congress of the party after the crisis. Finally in late April 2013, after more than two months of stalemate, the Italian President Napolitano, who himself had only just been confirmed for a further seven year mandate as President, offered the Prime Ministership to Deputy PD Enrico Letta the task of pulling together a government. This new government would be in the words of Napolitano "It was and is the only possible government," adding there was no room for "delay, in our country's and Europe's interests" (The Guardian 2013).

What is most unique about this government is that it is the first time Italy, in the post war period, has installed a "grand coalition" of both centre-left and centre right forces. While Berlusconi has no position in the government, his right hand man, Angelino Alfano is nominated to the powerful position of Minister of the Interior. Moreover the government is not entirely an elected government. More than one third of the Ministers are unelected merit based ministers. The "national coalition" was always considered a distant solution and became more viable as all other options were exhausted and agreement could not be reached. Its ability to pass profound legislation will be hampered by the presence opposing political sides. On the other hand going back to the polls was rejected by many and in the view of some would only produce even greater uncertainty – a solution none of the established parties sought fearing their parties would suffer even greater losses.

The new government knows full well that its task will be "promising to focus on improving the economy and unemployment rates and restoring faith in Italy's discredited political institutions" (ABC 2013). Growing economic decline in the southern Eurozone states has reached dramatic proportions with Spain declaring an official unemployment rate of 27 per cent and Greece needing to layoff 15,000 public employees to meet bailout conditions by the IMF. For Italy the economic needs are equally as serious if not as dramatic. One media outlet stressed:

Letta has said his priorities would be the economy, unemployment and restoring faith in Italy's discredited political institutions as well as trying to turn Europe away from austerity to focus more on growth and investment (Mackenzie and Jones 2013).

Letta's inaugural speech in the parliament in late April 2013 trying to shore up support for this "grand coalition" government contained aspirational content in terms of political reform. It raised such expectations that the Grillo movement representative Alessio Tacconi was forced to admit "If Letta does what he has promised, the Movement will no longer have any reason for its existence (Malaguti 2013). It was a rare show by the Five Star Movement of support to a speech which contained in lowering of politicians salary, elimination of the Provinces, removal of the property tax and no increase in sales tax.

Letta received further encouragement when the ratings agency Moody's kept its rating on Italian government debt unchanged at Baa2. Lower interest rates were also making it possible to buy time to implement much-needed reforms. Bond yields have fallen to their lowest in more than two years as investors hoped for enough stability to help Italy revive its economy and gradually tackle its large public debt. However as a form of warning, Moody's also said medium-term growth prospects were weak and forecast the economy would shrink by 1.8 percent this year, compounding more than two decades of stagnation.

CONCLUSION

The successful creation of a new Italian government through an emergency "national coalition" can hardly provide reassurance for a stable and effective government. It faces insurmountable tasks and hurdles in meeting the immediate needs of confronting a sluggish low growth economy, growing and high unemployment and large public debt. It also faces as discredited parties and unpopular political institutions. The show of strength which the Five Star Movement received in the elections, while manifesting itself as a protest movement, could be a clear warning to all, not only in Italy. A centre-left and centre-right together in the one coalition, after years of partisan hostility, seems difficult to believe that deep ongoing agreement will be possible. Nonetheless the emergency nature of the government and the agenda it has announced, places unprecedented pressures on what measures are required while the markets remain unnerved.

Crystal ball gazing on the duration of this government would suggest that the life of this government would be at best one year. Napolitano's recognition that this was "the only possible government" at this point in

time is a valid observation. With time there might be a change in the political mood of the country which at the moment is mutinous, angry and in search of answers. Italy's economic fragility requires little testing and the levels of unemployment in other Eurozone countries suggests that urgent rectification of the austerity based economy is needed. It would be a brave person who could reassure Italians that this government will not simply propose austerity as the way out of the economic *malais*. This was already tried by the Monti technical government and failed. Monti's almost disappearance from the political scene is testimony to this failed approach. Whether the Letta government will be able to restore faith in the political institutions and provide policies which grow the economy remains to be seen. Whichever way one looks at this government, this is yet another emergency solution to a failed political process. Given the circumstances that have favoured this unique "national coalition" to come to the task it would be unlikely that there are many more favourable cards which Italy can play.

FINANCIAL PLANNING FOR RETIREMENT AMONGST SOUTH AFRICAN PROFESSIONAL SOCCER PLAYERS

**J Maseko, Vaal University of Technology, South Africa
J Surujlal, North-West University, South Africa**

ABSTRACT

Logically, financially-educated individuals should make better financial decisions for their families, increasing their economic security and well being. The purpose of this study was to explore the financial planning and personal financial management of South African professional soccer players. In the process, a variety of issues were investigated. The research focused on the following important question: Why is financial literacy important particularly for soccer players who experience short-lived soccer careers. A quantitative research design involving the administration of a two-section questionnaire was adopted for the study. It was concluded that most professional soccer players plan poorly for their future because of a lack of financial literacy which results in them not being adequately prepared for the transition into retirement. Recommendations on the findings were made and the implications for future research outlined.

INTRODUCTION

In the last two decades, the issue of financial education has risen on the agendas of educators, community groups, businesses, government agencies and policymakers (Hilgert, Hogarth & Beverly, 2003). Financial literacy is the combination of consumer/investors' understanding of financial facts and concepts, and their ability to appreciate financial risks and opportunities to make informed choices, to know where to go for help and take other effective actions to improve their financial well-being (OECD, 2010). Individuals have had to become increasingly responsible for their own financial security following retirement (Lusardi, 2008). Furthermore, financial instruments have become increasingly complex and individuals are presented with new and sophisticated financial products from time to time in the market from which to choose from. Lusardi (2008) emphasized that the knowledge of more complex concepts, such as the difference between bonds and stocks, the working of mutual funds, and basic asset pricing is even scarcer. Increased interest in financial education has been prompted by the increasing complexity of financial products and increasing responsibility on the part of individuals for their own financial security (Hilgert et al., 2003).

Financial literacy is crucial for all employees. It is, however, particularly crucial for professional athletes due to their short-lived soccer career. Among these athletes are professional soccer players, many of whom receive lucrative salaries with little understanding of how to manage their finances (Ramsey, 2010). As a result, they extravagantly misuse their incomes as soon as they receive their first earnings. Many of them fail to budget for or save their money even though they intuitively know that this could improve their living style in the future. Indeed, financial literacy affects financial decision-making; and the lack of knowledge about basic financial concepts can be linked to poor planning for financial retirement.

Economists are beginning to investigate the causes and consequences of financial illiteracy to better understand why retirement planning is lacking and why so many households arrive close to retirement with little or no wealth (Lusardi & Mitchell, 2007). On the one hand, without money management skills, households have few other mechanisms to smooth out unexpected variations in their income, and so, shocks may leave permanent scars, such as interrupting the process of human capital accumulation at early ages. On the other, since financial literacy is one of the only means to accumulate assets in the absence of credit and insurance markets, the

capacity to save becomes one of the main vehicles of social mobility and of enhancing future income-earning possibilities.

Surveys of financial literacy have found that many households do not understand some fundamental financial concepts such as the difference between bonds and stocks (van Rooij, Lusardi & Alessie, 2007). Some studies have indicated that households or individuals that spend more effort planning for retirement reach retirement age with more wealth (Ameriks, Caplin & Leahy, 2003; Lusardi & Mitchell, 2007). Many of these studies have indicated that individuals with higher levels of financial literacy, income and wealth have more success in making informed financial decisions.

In terms of savings individuals have a choice between contractual savings or discretionary savings. Contractual saving involves individuals committing themselves to a series of payments such as premiums on insurance policies, contributions to pension funds and the capital amount payable on households' mortgage loans (Prinsloo, 2000). Discretionary saving, in contrast, refers to types of saving where households are not bound by any fixed commitments. All contractual saving normally stems from discretionary saving to the extent that contractual obligations are made on a voluntary basis. An exception is where the employee is bound by a contract of service to contribute to a pension fund.

South African professional soccer players do not enjoy the benefit of contractual saving, but rather they have to arrange for discretionary saving. Discretionary saving is based on individual choice which requires individual discipline and this becomes difficult particularly in the environment where there is no savings culture like in South Africa. Because of lack of financial literacy, many South African professional soccer players are unprepared and are ill-equipped to properly manage their salaries or realize the importance of making additional provision for their retirement. Over many years, education and information provision and promoting savings awareness through various campaigns have worked tirelessly to get South Africans to embrace their savings habit. According to Govender, the chairman of South African Savings Institute (SASI) government and corporate are saving, individual South Africans are not and the trend appears to be getting worse each year. The fundamental reason for this differential lies in consumer behavior and number of measures needed to be adopted to develop a savings culture in South Africa.

Life-Cycle Consumption and Saving Model

Considering the short lived career of professional soccer players the life-cycle consumption and savings model is used to highlight how this model can accommodate transitory career of professional soccer players. According to this model, individuals maximize utility or satisfaction over the entire course of their lifetimes. Decisions about savings made early in the life-cycle help determine the resources that are available over a long-term period. The life-cycle model implies that a retired individual's utility is a function of his/her ability to consume goods and services reflected in their current income and accumulated net worth.

To competently make saving and investment decisions, individuals need knowledge of the fundamental financial concepts including understanding of the relationship between risk and return; how bonds, stocks, and mutual funds work; and basic asset pricing (Lusardi, 2008). Furthermore a clear distinction between short-term and long-term financial planning is made. Short-term financial planning implies saving money for a particular consumption in a short period of time, such as saving to buy a television. On the other hand long-term financial planning involves saving money to sustain an individual in the long future period such as at retirement age. Short-term financial decisions differ from long-term financial decisions in two important ways. First, they are easily reversed in most cases. Second, there is far less uncertainty about the decision variables as one is concerned with the next few months rather than years.

Marx, Mporu, Nortje and van de Venter (2008) affirmed that one of the most common sensitive beliefs according to the life cycle theory is that as individuals' age, they are assumed to become less risk tolerant in all aspects of risk taking and therefore invest less of their portfolio in equities and more in fixed income securities. They maintained that generally as they age, individuals increase their level of safer daily risk choices that affect their health. From a financial risk perspective, the basis for this belief is that older investors have less expected time available to recover from potential losses incurred by riskier assets such as equities. This has always been a

very common perception among financial planners and has generated fashionable and often convenient advice such as recommending that individual's investment portfolio should contain a percentage equity equal to 100 minus one's age.

Marx et al. (2008) comment that life cycle may be broken into three distinctive phases, each with its own individual motives of how investments and personal money management are viewed. Firstly, during the accumulation phase a typical individual will accumulate long-term assets at an early stage of their working career. Debt management plays an important role during this stage since the debt on most of the long-term assets acquired is typically large relative to one's net assets. Secondly, the consolidation phase, where most of the individual's debt has been repaid and income will typically exceed expenses. This stage is characterized by accumulation of an investment portfolio, since the time to retirement decreases risk control and capital preservation becomes essential. Capital preservation is geared towards the maintenance of the purchasing power of an individual, thereby allowing the investor's portfolio to grow at least at the current rate of inflation. At this stage the portfolio is focused on medium risk with portfolio weighting heavier in fixed income generating instruments such as high-quality bonds or large capitalization equity issues. Thirdly, the spending phase, during which an individual is financially independent and expenses are not recovered from income received, but rather from investments and retirement portfolios. Once an individual has reached retirement age, the active reinvestment of lump sums or reinvestment of pension funds often takes place. The emphasis is on capital protection of the investment portfolio which calls for low risk investment yielding dividends or interests such as treasury bills or a form of money market fund (Marx et al., 2008).

For professional soccer players, the life-cycle savings and consumption model is critical because a soccer career is essentially short. The funds that have been accumulated during the soccer career have to sustain the player for a longer period of life expectancy. Relatively, professional soccer players do not have long working careers that allow them to anticipate the likely financial demands and challenges emanating from retirement. Furthermore, a professional soccer career lacks job security because of their contractual form of employment is highly conditional on performance. The financial planning for professional soccer players has to be realistic and consistent in the formulation of income goals given the life cycle and the risk tolerance preferences of individual investors. When an individual professional soccer player seeks professional advice of a financial planner, there is considerable research and planning that has to be conducted by the advisor before the actual portfolio construction can commence.

Problem Statement

There is a growing concern regarding financial well being of South African professional soccer players when they retire from their soccer career. This is as a result of lack of financial planning and money management skills. Many players accumulate liabilities and lack financial independence. The consequences of indebtedness are that when income increases the levels of indebtedness increases (positive correlation) (Daniels, 2001). There is a huge gap in research, particularly in the South African context that has addressed the issue of financial planning among professional soccer players. The purpose of this study is therefore to attempt to fill this void by exploring the financial planning and personal financial management of South African professional soccer players.

Methodology

A quantitative research approach was adopted for the study. Quantitative studies designs are specific, well structured, have been tested for their validity and reliability, and can be explicitly defined and recognised (Kumar, 2011:103).

Data Collection and Analysis

For the quantitative data collection, 193 South African professional soccer players who are currently playing in the Professional Soccer League (PSL) in South Africa completed a two-part questionnaire. Section A comprised items requesting demographic information of soccer players, and 15 items in Section B requested information on their financial planning and financial management.

Data were analysed using the Statistical Package for Social Science (SPSS-version 20.0). The reliability of the instrument was ascertained by using Cronbach Alpha. A Cronbach Alpha of 0.970 for the financial planning scale was recorded. This exceeded the recommended Cronbach Alpha coefficient benchmark of 0.7 (Nunnally, 1978).

Ethical Considerations

Ethical considerations are of the utmost importance because human-beings are involved. As a result, the issues of confidentiality and informed consent are inherent. Permission to conduct the research was attained from the respondents as well as respective soccer clubs in the South African PSL. All respondents were informed both verbally as well as through a covering letter of the purpose of the study. They were also assured of anonymity and confidentiality.

Results

Demographics

In terms of their playing careers 29% (n=56) of the respondents played for less than 2 years, 39.9% (n=77) played for 2-5 years and 38.1% (n=60) played for 6 years and more. The majority of players (65%, n=125) had only a matric as their highest qualification. Most of the players (49.2%, n=95) were in the 21-25 years age category and single (80.6%, n=166). Of the respondents, the majority (78.8%, n=152) was not aware of their financial worth after retirement, 55.4% (n=107) did not have any investments and 65.8% (n=127) did not receive any financial literacy training.

Financial planning and financial management

Table 1 illustrates the responses of respondents with regard to their financial planning and financial management. The results in Table 1 indicate that there are serious concerns regarding the financial planning of South African professional soccer players. The high percentage of respondents who disagreed with the statements regarding their financial planning and financial management reflects that most of the respondents have not considered or reflected on their financial security after they have completed their playing careers. The South African Football Players Union (SARFU) reported that some of the problems experienced by retired South African professional soccer players include poverty, illiteracy, poor financial planning and substance abuse (Fleishman-Hillard, 2011). However these problems vary according to individual preparation, level of education and prospective career outside soccer. This echoes the sentiments of Rintaugu and Mwisukha (2011) who indicated that the transition to a non-working environment is often most traumatic for those professional athletes who have been the most visible, having earned high incomes and have little formal education and few job skills to transfer to non-sport occupations.

It is evident from the results that many South African professional soccer players are unable to control their spending and manage their debts. A significant finding is the high percentage of the respondents who disagreed that they are able to control their debt (42%) or spending (47%), and manage their finances (40%). This may be as a result of their general spending and saving behaviour which is determined by various factors such as material possession and social needs, traditions, standard of living, existing indebtedness, net worth, disposable income, the stance of business cycle, institutional and regulatory considerations as well as fiscal and monetary policy.

Interestingly, many South African professional soccer players have not been taught the basic principles of personal money management. As a result they are not well informed about financial management and retirement options. A high percentage (50.3%) of the respondents disagreed that they had been taught basic principles of money management, and 56.5% disagreed that they were well informed about retirement options and 57.5% of the respondents disagreed that they were financially literate. Lusardi and Mitchell (2007), in their investigation on how workers collect information to make their savings decisions, demonstrated strong links between financial knowledge and financial behaviour. Using the responses to their survey, they emphasised that the lack of financial literacy bears important significances for lifetime wellbeing. The focus on low levels of financial literacy is driven by a strong need to foster sustainable, long-term economic growth. Improving financial literacy can have significant benefits for everyone, no matter what their age or income. By developing

confidence, knowledge and skills to manage financial products and services, individuals will be better able to overcome or avoid financial exclusion. Such exclusion impacts on the opportunities individuals can pursue, their sense of security and their overall emotional and physical wellbeing (ASIC, 2011).

Table 1: Financial planning and financial management

Item	Disagree % (n)	Neither agree nor disagree	Agree % (n)
I am studying for a qualification that I can use during retirement	76.6% (148)	4.7% (9)	18.7% (36)
Upon retirement I will receive a guaranteed pay-out	75.2% (145)	6.7% (13)	18.1% (35)
Retirement will give me the chance to do different jobs	62.2% (120)	18.7% (36)	19.2% (37)
I am aware of the different jobs that I can do during my retirement	59.6% (115)	21.8% (42)	18.7% (36)
I have a clear understanding of retirement planning	58% (112)	25.9% (50)	16% (31)
I will be able to manage my investments upon retirement	58% (112)	23.8% (46)	18.2% (35)
I am financially literate	57.5% (111)	28.5% (55)	14% (27)
I am well informed about my retirement options	56.5% (109)	24.4% (47)	19.2% (37)
I feel that I will be well off in my retirement	55% (106)	29.5% (57)	15.5% (30)
I feel that there are ample opportunities for my after retirement	54.4% (105)	28.5% (55)	17.1% (33)
I have been taught the basic principles of personal money management	50.3% (97)	32.1% (62)	17.6% (34)
I am able to control my spending	46.7% (90)	32.6% (63)	20.7% (40)
I am currently in control of my debts	42% (81)	38.9% (75)	19.2% (37)
I am able to manage my finances well	40.4% (78)	37.8% (73)	21.8% (42)

The high percentage of respondent who were in disagreement with the following statement: *I will be able to manage my investments upon retirement* (58%) implies that when they retire most soccer players will not be able to maintain their high standard of living consistently (Maseko & Surujlal, 2011; Ramsey, 2011). In the process they may compromise their financial independence and accumulate liabilities (Naidoo & Maseko, 2012).

CONCLUSION AND RECOMMENDATIONS

It is noted that the financial planning amongst South African professional soccer players constitutes a dynamic and complex field of study. It is rather unfortunate that most professional players in the PSL are financially ill-prepared for their future beyond their playing days. To prepare players for their future in terms of both their careers as well as financial security it is imperative for soccer clubs to provide financial education for their players so that they can understand the importance of retirement planning and become responsible for their own financial security after their professional playing careers. To infuse a radical paradigm shift on financial planning, a clause could also be included in the players' playing contract to make attendance of financial training programmes compulsory. Alternatively, players should seek the services of advisers they can trust (Hadley, 2010). An intensive programme is essential that will educate professional soccer players on budgeting, spending wisely, calculating interest rates, starting and running a business, calculating profit, and savings, among others. This will enable the soccer players to plan for a sustainable financial situation on retirement. These basic concepts are not a preserve of people in business; they are basic knowledge that everyone needs to have to enable them make right decisions about spending, investing excess resources and borrowing for various purposes.

LOCAL ECONOMIC DEVELOPMENT: AN EMERGING REALITY IN THE POST-APARTHEID SOUTH AFRICA

K.A. Mashamaite
University of Limpopo, South Africa

ABSTRACT

Over five decades the world has observed many years of unprecedented development policies and remarkable global economic growth. Despite increasing global economic growth, global divisions are increasing with economic gap between states and people growing which exacerbate poverty in most developing countries such as South Africa. Given increasing attention to poverty and underdevelopment, local economic development(LED) has become an emerging reality in South Africa due to transition to developmental local government where responsibilities to promote socio-economic development have been delegated to municipalities with the hope that governing at the local level may be easier and the notion of developmental local government may be feasible. The paper seeks to investigate the emergence of LED in South Africa since the advent of democratic state in 1994.

INTRODUCTION

The emergence of LED in recent years has attracted greater attention because of the ongoing developmental policy reforms in most countries such as South Africa (Akah, 2008). Nel (2001) and Ramukumba (2012) point out that LED has been practiced for a while in the majority of the first world countries such as the United State of America (USA) and United Kingdom (UK). While the reasons for the adoption of LED as economic growth and poverty alleviation strategies are many and varied, LED came as a result of the fall in the economic growth of most industrialised countries after the World War II (Nel, 2001; Ramukumba, 2012). Akah (2008) argues that despite the increasing attention associated with LED in recent times, there are still global divisions with economic gap between the states and people growing at a high rate in most developing countries. Millions of people previously cushioned by the state have been thrown into poverty with the transition to market economy which allowed them to face an unacceptable poverty situation and living below a poverty line (Akah, 2008). These conditions exacerbated poverty levels which ultimately compromised the abilities of the world's poorest people to exploit the available economic opportunities in most developing countries such as South Africa (Akah, 2008).

Given the increasing attention to poverty and the greater responsibilities assigned to municipalities in the economic and social development of localities, LED has since become an emerging reality in order to address the challenges of poverty, underdevelopment and rising unemployment in South Africa (Akah, 2008; Ramukumba, 2012). The advent of a democratic state in 1994 saw the inevitable emergence evolution of LED as a relatively new concept within all municipalities in the country. One of the reason for the emergence of LED in South Africa is the fact that the country is pursuing transition bridge to a developmental local government with greater responsibilities for the promotion of economic and social development that have been delegated to municipalities with the hope that governing at the local communities may be easier and developmental local government may be feasible (Akah, 2008; Ramukumba; 2012),. Since then, LED has attracted greater attention and interest from the central government and municipalities as well as within donor communities in the country (Akah, 2008). Accordingly, LED has been one of the preferred instruments for economic and social development in localities and communities to address the challenges of poverty and unemployment in South Africa.

The purpose of this paper is to investigate the emergence of LED since the democratic dispensation in South Africa. This is to determine how and why LED remarkably became one of the developmental approaches to economic growth and poverty at local communities. The paper discusses the concept and nature of LED, and also contextualises the global experiences of LED to South Africa. Furthermore, it also examines various pieces of legislation as well as policies designed to promote and support the development of local economies.

Defining Local Economic Development

According to Ramukumba (2012), it is imperative that before exploring the complexities of LED to gain some clarity on what essence the concept aims to be, however, the concept is compounded with diversities which could lead to terminological ambiguity. LED is defined as a process in which partnerships between local government, civil society and private sector are established in order to manage the available resources, create jobs and stimulate the economy of local communities (Nel, 2001; Triegaardt, 2007; Hampwaye, 2008; Mpengu, 2010; Ramukumba, 2012). LED put more emphasis on local control using the potentials of human, institutional and physical resources to stimulate local economy and job creation. LED is a 'participatory process that encourages and facilitates partnership between local stakeholders, enabling the joint design and implementation of strategies based on the effective use of local resources to create decent jobs and sustainable economic activities' (Naude and Badenhorst-Weiss, 2012, p. 51). According to Tsheola and Mokgokong (2012), LED is the process of 'incremental advancement of a combination of job creation, income generation, establishment of business partnerships, enhancement of entrepreneurship, as well as increased economic output and improved market opportunities' (p. 380).

Similarly, Ramukumba (2012) further defines LED as a process by which public and private sector as well as the civil society work collectively to create better conditions for economic growth and employment creation through the usage of available resources. As argued by Tsheola and Mokgokong (2012), LED 'manifests itself in a form of job creation, income generation, the establishment of local business partnerships, increased economic growth, improved market opportunities and enhancement of entrepreneurship at local settings' (p. 385). In light of the above, there are common similarities across these definitions of LED concept, which mainly differ in terms of specificity.

LED as a practical concept, aims to strengthen the economic capacities of localities in order to improve the future and quality of life for all (Ramukumba, 2012). It focuses on the community's competitive advantage and provides communities with the means to identify new opportunities, create jobs, income, develop local infrastructure and enhance the revenue sources for the municipality and its people (White Paper on Local Government, 1998). Thus, it lays an emphasis on local needs and the use of local resources for the development of its own economic potentials. According to Malefane (2009) and Ramukumba (2012), the main purpose of LED is to create the economic capacity of local communities in order to improve economic future and the quality of life for all.

Most communities in both the developed and less developed countries turn more increasingly to LED strategies as a response to the challenges posed by globalization and the widespread move towards decentralisation of governance to local governments (Ramukumba, 2012). 'Described as a locally driven process designed to identify, harness and utilize resources to stimulate local economy and create new job opportunities, LED has become a widely practiced and applied as a development strategy in the local government and at community levels which has since necessitated the policy considerations in South Africa' (Mpengu, 2010, p. 3; Nel, 2001).

Policy and legislative frameworks for LED in South Africa

The transition to developmental local government necessitated the need to apply and promote LED at local level to overcome the backlogs and challenges facing municipalities such as poverty alleviation and job creation in the country and resulted in a series of broadly interrelated legislative and policy considerations for LED which include the fact that unemployment and poverty situation in the country required the need to seek economic growth and employment-generating strategies at both national and local spheres of government (Akh,

2008, p. 20). The following are the policy and legislative frameworks implemented and enacted for LED in South Africa:

- **The Constitution of the Republic of South Africa (1996)**

Local government in South Africa is constitutionally mandated to promote social and economic development in their municipalities (South African Constitution, 1996; Mpengu, 2010; South African Local Government Association (SALGA), 2010). The Constitution places great responsibility on municipalities to facilitate and promote LED in the country (Triegaardt, 2007). Sections 152 (c) and 153 (a) of the Constitution provides for the municipalities to promote social and economic development of the local communities (Malefane, 2009; Mpengu, 2010). However, according to Department of Provincial Local Government (DPLG) (2006), the schedule in the Constitution that identifies the functions of municipalities does not include LED. Therefore, it can be interpreted that LED is a constitutional mandate for municipalities to promote social and economic development of localities in addressing issues of poverty and unemployment in which municipalities have a facilitating role to play in order to provide an enabling environment for investment through the provision of infrastructure and quality services, rather than programmes for job creation (DPLG, 2006; Tsheola and Mokgokong, 2012).

- **White Paper on Local Government (1998)**

The White Paper on Local Government (1998) introduced the concept of developmental local government which is defined as 'local government committed to working with citizens and groups within the community to find sustainable ways to meet their social, economic and material needs as well as improving the quality of their lives' (Triegaardt, 2007, p. 3; Rogerson and Rogerson, 2011, p. 999). The White Paper makes it quite clear that municipalities are not responsible for creating jobs but are responsible for ensuring that overall economic and social conditions of the locality are conducive to create employment opportunities. Accordingly, local government is charged with the responsibility to promote LED in municipalities by creating an enabling environment which will allow all individuals to have socio-economic conditions conducive for their daily activities (SALGA, 2010).

- **Municipal Systems Act 32 of (2000)**

According to the Municipal Systems Act 32 of 2000, all municipalities are required to develop and prepare annual and five year Integrated Development Plans that set out the development targets with detailed projects and programmes of municipalities (Allan, 2003, Triegaardt, 2007; SALGA, 2010). The Act requires municipalities to promote economic and social development. This Act obliges local government to draw up Integrated Development Plans that address spatial and transport planning, infrastructure and the promotion of economic development (Nel, 2001; Malefane, 2009; SALGA, 2010).

- **LED Policy (2002)**

The LED Policy emphasise a more community-orientated approach to LED, stressing that LED should be pro-poor orientated and target previously disadvantaged people and marginalised towns and regions. Ideally, municipalities should support local initiatives, which encourage local job creation while still responding to changes in the national and global economy (Patterson, 2008; Mpengu, 2010; SALGA, 2010).

- **Policy Guidelines for implementing LED in South Africa (2005)**

The vision that forms the core of Department of Provincial and Local Government's (DPLG) Policy Guidelines for Implementing LED in South Africa is the creation of robust and inclusive local economies that exploit local opportunities, address local needs and contribute to national development objectives such as economic growth and poverty eradication (DPLG, 2006; Triegaardt, 2007). As such, LED is designed to identify, harness and utilize resources to stimulate local economy and create new job opportunities (Mpengu, 2010).

- **National Framework for LED in South Africa (2006)**

The LED Framework focus on improving good governance, service delivery, public and market opportunities in municipalities as well as enterprise support and business infrastructure development (SALGA, 2010; Rogerson and Rogerson, 2011).

Local Economic Development as an emerging reality in South Africa

Local Economic Development, which is relatively a new development strategy in most developing countries such as South Africa, has been widely practiced for a while in most developed world countries such as the USA and UK (Nel, 2001; Mpengu, 2010, p. 2; Ramukumba, 2012, p. 10). Although there are many different reasons for the adoption of LED strategies in both developed and developing countries, this initiative is closely associated with the so-called 'development impasse' (Mpengu, 2010; Ramukumba, 2012). According to Ramukumba (2012) and Mpengu (2010) LED came as a result of the direct downfall on the economic growth of the first world countries after the World War II in 1945.

According to Nel (2001) and Triegaardt (2007), over one million jobs were lost in the 1990s as a result of poor economic performance, global competition and de-industrialization in most developed countries. The downfall of the economies in these countries exerted great amount of pressure on governments, in particular the municipalities, to be creative in attracting investments in order to improve and address the challenges facing their economies (Ramukumba, 2012). According to Bond (2001), the decline in economic growth in the global economy which started in the 1970's necessitated the need for local municipalities to be more entrepreneurial.

The world economic crisis observed during the 1970's remains as an intriguing phenomenon because of its intensity and duration which led to rising unemployment, high inflation and instability in the economic sector in most countries (Akah, 2008; Ramukumba, 2012). However, different countries and regions globally face similar challenges at varying degree and intensity. Accordingly, the macroeconomic policy instruments put in place after World War II to regulate the economy at international and national level, have seemingly reached inherent limitations or protected the interest of dominant nations such as the USA and UK as well as the powerful world institutions such as the World Bank and International Monetary Fund (Akah, 2008; Ramukumba, 2012). Since then, the overwhelming changes in the production, fragmentation of demand and continued expansion of international trade have increased the ineffectiveness of nation-states' regulatory structures and institutions (Akah, 2008).

As such, most countries such as South Africa have been forced to adopt free market policies through transnational corporations, in the hope of attracting new investments to spur development in their own countries. Transnational corporations have since become powerful to the extent that free market policies are imposed to less developed countries, while regions, localities and individuals within such setting are looking for or acting to create alternative economic possibilities that suit their needs and protect their local economic interest (Akah, 2008). With such circumstances, LED became an experimental tool in these countries to be explored not only as an alternative economic approach but also as a complementary model to overcome the weaknesses inherent in the conventional economic approach which seems to allot economic resources and processes through dominant world interest institutions (Akah, 2008).

Consequently, the world over the past decades has witnessed the emergence of LED as new local initiative that have become preferred instruments for economic development in localities and communities around the world including South Africa (Akah, 2008; Ramukumba, 2012). The evolution of LED in post-apartheid South Africa is closely linked to the transition to developmental local government to address the legacy of the past regime (DPLG, 2006). Constitutional debates on the future form and shape of local government articulated more proactive roles for municipalities during the early 1995 in the country. The declaration of local government as a sphere of government reflects the importance that was attached to local state actors during that early period. The Local Government is regarded as the sphere of government closer to the people (White Paper. Section 152 (c) and 153 (a) of the Constitution declare that a fundamental objective of local government is to promote social and economic development in localities within the country (South African Constitution, 1996; White Paper on Local Government, 1998; Nel, 2001).

The concept of LED is currently attracting considerable attention in both the government and policy agenda as well as within the donor communities such as the private sector and the rest of civil society in South Africa (Nel, 2001). Hence, LED is enjoying widespread acceptance and credibility in the country. Nel (2001) emphasises that although there is common agreement on the concept of LED, only few tangible results have been achieved since LED emerged on national development policy agenda. Many decades of apartheid regime in

South Africa eroded the capacity of most community initiatives aimed at the promotion of economic development as well as addressing issues of poverty and underdevelopment at local level (Nel and McQuaid, 2002). It was only after the collapse of the apartheid regime in 1994 and the initiation of development policy reforms that LED began to emerge to any significant degree in the country.

LED in South Africa is motivated by appalling levels of poverty and underdevelopment of local communities, and the need to address the apartheid legacy (Nel and McQuaid, 2002; Triegaardt, 2007). Accordingly, the main aim of LED is to address the inherited inadequacies and the failure of apartheid policies to facilitate equitable economic growth and social development in an effective manner (Malefane, 2009). Since the onset of democratization in South Africa, local stakeholders and communities in the country are now having more opportunity to participate in the promotion of economic activities at the local level since unemployment and poverty is most felt at this level. As such, LED has recently been adopted as an approach to create more equitable economic growth in South Africa in order to create conducive and enabling environment for local communities to exploit economic opportunities. Rogerson (2001) argues that LED should be an integrated and multi-disciplinary approach aimed at poverty alleviation through pro-poor economic growth which involves supporting sustainable economic activities in the municipalities.

The unique nature of LED in South Africa is based on the fact that there is significant endorsement for LED interventions and the wide spread application of LED interventions within the country (Nel, 2005). With such attention to LED by the government and other key stakeholders and the prioritization of the needs of the poor, the country serves as learning laboratory with respect to policies of LED on the continent (Nel, 2005; White Paper on Local Government, 1998). This therefore makes the case of LED in South Africa very significant.

CONCLUSION

The paper discussed LED in South Africa and how it emerged as a new developmental approach or strategy to create enabling and conducive environment for socio-economic development in the country. It can be concluded that the concept of LED is relatively new strategy which gained much attention after the advent of new democratic South Africa in 1994. Since then, LED emerged as new developmental strategy aimed at creating enabling environment for both social and economic development through ensuring that it improves the quality of lives for all citizens in the country. As such, municipalities in the country are recognized as the implementation agents of LED on behalf of the central government and must strive to provide a positive and conducive economic climate for all individuals within their municipalities. However, LED since its initiation, has not live up to its expectations and the success stories regarding the strategy have been very limited in terms of sustainable processes. Therefore, the strategy should be reviewed and revitalised if the aim of the strategy is to be realised in the country.

Given that, municipalities as agents of development, must also focus on improving the quality of life by providing in the basic needs of the local residents. As part of the process of developmental local government, the inclusion of all citizens should be compulsory and that policy and legal frameworks should be adhered to as the guidelines of achieving the aim of LED. LED experiences in South Africa are making a contribution to the debates in the international development arena, as such LED should be highly prioritized as one of the development strategies to address the challenges of underdevelopment and unemployment in the country.

THE INDEBTEDNESS OF PUBLIC SERVANTS IN THE PUBLIC SERVICE IN SOUTH AFRICA

Polly Mashigo and Masello Sekhukhune
Tshwane University of Technology, South Africa

ABSTRACT

The management of personal finance by public servants in the Public Service is endemic to the integrity with which they manage finances. There are concerns and indications of over-indebtedness of public servants in the Public Service in South Africa. The objective of this paper is to investigate the extent to which public servants in the Public Service are indebted and to determine the causes and the impact of such indebtedness. Literature review on indebtedness was done. The paper draws on the report released by Public Service Commission in 2007 on indebtedness of public servants in South Africa. Key findings reveal that public servants witness the greatest increase in the number of loans and percentages of indebtedness in the Public Service. Based on these findings, this paper recommends that urgent measures be put in place to deal with explosive debt crisis in the Public Service.

INTRODUCTION

South Africa has witnessed extraordinary growth in unsecured micro lending over the past few years which resulted in microloans being easily accessible to the greater public. (James 2010; Johnson and Rogaly 1997). While there is an increasing need for financial services to cater for a wide variety of applications (such as food, education and clothing as well as unforeseen circumstances like illness, theft and deaths) but this has to be coupled with the ability to manage personal finances in a disciplined manner (Gordhan 2012; Whiteford and McGrath 2000). According to Devpruth, manager of statistics at the National Credit Regulator (cited by De Waal 2012), South Africans owe some R1.3 trillion in consumer debt. This includes all outstanding debt balances including mortgages, vehicle finance and unsecured loans. Almost half of South Africa's population is trapped in debt spiral and are financially unwell due to poor financial management (Times Live 2012).

Public servants, are expected to possess the ability and competency to manage personal as well as government's financial resources in a more responsible, effective and disciplined manner. Public Service Commission (2007) maintains that accessing microloans and other credit is sometimes necessary to alleviate temporary financial challenges but the concern is when such debt is acquired as a result of over-indulgence therefore causing over-indebtedness. Governance without effective managerial leadership becomes futile in the provision of services to the public. There is, however, an unfortunate history of over-indebtedness among the public servants in the South African Public Service. When public servants in the Public Service are unable to manage their personal finances and take out loans which they cannot service, this poses a serious challenge in ensuring good governance or accountability for public resources. A bad financial administration is likely to fuel a negative perception about the standard of ethics in the Public Service (Public Service Commission 2007).

In addition to other credit, Baumann (2001; The World Bank 2002) indicate that most people are heavily dependent on the micro-lenders and informal local moneylenders for the provision of microloans/credit which is available at high interest rates and this also causes them to be trapped in debt spirals. An inability to service the micro lending debt leads to garnishee orders being issued against public servants who default on repayments.

RESEARCH OBJECTIVE

The objective of the paper is to investigate the extent to which public servants in the Public Service are indebted and to determine the causes and impacts of such indebtedness.

Research Methodology

Literature review on public servants' indebtedness was done. In November 2007, Public Service Commission released a report on the indebtedness of public servants in South Africa for the period 2006/2007. The comparison on income and expenditure surveys was compared in respect of trends in indebtedness, nature of debts and vulnerability. It focuses on government officials at the National and Provincial levels. Against this background, the paper attempts to discover the causes and impact of indebtedness of public servants in the Public Service in South Africa.

Research Problem

The underlying problem confronting public servants is over-indulgence in acquiring loans and this result in over-indebtedness and inability to service the loans. This is likely to fuel a negative perception in ensuring accountability for public resources. This also diminishes their wellbeing and negatively affects their productivity. In the final instance, garnishee orders are being issued on the public servants who default on repayments. It is questioned if they are able to manage and administer government's financial resources.

LITERATURE REVIEW

The South African Public Service

The South African Public Service plays a crucial role in service delivery. A Public Service is a service which is provided by government to people living within its jurisdiction, either directly (through the public sector) or by financing private provision of services (Naidoo 2004). It is associated with a social consensus (usually expressed through democratic elections) that certain services should be available to all, regardless of income, race or gender. Public services are considered to be so essential to all that for moral reasons their universal provision should be guaranteed (Siswana 2007; Naidoo 2004). Public servants refer to any individual employed by the government to render public services like educators, the South African Police services (SAPS) and health services. Public servants are expected to manage government's financial resources in a competent, efficient and disciplined manner. The wellness of public servants is a critical aspect of the government to create an effective and productive public service that is committed to service delivery. It becomes necessary to ensure that and assist public servants to manage not only their personal finances but also state's financial resources in a responsible and transparent manner. There are, however, concerns about the number of public servants who lack skills to manage financial resources and this is likely to fuel negative perception about the standard of ethics within the Public Service (Da Costa 2008; Public Service Commission 2007).

Public servants, like other individuals in South Africa, have access to financial services, especially credit. There exist many financial institutions, formal and informal, competing for clients and offering different financial products and/or volume of transactions. While banks are the main providers of financial service, the micro lending industry has also developed on a faster rate focusing on consumer credit (Meagher and Wilkinson 2001, Mashigo and Schoeman 2011). While it is acknowledged that access to credit is sometimes necessary to deal with temporary challenges, serious concerns are when public servants acquire such credit or debt as a result of over-indulgence. Da Costa (2008; Public Service Commission 2007; Schicks 2013) found that public servants over-indulge to an extent that they are reeling under a mountain of personal debts and are indebted and trapped in debt spirals. Indebtedness means using loans to pay off other loans and by allocating more than fifty percent of monthly net income to loan repayments (Schicks 2013). It is a financial state that imposes restrictions on the household's ability to repay their total outstanding debt. Some public servants take loans from more than one lender at the same time and accumulate more debts than they can handle. They even take out new loans to pay off existing ones (Schicks and Rosenberg 2011). According to the Public Service Commission (2007), the repayment of debts is made through the government's personnel and salary administration system (PERSAL) to

the lenders, and in most cases, to micro-lenders. Due to their inability to service their debts, garnishee orders are ultimately being issued on public servants. The commission further indicates that payments made through the PERSAL as well as garnishee orders place a huge burden on the public service and this has negative impact on their well-being and, in the final instance, productivity (Da Costa 2008).

Access to Formal Financial Services

Financial services entail a broad range of financial products. The term financial services, according to Greene and Berroth (2002), are about enabling people to amass usefully large sums of cash. Financial services include, among others, savings, credit, transmission of cash from one place to the other as well as other relevant financial products. The provision of financial (or banking) services is one of the major objectives in South Africa. The formal financial sector in South Africa is well developed and highly concentrated in urban areas in terms of services available and the volume of transactions (Mashigo 2007). Banks are the main providers of financial services, especially credit facilities. Banks compete for clients with ownership of mortgageable property of relatively high values. They target people who possess pay slips as proof of employment and collateral as security for loans. For the banking sector, collateral plays an important role because it insures repayment if the borrower's income is insufficient (James 2010). This carries with it the transaction and administrative costs, interest rates, and the costs of acquiring information about the borrower. Electronic banking, though convenient for clients, easily enables public servants to have access to the necessary technology to solicit multiple loans. Greene and Berroth (2002) point out that the environment in which majority of public servants live or work has high net worth demographics, electricity and communication channels, and therefore makes them part of these new ways of banking.

In addition, while the micro lending industry steadily grows on the basis of focusing on consumer credit and is regarded as a central poverty alleviation and a means of deriving economic growth (Van de Ruit 2001; Mashigo 2007), the industry is also easily accessible by both the medium- and high-income earners among which are public servants such as educators, the South African Police Services (SAPS) as well as the managers, Directors-General and Deputy Directors-General in the Public Service (Public Service Commission 2007). The industry was intended to distribute small-scale loans to the poor households who have been marginalised by the formal banking sector. The industry, like the banks, also targets clients with proof of employment and is characterised by large disparities in access, cost and types of credit provided based on income levels. The operation and regulation of the industry, which is aimed at protecting borrowers from exploitation and lenders from reckless lending, instead allowed lenders to charge interest rates that exploited borrowers who end up not having access under a controlled interest rate. Aggressive or reckless lending by micro-lenders places vulnerable borrowers in a debt spiral by lending them more than they can afford.

Furthermore, when access to formal financial services is exhausted, public servants look for alternative sources of finance such as the local informal moneylenders who are regarded as responsive to their financial needs at that time. These moneylenders provide lending of an emergency type and are usually operating outside the legal provision for lending (Greene and Berroth 2002). The moneylenders offer vulnerable clients loans of various amounts at exorbitant interest rates. The moneylenders are required to lend within the Usury Act's interest rate limits which are between 29 and 33 percent per year (Greene and Berroth 2002) but exploit clients by charging them monthly interest rates of between 40 and 60 percent (Mashigo 2007). The lenders operate in the black communities such as the townships, rural areas and corners of small cities. Micro Lenders Association (MLA) 2002) refers to them as unpleasant and shady characters who choose to remain faceless and with no physical buildings/offices or fixed addresses and show no mercy in their dealings with their clients.

An Overview of Micro Lending/Finance in South Africa

The concept of micro lending, according to Porteous (2001; Murdoch 1999), is derived from numerous examples of traditional informal financial systems that have existed around the world for many years. Micro lending emerged in its current form as an alternative to conventional banking, and micro credit has become a major tool of development among poorer segments of society. Micro lending, in which vital components include access to credit, savings, and insurance schemes, involves the distribution of small-scale loans to poor households (Meagher and Wilkinson, 2001). The micro lending sector differs from the banking sector with respect to client

features, loan portfolios, culture, and institutional structure. Micro lending/finance was founded on innovative financial contracts and products, and new attitudes other than conventional insurance mechanisms, to extend credit to the poor. In developing countries it is founded on, and generally made through, the dominant social technology, the so-called minimalist solidarity group lending method, developed by the Grameen Bank of Bangladesh in the 1970s which started shaping the modern industry of micro lending (see Mashigo and Schoeman 2011; Porteous 2001; Murdoch 1999). At that time, micro lending initiatives introduced many new innovations which, among others, removed the need for physical collateral and decreased asymmetric information problem and people could be relied on to repay their loans using joint-guarantees. The clients are expected to form groups through peer group self-selection, depending on self-formulated rules in terms of peer review to ascertain trust and a thorough knowledge of each member's life circumstances and to overcome uncertainty in the absence of financial collateral. These rules make transaction outcomes predictable and restrict the discretion of the individual.

Today, practitioners and governments around the world, including South Africa, are increasingly focusing on expanding financial services to the poor and low-income in frontier markets on the integration of microfinance/lending in financial systems development. The micro finance industry in South Africa is, however, also easily accessible to even the middle- and high-income earners (Mashigo and Schoeman 2011). The main concern is the continuing reckless lending by micro-lenders who place borrowers in debt spirals.

Regulation of Micro Lending In South Africa

South Africa took initiatives to protect consumers/borrowers from usurious exploitation by placing limitations and responsibilities on micro-lenders. Since there was no regulatory body in the past, especially before 1992, most micro-lenders conducted business in any way they liked and many borrowers suffered from their exploitative nature (Mashigo 2012). Micro-lenders used illegal methods to conduct lending and borrowing activities, for example, illegal provision of credit and collection methods were used. Micro-lenders commonly charged exorbitant interest rates on loans, took their clients' bank cards, personal identification numbers (PIN), pay slips and identity documents as prerequisite for obtaining a loan, and so that they can draw interest and redemption payments from the cash dispenser after pay has been remitted to the borrower's account (Meagher and Wilkinson (2002). Since 1992, the micro lending industry in South Africa grew significantly on the basis of focusing on consumer credit and experienced exponential growth. It has become a mainstream development activity and a means of deriving economic growth. According to Baumann (2001), 1992 marked the exemption of small loans from the interest rate limitation. The state issued an Exemption to the Usury Act of 1992 that removed interest rate ceilings on small loans under R6 000 with a repayment period of less than thirty-six months. The purpose of the Usury Act of 1992 was to place limitations and responsibilities on micro-lenders to protect consumers from usurious exploitation. Baumann (2001) mentions that this resulted in the tremendous growth in the micro lending industry with a central focus on providing short-term cash loans at very high interest rates on a large scale. Due to the aggressive lending by formal as well as informal (township) moneylenders and the uninformed and vulnerability of borrowers, these borrowers found themselves in a spiral of debts.

Although micro-lenders were forbidden by law to engage in harmful and exploitative practices, Public Service Commission (2007; Mashigo 2012), found that some still do and the practice is very prevalent in small cities, townships and/or rural areas. This provided the impetus for a second and new Exemption to the Usury Act in 1999 (Meagher and Wilkinson 2001). This, therefore, resulted in an establishment of the Micro Finance Regulatory Council (MFRC) in 1999 as a regulatory body and the new regulations to govern the industry. This called for revisions to the amount of small loans to be increased from R6 000 to R10 000. The main purpose of the MFRC was to promote sustainable growth of the micro lending industry, serve the unserved credit needs, while ensuring that consumer rights are protected. The lenders only focused on the low-income borrowers who were formally employed so that their salaries could be tapped to ensure repayment of the loans. The requirement is that borrowers become bank customers so that repayment is guaranteed through the provision of a bank debit card and personal identity number (PIN) to the lender. The vast majority (up to 80%) of the South African low-income groups continued to borrow funds from micro-lenders as an alternative source of finance (Micro Finance Regulatory Council 2003; Grenfell 1999).

In spite of these initiatives by government to protect consumers' rights, exploitation of borrowers by micro-lenders continues to be serious cause for concern. Poor information flow between the lenders and borrowers, for example, contributed to borrower exploitation, that is, lenders not providing accurate information to the borrower about the rules and regulations governing the micro lending business and the implications of the cost of lending. This compounded the danger of over-indebtedness. The concern raised by Baumann (2001) is that the dependence of people on micro-lenders leaves them deeply vulnerable to losing any scarce assets they may have and to rising cycles of indebtedness.

The weakness of the micro lending sector, according to Staschen (1999), is that it is largely unregulated and even unscrupulous lenders who exploited the borrowers by charging them exorbitant interest rates and causing them to be over-indebted entered the sector. Disclosing personal identity numbers and surrendering the bank cards violate the banking confidentiality and increases the danger of fraud on the side of the micro-lenders because the borrowers, including public servants, are vulnerable to exploitative practices of these micro-lenders who charge exorbitant interest rates. Some of the public servants lack experience in personal finance and do not know exactly how much is deducted from their accounts (Mashigo 2007). High interest differentials among different providers with identical products indicate lack of effective regulation. This exacerbates, instead of reducing, exploitative practices of micro-lenders. Another contributing factor was that the MFRC was unable to enforce the regulation on the entire micro lending industry. Meagher and Wilkinson (2001) emphasise that there still exist a large number of unregistered lenders who contravene the Act by offering vulnerable borrowers loans of various amounts and at exorbitant interest rates.

The challenge facing South Africa was to revise the legislation governing micro lending. Given the weaknesses in consumer credit legislation in South Africa, a regulatory framework, the National Credit Act No. 34 of 2005 (NCA), was introduced and came into force on 1 June 2007 repealing numerous legislations, including the Usury Act of 1968 and related subordinate legislation that allowed micro lending (Bankseta 2006). The main purposes of the NCA include improving accessibility of the credit market to all South Africans, including the previously disadvantaged consumers, enhancing consumer rights and education, consistent treatment of all consumers and credit providers, as well as promoting responsibility in the credit market by encouraging responsible borrowing, avoiding over-indebtedness and discourages reckless credit granting by credit providers (Republic of South Africa 2005; Bankseta 2006). This means the Act provides for consumer rights including protection against discriminatory and unfair credit market practices such as over-indebtedness. In order to achieve the purposes of the NCA, the National Credit Regulator (NCR) has been established in terms of the Act to oversee the NCA and to regulate and enforce consumer credit. In developing an accessible credit market, the NCR's role is to promote and support a credit market and industry that is fair, transparent, responsible, efficient and accessible.

In light of this, the legislation proved unable to enforce the regulation on the activities and practices of all the lenders, for example, informal and/or unregistered micro-lenders operating lending and borrowing businesses in the black townships, rural areas and small cities in urban areas. These lenders, according to (James 2010), contravene the legislation and continue to do business as normal and impact negatively on vulnerable borrowers by offering them multiple loans and at very high interest rates, causing them to be over-indebted. Mashigo (2007) found that the lenders continue to confiscate vulnerable borrowers' bank or ATM (Automated Teller Machine) cards and using these to withdraw the money owed to them at the end of the month. This, in itself, presents conflicting objectives between the regulation and the operation of micro-lenders. The regulation ignores the fact that these informal lending practices are continuing and intensifying and these micro-lenders are difficult to track and regulate.

The Causes and Impact of Indebtedness on the Public Servants

It becomes imperative in this paper to highlight what causes borrowers' indebtedness. Wisniwski (2010) found that most of the micro-lenders use persuasive sales techniques to attract borrowers and/or public servants to access loans from them. Micro finance institutions (MFIs) drive public servants to indebtedness, for example, by using over-aggressive sales and marketing techniques that pressurise public servants to take out a new loan after they have paid off existing ones. According to Mashigo (2011), some use eye-catching debt phrases such as "buy without deposit", "no payslip needed", "swipe your card five times in a month and stand a chance to win R50000

(\$5.556)”, “are you blacklisted? We can assist you remove your name”. Such techniques and phrases can incite borrowers to borrow beyond reasonable limit and place them in financial distress (Schicks 2013). Some of the practices relate to self-incentives that accrue to lenders than considering borrowers’ financial situations. Examples of such are using a volume-focused incentive system, where loan officers are rewarded for disbursing massive loans even if clients struggle to repay.

Many borrowers are vulnerable to indebtedness. The majority of public servants, for example, are unable to determine the total cost of credit such as how much interest rate is added to the initial loan but for as long as money is made available by the time it is needed (Mashigo 2011; The Education and Compliance Directorate 2013). In the absence of a credit reporting service, lenders find it harder to assess client repayment capacity because they have no way of knowing about clients’ repayment obligations to competing lenders (Schicks and Rosenberg 2011). Where the lenders are not assessing repayment capacity, ever increasing loan sizes can eventually outstrip borrowers’ ability to repay. The tendency of lenders to gradually increase loan sizes puts public servants at risk if there has not been sufficient investigation of their ability to repay (Schicks and Rosenberg 2011). The moneylenders, for example, provide instant cash to individuals without first checking whether the individuals are already indebted or not. Their practices are motivated by the inability of the government to track and regulate them and therefore operate illegally and in whatever manner they like (Mashigo 2012). Public servants also utilise financial services of these moneylenders who exacerbate their already existing debt problem. Bad borrowing decisions can also push public servants into situations where it is very difficult or impossible to repay their loans. Schicks and Rosenberg (2011) mention that public servants consistently make choices that diminish their well-being in significant ways. If public servants take loans for non-income generating purposes, then the loan use does not generate returns that compensate for the interest expense. In addition to this, lenders sometimes fail to give borrowers (public servants) clear and accurate information about loan costs and its terms, which could be communicated in a format that supports good decision-making. Concerns raised by De Waal (2012) are that the interest rates charged by the MFIs are higher than those charged by commercial banks and margins in unsecured personal lending are huge, while margins in banking products like credit cards, overdrafts, home loans and even asset-based finance like car finance are much smaller and consequently less profitable.

MFIs’ operations may reduce public servants’ ability to make smart choices if their advertising and face-to-face marketing do not communicate loan conditions including pricing in accurate, fair and easy to understand terms. Schicks (2013) indicates that where public servants are not informed about the total interest charged, they strongly underestimate the repayment periods and total amount to be repaid and may borrow more than they can handle.

The impact of indebtedness is also crucial in determining the manner in which public servants manage financial resources. There are various ways in which indebtedness impacts on public servants. Productivity is a fundamental aspect of service delivery in the Public Service. When public servants are indebted, this impacts negatively on service delivery and poses a serious challenge not only in ensuring good governance or accountability for public resources management but also in managing their personal finances (Center for Financial Inclusion 2008). The majority of the public servants who are indebted end up suffering from stress, anxiety, and the worst scenario, depression. As a result, they end up being referred for counseling and treatment. Coupled with this, is the problem of lack of money to attend such counseling and treatment. The problem may be exacerbated by the likeliness to skip recommended test, treatment, follow-up or visits to their medical practitioners (doctors). Public servants are directly affected by indebtedness in that they may need more money for hospitalisation, treatment and medication and this can indirectly affect the state in that these public servants are unable to work to their maximum capacity and this negatively impacts on productivity (Center for Financial Inclusion 2008).

For effective and increased level of productivity needs employees who are in a good state of health and mind. Once health problems are experienced by employees as a result of financial distress, this is bound to have a negative impact on their level of productivity (Public Service Commission 2008). Other contributing factors that negatively impact on productivity are ill-health, absenteeism and poor performance. If a person already suffers from one or other types of illness, financial distress could worsen his/her condition, resulting in the employee being away from work for an extensive period of time.

Schicks (2013) emphasises that indebtedness poses a serious risk to the micro finance institutions (MFIs) in that it contradicts the institution's social mission as it can worsen the poverty of microfinance customers, threaten their social positions and lead to psychological disorders. People who are affected by micro lending debt and especially garnishee orders tend to get sick more often than persons not affected by such a problem (Public Service Commission 2007). The other contributing factor is that most of the public servants who own bond houses are affected by fluctuations in interest rates. The increase in interest rate ultimately reduces their income and that leads to the drop in the general living standards (Center for Financial Inclusion 2007). This directly causes some of the public servants to fail to commit to repayment of their bonds. Those residing in leased properties fail to pay their rent and are as such evicted from the properties. Where bills for water and electricity services are not paid for, such services are then disconnected by the municipality from the houses and/or properties (Center for Financial Inclusion 2008). In the long-run, the creditworthiness of these indebted public servants can be negatively affected to an extent that they are permanently marginalised from accessing further credit. This is supported by Karley (2003) who found that about 29% of the South African population is unable to access credit partly due to indebtedness.

The indebtedness of public servants can impact on policy-makers and cause them (policy-makers) to destabilise the micro finance industry which might end up denying many potential borrowers access to credit. This poses a risk of backlash from donors, public and social investors, who may withdraw their funding, not only microcredit but microfinance in general (Schicks and Rosenberg 2011).

Schicks and Rosenberg (2011) found different levels of indebtedness. These include, among others, transitional over-indebtedness, pauperisation and extreme dependence. While, on the one hand, transitional over-indebtedness is when public servants spend their income servicing the debt to an extent that it leads to a poverty trap and prevents any accumulation of assets, pauperization, on the other, is when public servants go to an extent of selling their assets to finance their debt but the debt levels continue increasing with no realistic prospect of meeting their repayment obligations in the long run. Extreme dependence is when public servants depend on kin support for daily survival and have no possibility of ever repaying their debt (Schicks and Rosenberg 2011). The impact on public servants is complete loss of self-dignity and complete social isolation.

To augment their low levels of income as a result of indebtedness, public servants usually end up engaging in additional remunerative work outside the Public Service in an effort to try service their debts or ease their level of indebtedness. The fatigue and stress that is associated with the holding of two jobs at the same time is likely to impact negatively on the state's capacity to carry out its mandate of service delivery (Public Service Commission 2007). The level of indebtedness among public servants can result in the erosion of their ethics and morals to an extent that they may be enticed to commit corrupt practices by accepting bribes and committing fraud as a remedy to their financial strife (Public Service Commission 2008).

In the extreme cases, stress factor such as financial difficulties or indebtedness has shown to lead to suicide (De Waal 2012; Biswas 2010). The most common used method of suicide includes hanging, pesticide poisoning (eg rat poisoning), firearms and self-immolation (setting oneself on fire). Biswas (2010) mentions that government report in India revealed that more than 80 people have committed suicide due to micro loans default. Some indebted borrowers suffer from heart attacks due to the pressure exerted by micro finance institutions for repayment of debts (Biswas 2010).

Garnishee Orders

As alluded to above, access to credit is sometimes necessary to deal with temporary challenges, however, serious concerns are when public servants acquire such credit or debt that they are unable to service. In the final instance, garnishee orders are being issued on the public servants who default on repayments. A garnishee is a court order that is served by the sheriff or messenger of the court on the employer ordering the employer to make deductions from the employee's salary or wage in settlement of a debt owed by the employee to a third party creditor (Allwright 2012) or a process of petitioning for and getting a court order directing a person or entity (garnishee) to hold funds they owe to someone who allegedly is in debt to another person, often after judgement has been rendered (Hill and Hill 2005). A specified amount of money is deducted from the employee's salary or wages each time the employee is paid until such time the debt has been paid in full. A court will only make such

an order where it is satisfied that there is valid underlying debt, or there has been a valid written consent to the order being taken, or the court has previously made order instructing that the debtors (employee's) salary or wage be attached (Allwright 2012).

These garnishee orders impact negatively on debtors in that some of them do not fully understand the cost of an order, their obligations in terms of an order and how fees and interest influence the repayment period (Arde 2012). In addition to excessive legal fees that are charged, some irregularities include wrong capital amounts that are impossible for a clerk of the court to detect (Allwright 2012; Road 2008). Furthermore, there is also no statutory cap on the amount that can be deducted from the debtor's salary. The law only states that the deduction must not cause the employee not to have sufficient means for the maintenance of himself and his dependence but it is very common for a garnishee order to result in near-zero or even zero take-home income (Arde 2012). Allwright (2012) also found that poor administration by credit providers often leads to a situation where the same debt is handed over to different attorneys for collection. Road (2008) further indicated that debtors sometimes receive garnishee orders even if their loans are fully paid. This problem emanate from a situation where garnishee orders are issued from court which is unknown or inaccessible to the debtor. The law states that the garnishee order must be issued from the jurisdiction of the debtor's employer (Arde 2012). Most of the garnishee orders bear forged signatures and other sections of the documents are incomplete and salary deductions are done without the debtor's consent (Arde 2012, Road 2008). Debtors balances are sometimes affected by miscalculation made by attorneys wherein certain payments made are not recorded (Arde 2012).

RESEARCH FINDINGS AND DISCUSSIONS

The research found that 1.2 million public servants are indebted to micro-lenders. The total debt owed to micro-lenders by public servants amounted to R13,3 million during 2006/2007 financial year. Of this amount, R3,3 million (25%) is attributed to employees in the National departments (example. senior managers, Directors-General, Deputy Directors-General and heads of departments). The remaining R10 million (75%) is attributed to public servants based in Provincial departments (Public Service Commission 2007). Major concerns raised in this paper is that senior managers, who are high-income earners, are supposed to possess skills and competences to manage finances in a responsible and disciplined manner so that they are able to effectively deliver services to the South African community. It becomes questionable if these senior managers are able to carry out their employment responsibilities as they should and this deficiency impacts on their productivity. It was found that 4063 public servants made payments to micro-lenders through PERSAL and of these, 1304 (32%) were officials at Provincial level and 2759 (68%) at Provincial level. The majority of public servants who made payments to micro-lenders fall within the age group 40-49, and then 50-59 (Da Costa 2008). Other occupations such as the South African Police Service (SAPS) recorded the second highest number (843), followed by 299 of the occupational category Cleaners and 226 of the Nursing occupational category (Public Service Commission 2007).

It is imperative to emphasise that while it is found that public servants are indebted to micro-lenders as alluded to above, we argue that other sources of finance such as informal moneylenders also contribute to indebtedness. They offer unsecured loans at illegally high interest rates to individuals, often forcing repayment by blackmail or threats of violence or bodily harm (Mashigo 2012). These moneylenders were and still are regarded as very helpful, especially to those who are experiencing financial distress and need cash. When there is no other alternative for borrowers, the lenders appear to be the solution, and specialised in short-term loans, generally for thirty days. They were and still are most prevalent in black communities like townships and rural areas and lend mostly to people whose ability to repay can verify. The underlying problem is that these moneylenders place borrowers in debt spirals by providing instant cash to individuals without first checking whether such individuals are already indebted or not. The problem continues to exist due to inability of the government to track and regulate them.

It was further found that out of R1.2 million public servants, 216857 of them made garnishee related payments through PERSAL amounting to astronomical debt of R1 billion (around \$9 billion). R235 million (around \$2115 million) (23%) is attributed to garnishee orders paid by 59987 (28%) senior officials in the National departments and R776 million (77%) to 156870 (72%) by officials in the Provincial departments.

Given these figures, it is evident that indebtedness level is more pronounced at the Provincial than National level. These are indications of lack of proper financial planning by public servants especially on Provincial level. In view of these, if serious measures are not taken and put in place this situation will be damaging not only to the Public Service, but also to South Africa as a nation.

CONCLUSION AND RECOMMENDATIONS

The paper analyses the indebtedness of public servants in the Public Service in South Africa. It is evident that public servants are trapped in debt spirals and struggle to cope with their personal finances. The indebtedness has negative impact not only on them, but also on the Public Service as the employer as well as the public at large. While public servants are indebted to micro-lenders, we argue that alternative sources of finance such as informal moneylenders are sought and these exacerbate the problem. Tracking and regulating these lenders in South Africa appears to be difficult.

Although there is regulation governing micro-lenders, there are still increasing indications of reckless lending by most micro-lenders which place public servants in financial distress. This is evident from continuous court cases in South Africa pertaining to reckless lending and garnishee orders issued to public servants.

The alarming amount of debts as well as garnishee orders issued to public servants in the Public Service, especially senior officials at National and Provincial levels are serious concerns that need to be addressed. They are thus involuntary consumers of debt and have a high propensity to become permanently indebted. It is in this regard that urgent measures be put in place to assist public servants and deal with explosive crisis they face.

It is, therefore, recommended that to overcome the problem of indebtedness in the Public Service, PERSAL database needs to be continuously updated and audited so that the gaps and weaknesses can be identified. All debts of public servants should be included in the database to determine affordability and this will reduce indebtedness. In addition to this, credit bureaus should be reviewed in order to strengthen coordination and cooperation among lenders in general. This will ensure that total debt per public servant is disclosed to all lenders to limit credit exposures.

It is further recommended that public servants be educated through targeted borrower education programmes to improve their personal finance skills and to conscientise them about the implications and the cost of credit that impact negatively on them. In so doing, garnishee orders will be curbed. It is also important that regulators should learn from the failures of the previous regulatory framework and ensure that a sustainable and effective regulatory framework is structured, and not the one that repeats failures of the past. The framework should effectively minimise or reduce aggressive lending by micro-lenders while limiting access to loans by public servants/borrowers.

Furthermore, measures to track the formal micro-lenders who exploit public servants and contravene the rules have to be put in place or improved. The question for further research is how to track informal moneylenders in order to improve the operation of the micro lending sector?

SMALL BUSINESS DEVELOPMENT IN SOUTH AFRICA: BEST PRACTICES AND LESSONS FROM INDIA

Polly Mashigo
Tshwane University of Technology, South Africa

ABSTRACT

The paper assesses the development of small businesses in South Africa in an effort to alleviate poverty, create jobs and improve livelihoods. Lack of financial resources needed for investments in productive assets and to develop their businesses is a common problem confronting many small businesses. This paper analyses best practices and lessons from India to determine how small businesses are financed, promoted and developed. Lessons from India reveal that specialised and dedicated financial institutions, schemes and development institutions that have been established are successful in financing and developing small businesses. Based on these findings, it is recommended that effective financial institutions (especially banks), be established in South Africa to support and finance small businesses using different approaches.

INTRODUCTION

Small businesses/enterprises play a critical role in economic growth and development, and economic empowerment. Their main aims are to create jobs, alleviate poverty and sustain livelihoods. Government in South Africa had intensified its efforts to unlock the potential of the small business sector as a whole by creating a business environment that is market-driven and conducive to the entrepreneurial endeavours of all South Africans (Department of Economic Development 2010). After the political transformation of 1994, the South African government published, in 1995, its White Paper on the National Strategy for the Development and Promotion of Small Business in South Africa to create an enabling environment for the accelerated growth of the small business sector (Department of Trade and Industry 2003). A year later, in 1996, the National Small Business Act was promulgated to define the small business sector and classified it into four categories, namely, micro enterprises, very small enterprises, small enterprises and medium enterprises. Micro enterprises are described as those between one to five employees, usually the owner and family, with no license or formal business premises, have labour legislation and turnover is less than VAT registration limit of R300 000 per year. Very small enterprises have less than ten paid employees, use technology and operate on the formal market, include self-employed artisans and professionals. Small enterprises have less than 50 employees, are formally registered with fixed business premises and with the owner managing the business (no longer directly supervised) but more complex management structure. These enterprises have the ability to make the transition to medium-scale enterprise. Lastly, medium enterprises have less than 100 employees with mainly owner managed but decentralised management structure with division of labour. These enterprises operate from fixed premises with all formal requirements (Department of Economic Development 2010).

It is evident that all these enterprises, given their different categorisation and definitions, need different support strategies for their development. However, the National Strategy for the Development and Promotion of Small Business in South Africa was later on (around 2004) plagued by a host of problems which include poor/non-delivery by institutional structures. For example, the Strategy failed to differentiate between the different sectors of small business and an umbrella strategy, instead of different ones, was adopted to develop these businesses (Isern and Porteous 2005). This impacted negatively on job creation, economic growth and poverty alleviation. In an effort to address these, the South African government developed and adopted, in 2004,

the Integrated Small Business Development Strategy (ISBDS) in South Africa for over ten years (2004-2014), an economic strategy towards the promotion and acceleration of entrepreneurship and small enterprises as a means for employment generation and creating sustainable livelihoods (Department of Economic Development 2010). This is an endeavour to target different segments of enterprises or businesses to stimulate entrepreneurship through, among others, financial support initiatives and regulatory reform. The general small, medium and micro enterprises (SMMEs) were developed and regulatory frameworks and strategies or institutions to promote their growth introduced. However, these enterprises, according to Zingoni (2010), are one of the most important and yet most problematic for government and policy-makers due to their low growth rates and inability to create sufficient employment.

The concern raised here is that none of the established financial support institutions or strategies is targeted towards different kinds of enterprises. Njiro and Compagnoni (2010; Mashigo 2012) argue that institutions providing support to the enterprises operate in isolation and this creates duplication and overlap of some services. Furthermore, although microfinance institutions offer an essential financial service in the economy, information on these services is not effectively disseminated to all township and rural communities but overconcentration and focus tend to be in areas deemed more conducive for operations.

There are times when small businesses need sums of money greater than what they have and usually get such sums from borrowing. Many of them do not have any choice but to incur debt/credit due to their inability to finance their businesses on a continuing basis (AfricaFocus Bulletin 2004). The difficulty they face is that the provision by the formal banking and micro lending institutions is dominated by the need for collateral which is used to assess the probability that borrowers would default on loan payments and whether a borrower is considered a low or high risk (Song 2002). Majority of small businesses do not have collateral or valuable assets that can be used to secure credit and are, therefore, deprived of need-based financial services. Collateral plays an important role in bank's openness to loss and therefore in the transforming of uncertainty. Collateral serves as a guarantee for the lender or bank for taking the risk in case the borrower will default in that it decreases the amortization period of and loss on the loan. The need for collateral as mechanism to decrease probable loss from especially first time borrowers provides constraints for the lender to serve the credit needs of people who do not have such collateral or valuable assets that can be used to secure credit (Mashigo and Schoeman 2011; Murdoch 1999; Karlan 2007; Southern African Development Bank 2005). It is therefore questionable if these small businesses will become part of the economic mainstream if their social, economic and financial environment is not addressed by sustainable structures, mechanisms and policies that are specifically developed for them.

Given the current situation, circumstances and constraints under which small businesses operate, a rethinking in terms of their support and development becomes necessary. Practical implications are that with no effective support strategies, initiatives or even dedicated institutions, small businesses will continue to face obstacles in obtaining the finance they require to expand or even start-up and market conditions that exclude them and work in favour of large ones. This would have negative consequences which include inability to create new economic opportunities, become sustainable or even close down. Policy makers, government and other stakeholders in South Africa need to seriously consider and intensify the support for small businesses/enterprises through effective and tailor made policies and the distinction has to be made between different kinds of enterprises before such support can be provided and policies implemented and not only use general strategies for all of them. The formulation and monitoring of development policies, programmes and projects, for example, are important in this regard.

Many countries, such as India, for example, have different views with regards to collateral requirements and have demonstrated elements of best practices which enable the provision of loans/credit to people without collateral. Song (2002) argues that collateral does not always guarantee repayment of loans but can pose risks for a lender (e.g. bank) when a loan is impaired and other sources of payment which a borrower utilises become inadequate.

This paper resumes by analysing how small businesses in South Africa are financed and developed. It proceeds with the discussion on the National Strategy for the Development and Promotion of Small Business in South Africa. This provides an overview of some important strategies or institutions which were introduced to promote the growth of small businesses. The next section provides discussions regarding approaches and schemes that underlie successful international best practices to tackle the problems that hinder small business

development. Of importance in this section is an analysis of successful approaches and schemes initiated by India to finance, develop and support small businesses. On the basis of this, conclusions and recommendations are also presented in the last section.

RESEARCH PROBLEM AND OBJECTIVE

An underlying problem confronting many small businesses/enterprises seeking a loan to develop their businesses is lack of collateral or valuable assets required by the formal banking and/or micro lending institutions in securing loans/credit. These institutions' concern is that lending to people and/or small enterprises whose repayment capacities seem uncertain is risky and unprofitable and are therefore marginalised. The objective of this paper is to analyse best practices and lessons in India and to determine how small businesses are financed, promoted and developed.

RESEARCH METHODOLOGY

The research is based on review of accumulated literature related to small business development in South Africa. International best practices and lessons which are equally important and crucial were also used in an attempt to identify strategies that underlie successful implementation of financial institutions and schemes. Best practices and lessons from India are therefore analysed to determine how small businesses are developed. Evidence is provided that dedicated banks and schemes such as Small Industries Development Bank of India (SIDBI), Credit Guarantee Fund Scheme for Micro and Small Enterprises and SIDBI Foundation of Micro Credit (SFMC) effectively provide a complete range of financial and non-financial services to small and micro businesses as well as micro finance institutions. The practices can be instrumental in improving access to credit to small businesses in South Africa thereby helping them to develop and grow their businesses.

Financing and developing small businesses in South Africa

The financial system in South Africa has undergone significant changes and transformation to accommodate a rapid growth of the micro lending providers who employed different strategies in providing credit to the poor and small businesses. In response to the increasing need for micro credit, the providers started to design financial products, developed new concepts, strategies and methods to focus on the financial needs of small businesses as well as other poor households. Micro finance therefore emerged as an alternative to conventional banking and has become a major tool of development among the poor segments of society and an appropriate solution to the inaccessibility of credit by small enterprises. Both the poor and small enterprises need small amounts of loans in the form of micro credit which is acute for the development and sustainability of their livelihoods and businesses. Micro credit, a component of micro finance, according to Mallya (2005), is a fund source that is made available to very small livelihood ventures or activities which directly benefit the poor, or the category of financial services offered to lower-income people, the unemployed as well as small enterprises and others living in poverty, where the unit size of the transaction is usually small (Isern and Porteous 2005; Smit et al 1996). Micro credit has, in many developing countries, successfully enabled extremely impoverished people, including small enterprises, to engage in self-employment projects that allow them to generate an income and, in many cases, begin to build wealth and exit poverty. Access to credit has changed the lives of the poorest communities in the world. According to Van de Ruit (2001), many studies have shown the importance and benefits of access to credit as a poverty alleviation strategy. Most poor people and small enterprises are able to smooth consumption, sustain loan repayments, develop their small businesses, and begin to improve household conditions in general. When small credit is received, it creates an addition to the resources available during that time and can be allocated to the household activities and businesses. The availability of micro credit can contribute greatly to the development of small businesses and can help them expand their businesses, build assets, stabilise consumption, shield themselves against unforeseen circumstances, and most importantly, create jobs and improve livelihoods (Van de Ruit 2001).

In an effort to support and develop small businesses, South Africa took important initiatives and strategies to develop small businesses. It becomes imperative to analyse some of the strategies and/or institutions that have been developed and established to support small businesses in South Africa.

The National Small Business Strategy (NSBS)

The White Paper on the National Strategy for the Development and Promotion of Small Business in South Africa was published, in March 1995, to create an enabling environment for the accelerated growth of the small business sector (Department of Trade and Industry 2003). A year later, in 1996, the National Small Business Act (Act 102 of 1996) was promulgated to regulate, stimulate and promote small business activities in South Africa. Institutional structures were therefore created from the Act to coordinate the National Small Business Strategy (NSBS). The Act defines the small business sector and classifies it into four categories as described above, namely, micro, very small, small and medium enterprises (von Broembsen 2003). Specific objectives of the NSBS are job creation, economic empowerment and poverty alleviation. The focus would be on support programmes that would provide training in basic business skills to equip people to run and operate their enterprises more profitably, and in so doing, enable them to cross the poverty line (von Broembsen 2003).

However, eight years later, around 2004, after an intensive process of consultation with key stakeholders in small businesses in South Africa, a wide-spread consensus was that the National Small Business Strategy has had very little impact on small businesses. Critics were based on the poor/non-delivery by institutional structures. For example, the Strategy failed to differentiate between the different sectors of small business and an umbrella strategy, instead of different ones, was adopted to develop these businesses (Isern and Porteous 2005). This impacted negatively on job creation, economic growth and poverty alleviation. Small businesses or SMMEs continue to face obstacles in obtaining the finance they require to either start-up or expand. There is also a history characterised by the dominance of large capital-intensive businesses and the continuous neglect of small enterprises.

In an effort to address these challenges, the South African government developed and adopted, in 2004, the Integrated Small Business Development Strategy (ISBDS) in South Africa for over ten years (2004-2014), an economic strategy towards the promotion and acceleration of entrepreneurship and small enterprises as a means for long-term employment generation, stimulating economic growth, poverty alleviation and creating sustainable livelihoods (Department of Economic Development 2010; Department of Trade and Industry 2003). The ISBDS builds upon the definition of the small business and embraces all small, micro and medium-sized enterprises (SMMEs). This is an endeavour to target different segments of enterprises or businesses to stimulate entrepreneurship through, among others, financial support initiatives such as the establishment small enterprises financing schemes like Khula Enterprise Finance and the South African Micro Finance Apex Fund (SAMAF) (discussed in the section below), regulatory reform and access to appropriate skills.

The Small Enterprise Development Agency (SEDA) was established in December 2004 under the Department of Trade and Industry in terms of the National Small Business Amendment Act to provide business development and support for micro/small enterprises through development support programmes and has branches and Enterprise Information Centers and Technology Support Incubators in some of the Provinces (The Small Enterprise Foundation 2012). SEDA itself does not have branches in all the Provinces, for example, in Gauteng. Not even a single Enterprise Information Center exists in other Provinces like Gauteng. The challenge though is that SEDA does not lend money itself and its special focus is cooperative enterprises and not small or micro enterprises. SEDA provides non-financial support services such as business registrations, training, mentoring, and business planning.

In an attempt to provide support to micro finance institutions, two wholesale financing agencies, the Khula Enterprise Finance Limited and the South African Micro Finance Apex Fund (SAMAF) were established. Khula Enterprise was established and incorporated in 1996 to develop the underserved segments of small and micro enterprise (SME) sector's access to loans, start-up or early expansion capital mainly through aligning with commercial banks, specialist funds and provides capital to the Retail Financial Institutions (RFIs) which in turn loan to the SMEs with substantial low interest rate (Khula Enterprise Finance Limited 2010/2011). The challenge is that Khula Enterprise Finance does not directly lend money but helps small and medium enterprises (SMEs) to obtain loans. It increases access to finance to SMMEs through financial intermediaries and provides mentorship to the enterprises (Khula Enterprise Finance Limited 2010/2011). Khula, in its 2010/2011 Annual Report, acknowledged its weaknesses and market failure in reaching all the SMEs that require business finance

to start or expand their enterprises. Bad debts incurred by various RFIs were cited as some of the contributing factors.

In 2006, the South African Micro-Finance Apex Fund (SAMAF) was established to provide affordable finance to micro enterprises. Like Khula Enterprise Finance, SAMAF does not provide finance directly to micro enterprises but pilots its apex developmental micro-financing fund model, utilising community-based financial intermediaries like financial institutions, the Financial Service Cooperatives (FSCs) (with a minimum of 150 members) and Micro Finance Institutions (MFIs) to extend their financial services and capacity building, to encourage the mobilisation of savings by the small/micro enterprises and the poor in the rural communities. This does not solve the problem of finance because the MFIs' loans are not accessible due to collateral as a requirement to access such finance. The loans are only accessible to the employed. FinMark Trust and the Centre for Microfinance (2009) found that Khula Enterprise Finance's provision of finance to smaller institutions failed due to the perpetual undercapitalisation of such institutions by its small short-term grants and slow approval and disbursement cycles.

In view of the above, effective strategies, initiatives or institutions that are proficient in improving access to financial needs of small businesses, the SMMEs, are essential in order to assist them in achieving the ability to create self-employment that will uphold the economic activities necessary for their continued existence. However, the lack of access to finance due to collateral constraints, high transaction costs and information asymmetries still present themselves as the greatest obstacles that hinder the performances and growth of small businesses. Burke and Hanley (2002) point out that whether or not financial institutions can choose to lend to lower risk ventures depends, among other things, on the availability of physical collateral and the degree of information existing between the institution and borrower. The lack of information about abilities and character of small businesses as borrowers, their creditworthiness, together with lack of collateral, increase transaction costs and this provides constraints in providing small loans. Financial contracts (lending and borrowing) need the assessment of various probable specific, systematic events and probable states that emphasize the importance of the distribution of information among the parties acting in the financial sector. This is demonstrated by the commercialised and viable existence of a whole different range of institutions like banks, credit agencies and individual credit references and the use of mechanisms like collateral as well as history of default, all playing a pivotal role in financial contracts. The limitations on human knowledge or ignorance hamper informed decisions-making especially by the banks (lenders) and efficient pricing with high costs to enforce contracts in the end (Stiglitz and Weiss 1981; Bernanke 1980). This means that it is difficult and costly for the lenders/banks to acquire initial information about the intentions and behaviour of borrowers and also to secure repayment after a transaction has been concluded. When a bank grants credit, it means allocating estimated risks of nonpayment based on a borrower's repayment capacity to meet his obligation under the loan contract (Song 2002). Collateral then becomes a requirement for a bank in case a borrower defaults. The absence of contracts simply means borrowers fail to meet banks' collateral requirements even if they (borrowers) have assets but which banks would have difficulty accepting as collateral. Banks then hesitate to lend to people whose repayment capacity seems uncertain, risky and unprofitable. The risk of any decision is therefore incalculable as it may arise in a situation where all plausibly available information fails to give even a sense of the risk (Stiglitz and Weiss 1981).

Furthermore, the above-mentioned institutions providing support to small businesses/enterprises operate in isolation and this creates duplication and overlap of some services. It is further argued that although micro finance institutions offer an essential financial service in the economy, there is no sufficient support or relevant strategies from government for these institutions to support small businesses. Information on these services is not effectively disseminated to all township and rural communities but overconcentration and focus tend to be in areas deemed more conducive for operations (Mashigo and Schoeman 2011).

Many countries around the world, for example, India, and researchers, however, have a different view regarding collateral. Although collateral may be considered a requirement for credit, experiences around the world (Fleisig 1995; The World Bank 2012; Fernando 2012; Song 2002) suggest that lack of collateral or asset ownership does not necessarily mean that there is a high risk of default on loans and have proved that it is possible to provide loans to borrowers such as small enterprises without collateral. The researchers are of the view that practically, collateral may not be the solution to transactional economic problem when such collateral becomes illiquid (difficult to value, convert into cash, size or foreclose especially during periods of financial distress) and ultimately costly. Even more critical is when a loan is impaired and primary sources of repayment

which a borrower uses become inadequate. In this case, collateral does not benefit the bank/lender. This refutes the assumption that loan risk is inversely related to asset/collateral ownership. Various schemes, financial institutions and approaches of security related to loans have been found in India and which effectively finance, support and develop small businesses and successfully tackling the problem of collateral.

Small Business Development in India: Findings and Discussions

The paper attempts to identify approaches and schemes that underlie successful international best practices to tackle the problems that hinder small businesses from accessing credit and developing. Alternative initiatives to conventional banking practices are found in India, which had demonstrated that it is possible to grant loans to borrowers who and small businesses which do not possess collateral or valuable assets (Food and Agricultural Organisation (FAO) undated; Sinha 2009). This refutes the South African notion that collateral constraints and high transaction costs make it difficult for the financial institutions to quantify risk. Against this background, a rethinking to conventional banking and micro finance practices is evident and an examination of other approaches and schemes as strategies for developing small businesses is necessary. India has different views regarding collateral requirements in loan contracts and uses specialised and dedicated financial institutions and schemes to finance, support and develop small businesses.

The Indian Financial Sector

Like South Africa, banks in India, act as financial intermediaries to minimise transaction costs through enjoying economies of scale by aggregating uncorrelated demand (Bisman and Goela 2010). The expansion of financial services in India started with the nationalisation of all banks during the late 1960s, and to reinforce this, the Regional Rural Banks were established in 1976 to direct credit (Sinha 2009). Directed credit then became the focus of the Indian financial sector with the purpose of meeting the financial needs of the rural sector in general and the poor in particular. However, the financial position of the rural banks deteriorated and were unsuccessful due to, among others, mismanagement and corruption of government officials (Sinha 2009). Extensive misappropriation and misutilisation of funds impacted negatively on the directed credit.

In an effort to remedy the situation, development initiatives were taken to improve the provision of credit and to promote more equitable levels of development. Development banks were initiated, sponsored by government of India and funded by central banking institutions (i.e The Reserve Bank of India), some private and other public financial institutions (International Development Finance Club 2011). The distinguishing feature from conventional banks is that development banks do not take deposits from customers and this limits their ability to effectively provide funding. Among development banks operating in India is the Small Industries Development Bank of India (SIDBI) which purpose is to promote, finance and develop micro, small and medium enterprises (referred to as MSME) sector (Reddy 2012; Ministry of Micro, Small & Medium Enterprises undated; International Development Finance Club 2011).

The Indian Micro Finance Sector

Micro finance in India was introduced in the 1980s with an objective to reduce poverty. The establishment of the micro finance sector was to deal with the problems of non-availability of timely and adequate credit at reasonable interest rate to micro, small and medium enterprise sector as well as the poor segments of the population (Ministry of Micro, Small & Medium Enterprises undated). Like South Africa, one of the major causes to non-availability of bank finance is the high risk perception of lending to SMMEs/MSMEs and consequent insistence on collaterals which most of these enterprises do not have. The problem becomes more serious for micro enterprises requiring small loans. Banks generally hesitate to provide small loans due to the high transaction costs of administering such loans (Mashigo and Schoeman 2011; Murdoch 1999). Despite the decline in the incidence of poverty over the years (around 2000), wide disparities continued to prevail in the poverty levels in India (Food and Agricultural Organisation undated).

The micro finance institution and/or programmes in India are not subjected to regulation and supervision as they are registered as Societies or Trusts and this non-regulation had detrimental effects in that these institutions are unable to access funds from the financial sector (International Development Finance Club 2011).

Micro finance institutions, however, gained momentum when they received support from SIDBI through the SIDBI Foundation for Micro Credit (SFMC) in 1999 (Food and Agricultural Organisation undated, Bisman and Goela 2010). SFMC, SIDBI and Credit Guarantee Fund Scheme for Micro and Small Enterprises, which are important initiatives taken by India to develop small, medium and micro enterprises are discussed in detail below.

Small Industries Development Bank of India (SIDBI): An overview

In an effort to generate employment and contribute to economic growth, India explored the role of small businesses/enterprises and started to take initiatives to develop these enterprises. According to Department of Financial Services (2010), micro, small and medium enterprises (MSMEs- popularly known as SMMEs in South Africa), contribute significantly to the national economy in terms of production, employment and exports. Small Industries Development Bank of India (SIDBI) was therefore established in 1990, under an Act of Indian Parliament, as the principal financial institution for the promotion of micro, small and medium enterprises (MSMEs) sector and for coordination of the functions of the institutions engaged in similar activities (Department of Financial Services 2010; Small Industries Development Bank of India 2012). SIDBI is owned by 31 public sector banks and financial institutions and is under the control of Ministry of Finance and regulated by Reserve Bank of India (RBI). The Bank (SIDBI), in this case, provides refinance support through a network of eligible member lending institutions such as scheduled commercial banks and selected Regional Rural Banks which are sustainable and few development finance corporations, for onward lending to MSMEs and direct assistance is channelised through the Bank's branch offices. SIDBI promotes employment oriented industries especially in semi-urban areas to create more employment opportunities. Other important activities of SIDBI are the extension of financial assistance in the form of loans, grants, equity and quasi-equity to non-government organisations (NGOs), the micro finance institutions (MFIs) for on-lending to micro enterprises and the poor/weaker sections of the society to help them engage in income generating activities on a sustainable basis (Sinha 2009; Small Industries Development Bank of India 2012). SIDBI had, in 2012, an asset base of over US \$12 billion and earned net profit of US \$ 100 million.

In addition to SIDBI's activities as the prime lending institution, refinance became an important initiative of uplifting MSMEs. The Bank initiated various schemes to further channel funds to small, medium and micro enterprises and the poor and to deal with collateral problems.

Credit Guarantee Fund Scheme/Trust For Micro and Small Enterprises (CGMSE)

Availability of credit without the hassles of collaterals or third party guarantees has been found to be a major source of support in countries like India to new and existing small enterprises through setting up a specialised unit (scheme) of their own small, small and micro and enterprises (MSMEs).

The government of India launched the Credit Guarantee Fund Scheme For Micro and Small Enterprises (CGMSE) in 2000 to strengthen credit delivery system and facilitate the flow of credit to the enterprises by making available collateral-free low-cost credit to micro and small enterprises. This is an important initiative which differs from those of South Africa. As alluded to above, in South Africa, lack of collateral becomes the problem of inaccessibility to finance or credit by small enterprises. Whether or not financial institutions can choose to lend to lower risk ventures like these enterprises depends, among other things, on the availability of physical collateral. Under the Credit Guarantee Fund Scheme For Micro and Small Enterprises in India, are eligible lending institutions such as selected rural banks, scheduled commercial banks and development financial corporation (Ministry of Micro, Small & Medium Enterprises undated, Reddy 2012). Since 2010, there were 112 eligible micro lending institutions under the scheme providing finance to micro, small and medium enterprises. Credit facilities include both term loans and working capital facility extended to new and existing micro, small and medium enterprises (MSMEs) without any collateral security or third party guarantee (Sinha 2009; Small Industries Development Bank of India 2012). A very crucial and important observation is that India protects the small industries and members of society from being trapped in a debt spiral. In this case, an important requirement under the guarantee scheme is that the credit facility is availed by the borrowing unit from a single lending institution.

Under the scheme, is the guarantee cover to the extent of 75% of the amount of the sanctioned amount of the credit facility and 80% for loans to micro enterprises. This guarantee cover is used to settle the loans (up to 75% or 80% where applicable) in case of default. The guarantee fee payable under the scheme is 1.5% and a very small service fee of 0.75% on the credit facilities sanctioned (Ministry of Micro, Small & Medium Enterprises undated). In an effort to create greater awareness about the guarantee scheme among micro and small enterprises, banks, industry associations, other stakeholders and the public, the scheme awareness programmes have been developed through multi-channel approaches like posters and mailers, print and electronic media, workshops and seminars, exhibitions and meetings at various districts or areas. In addition, training is provided to micro lending institutions about operational modalities of the scheme (Small Industries Development Bank of India 2012; Sinha 2009).

Similar approaches are found in Canada and Spain. For example, government loan guarantees play an important role as security/collateral for loans. Such guarantees though have to be signed by appropriate authorities (eg government and private bank) and their value depends on terms and conditions of such guarantee and the creditworthiness of the issuing bank (Song 2002). Government loan guarantee was found to be an effective approach that serves as substitute for the borrower's collateral as the government makes the loan and the risk of the borrower defaulting is shifted to the government (Fleisig 1995). To improve repayments, government minimises the extent to which it is requested to honour its guarantees (Fleisig 1995). The minimisation of guarantees, according to Song (2002; Fleisig 1995) have been successful.

SIDBI Foundation for Micro Credit (SFMC)

SIDBI Foundation for Micro Credit (SFMC) was launched by the Indian government in January 1999 for channelling funds to the poor in line with micro credit schemes. SCFM is the apex wholesaler for micro finance in India providing a complete range of financial and non-financial services such as loan funds, granting of support, equity and institution building support to the retail micro finance institutions (MFIs) so as to facilitate their development into financially sustainable entities. The SFMC plays an increasingly important role in providing user-friendly formal financial services to the poor due to the failure of the main poverty alleviation programme in India- the Integrated Rural Development Programme (Sinha 2009; Chakrabarty 2011). In practice, SFMC acts as an oversight over MFIs which are intermediaries between the retail borrowers consisting of poor people and individual borrowers living in rural areas or urban slums and the public sector development finance institutions. The purpose of SFMC is to create a national network of strong, viable and sustainable micro finance institutions from the informal and formal financial sector to provide micro finance/credit services to the poor and small enterprises (Small Industries Development Bank of India 2012; Chakrabarty 2011).

As alluded to above, micro finance institutions in India are not subject to regulation and supervision, however, SFMC plays a significant role in advocating appropriate policies and regulations and acts as a platform for exchange of information across the institutions. SFMC upscale the flow of micro credit with enabling policy modifications relating to simplification of the procedures in availing assistance and substantial relaxation in the security/collateral (Chakrabarty 2011; Small Industries Development Bank of India 2012). However, this posed serious challenges to the SFMC. These challenges were dealt with by implementing the rating system of the borrowing institutions to meet the requirements of the revised dispensation which called for selection of suitable micro finance institutions which could use collateral-free approach. Capacity Assessment Rating (CAR) was therefore introduced as a supplementary tool to assess the risk perception of MFIs. Creditworthiness is based on the rating of the borrowing institutions rather than availability of security/collateral requirements. In an effort to alleviate poverty and improve livelihoods, the MFIs may on-lend directly to self-help groups (SHGs). The group system is used by MFIs in India to distribute finance to their clients. Group lending has been pioneered by Bangladesh and found to be successful in eliminating the problem of collateral. Food and Agriculture Organisation (undated; Fleisig 1995) found that many poor and very small enterprises around the world had difficulty making savings and accessing loans due to collateral constraints. Group lending approach was popularized by Bangladesh, through its specialised bank, the Grameen Bank, where community members voluntarily form informal small groups (Johnson and Rogaly 1997; Rahman 1997) which are used as social technology to access credit and mobilise savings. Evidence shows that the Grameen Bank used unconventional banking practice to lend money to the poor and/or very small businesses with a reasonable degree of financial self-sufficiency and repayment rates (Rahman 1997; Mashigo 2007; Mashigo 2012). Group members are

encouraged to contribute amounts of savings into a Bank account which (savings) is then used as collateral for loans. In this case, credit is granted to borrowers who comprise small groups while using joint-guarantees.

Within the self-help groups in India, community members, especially women, gain a sense of self-respect and confidence from a collective sharing of experiences and common action. Community members become increasingly involved in joint-enterprise management. These joint-enterprises are financially supported by MFIs and generate joint-income which helps to alleviate the income burden on men and women and contributes towards the drive from poverty. India has vigorously promoted the self-help group system which continues to be used for financial intermediation by both commercial banks and MFIs.

In an effort to alleviate poverty and improve livelihoods, the government of India provides funds for micro finance programmes to SIDBI (Small Industries Development Bank of India), called portfolio risk fund (PRF), which became operational since March 2004. The PRF is used for security deposit requirement of the loan amount from the MFIs or non-governmental organisations (NGOs) and to meet the cost of interest loss (Samal 2012). According to Bhavan (2004), SIDBI takes deposit equal to 10% of the loan amount. The government provides the needed funds (PRF) on half-yearly basis depending on demands for security deposit. The share of MFIs amounts to 2.5% of the loan amount (i.e 25% of security deposit) and 7.5% (75% of security deposit) would be adjusted from the funds provided by the government (Bhavan 2004).

The SFMC impacted positively to the India's community in that some reduction on the dependency on the informal sources of finance like moneylenders was noted. These informal sources were reported to charge exorbitant amounts of interest, for example, 36% and sometimes up to 200% for short-term loans (Food and Agriculture Organisation undated; Karlan 2007).

While the above approaches and schemes have proven to be successful in India, it is important to mention that they would not automatically work in South Africa but have to be carefully considered and can be instrumental in improving access to credit to small businesses in South Africa thereby helping these businesses to develop and grow. This needs the creation of an enabling policy environment with the support of policy makers, government and other stakeholders.

CONCLUSION AND RECOMMENDATIONS

This paper assesses the development of small businesses in South Africa and analyses some best practices and lessons from countries like India to determine how small businesses are supported. While it is evident that strategies initiated by government to finance, support and develop small businesses in South Africa are ineffective due to, among others, collateral constraints and high transaction costs, the paper demonstrates that specialised and dedicated financial institutions and schemes that have been established in India are successful in financing and developing small businesses. It is evident that collateral may not practically be the solution to transactional economic problem when such collateral becomes difficult to value.

There is no doubt that the development of some specialised financial institutions such as the Small Industries Development Bank of India (SIDBI) through its unique schemes like Credit Guarantee Fund Scheme for Micro and Small Enterprises and SIDBI Foundation for Micro Credit (SFMC) are important initiatives taken by India to develop small businesses. In addition to these, approaches such as the group system used by India's micro finance institutions (MFIs) to distribute finance to the community and/or small businesses have been found to play an important role in providing credit through removing the need for collateral.

There are lessons to be learnt from India's best practices which demonstrate that it is possible to finance, support and develop small businesses. Based on the findings, the paper recommends the need for South Africa to consider establishing dedicated financial institutions or a bank that will specifically cater for the financial needs of small businesses rather than to introduce a series of strategies or institutions that fail to support small businesses.

The same approach of assisting the poor and small businesses through the adaptation of the group lending system is essential if South Africa needs to improve their support and development. The joint-enterprise management and the joint-income generated by community groups have been proven by India to be successful in

soliciting finances from the MFIs and contributing towards the drive from poverty. The adaptation of the group system can be instrumental for South Africa. In this case, the formation of groups which, small businesses can become part of, can help in mobilising savings to be used as collateral for credit. Loans/credit can then be applied for where the group members become jointly liable for repayment of such loans.

Furthermore, it is recommended that South Africa develops strategies to support micro finance institutions (MFIs), empower them and enable or use them as effective financial delivery vehicles to communities and/or small businesses in an effort to develop them, generate employment and contribute to economic growth.

It is important to mention that the approaches and schemes, though successful in countries like India, have to be carefully considered in South Africa and can be instrumental in developing small businesses. To achieve this needs the creation of an enabling policy environment with the support of policy makers, government and other stakeholders. The financial support for small businesses has to be seriously considered and intensified through effective and tailor made policies and the distinction has to be made between different kinds of enterprises, the small, medium and micro enterprises before such support can be provided and policies implemented and not only use general strategies for all of them.

CHANGE MANAGEMENT: ABSOLUTIONS ON LABOUR CHALLENGES – AN EXPLORATORY FUTURISTIC APPROACH TO UOTS

Paul N. Masina and Nafta Mokate Lehobye
Tshwane University of Technology, South Africa

ABSTRACT

Since the merger of institutions of high education in South Africa (SA) took place in 2004, Universities of Technology (hereinafter referred to as UoTs) seem to have been the most hit by a process of change. The whole mystery of this transitional change process was essentially transformational strategy from the so-called 'match and place process' that was to be adopted in the form of global restructuring within UoTs. The match and place process in turn brought with it a whole bunch of intolerable labour related repercussions that 'broke many hearts' within the respective workplaces of the UoTs. Against this background, it would appear that there are still a way too many challenges that trigger dissatisfaction amongst employees in workplaces within these UoTs against the labour justice on employees, particularly on skills development. Arguably, in situations given, it would normally mean that there are numerous provisions in terms of the SA labour legislation that are violated against employees an example of which is Skills Development Act 97 of 1998. The question now is; for UoTs to avert this state of affairs what else should then be done?

INTRODUCTION

Since the merger of institutions of high education in South Africa (SA) took place in 2004, Universities of Technology (hereinafter referred to as UoTs) seem to have been the most hit by a process of change. The whole mystery of this transitional change process was essentially transformational strategy of a so-called 'match and place process' that was to be adopted in the form of global restructuring within UoTs. The research problem to be addressed is 'the challenge of ignoring skills development rendering UoTs incompetent by defeating the ends of labour justice'. It is thus the purpose of this qualitative research paper to explore and illuminate possible violations by tabulating the observations, discussing them and then providing suggested solutions.

METHODOLOGY

The research problem to be addressed is 'the challenge of ignoring elements rendering UoT incompetent by defeating the ends of labour justice'. It is thus the purpose of this qualitative paper to explore and illuminate possible violations by interpreting Skills Development Act and apply it to the research problem. To arrive at the solution, these will coherently be contextualised with organised literature within this context demystifying institutional aftermaths of change management. Longitudinal observations will be tabulated providing discussions and suggested solutions. In this way the tabulated suggested solutions will indicate indeed that for UoTs to utilise productively their human resources as human capital successfully, then they have to rethink and consider developing skills as transformational strategy.

THEORETICAL FOUNDATIONS

The solution to the research problem will be triangulated first, through organized literature. Second, it will be shown through longitudinal observations at the Tshwane University of Technology (TUT), as sample of the

research target population of the UoTs. Third, the application of Skills Development Act 97 of 1998 as amended (Alas, 2007), as tabulated in Table A below. Following is table that shows the observations, discussions and suggested solutions.

Tabulated Observations, Discussions and Suggested Solutions

Table I: Empirical Outlook on Snap interviews Conducted at TUT
in Collaboration with the Case Study (Lehobye, 2012)

No.	What the Researchers Set Out to Expose	Analyses	Suggested Solutions
1	A Senior Manager manipulating HR processes to employ his own wife and Son in his own department.	This comes out to be what uses to be known as nepotism. Nepotism is a situation where an employee in the position of power employs his/her closest family members disregarding the set policies whether they have all what it takes to qualify for such positions or not. This is normally an actionable 'offence' and yet nothing is said to have been done.	In situations like the given, any reasonable senior manager should have known that the act of nepotism is actionable in which case he or she would not have any justification whatsoever but to step down and be removed from all his or her contractual rights and duties.
2	Senior Managers who scrap university computers before time just to benefit their own homelands.	The observation made in TUT indicates that new computers would only be rendered obsolete after a period of three years of their use within the University. Removing them before this time to benefit some homelands at the expense of the others is not just unfair but actionable 'offence'.	Senior manager in this case should step down. The reason is if the senior manager really feels the need for computers for his own home-land should go through procedures for considerations of donations or buy these computers at an auction held at TUT from time to time. Every senior manager is expected to have reasonably known this.
3	University Council Cabals appointing a candidate with Fraudulent Qualifications.	This statement is not an easy one. One will have to understand what 'fraudulent' here mean. Fraudulent, according to the Dictionary means obtaining undue benefit after having misrepresented true facts about something knowingly to be deceitful.	If the alleged fraud was indeed found to have been committed by a competent organ of state such as South African Qualifications Authority (SAQA) and such fraudulent qualifications were indeed used to earn undue benefits, these benefits should forthwith be frozen, including any property so acquired, all entitlements stripped off and criminal charged pressed against such a perpetrator. On verifying older documents already submitted, documents that are 20 years or more are admissible pursuant to the ancient document rule.
4	University	The university management	As the contract is already

	Management signing a contract for residences in Pretoria North and Polokwane without conducting physical inspection only to discover that the buildings there were in a mess. (No action was taken against those members).	before signing should have first satisfied itself about the condition of the residences justify this according to the current market condition of such residences.	concluded, meaning that the university management is fully satisfied even if the residences are so dilapidated, contractually, nothing at this stage can be done as a remedy to that. It is only from the side of the university to take corrective action to its members. Corrective action may indeed mean stepping down.
5	Students relocated from a residence where they were paying R16000 per annum to the one where they are paying R29000. (No one has been taken to task for such action).	There is no student on earth who can just choose to pay R29 000 instead of R16 000 per annum. Although the reason speaks for itself but the difference of R13 000 is indeed too exorbitant to imagine for a any student budget.	What should actually happen here is simple. If this was the first offence on the part of this perpetrator, and the investigations indicated that there was some kind of human error involved where this situation could be corrected, he or she should pay R13 000 already suffered for each per annum for that long. The level of adavance will then determine whether human error was involved or not. If no such an agreement is reached between the perpetrator and the university, perhaps because of this adavance, the former should just step down outrightly.
6	Former Human Resources Development employee resigns today and the following day works for a company that has a contract with the department that she used to manage. (The matter is treated as normal). The same is happening at Corporate Affairs and Marketing.	The employee seemed to have abused her power to such an extent that even after her resignation she continues or allowed to continue to go away with her own share of legacy. This allowance appears not to end only with Corporate Affairs and Marketing but extends to some other unreported incidents from other departments as well, if a forensic investigation be launched.	This in effect denotes the level of adavance that the employee really enjoyed over her stay at TUT. If this matter is indeed treated as normal like in some other cases in this report, it means there is some kind of a hidden and serious problem. This might be so in that those who have to take a decision and still fail to their hands are so dirty that they cannot handle the situation. The employee who resigned most certainly knows their weak points which, if divulged, can also cause them their jobs. Thorough investigation is necessary to out-root this.
7	People retire today and they are employed next day in the same position as contract employees without	'People' here means more than just one person. Contractually, people should retire at their pensionable age and if retiring	If TUT allows, even if it is just one person to retire today and are employed next day in the same position as contract employees without following

	following due processes. (This is seen as a normal practice).	prematurely and are allowed to do so, a precedent is set and TUT may not be able to have that situation under control in any manner even if a collective agreement can be reached.	due processes, the same principle should apply to everyone. It will just be a petty that this cannot be reversed. In cases like this, a technology called Originate e-Contracting as described (cf Cp 6, below) can sort this where it would just automatically determine pensionable age and when that comes, automatically stops the employee from receiving monthly salaries but just a once off lump sum. It is not as if these managers do not know these technologies, they are just adamant to implement technologies from which they will not benefit. In most cases it would seem that it is just the question of self enrichment.
8	A Senior Manager who defrauded the university through short courses is allowed to resign without facing the music. The next day the same person is appointed in another university in the same position...	This situation here implies that most senior managers seem to take the departments that they manage for their own laurels in which they would just do almost anything as they wish. Short causes should be approved by the university council and the DoHE.	This is one of such cases of self-enrichment. After resigning from the university and next day on the same position, he is employed by another, means that fraud has been committed through someone providing things such as false testimonials in the name of TUT. The new employer should be made aware so the new employee short be made to step down.
9	Line manager impregnating an administrator... (Nothing is done about it except it being just a rumour).	Impregnating someone as line manager is something that started from sexual harassment which should has been so persistent that it now resulted in pregnancy. It does not just start anywhere. It starts from sexual harassment. Every manager should know, or ought to have reasonably known that sexual harassment at workplace is not only undesirable but punishable.	This line manager should first be investigated to avoid rumours. If this be just an allegation or a mere rumour, it should be determined whether this rumour is a reasonable rumour or not. But most importantly, the line manager's services should first be suspended and DNA tests be insisted on as part of investigations. This should not be seen as just a bold step but is a correct procedure to be followed.
10	The abuse of forensic audit to fight factional battles.	This statement also does not breathe sufficient information and thus a bit difficult to analyse.	Forensic audit when it is an unqualified report should be acted upon because it is tested. Those, against whom it deals and have powers to ignore it, should be taken to task. In fact, any manager may not refuse any tested reality and once you

			do means somehow you are already guilty yourself and such an adamant power abuser does not belong with academia.
11	Collusion between line managers to disadvantage workers.	Yes, some line managers are fair while others are really not. When there is collusion between them, what takes precedent should be policies. Policies too many TUT managers thus far, especially those working against them, are never construed as policies, not to speak about when they turn to favour their subordinates.	To put subordinates at a disadvantage is the duty in most cases of those managers who do not always have suitable qualifications and thus try by all means to do things that will render those hardworking well qualified subordinates incompetent. Even any effort of good work by subordinates is never considered. These managers should be excluded from the ranks of management until they produce documents not only of their required qualifications per se, but those documents that will show what achievements they earned during their tenure of office. Failure in this regard should be the basis of the demotions not with the same salary and such managers should with immediate effect be identified and be dealt with accordingly.
12	Manipulation of procurement processes...	This seems to concern self-enrichment.	Those managers abusing these powers should be dealt with rigorously.
13	Academic HOD's selling students their own textbooks which are of inferior standard than what is available in the industry.	Most academic HOD's do not have time to do their academic work, at least according to this report. This is conspicuous in that they spend most of their times doing things that would render their subordinates incompetent also in an attempt to disadvantage them (see bullet 12, above). However, if one of such HODs managed to publish a book, in most cases such books do not align themselves with the current syllabus taught. The policy also stipulates that such books do not have to be made available for sales to students.	There is already a precedent in TUT where an academic HOD sold his books to students against the TUT policy and the academic on this realization was forthwith sacked (see Administrator Report, 2011). The same precedent should also apply here.
14	SRC members registering without attending classes while	Every student should attend their classes from the beginning to the end of all	There is indeed a reality behind the fact that student representative council is a body

the university is paying for their fees.	the terms. According to the TUT student Rules and Regulations, every student should have at least 85% of continued attendance for them to qualify for the exam entry.	of student managers who are also part of the university stakeholder-ship. These managers should engage in student affairs and participate in the university activities that concern students directly. Where do these students have that time in their hand? This is the university that is entrenched in the use of technology. According to Kekwaletswe (2007) and Lehobye & Ndung'u (2012), technology can be used outside classes to close this gap.
--	---	--

Table A above, is an extraction from Lehobye (2012) working Thesis that collaborates with the longitudinal observations made within a period of two years from 2010 to date. It encapsulates most observations that are contrary to the aims of the Skills Development Act almost entirely. Harvested from Lehobye (2012) working Thesis, they were in turn derived from NEHAWU Report (2012) directed to the TUT Administrator. Looking at these observations as discussed, it would be realized that if these are not sorted out in time, these universities will indeed, in no uncertain terms, collapse before the end of the decade. Following are the aims of the Act 97 of 1998 to be applied to this paper's research argument.

Application of Act 97 of 1998

Following are the aims of the Skills Development Act (Act 97 of 1998), as amended by the Amendment - Skills Development Act - 2003 and Proposed Amendments to SETA's June 2006 the following aims are apparent including:

To provide an institutional framework to devise and implement national, sector and workplace strategies to develop and improve the skills of the South African workforce; to integrate those strategies within the National Qualifications Framework contemplated in the South African Qualifications Authority Act, 1995; to provide for learnerships that lead to recognised occupational qualifications; to provide for the financing of skills development by means of a levy-grant scheme and a National Skills Fund; to provide for and regulate employment services; and to provide for matters connected therewith.

Regarding the observations above it would seem apparent that the above Act appears not to be adequately applied by the UoTs. In order to revive the UoTs back to their expected status, the above aims of the Act 97 of 1998 should be applied with rigour.

CONCLUSION

This paper came up with suggested solution as to how the UoTs would be helped to resuscitate or revive from their present status. The feelings of adamance and arrogance do not belong to academia, so is the nursing of personal whims and caprices at the expense of others by some of UoTs managers. However, what was germane in this paper is proper utilization of human resources at the interest of the employer – the University. It would seem that the UoTs in SA appear hesitant to act upon academically sacrilegious and abominable acts by managers most of whom are even unqualified. The fact is managers are allowed to do as they wish within the UoTs thereby increasing skills development gap delaying the ministerial mandate of academic delivery within the given time frames.

AMBUSH MARKETING DURING WORLD SPORTING EVENTS: SOME LEGAL AND ETHICAL ISSUES

Jamwell Maswanganyi
Tshwane University of Technology, South Africa

ABSTRACT

From time to time countries host big sporting events, including the Soccer World Cup. During these events, businesses fight for space to market their products. Host countries and sponsors therefore usually enter into agreements with the controlling bodies of the events, e.g., Federation Internationale de Football Association (FIFA) in the case of the soccer world cup. These agreements seek to ensure that the parameter within which business is conducted is clear and that there is no ambush marketing during the events. What impact do these rules have on non-sponsors, especially small businesses? Are they unfairly restricted from marketing? The established thinking is that sponsors and sporting controlling bodies are being treated unfairly. The study however here investigates the extent to which the rights of the organizers of big sporting events affect non-sponsors, especially small businesses. The legality and ethics of ambush marketing during these events will also be examined, using various legal and ethical theories, so as to determine the extent of fairness or unfairness of rules protecting the sporting controlling bodies and their partners. The study uses South Africa's recent hosting of the 2010 Soccer World Cup as a case study. South Africa's regulatory framework around ambush marketing is therefore explored. This will provide future guidance for other sporting events. The study, in brief, looks at the regulatory issues, the ethical issues and some ambush marketing case studies, and then provides some recommendations. The study argues for a more balanced approach in the rules governing big sporting events.

INTRODUCTION

Major sporting events like soccer world cups remain some of the wealth generating mechanisms for the holders of the rights, i.e. Federation Internationale de Football Association (FIFA), big sponsors, and host nations. The study is necessitated by the increasing problem of ambush marketing during these major sporting events. Service and other organizations may be the victims of ambush marketing in different contexts. They might be victims of ambush marketing as sponsors, where they spent a lot of money, but those who did not spend a cent take advantage of it. They may also be victims where, as small businesses, they cannot afford to sponsor the event, but are also prevented from marketing themselves during the event. The study seeks to examine this problem. The study argues that the current arrangements during major events are not balanced, and generally favour more resourced companies, which are in a position to sponsor big events. It is therefore the key objectives of this study to examine the different rules and laws governing marketing during major sporting events, more in particular the FIFA World Cup. This examination will create space for a call for legal reform or improvements in the regulations.

BACKGROUND TO THE STUDY AND CONCEPTUAL FRAMEWORK

South Africa recently hosted the world cup, i.e. the 2010 World Cup. This was part of a series of many other world cups hosted by other nations of the world. During the world cup, there were some reports of companies trying to ambush the big event, in terms of marketing. This happens in many other events, big or small. As earlier indicated, the study therefore needs to explore the legal complexities surrounding the activity of ambush

marketing during big tournaments, more in particular, the Soccer World Cup, organized by FIFA after every four years, on different countries. FIFA is the international football controlling body, based in Zurich, Switzerland. FIFA WORLD CUP is one of the largest single sporting events world-wide (see FIFA Rights Protection Programme at the 2010 FIFA World Cup South Africa, FIFA, 2010 at 3, for further discussion). Given FIFA World Cup's mass appeal character, the study focuses more on this event, as the same principles will apply to other similar sporting events with mass appeal, namely World Cricket, Olympics, Rugby World Cup, etc. The discussion is intended for services companies, though most principles will also be applicable for companies selling or marketing goods. Legislations governing the marketing of goods are therefore, where necessary, also looked at.

DEFINITION OF AMBUSH MARKETING

Because the theme of this discussion focuses on ambush marketing, it is here necessary to give a critical examination of the meaning of ambush marketing, and its application in different contexts. The critical examination will be necessary to show what is, or is not, should or should not be, ambush marketing. The 'is and should' combination here will also be talking to law and ethics respectively. Though there might be no precise definition of ambush marketing, most legislations (as will appear below) appear to view it as association, by a non-sponsor, with a particular event, as if the non-sponsor is the sponsor. A survey of some literature, which in the context of this discussion is mainly in the form of legislations, point towards this.

In South Africa Ambush marketing is governed by the following laws, amongst other laws: Trade practices Act 76 of 1976 (though this Act has since been repealed by the Consumer Protection Act 68 of 2008, it was still the applicable Act during the hosting of the 2010 World Cup, so its provisions remain valuable, more so that some of its substantive provisions have been adopted by the Consumer Protection Act and other legislations), Trade Marks Act 194 of 1993, the Merchandise Marks Act 17 of 1941 and other related legislations to be touched on below, to the extent of their relevance. As earlier indicated, the legislations here will not be confined to those governing the marketing of services, but also those dealing with the marketing of goods, as the principles can by adaptation be used also for other categories of marketing. There will also be a brief look at the constitutional position. Before looking at legislations and other laws, it is necessary to first look at ambush marketing practices and strategies.

AMBUSH MARKETING PRACTICES, STRATEGIES AND TACTICS

What do ambush marketers usually do? Despite a number of laws and regulations dealing with ambush marketing, ambush marketers still continue their business. They change strategies and tactics. In a real South Africa case, decided by the Gauteng North High Court, a restaurant started deco rating its surroundings with banners reflecting the different countries participating in the World Cup in South Africa. It also added the name World Cup 2010 to its signage. It took advantage of the fact that it was located near Loftus Stadium, one of the world cup stadiums. It did not have authorization from FIFA. The Court ruled in favour of FIFA (Dean, 2009).

There is also the world publicized story of the Dutch women who wore yellow mini-skirts, bearing Bavarian Beer, into the stadium. Bavarian Beer was not one of the sponsors. The women were also prosecuted (Mail & Guardian, 2010). However, the case involving the Dutch women may have backfired on FIFA and the sponsors. The arrests of the women led to worldwide publicity, which may have benefited the ambush marketer. The sponsors were overshadowed in the publicity that followed.

Other tactics are those used by Nike during the 1996 Atlanta Olympics, which paid for some billboards around the Olympic stadiums before the event (Sportsdoc, 2007). This advertisement gave Nike wide publicity, despite it not being the sponsor of the event. It is difficult to deal with such cases. Though this was not a FIFA event, the problems experienced here are similar to those experienced under FIFA events.

In the three cases above, two involved big companies, while one involved a small company. The small company could not, even if it wanted to be a sponsor, afford to do so. There are many small companies in similar

situations, and some in worse situations than this restaurant. In my view, there is very little justification in big companies directly benefiting from events they are not sponsoring, despite that they have the resources to sponsor. Rules against such companies need to be tougher. It is far easier for the public to confuse the big companies with the sponsors. These companies usually have the market internationally, so for them to associate with the event might take unfair advantage thereof. For a small company, with a very localized presence, there is very little chance that the public can confuse it with a sponsor.

Even in the case of big companies, where the ambush marketing is not direct, like in the Nike Case, it might be unfair to prohibit them. Sponsors do not sponsor so as to own the whole world during the specific event, but only to own certain areas. For them to have very wide-ranging rights might lead to disproportionate benefits, not justified by the sponsorship. Sponsors should, as a matter of fact, understand that even if they have sponsored, this does not entitle them to every benefit available. They have a social responsibility to share certain types of benefits with the public.

AN EXPOSITION AND EVALUATION OF THE REGULATORY FRAMEWORK GOVERNING AMBUSH MARKETING

Trade Practices Act

This Act appears to be the heart of the regulation of ambush marketing (as this Act has since been repealed by the Consumer Protection Act, where necessary, I will indicate the corresponding sections of the Consumer Protection Act, so as to reflect on the current position also). The Act prohibits any false or misleading statement, communication or advertisement representing or implying a connection or association with a particular sponsored event or the sponsor of the event. A person causing such activities to be made is also equally prohibited from doing so (s 9(d)). The subsection therefore has the following requirements:

There must be a false or misleading statement

The reading of the section implies that the statement or communication should be false or misleading. The phrase ‘false’ or ‘misleading’ is relative, and should therefore be read in relation to the second element below i.e. implying association between the person and a particular sponsored event. The new Act, namely the Consumer Protection Act, also has a similar provision. Section 29(b)(iv) of this Act also prohibits the marketing of goods and services ‘*in a manner that is misleading, fraudulent or deceptive in any way, ...*’. This prohibition is in relation to the sponsoring of any event, amongst other things.

Representing, implying or suggesting a connection or association between the person and a particular sponsored event

The requirement here, as provided for in the Trade Practices Act, is that the statement or communication must suggest some connection between the person and the particular sponsored event. This implies that any communication or advert short of this will not be in violation of the Act. Intention appears to be implied as an element here. This means that situations where persons, for their own personal use, wear clothes bearing a particular label might not be seen as violating the Act. On the other hand, where a mass of people do so at a particular event, this might be a pointer towards an intention to mislead. This will however depend on the nature of the event (also see the discussion of the Bavaria Beer ambush marketing case study below).

Causing the prohibited statement to be made

This further requirement under the Trade Practices Act will apply mainly in situations where persons are used by others, mainly big companies, to go and advertise during the specific events. The persons sending the advertisers

will also be held responsible. And so are the participants themselves. Although the Consumer Protection Act does not appear to have an equivalent wording on this, the interpretation of s29 of the Act will not be inconsistent with this requirement.

Trade Marks Act

The Trade Marks Act makes provision for the registration of trade marks. The Act should be read together with other legislations like the Consumer Protection Act (for example, s79 of this Act regulates the use of business names, more especially during advertising. S81 (2) in particular prohibits usage of names that may be confusingly similar to other names, or may falsely imply or suggest some connection with another person or entity). Under the Trade Marks Act, some requirements, as discussed below, need to be met for such registration to take place.

The trade mark must be distinctive i.e. it must be capable of distinguishing the applicant's goods or services from those of another, in the same category (s 9(1)). Other requirements are implied from what is not considered to be registrable trade marks under section 10. Section 10 may prevent a lot of trade marks intended for use during the world cup from being registered. The Act makes it difficult for certain trade marks to be registrable even under a normal situation (outside the periods of big sporting events), might also be difficult to register during, or in anticipation of, the big sporting events. Such marks, as discussed below, are therefore non-registrable.

Section 10 (2) (c) of the Act considers as non-registrable a mark consisting of a sign or an indication which has become customary in the current language, or bona fide and established practices of a trade in question. This may make it difficult for companies that seek to take advantage of the big sporting events, or companies sponsoring the events. Section 10(3) also makes non-registrable a mark in respect of which the applicant has no bona fide claim to proprietorship. Section 10 (4) further makes non-registrable a mark where the applicant has no bona fide intention of using it as a trade mark. For example, where the applicant, anticipating the World Cup, attempts to register marks with the intention to prevent others from registering them, this could be considered non-registrable. Where an applicant makes the application for registration in bad faith, this will be considered non-registrable under section 10(7) of the Act. The same principle applies in case an applicant attempts to register a mark imitating a well-known trade mark under the Paris Convention, as this will be non-registrable under section 10(6) of the Act. This will prevent applicants from taking advantage of well-known trade marks associated with big sporting events. The principle might apply where the intended trade mark contains emblems of an international organization, as this might be non-registrable under section 10(8)(d) of the Act. Lastly, sections 12 to 17 of the Act make a mark non-registrable if it is likely to cause deception or confusion if registered.

The Merchandise Marks Act

The most relevant section of this Act is section 15A, which empowers the relevant Minister to designate a particular event as a protected event, subject to certain conditions as may be appropriate (s15A(1)(a)). Big sporting events like world cups are usually so designated. For an event to be so designated, it must be in the public interest, and that the organizers must have created sufficient opportunities for the benefit of small businesses, more in particular those previously disadvantaged (s15A(1)(b)). During the period of the protected event, no person may use a trade mark in relation to such event, with the purpose of deriving promotional advantage, without the permission of the organizers. The use of the trade mark, to be prohibited, must be intended to be associated with the particular event (s15A (3)). The requirement of intention therefore links up with that as provided for (as implied there) in the Trade Practices Act (and also impliedly in the Consumer Protection Act, which repealed the Trade Practices Act). Section 15A (1)(a) of the Merchandise Marks Act further makes provision for the period of protection, which may not end more than one month after the event ended.

Punishment for violating the provisions

The Merchandise Marks Act prescribes punishment for violation of some of the principles above, including fines. Though the provisions do have an option of both fine and imprisonment, where it only makes provision for fine, the fine is very small, currently set at a maximum of R5000 or R10 000 per infringing article or item, depending on the nature of the offence (s 20(1)). This implies that companies, which know that they can make a lot of money out of ambush marketing, can violate these provisions, knowing that they will pay a lesser fine. The fines don't distinguish between small and big companies involved in ambush marketing. The fines will therefore, indirectly, only be restrictive on small businesses. Confiscation of the infringing goods is also contemplated (s 20(2)). Even confiscation will however not deter big companies.

Section 19(1) of Counterfeit Goods Act 37 of 1997 does not make anything better by way of fines. However, it has an additional provision that criminal or civil liabilities under other laws are not affected by this Act (s21). This means that persons whose intellectual property rights have been infringed can still institute civil claims against the wrongdoers. Similarly, other criminal liabilities can be laid against the wrongdoers, subject to the Constitution of the Republic of South Africa, 1996 and the Criminal Procedure Act 51 of 1977 (see s21 of the Counterfeit Goods Act). It appears, in my view, that there is nothing preventing both criminal and, more especially civil, liability against the wrongdoers, even under the Merchandise Act.

Though the Trade Practices Act makes provision for either fine or imprisonment, or both, it does not however specify the amount of fine (s19)). However, given the close similarity between the purpose of the above Acts and this Act, it can be reasonably inferred that the weaknesses discussed with regard to the above Acts can as well apply here i.e. the fine might not be differentiated as between big and small companies.

What can the possible defences to the legislations above be?

It appears that the common thread in the above legislations is that there must be an intention to associate or create an impression of association with a particular event or trade mark. Those charged will therefore need to have certain defences, for them to escape liability, criminal or otherwise. It might be a possible defence by those charged that there was no intention to mislead the public into believing that there was any association with the event. Related to this will be the defence that there was no creation of an impression of association with the event, whether intentional or otherwise. It might be difficult in the case of big companies to disprove intention or creation of an impression of association, given that it is easier for the public to assume association in the case of companies with the potential to associate with such events through sponsorships. In the case of small businesses, it might not be difficult for them to disprove any intention to associate, or creation of any impression to do so, given that their size cannot easily be associated with such events, unless the businesses concerned do all they can to so associate.

Special Legislations and Regulations before, during and immediately after the World Cup

As a way of protecting the event, host governments usually enact special legislations and regulations around the time of the event. In the case of South Africa these special measures are also contemplated under s15A of the Merchandise Marks Act. Some of the legislations enacted include the 2010 FIFA World Cup South Africa Special Measures Act 11 of 2006 and the Second 2010 FIFA World Cup South Africa Special Measures Act 12 of 2006. The first Act (No. 11 of 2006) was intended to give effect to the agreement and guarantees SA had with FIFA, with regard to the hosting of the world cup. It provided for details around how access to designated areas, restricted zones, etc, had to take place. It also gave powers to ministers, more in particular, Safety and Security Minister, to make other necessary regulations, so as to give effect to the Act.

The second Act (No.12 of 2006) also had related objectives, as the first one (Act no.11 of 2006), with the latter, however, focusing on the accreditation of foreign medical contingent. This would enable them to operate within the country without the need for registration, as required by local laws. This Act also allowed the bringing into the country of some unregistered medicines, despite that being in contravention of the local laws regulating the registration of medicines and related substances. This was intended to ensure that the visitors are not unnecessarily restricted from operating within the country during that period. Of more importance to ambush marketing, the second Act (No. 12 of 2006) empowers the Minister of Trade and Industry to extend the period of

operation of the declaration of the World Cup event as a protected event, provided the extension should not be more than six months after the event had ended. This is meant to ensure that ambush marketers should not take unfair advantage of the event just immediately after the world cup has ended.

The common law position

Apart from the statutory position, it is here necessary to examine how ambush marketing could be viewed from a common law position. Under common law, a person can be prevented from imitating the goods or services of another, or creating an impression that his goods or services are goods or services of another. The person whose goods are imitated can therefore institute a delictual action against the imitator, based on passing off. Ambush marketing can therefore easily fall foul of these principles. An ambush marketer, by associating himself to a particular event or sponsor, could be said to be committing an act of delict. This could also undermine fair competition principles. So as to protect themselves, potential ambush marketers will need to conclude contracts with the sponsors, for licensing. This might also be a hindrance to small businesses, which might not afford the licensing fees.

Constitutional framework

Section 2 of the Constitution of the Republic of South Africa, 1996, provides that the Constitution is the highest law of the land, and any law inconsistent with it is invalid. It provides for a bill of rights, where rights like equality, human dignity, freedom of association, freedom of expression, freedom of trade, occupation and profession, etc are provided for. In the context of ambush marketing, those who are restricted from advertising are likely to view such restrictions as a restriction on their freedom of expression and freedom of trade. This may therefore leave the question whether restrictions of this nature are reasonable and justifiable in an open and democratic society, based on human dignity, freedom and equality (s36). These constitutional demands therefore require that organizers and sponsors of events, when framing their rights' protection programmes, should do so in such a manner that the restrictions imposed on others do not violate these principles. This framework also exists at international level, through the Universal Declaration of Human Rights (1948), which has the same spirit.

International law position

Because most of these events have an international status, the international law position is here given. Apart from the international human rights instruments like the Universal Declaration of Human Rights, there are other instruments dealing with more specific issues around intellectual property and related rights, which are usually the point of dispute in ambush marketing cases. The rules of the World Intellectual Property Organization (WIPO), a United Nations (UN) agency, will be examined, to the extent of their relevance to the issue of ambush marketing.

World Intellectual Property Organization

Here the paper only focuses on the Paris Convention for the Protection of Industrial Property, which is administered by WIPO. Art 10bis thereof provides for protection in the case of use of trade marks that might create confusion. This will prevent ambushers from using or registering marks that might be confused with FIFA or the sponsors. Art 11 further makes provision for the temporary protection of certain marks during international exhibitions. In my view, the world cup might fall under this protection. This framework could therefore be useful in that most countries of the world are members of the UN, and will therefore be likely to be aware of these instruments.

World Trade Organization (WTO)

What are the rules of the World Trade Organization (a voluntary international trade organization where most states are members), in so far as they are relevant to ambush marketing? WTO has TRIPS (Agreement on trade-

related intellectual property rights), which deals with various types of intellectual property rights. The WTO does not, however, have specific rules dealing with ambush marketing. Its principles, in the case of trade marks, are similar to what the paper discussed above. For example, no person is expected to use his trade mark in a manner that may create deception or confusion with another trade mark owned by someone else. The owner will therefore be able to prevent such persons from using the trade mark (art 16(1)).

FIFA Rules

FIFA has its rights protection programme during major soccer events. This outlines what will, or will not, be allowed during the soccer events. For the 2010 World Cup in South Africa, FIFA had what is referred to as 'The FIFA Rights Protection Programme', detailing what may or may not be allowed during the event. The Programme is mainly meant to protect the sponsors of the event. The programme also outlines its partners, sponsors and national supporters of the world cup. It further outlines the protected marks. These marks include terms, symbols, etc. associated with the event e.g. words like world cup were part of the protected marks during the event (FIFA, 2010). No direct reference to these words could be used by unauthorised persons. In addition, activities associated with the event were restricted, for example ticket promotion (FIFA, 2010). The world cup also led to the making of certain special legislations, as discussed above, so as to protect the event.

ETHICAL QUESTIONS AROUND AMBUSH MARKETING

The paper here briefly looks at some ethical issues, guided by some ethical theoretical traditions. Ethics concerns questions (systematically) about why certain things are considered right or wrong, good or bad, just or unjust. It is therefore about justification of actions or decisions, or some habits. There are many ethical theories accounting for why actions can be right or wrong, or persons being good or bad. These are deontology, utilitarianism, virtue ethics, stakeholder theory and stockholder approach. Despite there being many theories, the discussion here will only be confined to stockholder and stakeholder theories, which this study considers more relevant to the type of disputes during these major events. A short discussion of these therefore follows.

Recently there has been some scholarly debate around the purpose of a corporation or a business. There has been a similar debate around the role of corporate executives, in relation to the purpose of the corporation or business. The question around the purpose of business arose in the context of analyzing the role of business in what is referred to as corporate social responsibility. The debate is about whether the purpose of business is only to make profits, or whether it also includes the undertaking of corporate social responsibility activities. By extension, the debate usually also includes whether the focus is only on the promotion of the interests of shareholders (stockholders) or whether it also includes the promotion of the interests of other stakeholders like employees, customers, the community, the protection of the environment, etc. The theory restricting protection to stockholders is referred to as stockholder theory, while the one covering stakeholders is referred to as stakeholder theory (Beauchamp, Bowie & Arnold, 2009).

Stockholder approach

The stockholder approach has been made popular by Milton Friedman, who is of the view that the role of business is to maximize profit, and that it should do so for its stockholders or shareholders (Beauchamp, Bowie & Arnold, 2009, p.45). Friedman considers the stockholders as the owners of the corporation to whom profits belong (Beauchamp, Bowie & Arnold, 2009). Friedman argues that the corporate executives do not have the mandate to pursue corporate social responsibility activities. Their role is to carry out the mandate of the owners, being that of making profits (Friedman, 2009, p.52). Stockholder theory is therefore very narrow and rigid. The implication of this in the context of ambush marketing is that those companies who have sponsored specific events will only focus on the interests of their shareholders, and be less concerned about the plight of all others, including small businesses which might suffer as a result of exclusive agreements between sponsors and FIFA. The sponsors may sometimes want to exclude others even where they will not lose anything by letting them market, just out of the urge to have monopoly. The fittest, being the more resourced, will rule. The concept of sharing resources, which should be what these big sporting events are all about, will be ignored.

Stakeholder approach

The proponent of this theory is Edward Freeman, according to whom the purpose of a corporation is to promote the interests of key stakeholders like customers, employers, community, and the shareholders themselves (Freeman, 2009, p.56). The theory is more flexible and therefore capable of catering for the interests of different stakeholders. In the context of big sporting events, where many stakeholders might have different interests, the theory can be more suited. The interests of small businesses, of the unemployed, of the environment, of the sponsors too, of government may well be taken into account. Very restrictive sponsorship arrangements could therefore also be discouraged. The theory is therefore to be adopted in the context of dealing with ambush marketing during big sporting events. It can promote resource sharing between small and big business during these types of events.

RECOMMENDATIONS

Ambush marketing rules need to make a distinction between big companies and small companies (including individual hawkers). How the size of the small business should be determined is not part of the scope of this discussion now. The differentiation will ensure that small companies are not negatively affected by the rules. This differentiation can also be made when determining the fines to be meted out, as it will be far more burdensome for a small company to pay a particular fine than a big company. A stakeholder approach to decision-making should also be preferred to a stockholder approach in this regard.

CONCLUSION

The problem of ambush marketing is here to stay for some time. Survey of literature has shown that the problem is too complex to regulate, given that ambush marketers change strategies. It is therefore not possible to make rules that will cover every eventuality. What will also remain a concern is that although some legislations e.g. the Merchandise Marks Act, do contemplate that small businesses should be given opportunities, there was very little to show, by way of special rules and practices during the event, that there is any intention to give small businesses priorities. The laws also do not clearly indicate how the small businesses should be given this priority during the big events, more especially in the context of ambush marketing. In conclusion therefore, one should state that the laws and rules regulating marketing during big sporting events remain unfair to small businesses. Some legal reform in this regard is therefore called for.

SOUTH AFRICA'S APPROACH TO THE TAX TREATMENT OF MEDICAL CONTRIBUTIONS AND RELATED EXPENSES: SOME LEGAL AND ETHICAL QUESTIONS

Jamwell Maswanganyi
Tshwane University of Technology, South Africa

ABSTRACT

The right to health is considered one of the most important rights protected by most constitutions and other laws all over the world. This could be considered as important as the right to life, being so closely linked to it. The tax treatment of contributions, donations and expenses related to people's health therefore calls for some academic scrutiny. The South African tax system does allow instances where some categories of persons, for example, the elderly, can get some favourable tax treatment, more especially in relation to deduction of medical expenses. This favourable tax treatment is however very limited in the case of other categories of persons. Should there be any limitation with regard to the tax treatment of expenses, and other categories of transactions which have some bearing on people's health? What are the underlying principles for the tax treatment of medical contributions and related transactions? The paper here examines the current tax legislations dealing with these aspects, the practices and the principles governing them. The paper then argues that the legislations, practices and principles undermine the right to health. Some legal and ethical theories will be used to tackle the question. The paper then proposes legal reform on the issue.

INTRODUCTION

Most legal systems of the world provide for the taxation of their subjects, using a variety of criteria. What the basis of these criteria and principles are may not always be clear-cut. This paper seeks to look at the South African taxation system, and the criteria it uses to differentiate the taxation of its subjects, more especially in those areas that impact on the health of the nation. The paper therefore looks at the tax treatment of medical expenses and related transactions impacting on health. While different ethical theories exist for dealing with the rightness or wrongness of actions, goodness or badness of character, etc, this paper focuses mainly on theories of distributive justice, more in particular the egalitarian and libertarian theories. The former theory is represented by John Rawls, while the latter is represented by Robert Nozick. Justice theories are considered more suited in dealing with questions of allocation of resources, and of social burdens and benefits. The approach in this paper is to contrast Rawls and Nozick, and then evaluate their relevance to questions of determining the best principles around which benefits and burdens of taxation should be distributed.

EXPOSITION OF THE SOUTH AFRICAN TAXATION FRAMEWORK, IN RELATION TO MEDICAL EXPENSES AND RELATED TRANSACTIONS IMPACTING ON HEALTH

In South Africa, tax matters are mainly regulated by the Income Tax Act 58 of 1962. Section 18 of this Act provides for the deductibility of medical and related expenses. This includes some prescribed medical aid contributions (Huxham & Haupt, 2011, p.225). It also includes some other qualifying medical expenses.

Qualifying medical expenses are those paid for by the taxpayer, but could not be recovered from the medical aid scheme (Venter, Stiglingh, De Hart, Coetzee & Koekemoer, 2010, p.163). As not every medical expense will qualify, it is only those expenses paid by the taxpayer to a medical practitioner, optometrist, dentist, homeopath, and other related health professionals, for professional services rendered or medicines supplied to the taxpayer that will qualify for deductions (Venter *et al.*, 2010, p.163). It also includes expenses paid to a pharmacist, for any medicines supplied by such pharmacist, on the prescription of a doctor or any other person so authorized by s18 of the Act (No. 58 of 1962). Expenses paid to a nursing home, or related persons or institutions as provided for under s18, for any illness or confinement of the taxpayer or his dependants also qualify (Venter *et al.*, 2010, p.163). All the expenses under s18 of the Act, to qualify, should have been expended for the taxpayer himself or his dependants (for any other expenses, see Venter *et al.*, 2010, p.163).

Although there have changes in the most recent past about the way medical and related expenses are treated, the paper looks at both scenarios. There are also proposed changes, due to take effect as from 1 March 2014, from which date there will no longer be deductions for medical expenses, where these expenses will be converted into additional medical tax credit (Venter, De Hart, Coetzee & Koekemoer, 2013, p.164). Before briefly explaining how this different treatment of medical expenses and related transactions works, it is necessary to look at some technical aspects regarding how the system works. Before the current changes, a taxpayer could claim the deductibility of medical contributions and other qualifying expenses, with the result that his taxable income is reduced thereby.

Where a taxpayer is a contributor to a registered medical aid scheme and is below the age of 65, the taxpayer would be entitled to deduct his contributions up to a family limit. A family was calculated by multiplying a specified figure, which at the time of the current changes came about stood at R720 per taxpayer per month. If the taxpayer had some dependants, the taxpayer would also qualify for another R720 for the first dependant, and then R440 per month for any subsequent dependant or dependants. A dependant, for the purposes of this, could be a wife, children or any other person considered as such by the medical aid scheme (For more information on this, see Stiglingh, Koekemoer, Van Schalkwyk, Wilcocks & De Swart, 2012, p.343). If this taxpayer was unmarried, and contributing to the scheme for about R2000 a month, his deduction would be as follows:

Family limit: $R720 \times 12 = R8640$. His total contributions: $R2000 \times 12 = 24\ 000$. Though the taxpayer's total contributions stand at R24 000, he would only be allowed to deduct up to R8 640, being the total limit. The remainder of the contributions i.e., those not allowed as deductions, will then be added to any other qualifying medical expense actually incurred by the taxpayer in terms of section 18 and deducted based on the 7.5% rule (Venter *et al.*, 2010, p.167). Assume that his other qualifying expenses were R10 000, and his taxable income was R400 000, after the medical aid contribution was deducted, while also excluding any retirement fund lump-sum benefit and lump-sum withdrawal benefit received, as required by the formula (Venter *et al.*, 2010, p.167). The deductions, based on the 7.5% (of the taxable income), would be as follows: The total expenses (medical contributions not allowed plus the qualifying expenses) minus the 7.5% of the taxable income, with the difference being the amount to be deducted from the taxable income. This would work like this: $R15\ 360$ (remainder of the medical aid contributions not allowed above) plus $R10\ 000$ (the qualifying expenses) = $R25\ 360$ minus $R30\ 000$ (i.e., 7.5% of 400 000). The difference would be: NIL (as the amount would be a negative amount). The result of this would be that there would be no further deduction allowable, beyond the R8 640 above.

However, if this person was married with 4 children, the answer could change dramatically. In short, the taxpayer in such circumstances would be able to deduct the whole of his medical contributions (but not the qualifying expenses in this case). This would have come about as follows: Taxpayer's limit: R8 640 ($R720 \times 12$); First dependant or wife's limit: R8 640 ($R720 \times 12$); Children's limit: $R21\ 120 (R440 \times 12 \times 4)$. Total family limit: R38 400. Because the family limit here is higher than the actual contributions to the medical aid scheme, the whole contributions would be deductible. Having dependants is therefore a factor in determining the amount of deductions one would be entitled to.

Where the taxpayer in any of the scenarios was aged 65 or above (married or unmarried, having dependant or no dependant), the taxpayer would be able to deduct all his contributions to medical aid scheme. Unlike in the case of those below the age of 65, the taxpayer would again also be able to deduct all the qualifying

expenses incurred under s18 of the Income Tax Act. The same, i.e. full deductibility of medical expenses, will apply to a taxpayer, irrespective of age, who is disabled, or has a spouse or child who is disabled (Venter *et al.*, 2010, p.164). The contribution by the taxpayer's employer to the medical aid scheme will also not be considered to be a fringe benefit (and therefore not taxable in the taxpayer's hands), for those aged 65 or above. Such contribution is treated as a fringe benefit in the case of the taxpayer aged below 65, irrespective of whether he has disability or not (Venter *et al.*, 2013, p.164).

The new changes relating to medical expenses do not change the situation of those aged 65 and above. All medical contributions and qualifying expenses are still deductible in full. For taxpayers below the age of 65, the system of family limit has been changed into medical tax credits, calculated as follows: R230 per month per taxpayer; R230 per month per first dependant; R154 per month per every additional dependant. This means that the taxpayer is able to claim medical tax credit to the extent of these amounts. Any contribution by employer to the medical aid scheme will be treated as a fringe benefit, and therefore taxable (Venter *et al.*, 2013, p.158). Any additional expenses incurred by the taxpayer, not linked to contributions to the medical aid scheme will be added to any contributions that exceed four times the medical tax credit (Venter *et al.*, 2013, p.160). The total thereof, to the extent that it exceeds 7.5% of the taxable income (excluding retirement fund lump-sum benefits and retirement fund lump-sum withdrawal benefits, and after deducting donations to public benefit organizations), will be deducted (Venter *et al.*, 2013, p.160).

In the case of persons with disability (or persons whose spouses or children have disability), all the medical expenses other than contributions to medical aid scheme will be deducted in full. In the case of medical aid contributions, the system is almost similar to that of the taxpayers below 65. (For further information on the proposed changes into the medical tax credit system for all the taxpayers, including those above the age of 65, though operating slightly differently from the current system, see Venter *et al.*, 2013, p.164).

From the above one can conclude that there are a number of factors generally taken into account when dealing with medical contributions and expenses. The following appear to be some of the key factors, namely, age of the taxpayer, marital status (to a very limited extent), whether one has dependants or not and the level of income, amongst other possible factors. What is the justification for these factors to be used in such cases? So as to deepen understanding on this, some ethical theories are therefore looked into, more in particular those dealing with distribution or allocation of resources.

EXAMINATION OF THE ETHICAL THEORIES DEALING WITH QUESTIONS OF DISTRIBUTION

Although many other theories could possibly account for why some principles, and not others, are taken into account when dealing with the deductibility of medical and related expenses, it is the theories of John Rawls and Robert Nozick which could deepen understanding on this. The theorists, one libertarian (Nozick) and the other considered egalitarian (Rawls), both deal extensively with questions of justice in the distribution and allocation of resources. Based on Nozick's own classification of the approaches he follows and that followed by other theorists like Rawls, the approaches are also categorized as non-patterned and patterned, respectively. The latter bases its distribution on specific properties (or patterned principles) like need, moral merit, etc. (Nozick, 2002, p.517). Allocation according to this approach takes the shape, 'distribution according to need; according to merit', or 'from each according to...' etc. (Nozick, 2002, pp.517-518). Non-patterned principles are not based on some properties and past actions of a person. They are based on the process of 'just acquisition, just transfer and just rectification' (Stumpf & Abel, 2002, p.514). It is therefore important look at how these approaches have implications for tax policy, more especially in relation to medical deductions.

Robert Nozick's theory of justice

The main focus of the Nozickian theory is on how the basis of distribution of resources should be. Nozick questions theories like egalitarianism, which looks at the current resource distribution as the basis of assessing what is just. He looks at the past (historically), and then argues that if the property has been acquired properly, the holder thereof is entitled to it. Nothing therefore binds the holder to distribute. If the acquisition of the

property was improper, there can be justified deviation from the protection of liberty, and therefore allowing the rectification of the problem. The argument can therefore be represented in as follows: 'A' acquired his property properly (justly). It is unjust to distribute any person's property to someone else, if properly acquired. Therefore, it is unjust to distribute A's property to someone else.

Advantages of Nozickian theory

The theory provides a sound and clear basis for why distribution from one person to another should take place. It can therefore be important for clarification purposes. It can therefore be useful in dealing with issues of distribution at personal level (micro-level). For example, at personal level, if A has been disadvantaged by B, he can undoubtedly lay a claim for whatever B has acquired. In most legal systems there are even settled principles to deal with this type of scenario. Enrichment action is one of them, which allows a person at whose expense somebody has benefitted, to have the disturbed equilibrium restored (through compensations). In the law of contract, there is a principle of *restitutio in integrum* (restitution), where the party seeking the restitution has been wronged. For example, where a minor has entered into a contract to his own detriment, he may claim restitution from the other party (Fouche, 2007, p.70).

Some problems with Nozickian theory

There are a few problems with (or objections to) Nozickian theory. Nozick sometimes uses a straw man argument. He misinterprets what other theorists on distributive justice argue for. For example, his example of the basketball player seeks to suggest that other theorists' main focus is prohibition of accumulation of wealth and use of talents (Nozick, 2009, p.684). The other theorists like John Rawls do not prohibit that, but only argue for active measures to be taken to deal with the situation of those in disadvantaged situations. Rawls does not argue against any distribution to those not disadvantaged. Nozick further makes an irrelevant appeal to emotions by simply locating his examples in socialist societies (Nozick, 2009, p.685). It is not relevant to do so under the circumstances. That could further be viewed as some preconceived and prejudiced ideas about socialist societies. It is also incorrect to associate all forms of centralized distribution, through for example taxation, with socialism. It is possible to have this without being a socialist society. Further, Nozick's reference to other theories as patterned, and his as non-patterned, may suggest that his theory is more flexible to situations, while the others not. This appears misleading.

Despite the clarity that the theory provides in the case of personal situations, the theory is however not appropriate in dealing with questions of distribution at macro-level (outside close and personal situations). It is in fact an over-simplistic principle at that level. For example the rectification principle, which implies that the wrongdoer must have been identified, from whom the redress must come, is not appropriate at macro-level decision-making. Usually the disadvantages in communities can be systematic, with no particular person (wrongdoer) easily identifiable. The rectification principle might find it difficult to deal with this type of a situation. In the context of progressive taxation the theory might discourage this, as there might be no justification, according to the theory, to have those who earn more pay more. The progressive system of taxation bases taxation on the level of income a person earns, and it requires a person to pay more if he earns more (Venter *et al.*, 2013, p.3). The system may not properly account for why those facing social disadvantages, namely, the aged, disabled and those with dependants may, within the taxation system, have to be treated differently from those without these disadvantages.

The system of providing extra tax rebates for the aged (in South Africa it covers natural persons aged 65 and above, plus additional rebates called tertiary rebates for those aged 75 and above), might not be easily accounted for through Nozick's libertarian principles (also see Venter *et al.*, 2013, p.13, for the rebates). Those who are 65 and above also enjoy tax exemptions in relation to local interests received. As already discussed above, in the context of the deduction of medical contributions and expenses, the South African tax system treats those above the age of 65, those disabled and those with dependants (and indirectly those who are married, as spouses may qualify as dependents too) more favourably than those without these qualities. In general, expenses on health-related activities are treated more favourably than general expenses, e.g., expenses on personal maintenance like buying food, clothes etc., are not deductible. Though unstated, the South African tax system could, in Nozickian language, be viewed as a patterned system in this context. In other words, it allocates

resources according to a particular pattern, based on some properties (characteristics) like age, disability, marital status, having dependants. The allocation could be viewed as being some distribution 'according to' these properties. Nozickian theory is therefore likely to reject these as patterned, and opting for what it considers non-patterned (not based on specific predetermined properties).

The other problem relates to Nozick's 'justice in acquisition' principle, which focuses on how the property was acquired or transferred. Does this really entail going back to history? How far should we go, if we do? A's property, though properly acquired by him, might have been acquired from a person who did not properly acquire it. Many chains may have been broken in the middle. Though this paper concedes that the theory is capable of being applied well at personal level, this example shows that even at personal level, the resolution will not be that simple. This can clearly oversimplify issues if it were to be also applied at national level. It may provide very little guidance as to what we need to do to alleviate the plight of those socially disadvantaged. If it does provide such guidance, it may at best discourage any positive measures to alleviate the plight of those in the disadvantaged situation.

The system of giving favourable tax treatment, through medical deductions, for the aged, disabled and other similarly situated persons will therefore not be accommodated in this theory. Because even in the case of all other natural persons (and possibly any other persons), the condition of being unhealthy is a social disadvantage, but the theory would not accommodate any system that allows favourable tax treatment for persons who seek deductions for the expenses incurred on medical and other health-related conditions. The theory would therefore fail as a basis for the fair distribution of social benefits and burdens, more especially through a tax system.

Rawlsian theory

Rawls considers justice as a first virtue for social institutions (Rawls, 2009, p.674). Rawls argues for a method by which fair principles of justice can be developed. The principle (or method in this context) is referred to as the original position. Rawls asserts that for persons to develop fair principles of justice, they must first place themselves in a position of ignorance ('in a veil of ignorance'). This implies placing themselves in a position where they do not know what their future positions, status, etc., will be. This is considered an impartial position. If principles are chosen from this position, their choice will therefore be impartial. In other words, this will prevent situations where a person chooses a particular position, in what appears to be a neutral situation, yet the person is taking the position to pursue his or her own interest. Not knowing your future position will, according to Rawls, prevent this from happening (Rawls, 2009, p.677).

From this position could be developed principles of justice. The original position will, according to Rawls, most likely lead to fair principles. Even if the principles taken may have undesired results, those who took them will not have foreseen them. Rawls developed two principles of justice: Firstly, that each person should be permitted the maximum acquisition of basic liberty compatible with the same liberty available to others, and secondly, that inequality should be permissible if this is to the advantage of everyone. The latter is what is called the difference principle (Rawls, 2009, p.677). The first principle is the rule, and the second the exception to the general rule. The second principle also encompasses equality of opportunity in terms of access to positions and offices.

These principles are altogether designed to provide a way of assigning rights and duties in societal institutions (Rawls, 2009, p.674). They are designed to apply in a particular preferential order, with the first given priority.

Rawls' basic claim in his theory of justice can therefore be summed as follows:

Justice is the first virtue of social institutions. Laws and institutions not in conformity with it are therefore unjust. There should be fairness in both the design of the principles of justice, as well as its application of the principles (the actual distribution of resources). Fairness in the design implies using the original position as a starting point when developing principles of justice. Fairness in the application implies using the two principles of justice discussed above. Law and social institutions are therefore just if they conform to the above principles, and unjust if they don't. Rawls also emphasizes the role of institutions in ensuring justice. He says in this regard:

Finally, there is a distribution branch. Its task is to preserve an approximate justice in distributive shares by means of taxation and the necessary adjustments in the rights of property. Two aspects of this branch may be distinguished. First of all, it imposes a number of inheritance and gift taxes, and sets restrictions on the rights of bequest. The purpose of these levies and regulations is not to raise revenue (release resources to government) but gradually and continually to correct the distribution of wealth and to prevent concentration of power detrimental to the fair value of political liberty and fair equality of opportunity. For example, the progressive principle might be applied at the beneficiary's end. Doing this would encourage the wide dispersal of property which is a necessary condition, it seems, if the fair value of the equal liberties is to be maintained' (Rawls, 2009, p.681).

Possible objection to the Rawlsian theory

The theory could be said to be not a truly equalization theory, but one of improvement or betterment of conditions of persons. If it does promote true equality, it is just ambiguous in saying so. Inequality will be allowed as between different persons, so long as the least well-off is not more disadvantaged than before. The theory therefore falls short of true egalitarianism, in providing the way resources have to be allocated, but has moderate egalitarian elements in the method of designing principles of justice.

The theory is not clear about how it will resolve situations where different categories of basic liberties conflict. The theory therefore fails in telling us how to prioritize different interests and rights when they conflict with one another. The only prioritization Rawls provides is as between the first and the second principles of justice he proposes (Rawls 2002: 511). The proponents of theory might however respond that this objection is not unique to Rawlsian theory, but is also applicable to many other theories (including deontology from which Rawls' theory is adopted), virtue theory, libertarian theory, etc. This objection might however remain fatal even in our choice of taxation principles, in case of conflicting priorities. For example, how do we choose whether to prioritize health promotion through tax deductions for medical and health-related expenses, and not do same for expenditures on nutrition-related transactions, on gyms, etc., which may equally promote health? In other words, the theory might not tell us why we should take this option, but not that option.

The theory has some ambiguity and lack of details in certain aspects of the theory. For example he says:

"A departure from the institutions of equal liberty required by the first principle cannot be justified or compensated for, by greater social and economic advantages" (Rawls 2009: 678).

Rawls again says:

"Thus the principle (difference principle –my emphasis) holds that in order to treat all persons equally, to provide genuine inequality of opportunity, society must give more attention to those with fewer native assets and to those born into the less favourable social positions" (Rawls 2009: 679).

This makes the position of whether or not there should be deviation from the first principle a bit ambiguous.

Advantages of the Rawlsian theory

Despite some of the objections to the theory above, there are some advantages that cannot be easily refuted by the objections. Even though the theory has more emphasis on protection of liberty, it does also allow for exceptions. It is therefore less absolutist than traditional deontologists. The exceptions, as discussed already, allow for inequalities where the inequalities are to the advantage of all, more in particular the least advantaged. In the context of taxation, the theory does accommodate the use of taxation as a tool of distribution. The theory may therefore also accommodate the use of taxation for the purpose of benefitting the least advantaged. This could take place through the progressive system of taxation which, as already indicated above, bases taxation on the level of income a person earns, and a person pays more if he earns more (Venter *et al.* 2013: 3). The theory is likely to discourage regressive forms of taxations, where the more you earn, the less you pay (See Venter *et al.*

2013: 3). The theory can in this regard properly account for why certain persons should receive favourable tax treatment, based on their social conditions of disadvantage.

In the context of medical tax deductions, the theory therefore can adequately account for why having such (medical) deductions for all persons, is just, if the condition of being ill, and therefore resulting in health-related expenditures, is considered to be a social disadvantage. It may further account for why having favourable treatment for the aged, disabled, and those with dependants, in the form of having comparatively more deductions than for the rest, is justified. This can be accounted for through the difference principle, as espoused by Rawls. However, as indicated in the objections to the theory above, the theory may not properly account for why some categories of expenditures on health promotion should be prioritized more than others. It may equally not tell us why some categories of social disadvantage are more important than others, e.g., why should the aged qualify for additional rebates, but a disabled person not? Or why should a person with dependants qualify for additional medical deductions, while a person with some chronic illness (short of being classified disabled) still might not qualify for the additional deductions if not having dependants? The theory might say very little about these questions.

Despite these shortcomings, Rawlsian theory still provides a better account of why we need to accommodate those who are socially disadvantaged. A better theory, however, still needs to be developed for accounting for why and how the tax system should differentiate as between different categories of taxpayers. Better principles need to be found to respond appropriately to the challenge.

The position taken in this paper is that a medical condition in itself creates a social disadvantage for all persons, young and old, disabled or not, married or unmarried, having dependants or having none. The taxation system should therefore consider full deductions for all persons, in all categories, so long as it can be shown that the expenditure was incurred on medicine and some defined health-related transactions. Donations on health-related matters should be treated along these lines, therefore allowing for full deductions by the donor, for the donations made to a health institution or on health-related grounds (the current rules in relation to donations to non-profit organizations is to limit deductions up to a certain amount, currently fixed at 10% of the taxable income, and donations rules relating to non-qualifying non-profit organizations do not treat donations on health-related matters any specially. For further information on this, see Venter *et al.* 2013: 154).

Health is a matter of life and death, and therefore needs to be given some priority in our tax systems. The absence of favourable tax treatment mechanisms in this regard may undermine the constitutional right of access to health, as provided for in terms of s27 of the Constitution of the Republic of South Africa, 1996. The state is required under this section to take legislative and other measures, within its available resources, to achieve the realization of these rights, on progressive basis.

CONCLUSION

This paper had to look at whether there is any need for favourable tax treatment of medical and related expenses, for all persons, and if so what the principles are for dealing with same. The current South African tax system appears to make more favourable tax treatment for certain categories of persons, based on age, marital status, number of dependants and disability. While this is supported, the paper argued for the widening of this favourable treatment for all categories of persons who spend money on medical-related transactions. Different theories are used to argue for the position. The theories of John Rawls and Robert Nozick are contrasted, and Rawls theory is found to provide a better account for why those socially disadvantaged could be treated favourably. The paper here argues that those with some illness, and therefore involuntarily spending money thereon, need to be treated favourably too. The favourable tax treatment should therefore not only be confined to those presently covered by the South African tax system, but needs to go beyond that. Some legal reform in this direction is therefore warranted, through the broadening of the categories of persons considered for favourable tax treatment on their medical and related expenses.

ENVIRONMENTAL IMPACTS FROM COAL MINING IN SOUTH AFRICA

Kenneth M. Mathu
Vaal University of Technology, South Africa

ABSTRACT

The South African coal mining landscape was explored to establish its impacts on the environment. The mining companies, the government watchdogs on the environmental affairs, mining processes, transportation modes and the coal consumption for domestic and export plus the other role players in the industry are described. The environmental impacts from the coal mining process, beneficiation, transportation and coal use are discussed. The impacts on the soil, underground water and air are also articulated. The danger posed by the acid mine drainage and the discarded coal mines in the coalfields of Mpumalanga are also expressed. The two market segments for the South African coal: domestic and export and their contribution to the environmental degradation are expressed in details. The sustainability reporting and its three tiers: economic, environment and social are stipulated. Subsequently, recommendations are made to reduce environmental degradation in future by implementing green supply chain; use of clean coal technologies; improve collaboration for the coal supply chain and introduction of less cumbersome legislations to expedite coordination of environmental management. This is in line with the South Africa's plan to move to a low-carbon, resource-efficient and climate-resilient green economy that would deliver high-impact socioeconomic and environmental benefits.

INTRODUCTION

The study explores the coal mining landscape in South Africa which commenced more than 100 years ago. The mining areas, mining companies and the role players in the industry who includes the coal users and the logistics companies form the basis of the study. The other role players include the South African government watchdogs on the environmental affairs: Department of Mineral Resources (DMR), Department of Environmental Affairs and Tourism (DEAT) and the National Energy Regulator of South Africa (NERSA). The Chamber of Mines of South Africa was included as it provides research function for the industry and its socio-economic attributes to the country.

The environmental impacts from the coal mining activity, handling, stockpiling, beneficiation, transportation and consumption by the customers are expounded. These comprises site clearing of vegetation, ground excavation, soil and underground water disturbances, beneficiation, dump sites for discarded coal, modes of transport and the dangers posed by acid mine drainage (AMD).

The study focuses on both domestic and export markets comprising 75 percent and 25 percent respectively of the total coal produced in South Africa. The domestic market is predominantly for electricity generation by ESKOM and for the production of liquid fuels and petrochemicals by SASOL. Coal for export is mainly from Mpumalanga coalfields and exported through Richards Bay Coal Terminal to Europe Union and Asian countries. Hence, South Africa is one of the global top 20 major polluters of the environment. Subsequently, the study looks at the United Nations campaign on climate change under the auspices of the United Nations Framework Convention on Climate Change (UNFCCC); the clean coal technologies and the sustainability reporting on the triple bottom lines: economic, social and environment in pursuit of sustainable development.

PROBLEM STATEMENT

The problem statement for the study is the continued degradation of the environment in South Africa emanating from coal mining and its supply chain. The adverse effects on the environment are experienced from the coal mining process, stockpiling, processing, transportation and in the coal utilization. The soil and plant life are affected by excavation while dust and use of chemicals pollute the atmosphere. The surface and underground water table are interrupted and toxic elements develop when water gets in contact with the exposed rocks forming acid mine drainage that could contaminate water if it is not drained appropriately.

The other major impacts emanates from burning of coal for the generation of electricity and during transformation into liquid fuels and petrochemicals. The coal dust from the stockpiles and on transportation in uncovered facilities are other concerns for air pollution.

THE PURPOSE OF THE STUDY

The purpose of this study was to establish how coal mining and its supply chain impacts on the environment with a view of establishing a lasting solution to pollution. It was carried out by looking at the critical areas in the South African coal supply chain that included:

1. Reviewing critically the South African coal mining industry and its landscape.
2. Reviewing literature on South Africa coal mining and supply chain.
3. Determining the environmental germane to the industry.

METHODOLOGY

This study has adopted a qualitative research paradigm. According to Cooper and Schindler (2008: 162-168) the outcome of the qualitative interview depends very much on how the researcher prepares the participants for the interview. 'Qualitative research has substance, gives insight, shows sensitivity and is unique in conceptualization, yet grounded in data' (Corbin & Strauss 2008: 302).

The study involved the selection of participants, undertaking the interview, feedback on the interview for validity/reliability and facilitating data collection in a recorded form using an audio data recorder and field notes. Citing Goddard and Melville (2005: 49) the researcher must not direct the participant's answer through his tone of voice or rephrase the research question. Research design involves activities of 'collecting and analysing data, developing and modifying theory, elaborating or refocusing the research questions, identifying and addressing validity threat' (Maxwell 2005: 2).

A purposive sampling process was used for the selection and inducting the participants. The participants were top professionals who were also involved in decision making in their organizations in order to provide credibility to the study. There were 14 respondents earmarked for this research and 13 of them responded: 12 respondents were interviewed at their work place while 1 respondent provided a telephonic interview. The 13 respondents comprised 4 Chief Executives and 9 senior professionals in the mining and affiliated industries nominated by their respective chief executives.

Sample and Procedures

The researcher is required to obtain permission for access to individuals and institutions from gatekeepers of the target institutions (Ehigie & Ehigie 2005: 622-623). The permission to conduct research either oral or written is paramount (Cooper & Schindler 2008: 37). The objectives for the research were addressed to 'gatekeepers' by the researcher and also stated the value proposition for the study, purpose and ethical considerations that also addressed the 'informed consent' (admissibility for research process). A research introduction letter from the Vaal University of Technology formed part of the presentation. The content of the letter included the

introduction of the researcher, confidentiality undertakings and the use of audio digital data recorder for recording the interviews.

Data analysis

The research data was collected from the respondents using the audio digital data recorder and from the field notes. The collected data was transcribed and content analysis was used for the translation and analysis. The emerging themes and sub-themes were recorded and evaluated establishing how the industry impacts on the environment.

Reliability and Validity (Measures of Trustworthiness)

The reliability and validity of data from this study were ascertained through triangulation: comparing data from the interviews, feedback from the participants and from the literature. Triangulation enhances validity and richness of data by looking at issues from different angles (Lee & Lings 2008: 239). 'Multiple sources lead to a better understanding of the phenomena being studied' (Willis 2007: 219).

Ethical Procedures

According to Eriksson and Kovalainen (2008: 68) research is vulnerable to 'lies, fraud and wrongdoing' hence, ethical adherence is paramount. The ethical issues for this study were formally addressed by the researcher to the institutions' gate-keepers and the respondents.

RESULTS

The findings revealed the adverse impacts on the environment from the South African coal mining industry and role players. Four major themes emerged out of the study reflecting the impacts from the legislation process to the processes of the coal supply chain and the role players in the industry. The major themes comprised the earth's surface factors, air pollution, coal use impacts and coal transportation. Emanating from the broad categories that were identified were several sub-themes and they are expressed in Table 1.

Table 1: Themes and Sub-Themes Emanating from the Interviews

THEMES	SUB-THEMES
Earth's surface factors (mining process)	Soil, ground deformation, solid waste, ground/surface water, Acid Mine Drainage (AMD)
Air pollution	emissions from processes, beneficiation, industry and homes
Coal use impacts	Power station (electricity generation), Liquid fuels/petrochemical plants
Transportation	- Conveyor belts , rail, road

Source: Own research

DISCUSSION

There are 73 collieries in South Africa most of them owned by the five leading mining companies and distributed nationally as follows: Free State (2); Gauteng (1); Kwazulu-Natal (7), Limpopo (2) and Mpumalanga (61) (DMR 2008).

The factors contributing to the environmental degradation include earth's surface factors (mining process); air pollution; coal use and transportation.

Earth's Surface Factors (Mining Process)

The adverse effects from coal mining process include deformation of the landscape, destruction of plant life, soil erosion, solid waste production and interference with the surface/ground water posing the danger of acid mine drainage mixing with surface/ground water. According to McDonald (2002: 159) coal mining process impacts on land, air and water resources causing disturbance to the environment. The mining process includes ground excavation, coal washing and stockpiling that cause gaping holes in the ground, soil removal, contamination of surface/ground water and creation of solid wastes, water contamination, salination and siltation. The contaminated water contains poisonous or polluting substance. The salination contains high concentration of salt while siltation occurs when the running water carries fine sand, clay or other material.

1. Impacts on the soil

Mining activities cause severe disturbance to the soil environment in terms of soil quality and productivity and this is of serious concern worldwide (Mentis 2006:193). In terms of South African legislation, developers are required to rehabilitate ecological damage they inflict on the environment. In the case of the disused and discarded coal mines' rehabilitation has not appropriately been done in South Africa (Viren, Andrew & Sreekanth 2006: 297-307).

2. Impacts from solid waste

The mining industry is the largest contributor of solid waste in South Africa. It is estimated that for every ton of metal that leaves the mills, 100 tons of waste is created. A major source of solid waste in the coal mining industry comes from the poor quality discarded coal and ash separated when coal is washed (beneficiation) and blended for quality. According to Lloyd (2002: 3) over 80 million tons of coal wastes are dumped in South Africa annually.

3. Impacts from acid mine drainage (AMD)

Acid mine drainage (AMD) involves highly acidic water, usually containing a high concentration of metal sulphide and salt as a consequence of mining activity. The major sources of AMD include drainage from underground mineshafts, runoffs and discharge from open pits and mine waste-dumps, tailings and ore stockpiles, which make up nearly 88 percent of all waste produced in South Africa. Drainage from abandoned underground mine shafts into surface water systems either as decants or spillage may occur as the mine shaft fills with water (Manders, Godfrey & Hobbs 2009:1).

Air Pollution

The air pollution factor results mainly from coal-bed methane gas, a greenhouse gas which is a serious security risk in coal mining due to its explosive nature. Therefore, air pollution manifests from mining processes, coal beneficiation, coal stockpiles and coal use at home/industry (McDonald 2002: 158).

Mining processes

The use of chemicals in the coal mining process disrupts the hydrological pathways and contaminates oozing water from aquifers (water absorbing rocks) depressing the water table. Such type of water is saline and has heavy concentrations of salts such as calcium sulphate, sodium sulphate, magnesium sulphate or sodium bicarbonate, depending on the area. This polluted water is what is called 'Acid Mine Drainage'. In South Africa, water from Mpumalanga coalfields is rich in calcium sulphate while water from Waterberg coalfields has more concentration of sodium bicarbonate Manders *et al.* (2009: 1).

1. Impacts from coal beneficiation

The use of both 'wet separation' and 'dry beneficiation' causes pollution. Wet beneficiation is the process of the removal of the contaminants and the lower grade coal to achieve a product of quality which is suitable for the application by the user - either as an energy source or as a chemical agent or feedstock using water (Pinsloo 2009: 2). The process uses approximately 200 liters of water to process one ton of coal. Dry beneficiation is used in areas with water shortage and produces dust pollution (Singh & Beukes 2006: 40).

2. The impacts from coal stockpiles

The dust from the coal stockpiles pollutes the atmosphere, while the rain water washes the dust away causing damage to vegetation and polluting surface water.

3. Impacts from coal use at industry and homes

The environmental impact from the coal use at the industry and at homes is the greenhouse gases emissions to the atmosphere and the impacts emanating from the transportation from the coal mines.

Coal Use

The major impacts from coal use are mainly from emissions from coal burnt from coal-fired power stations and industries that produce liquid fuels and petrochemical products.

1. Impacts from coal burnt at coal-fired power stations

The power plants pose the greatest concern for air quality as they burn massive quantities of coal which emit massive greenhouse gases into the atmosphere as stated by the South African Government Gazette in 2006.

According to ESKOM (2009:80), the quality of air emission at ESKOM power plants has deteriorated since 2007 due to factors such as power stations running at higher load factors to meet energy demand; poor quality coal; inadequate maintenance due to lower reserve margins; and poor performances in some power stations.

ESKOM has planned for 40 new coal mines costing over R100 billion that need to be built to provide a sustainable coal supply to the existing power stations and the new ones that are planned to come on stream in the short and medium-term (Wilhelm 2009: 7-9).

2. Impacts from coal transformation into liquid fuels and petrochemical products

In South Africa the transformation of coal-to-liquid (CTL) fuels and petrochemical products is done by a local internationally acclaimed company SASOL using Fischer-Tropsch synthesis technology. The technology produces massive emission of carbon dioxide to the atmosphere making Secunda plant the single largest emitter of carbon dioxide in the Southern Hemisphere (SASOL 2008: 83).

Transportation

Transportation of coal from the mines is determined by the type of end users. The bulk of the domestic coal for power generation is transported from the mines operating adjacent to the power stations via the conveyor belts and the other modes used are road and rail. The road transport is mainly to the coal-powered power plants and impacts heavily on roads and causes noise and air pollution. The rail is mainly for the transportation of export coal and causes minimal pollution (Bischoff 2009: 100-101).

STRENGTH, LIMITATION AND FUTURE DIRECTION

A remarkable strength was the use of purposive sample. This ensured that the data was collected from credible sources comprising respondents who were professionals and involved in decision making in their respective organizations. The nature of the study provided limitation due to the high level of the targeted

population in the coal mining and affiliated industries. Coal being a primary source of energy in South Africa and energy being sensitive as a key role player for sustainable development restricted the flow of information. However, the use of peoples' skills, tact and professionalism made it possible to acquire the required information.

The future of coal mining could focus on the clean technologies and diversifying to renewable sources of energy in order to reduce environmental degradation. The 2011 South African government integrated resource (IRP) plan on energy anticipates that by 2030 the energy generated from carbon-dioxide free sources (including nuclear) will be nearly 30 percent of the total energy mix in the country. There are also needs for improved collaboration in the industry to tackle the environmental issues through effective and less cumbersome legislations. Integrated reporting by mining companies need to be enforced as stipulated by the King Report III that corporate reporting should incorporate the three tiers of sustainability: economic, environment and social aspects.

The dilapidated coal mines should be rehabilitated and the present requirements for new mining ventures to contribute towards decommissioning costs of the mines should be enforced for future developments. The coal logistics in South Africa should look into minimizing coal transportation by road as it is a menace to the community and the environment.

RECOMMENDATIONS

The United Nations campaign on global climate change and sustainable development under the auspices of United Nations Framework Convention on Climate Change (UNFCCC) provides a framework for countries to save the planet earth. In order to facilitate sustainable development and reduce environmental degradation from coal mining in South Africa, the following issues need to be addressed and implemented without delay:

- Introduction of clean coal technologies and carbon emission audit;
- Enforcing carbon emission credits;
- Action plan for immediate rehabilitation of dilapidated coal mines to be enforced;
- Implementation of management of policy on acid mine drainage (AMD);
- Drastic reduction of coal transportation by road.
- Implementation of sustainability reporting
- Implementation of green supply chain/logistics

This is in line with the South Africa's plan to move to a low-carbon, resource-efficient and climate-resilient green economy that would deliver high-impact socioeconomic and environmental benefits.

CYBERMARKETING AS A TOOL FOR LOYALTY OF STUDENT IN HIGHER EDUCATION INSTITUTIONS FROM BRASÍLIA/BRAZIL AND KENTUCKY/USA

Alano Nogueira Matias
Fundação Getúlio Vargas – RJ, Brazil

ABSTRACT

The present research work aimed the study of the advantages that the internet offers to the organizations in the relation with the customers, analyzing the result of the relation between the cybermarketing and the loyalty of the client with the superior teaching institutions from Brasília/Brazil and Kentucky/USA. Within the use of the ANOVA technique this research worked with two hypothesis which are the H0 that implicates in the non interference of the cybermarketing in the loyalty of the client with the teaching institutions and H1 which claims that there is an influence of cybermarketing in the customer's loyalty. The final result of this work was the acceptance of the H1 Hypothesis and the negation of the H0 hypothesis.

INTRODUCTION

Within a very competitive and demanding of assertiveness perspective, since the early years of the 21st Century, comes the Cybermarketing, a new conception of Marketing, based upon the technological innovation, making the internet and databases of the virtual world its work tools. This research work has enabled the study of the advantages that the internet offers to the organizations in engaging with the customer. With the Higher Education market heated and an intense competition, due to emerging strategies and the re-engineering, the science of marketing had to be adjusted to the new scenario. On the other hand there is a more demanding customer after the purchase of the service, requiring different treatment and seeking a more personalized service. The company, during these contacts, mediators or need specific tools for better results and win customer loyalty. Therefore, the present study analyzes the outcome of the relationship between customer loyalty and cybermarketing in higher education institutions in Brasília / Brazil and Kentucky / USA. The research was structured to begin with an introduction about the work in its first chapter, in which there is also the definition of the subject and its boundaries, its general and specific objectives, the problem formulation and its justification. In the next chapter, the theoretical and empirical research strategies for implementing the loyalty program were defined, which will, then, be interpreted in relation to the theoretical foundation. Finally, the author's conclusions about the research were presented. The aim of this study was to analyze the importance of the Cybermarketing as a tool for loyalty in the relationship program with the students among organizations in the segment of higher education in the cities of Brasília / Brazil and Kentucky / USA. As specific objectives to be achieved the research aimed to describe the concepts of Cybermarketing or Virtual Marketing; as well as demonstrate the involvement and the relationship between cybermarketing and customer loyalty.

DEVELOPMENT

The marketing combined with technology has become an important and necessary tool for the present days in modern enterprises and in this context the concept of cybermarketing emerges, which is seen as a basic tool for customer relationship, representing the latest evolution of direct marketing. Within this context, technological developments and its evolution obligated the enterprises to sustain this progress to align to their strategies as competitive advantage. Therefore, Cybermarketing arose from changes in the external environment, such as globalization and technological innovations. While the cybermarketing comes from the evolutionary process of the

classical marketing to modern marketing of the e-commerce, causing enterprises to adapt to the new competitive landscape in pursuit of the specific relationship between company and customer. Now the customer can combine the product, service, price and promotion in infinite varieties in real time, i.e., the customer can interact with the company in the process of value creation. Currently, the cyberprice is influenced by the client, since this has the option of immediate comparison of a great variety products and services. Relationship marketing gives customer an opportunity to individually decide how he wishes to communicate with the company and the technology made the communication interactive in relation to the customer's desire to relate with the company. The communication made on the Internet or Cybercommunication aims to attract, identify and build customer loyalty. The Internet has been both for company and for the customer, an effective, reliable and inevitable tool regarding communication, before the final decision in the negotiation of a particular product or service. Thus, through this communication it is advantageous to generate the momentum of the relationship with the client to maintain the loyalty, encourage future negotiations and achieve the expected return for the company. The dialogue, within the concept of cybermarketing, is the way that propagates the information or data electronically. With the advancement of computer technology, this process could be evidenced. The customer will always be the target of information, and thus is the basis of all dialogue. Through the website, the company will interact during the process of negotiation, and post-sale, in order to continuously satisfy the customer, wishing him the sensation and the conviction that he has made a good deal. Thus, the era of interactive marketing emerges where communication is bilateral and the client responds in real time, i.e., the company sees and understands what the customer says and what he wants. Therefore, to modern institutions, it is not just integrating in bilateral dialogue, it is also necessary for the company to integrate these new strategies to the internal system, having a upper management taught for the implementation and operation of these new communication processes with the key question of customer loyalty. New customers, proposed as Cybercustomer, seek excellence, speed, lower price and wide availability service station with several options and Cybercustomer knows what he wants and when he wants, so he is extremely demanding. It is mainly because it has access to all necessary information to be able to require, but before building customer loyalty, the company must know it, based on the database of the customer. With this we can calculate the level of reaction with action stimuli of the communications. With the help of software, the calculation of identifications can be faster, generating competitiveness for the company. The relationship marketing is essential to the development of leadership, customer loyalty, and rapid acceptance of new products and services to market. The creation of solid and lasting relationships is a hard task, difficult to maintain. Keeping a customer is easier and cheaper than acquiring a new. The Relationship Marketing comes to prioritize the importance of knowing how to treat a potential customer, to make him a client and to make him loyal. Loyalty is to involve expectations and overcoming them in such a way that cause the customer to deposit the level of confidence in the brand, catching a glimpse of the interest of the company. To seek involvement, we need to establish solid relationships with the customer in the long term, through a continuous process of communication that includes the data base, feedback and dialog. A company needs to develop a system of care and maintenance programs for customers and retain their loyalty and it is in this sense that this research becomes important for higher education institutions. The methodology used was the case study and the conduct of data collection was applied to direct observation, questionnaires and interviews. The field procedure involved direct access, extracting the object of study within the institutions, for material collecting and general information developed through questionnaires. The data collected were tabulated, and the results presented in tables and graphs, showing the frequency distribution of responses. These data were treated using the Likert scale for better analysis of the results. About the type of approach, it was used the ANOVA test (Analysis of Variance of two factors with multiple shows per group) to evaluate the variance of the average questionnaire applications in different institutions. The ANOVA in this research worked based on two hypotheses: the H0 implies in the no interference cybermarketing in customer loyalty with educational institutions; and H1 which states that there is rather a cybermarketing influence on customer loyalty. It has also been applied to the research the chi-square test specifically for the questions of the questionnaires, emphasizing that the significance level that will be worked on this postdoctoral research will be 0.05. For the research it was considered as population higher education institutions, and as a sample, 5 Institutions from Brasilia / Brazil and 5 Institutions from the United States / Kentucky, all chosen by the criterion of convenience. After the analysis of the data it was possible to verified that there is a strong influence on the cybermarketing loyalty among clients and higher education institutions, for according to the Calculations of the statistical technique for comparison of means the result of "P" was less than 0.05 and that was confirmed when it was found that the "F" was greater than "F" critical, so it is clear the importance of a strategic investment in tools cybermarketing for institutions of higher education remain competitive in this strained market.

CONCLUSION

After data analysis it was possible verifying that there is a strong influence of cybermarketing in the loyalty among customers and superior teaching institutions, for according to the calculations of the statistical technique of media comparison, the “P” result was under 0.05 critic, so it is proved the importance of a strategic investment in the tools of cybermarketing so that the superior teaching institutions keep competitive in this so intransigent market.

KNOWLEDGE MANAGEMENT AND COMPETITIVE STRATEGY

**Florinda Matos, ICLab - Intellectual Capital Accreditation Association,
Portugal**

**Isabel Miguel, Instituto Superior de Línguas e Administração, Portugal
Susana Rodrigues, Polytechnic Institute of Leiria, Portugal**

ABSTRACT

In the last three decades, the world's economy has undergone profound economic changes that have come to reflect on how economic factors affect productivity. So we have gone from an economy based on traditional resources, land, capital and labor, to an economy increasingly based on intangible assets that are of difficult financial accounting and have high impact on the productive performance of organizations. These assets are recognized as knowledge assets and have begun to have a strategic value. Peter Drucker (1993) considers that the basic economic resource is no longer the capital or the natural resources or labor, but the "knowledge" and that knowledge workers play a central role. According to this author, organizations are constantly abandoning obsolete knowledge and creating new knowledge. On this matter, Stewart (1997) adds that "knowledge has become the primary ingredient of what we produce, make, buy and sell. As a result, its management - the pursuit and development of intellectual capital, its storage, its sale, its shares - has become the most important economic task of individuals, organizations and nations" (p. 41). Nonaka and Takeuchi (1995) developed a model that relates the innovation process with tacit and explicit knowledge present in an organization. For Matos & Lopes (2008) knowledge is information to be used by the human mind allowing decision making in a given context and organizational knowledge management, understood as "knowledge management" within the organization, using new technologies, as well as the organization's ability to identify and codify knowledge, stimulate its development and facilitate its implementation" (p. 234). In this sense, strategic planning detains itself on the importance of intangible assets that are recognized as one of the key differentiating (Hoskisson, Hitt & Wan, 1999) and even competitive factors (Porter, 1986). And so, similarly to what happens with financial assets, organizations that know how to better manage and predict the evolution of these features will be the best prepared and the most competitive ones. This paper presents the results of a survey conducted with the objective of identifying the perception that decision-makers have regarding the relationship between knowledge management and organizations strategy. Although there is recognition that strategic management based on knowledge resources is crucial to achieve competitive advantage, it appears that this perception is very limited to theoretical concepts, because in practice, companies do not have medium and long term strategies, based on the evolution of these assets.

INTRODUCTION

Following the Lisbon Strategy which set as its main objective the strengthening of a more competitive EU economy, knowledge-based, the European Commission has given much importance to the issue of intangible assets, namely those related to innovation policies. The knowledge thus emerges as a strategic factor in the process of wealth creation, enterprise-wide and even global and the competitive advantage requires continuous innovation in close relation with knowledge (Nonaka & Takeuchi, 1995).

Activities in knowledge management are recognized as fundamental. The systematization of activities enables the manager, a facilitation of their work in the organization, leading to moments of creation, which are the basis for the sustainability of innovative companies. Therefore, the strategic management of knowledge

resources is now the main determinant of organizational competitiveness and as mentioned by Davenport and Prusak (1998) this advantage is sustainable and leads to superior performances (Peteraf, 1996). This paper presents the results of an exploratory study conducted among the decision makers of Portuguese companies that aims to determine the perception they have of the relationship between knowledge management and strategy of organizations.

LITERATURE REVIEW

Knowledge Management

We live in a new era, a new organizational paradigm, where knowledge has become the main competitive advantage. The literature contains numerous definitions of knowledge.

Polanyi (1958) describes knowledge as something that can be articulated in words, but language itself is not a way to transmit knowledge. When tacit knowledge is explained through language, it can be focused on reflection. The knowledge about the focused object or phenomenon is defined as focal knowledge and the knowledge that is used as a tool to manipulate or enhance what is focused is tacit knowledge. Polanyi emphasizes the functional aspect of knowledge, ie, considers knowledge as a tool by which we operate and / or gather new knowledge. Schultz (1981), Economics Nobel Prize, alluding to the power of intangible capital, said: "The decisive factors of production to improve the welfare of poor people are not space, energy and arable land; the deciding factors are the improvement quality of the population and advances in knowledge. Such improvements can be increased by proper investment in human capital" (p. 4).

Nonaka and Takeuchi (1995), consider knowledge a "dynamic human process of justifying personal belief regarding the truth" and understand as fundamental to the creation of knowledge the difference between tacit knowledge (which is obtained through practice) and explicit. Nonaka and Takeuchi (1995) state that "explicit knowledge can be articulated in formal language, including grammatical statements, mathematical expressions, manual specifications, and so on. This kind of knowledge can then be transmitted formally and informally among people" (p.65). According to the model of knowledge creation of Nonaka and Takeuchi (1995) human knowledge is created and expanded through the interaction between tacit and explicit knowledge. The tacit knowledge becomes explicit (codified), and the explicit becomes tacit in a dynamic and interactive way. These authors argue that "knowledge is created only by individuals" and also that "the organizational knowledge creation should be understood as a process that extends 'organizationally' knowledge created by individuals, crystallizing it as part of the knowledge network of the organization" (p.65).

According to Sveiby (1998), knowledge is not a scarce resource, since it can be produced by the human resources from nothing, that is why an economy based on knowledge management can have unlimited resources. Stewart (1997) states that "Knowledge is what we buy or sell. We cannot detect a smell or touch it" (p.14). Davenport and Prusak (1998) argue that it is only through knowledge that uncertainty can be reduced. Drucker (1993) states: "In the past, the sources of competitive advantage were labor and natural resources, now and in the next century, the key to build the wealth of nations is knowledge" (p.183).

For Grant (1996) knowledge is the most important resource that contributes to the success of the organization and it is through knowledge that companies can innovate, staying active and competitive. Bontis, Dragonetti, Jacobsen and Roos (1999) consider knowledge as being essential to sustainability: "Welcome to the information age, where products and companies live and die on information and the most successful companies are the ones who use their intangible assets better and faster. Knowledge and information are nowadays the drivers of company life, much more so than land, capital or labor" (p. 1). Also Porter (1998) develops the same thesis, considering that in neuralgic sectors of an economy, the determinants factors must be created by organizations, being these trained human resources factors or a scientific differentiated base.

The role that intangible assets play is important in creating value within the organization. These assets are of physical nature and create future value, often referred to as knowledge assets in economic theory (Cabrita & Vaz 2006). Organizations that fail to recognize that knowledge is power will tend not to survive in this global world.

Knowledge Management in Portugal

In Portugal there are little public or private organizations with formal programs of knowledge management, the concept is almost not covered. The exceptions that prove this rule are that large or multinational organizations introduce corporative programs from their parent companies and enable the development of knowledge management in an integrated manner. Being sure that organizations that have this type of knowledge management programs are still few in number, in Portugal, the number of which nevertheless have initiatives that somehow fit this area, are admittedly much more numerous.

Indeed, if we assume that the knowledge management as a set of coordinated initiatives, interconnected, aligned with the organizational strategy would aim the promotion of the acquisition, creation, archiving, retrieving, sharing, evaluation and use of operating knowledge, there are few organizations that do not create initiatives directed to one or more of these aspects.

Organizations consider crucial, for some time, that the communication in performance evaluation, establishing awards to encourage creative ideas, organize social gatherings for informal sharing of experiences and exposure, implement databases for archiving project reports, create pages of contacts in organization, using data mining to generate knowledge from the data they have, among other initiatives. According to Silva and Neves (2003) the Portuguese organizations are reluctant to risk themselves in a more formal and especially more intensive and systematic way in knowledge management for the following reasons:

- There is generally a passive attitude in Portugal regarding what is happening in other countries.
- There is the low level of academic training of the majority of the employed population.
- A country's competitiveness is considered to be low.
- There is an exaggerated importance given to the rank and academic titles.
- Insufficient good examples of leadership in relation to the creation and trusted environments.
- There are strong sub-cultures, well-creased in Portuguese organizations with divisions between hierarchical levels.
- International economic situation, marked by great uncertainty.
- Often there is put a huge emphasis on technology.
- The national culture is mainly concerned with short-term goals.
- The profile of the Portuguese organizations that are dominated by micro and small enterprises.

Knowledge management in Portugal is just in its initial stage, regarding awareness of the crucial role that it already represents in the most competitive countries.

EMPIRICAL RESEARCH

Methodological Framework

Based on the objectives of this exploratory research, identification of field analysis was conducted, composed "by opinion of 13 Portuguese opinion makers ". The sample was determined using a targeted sampling method, being chosen the field analysis depending on the features and accessibility.

Semi-directed interviews were applied since this was the technique that best guarantees the collection of as much information about the problem under investigation. The design of the interview guide was a long process in which the questions were modifying and making successive trials in the test population, in a process of continuous feedback. Following the methodological procedures set out above, we used content analysis, according to Bardin (2009), with the following steps of content analysis: pre-analysis, content analysis, processing of the interpretation of the results. As one of the techniques mentioned by several authors, the analysis of categories, according to Bardin (2009), is the technique used in this research. We started by defining the categories guiding the questions asked to respondents, followed by the analysis of the collected material for interpretation of the dominant themes in each category.

Presentation of Research Answers Most representative

Question 1: What is your definition of "Knowledge"?

"Knowledge is everything that results from the interaction of man with his environment oriented to specific objectives and applied usefulness."

"Knowledge is transforming theories into reality."

"Knowledge is a familiarity with someone or something, which can include facts, information, descriptions, or skills acquired through experience or education. It can refer to the theoretical or practical understanding of a thing. It can be implicit (as with practical skill or expertise) or explicit (as with the theoretical understanding of something)."

"Intangible active, immaterial, intangible, tacit or explicit, with the potential to influence the performance, and for this reason, must be identified, stored, replicated and made available."

"It is an intangible resource, developed and built in a personal and social way, based on formal and informal learning, as well as the experiences we have during the existence and has an orientation towards action, as it is on this basis that we take decisions that solve problems, etc."

"The ability to interpret adequately the information existing in a given context."

"In the view of organizational or management the most concise definition is the one of Sveiby (1997): "capacity to act."

"Add something new from positive to what already exists."

"Knowledge is obtaining new information."

"The way in which an individual performs an action."

"All intangible assets of an organization."

Inference

Knowledge is: everything; transforming theories into reality; facts, information, descriptions, or skills; intangible active, immaterial, tacit or explicit; is an intangible resource; capacity to act; add something new; obtaining new information; performs an action.

Question 2: What is your definition of "Knowledge Management"?

"Knowledge Management implies the process from generation to generation, data, information involving a process of transformation of added value that is knowledge itself, and how this transformation process is

strategically integrated in the mission of the organizations. That is, going from generation to transmission and integration in organizational memories.”

“The need to systematize the practices and advances that are being made.”

“Knowledge Management comprises a range of strategies and practices used by an organization to identify, create, represent, distribute and enable adoption of ideas and experiences. Such as insights and experiences that allow knowledge embedded in individuals or in organizational routines.”

“Management of intangible assets, tacit or explicit, with the potential to influence the performance organizer, and that for this reason, must be identified, stored, replicated and made available.”

“Knowledge management is, first, an organizational strategy defined and composed and based on a set of practices (which may take a more formal or informal nature) that enable and lead to the development of a set of processes, including the creation / acquisition of knowledge, sharing of knowledge, knowledge storage, retrieval and use of knowledge.”

“To ensure that the relevant knowledge of each individual is not lost and is properly channeled to where it is most needed at any given time.”

“Set of activities (acquisition, creation, distribution, storage and application) that maximizes the efficient use of organizational knowledge.”

“Ability to manage information to build knowledge.”

“The way organizations manage the knowledge that they acquire.”

“Management of a crucial asset in an organization.”

“Managing the most important asset of an organization.”

Inference

Knowledge Management is: process from generation to generation, data, information; transmission and integration in organizational memories; systematize practices; strategies and practices used by an organization to identify, create, represent, distribute and enable adoption of ideas and experiences; management of intangible assets, tacit or explicit; an organizational strategy; a way to ensure that the relevant knowledge of each individual is not lost and is properly channeled; set of activities that maximize the efficiency of use of organizational knowledge; ability to manage information; the way organizations manage the knowledge; management of a crucial and most important asset.

Question 3: What are the most strategic topics in the area of Knowledge Management?

“KM is a way to generate economic gains without KM in a global society the result is failure.”

“Quality and productivity.”

“Find mechanisms of transmission between KM and results.”

“Productivity, quality, profitability, competitiveness, image and reputation.”

“Competitiveness, employee satisfaction, productivity, economic growth, etc.”

“The immediate cost reduction through retirement / dismissal of employees and seniors with higher earnings, limits the future profitability of organizations by loss of knowledge”.

“Economic growth, competitiveness, productivity, differentiation.”

Inference

Most strategic topics: generate economic gains; quality and productivity; mechanisms of transmission between KM and results; profitability, competitiveness, image and reputation; employee satisfaction; economic growth; immediate cost reduction; differentiation.

Question 4: What is the relationship between Knowledge Management and company strategy?

“If the strategic orientation is not the KM an organization will hardly survive in a complex and competitive environment.”

“The ability to compete in the market and win new markets is important.”

“The relationship of intellectual capital with business strategy, rather than the process of knowledge management.”

“The KM must be designed, defined and delineated based on a vision, mission and overall strategy of an organization.”

“KM that does not receive the approval by the strategy is a waste of time. The strategy is the umbrella under which all organizational initiatives are kept save.”

“The implementation strategy of the company depends on good knowledge management.”

Inference

Relationship between Knowledge Management and company strategy: to survive in a complex and competitive environment; the ability to compete in the market and win new markets; the relationship of intellectual capital with business strategy; vision, mission and overall strategy of an organization; strategy is the umbrella under which all harbor organizational initiatives keep save; implementation strategy of the company depends on good KM.

CONCLUSION

Throughout this research it was verified that respondents makers have the notion of what is meant by knowledge and the importance of knowledge management to organizational competitiveness. This notion is very close to that which is transmitted by the main authors of literature in this area. There is the notion that knowledge is associated to the skills of individuals, distinguishing between individual knowledge (tacit knowledge) and organizational knowledge (explicit). Knowledge comes with a strong connection to information and is therefore highly valued. Knowledge is a source of competitive advantage and should be a decisive strategy. And it must be sustained in knowledge management.

Economic growth, productivity, profit, quality, differentiation, cost reduction, image and reputation and employee satisfaction are seen as the most important topics of the relationship between strategy and knowledge management. Knowledge is only valuable when used and it is much more valuable when used to create organizational value and hence competitive advantage. However, despite the awareness of decision-makers the question remains: Why are there so few formal programs of knowledge management in Portuguese organizations? And why doesn't, for this reason, knowledge management arise in association with the competitive strategy? In another exploratory research we will try to find the answer to these questions that we believe are strategic for the competitiveness of companies.

THE FUTURE OF THE HOTEL GROUP BUSINESS SALES FORCE: EVOLVING TOWARD OBSOLESCENCE?

Richard G. McNeill
Northern Arizona University, USA

ABSTRACT

In approximately 2003, Sales, one of the world's oldest professions, encountered cataclysmic change. Static Web 1.0 evolved to dynamically interactive Web2.0 and the rise of social media increased informational power to buyers. In the hotel business, group salespeople began to realize that cold-calling was dying – buyers would no longer take phone calls. Concomitantly, meeting planner buyers began to hire third-party intermediaries who quickly separated sellers from end-user buyers. Relationship selling began to suffer and perplexity arose. What to do? This paper offers two models to provide a preliminary map to the new world of buying and selling with a focus on hotel group sellers interacting with meeting planner buyers.

INTRODUCTION

This is the story of a significant shift in the way sales, in general, and hotel group sales, in particular, is evolving. The strategic implications invite a rethinking of organizational structure aimed at elimination of silos and the convergence of marketing, sales, and hotel revenue management synchronized to generate total topline revenue. The managerial implications of this shift impacts sales force restructuring, motivation, training, and possible elimination.

If salespeople do not generate new business, then their rationale for existence ceases. From the hotel sales force point of view, today's hotel group business sales forces are being intermediated from initial direct contact with their end-user meeting planner customers. Sales forces have, over the last decade and a half, evolved from transactional sellers to consultative/relationship based sellers which require a deep partnership with buyers which begins from the onset of first contact with a potential buyer. Just when sales forces were successfully utilizing consultative selling methodologies, the world has again changed. Today, third-party intermediaries are separating sales people from initial contact with end-user buyers not only physically, but from fully developing relationships prior to final negotiations. Increasingly, meeting business is brought to the hotel's doorstep by intermediaries and not by direct actions of hotel group salespeople.

If buyers have control of market information and their hired third-party buyer representatives, then they do not need a hotel salesperson. What they need is someone at the hotel to take their order. From the end-user buyer meeting planner's point of view, they welcome third-party intermediaries who promise to do all of the leg-work of meeting site selection at no cost to the meeting planner. Third-party intermediaries are seasoned former meeting planning and/or hotel sales veterans who aggressively negotiate price concessions and earn commissions from the hotel. If a particular hotel is fortunate to be selected on the *Short-List* (a few highly screened properties), the final selling negotiations can be facilitated by non-salespeople - hotel staff trained in the final customization of order-taking.

Today's buyers are aggressively screening-out old-fashion cold-calls initiated by hotel salespeople and consider them a form of *Interruption Marketing*. These buyers prefer to obtain information from social media

word-of-mouth or general Internet search. It is already apparent that buyers do not want to be *found* by sellers, but want to *find* them. The *cold-call* is rapidly dying or already dead, and that the tables have been turned 180 degrees as the previous seller, *Hunter*, is becoming the *Hunted*.

Thus, relationship dependent selling methodologies are becoming increasingly ineffective. The hotel sales forces are becoming confused and frustrated as previously effective consultative/relationship selling does not seem to work as in the past. Simultaneously, hotel ownership, general management, and sales/marketing leadership continue to demand their salespeople practice the previous and increasingly impotent selling methodology. And, this same management tends to blame less effective sales results on the salespeople instead of recognizing that in the Social Era, selling methodologies have evolved away from once familiar, if not habitual selling practices.

If hotel group salespeople are increasing intermediated from buyers, are increasingly being ignored by potential buyers, and are not perceived by buyers as adding value, then their jobs are clearly placed in peril.

This paper is both a conceptual and a qualitative/exploratory study. From the literature, the author designs two models. Then in the qualitative study, he takes the models to the hotel sales field to ascertain their accuracy by directly interviewing hotel sales practitioners. This study reports the results of a qualitative/exploratory study to understand today's general dynamics operating within buying/selling relationships and between meeting planner buyers and local hotel group sales forces. We focus on the local hotel group sales force and indirectly imply that trends here will, in the future, expand into other hospitality sub-industries if not into other non-hospitality industries.

Purpose and Research Questions

Sub-Purpose one. To help practicing in-house consultative hotel salespeople, as well as current hotel academics better understand today's buying/selling environment. To this objective, we develop a visual model summarizing these changes, *Third-Party Intermediation Model* (Figure 1).

Research question one. Are *consultative* hotel salespeople becoming obsolescent by being *commoditized* out of their traditional and key relationship building value-added role?

Sub-Purpose two. To develop a current reference map, the *Combined Buying/Selling Exchange Model* (Figure 2), that serves to identify the changing dynamic interacting forces.

Research question two. What does the beginning to end buying/selling exchange process look-like today? And, how does it compare to a previously successful and traditionally practiced consultative relationship selling approach? Has the power in the buying/Selling process shifted to the Buyer?

Sub-Purpose three. To preliminarily verify both the *Third-Party Intermediation Model* developed in Sub-Purpose One (Figure 1) and the *Combined Buying/Selling Exchange Model* developed in Sub-Purpose Two (Figure 2). Preliminary verification is accomplished by a qualitative exploratory study.

Research question three. Do the two conceptual models – *Third-Party Intermediation Model* (Figure 1) and *Combined Buying/Selling Exchange Model* (Figure 2) correspond with current meeting buying/selling realities found in the industry?

Through a literature review, we will first provide evidence to answer Research Questions One and Two as well as develop two descriptive models. We will then address Research Question Three through a qualitative study.

Significance

What does a study of U.S. based local hotel sales forces have to do with global hotel group business markets? First, within the global travel and tourism industry, hotel meetings and convention sales is big business. Second,

U.S. hotel corporations will undoubtedly influence global sales and marketing trends. Third, intermediation forces, separating traditional hotel sellers and meeting planner buyers is rapidly expanding globally.

Like nested Russian dolls, worldwide Travel and Tourism account for approximately US \$2 trillion or 2.8% direct spending (9% adding indirect spending) of global GDP. U.S. Travel and Tourism accounts from approximately US \$708 billion or 35% of the global direct spending (WTTC, 2012, February 28). And, within the U.S. Travel and Tourism industry, a 2011 study by the *Convention Industry Council* (CIC) estimated that U.S. Meetings and Conventions account for US \$ 108 billion or approximately 16% of U.S. Travel and Tourism (CIC, 2011).

Arguably, most hospitality scholars would agree that U.S. based hotel corporations dominate both geographic presence and exert a disproportionate influence on worldwide hotel management best practices. For example, *Hotels Magazine's* annual global survey indicates the world's leading hotel corporations, ranked by number of hotel rooms listing: #2 *Marriott*, #3 *Hilton*, and # 7 *Starwood*. As a major exception, *Intercontinental Group* of Denham, England, with a predominance of U.S. dominant brands, ranks # 1 (Hotels, 2012, July/August).

Additionally, the third-party and other intermediary forces mentioned above are significantly increasing in global reach and influence. Firms such as *HelmsBriscoe* and *Cvent* have been recently experiencing 40% -50% annual revenue growth and with increasing global presence (Sturken, 2013a, January 1). So, the trend outlined in this present study is very likely to be repeated globally.

Limitations

First, the design of conceptual models (Figures 1 and 2) are conceptual maps drawn from the literature. And, this, in turn, relies upon the author's ability to synthesize the literature with his 18 years of general and hotel sales experience and with his additional 24 years of hospitality sales teaching and research.

Second, the qualitative study which tests the two conceptual models has, as many qualitative studies, a limited population of 21 stratified and industry knowledgeable interviewees. And it must be remembered that the purpose of qualitative studies is never to generalize to larger populations, but to provide insights for further, hopefully, qualitative studies.

Third, this paper does not address B2C (Business to Consumer) hotel sales. It focuses on B2B (Business to Business) hotel group sales which averages about 60% of upper STR category (STR, 2013) hotels and resort revenue.

LITERATURE REVIEW

Research Question One – Commoditization and Salesperson Obsolescence

Commoditization in past research. The opposite of *differentiation* is *commoditization*. *Consultative/Relationship Selling* depends upon differentiation. Neil Rackham (Rackham and De Vincentis, 1999) observes that when a product becomes commoditized or looks like and is of a similar actual or perceived quality as its competitor products, then the buying decision is based not on unique attributes, but price.

A product/service today is composed of several component parts: The product, the company, and the salesperson. The product/service is composed of both tangible and intangible parts. The positioned company brand guarantees certainty, service, and backing the product/service. The salesperson is the messenger and the manner in which they deliver the message builds relationship/trust connections with the buyer. All of these component parts can, if not maintained as unique and differentiated, quickly become perceived by the buyer as commodities.

Hotel group salespeople have been practicing consultative and relationship selling for the last 15 years or so. This selling methodology enabled them to establish relationships with potential buyers at the beginning of

the buying/selling cycle and carry these relationships through the implementation and after-sale management of a contracted meeting. Having established strong relationships, these salespeople were able to develop repeat and referral business from their satisfied customers. But, the old world of the consultative salesperson based on established relationships and differentiation is changing. Commoditization is trending both for the hotel/resorts themselves and for the hotel group salesperson.

Commoditization directly affecting traditional consultative hotel salespeople. As a result of third-party intermediaries serving as a barrier, buyers and sellers are separated from early and deep communication with each other. This separation, along with a barrage of electronic standardized RFPs (*Requests for Proposals*) generated through computerized platforms has caused buyers to begin viewing salespeople as commodities – one is interchangeable with the other. And, why not? Neither the buyer nor the seller personally knows the other and relationship or consultative selling is impossible. Only if the seller reaches the *short-list* (preferred four or five vendors) will a salesperson's skills at customizing the hotel venue to meet a buyer's deepest and most subtle needs have an opportunity to shine (See Figure 2). As a note on RFPs, 63% of 382 respondents in a *Successful Meeting's Magazine* survey said that online Requests for Proposals were growing "somewhat" to "very much" more important in 2013 (Jakoson, 2013, January).

Commoditization is increasing and replacing previous differentiated hotel products/services, I believe, for three primary reasons:

First, hotel corporations – the big three who dominate, Hilton, Marriott, and Starwood –which this author will use as a proxy for all meeting/group hotels, have *me-too* brands in all of the six *chain* STR scale categories (STR, 2013). Spread relatively evenly across the top three STR tiers, Hilton has seven brands, Marriott has eight, and Starwood has nine. Note: STR has a seven level category system - *Independents* is the seventh level.

True, each individual brand and each hotel within that brand is unique in location and architecture, so they are not true commodities. But, arguably, brand, service and experience levels is relatively the same in each of the STR scale categories. And, this commoditization has been exacerbated by the industry's, misguided I believe, inexorable affinity to the concept of *Best Practices* – we externally share our competitive advantage with others who readily copy.

Second, consultative hotel salespeople - no longer can differentiate themselves through relationship building with the end-user buyer. The primary reason is the rise of Third-Party Intermediaries who place a barrier between them and the buyer.

True, at the mid-point of the buying/selling exchange process (see Figure 2), the seller meets the buyer for the first time. From this point and through the process, sellers have an opportunity to build relationships.

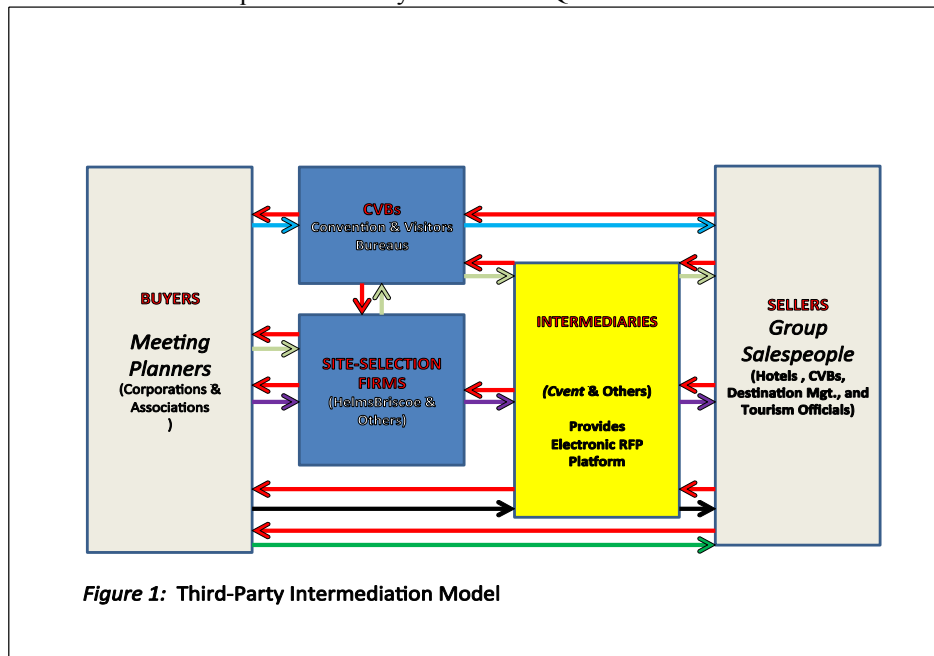

Third, third-party intermediaries. Today, the buying/selling exchange process has been intermediated by the growing power of third-parties. Third-party intermediaries are hired by and loyal to end-user meeting planner buyers and the buying/selling process has been severed at the mid-point (see Figure 1). Hotel sellers often don't even know the name of these end-user buyers until the sellers have passed through a third-party controlled gauntlet of standardized RFP (*Requests for Proposals*). Thus, the seller has little opportunity to begin establishing relationships with the end-user buyer until the point they are perhaps selected among the few, put on a short-list, and invited to sit across the negotiating table with the end-user buyer.

Cost-cutting within buyer organizations invites sub-contracting. Additionally, formal meeting planning staffs are being cut and the meeting planner is often a person – not a formal meeting planner, but a person wearing multiple hats. If you were inexperienced, and the hotel paid the cost of a third-party intermediary, wouldn't you use them? An inexperienced person wants certainty, thus hiring such firms is simply free help (Sturken, 2012, February 1).

While OTAs (Online Travel Agencies), such as *Expedia* and *Travelocity*, offer a similar barrier between the selling hotel and individual traveler buyers (B2C markets), in this study we are concerned with third-party intermediaries or *Meeting Buyer Representation Firms* (a term coined by this author) such as *Helms*

Briscoe, HPN, and others operating in the B2B markets of group business. Additionally, hotel group sellers are intermediated by full service meeting firms and powerful meeting venue sourcing firms such as *C-vent* which deluge hotel sales forces with electronic RFPs (Requests for Proposals). **Note:** Cvent is similar to *Match.com* for individuals – but Cvent matches meeting planners with meeting hotels. Most importantly, the hotel salesperson answering these RFPs, often never knows the name of the end-user meeting planner customer especially if a third-party intermediary is involved. – often third-party intermediaries tend to believe that the hotel salesperson will cut them out of the deal. The problem associated with relationship building, is that the seller often does not know the customer’s name until the hotel is on a short-list of possible three to four potential venue buys.

Figure 1: Third-Party intermediation model. This model was developed from the literature review above. It will be tested in the qualitative study of Research Question Three below.

Research Question Two – Power Shifting to the Buyer

Above, we have discussed how the hotel group seller is losing power to *Third-Party Intermediaries*. As third-party intermediaries represent and work for buyers, power also transfers to buyers. But, how are buyers *directly* gaining power over sellers in the buying/selling process (See Figure 2)?

The formerly *hunted* (buyers) are becoming the *hunters*. Today, a sea of digital connectivity coupled with an economic buyers’ market, has transferred informational power to the buyer. The historical pendulum of information power has swung from the seller to the opposite side of a continuum – to the buyer. One would think that traditional relationship selling would be enhanced by increased connectivity and resultant communication. But, in fact, digital connectivity has attenuated the traditional relationship selling process which once enjoyed buyer/seller contact through the entire cycle (See Figure 2).

The preference of meeting planners is to ignore traditional *cold-calls*. They prefer to pro-actively initiate a search for a potential meeting venue after they have migrated from a *No-Need* stage to a *Need* stage. These buyers armed with informational Internet search power and the word-of-mouth referral and vetting power of their social media networks, regard unsolicited initial communication from sellers as *interruption marketing*. In an earlier time, traditional relationship selling began at the top or beginning of the buying/selling process. Today, sellers often do not even know the name of the buyer until the buyer has placed them on a short-list at step four (See Figure 2).

Figure 2: Combined buying/selling exchange model. This model was developed from the literature review above. It will be tested in the qualitative study of Research Question Three below.

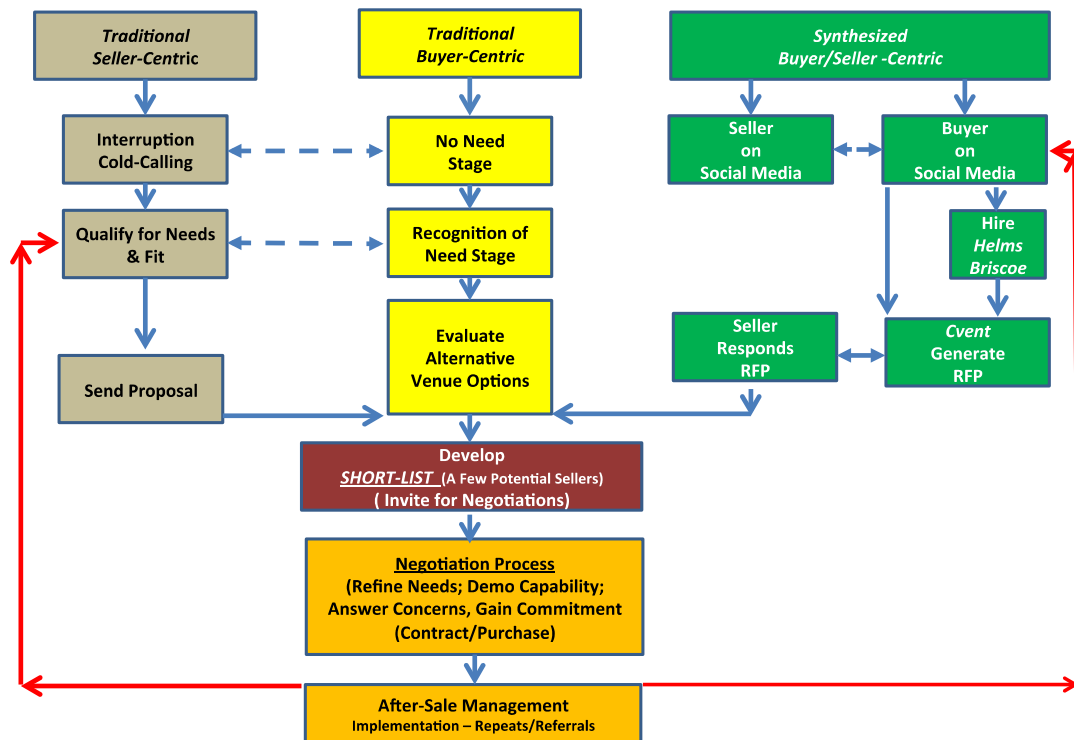

Figure 2: Cobined Buying/Selling Exchange Model

Research Question Three – Do the Two Conceptual Models (Figures 1 and 2) Correspond with Practice?

A qualitative study was designed to determine if the two models resulting from the Literature Review (Above) correspond to practices and perceived realities in the hotel Industry?

QUALITATIVE RESEARCH STUDY

Methodology

Qualitative/Exploratory study. As noted above, rapid change is occurring in the buying/selling process associated with hotel salespeople selling to meeting planning buyers. In such a fluid situation, exploratory studies attempt to learn the right questions to ask so that they can be followed up by a larger qualitative study. This qualitative/exploratory study is part one of a planned part two quantitative follow-up study.

Participants. Between September 1 and December 31, 2012, twenty-one approximate one and one half hour face-to-face interviews were conducted. The author guided the interview sessions and digitally recorded.

Hotel/Resort Properties. The 21 participants were stratified to provide a robust cross section of views. Group sales forces generally operate in three top-tiers of the lodging industry. *Smith Travel Research (STR)* scales seven categories of properties based on the following 2012 U.S. *Average Daily Room Rate (ADR)* (STR, 2013): # 1, *Luxury Chains* at \$265 - # 2, *Upper Upscale Chains* at \$158 - # 3 *Upscale Chains* at \$119 - # 4,

Upper Midscale Chains at \$98 - # 5 Midscale Chains at \$78 - # 6, Economy Chains at \$54, and # 7, Independents at \$116. All 21 interviews were in properties classified in the top three STR categories.

Interviewee Job Titles. Sixteen of the interviews were with people directly involved in hotel sales: Seven salespeople, and nine Directors. Five interviews were with people involved in sales support: Three CSMs (Convention Services Managers) and two hotel revenue managers.

Process/Apparatus. Interviews were guided by the author of this study using five major topic areas, guiding questions that related to the two conceptual models discussed above. These five questions were asked of all participants. Resulting conversations were digitally recorded and transcripts later developed. Transcripts were analyzed using qualitative software, *Nvivo 10* (Nvivo10, 2012). Essentially, qualitative software eases a researcher's ability to search through large amounts of text and locate exemplar statements and to cluster, tag, or categorize reoccurring themes.

Findings & Results

Findings. The following selected/representative tags and categories were generated from the analyzed text of the 21 interviews. Here are the top ten in no particular order:

1. Buyer perceived commoditization of hotel experiences (not actual commoditization of the hotel itself),
2. Price-centric negotiations by third-party intermediaries is rapacious and costs 10% to 20% commissions paid from hotel. And, this is after they have already beaten us down on room and other rates.
3. Relationship selling is dying as we are being separated from the buyers by the buyer's own refusal to take phone calls as well as by third-parties withholding the names.
4. Buyers are unreachable by cold-calls but management still requires these low ROI (Return on Investment) activities.
5. Much of the salesperson's time is spent answering massive deluges of RFPs and often seller never hears back from person to whom RFP was sent.
6. Change is happening so fast today, one can never fully adjust to one change before another occurs.
7. Revenue management is seizing power over the salesperson's pricing.
8. Meeting planners seem less professional today than a few years back,
9. I think you should reconsider advising anyone to go into hotel sales today.
10. Hotel sales is not what it was a few years ago, my relationships are dying and I don't seem to be able to generate new ones as easily as before.

Summary of Findings. The findings confirm the general description contained in the two models, Figures 1 and 2.

CONCLUSIONS, IMPLICATIONS, AND RECOMMENDATIONS

Conclusions

Addressing Research Question One. . Are *consultative* hotel salespeople becoming obsolescent by being *commoditized* out of their traditional and key relationship building value-added role? Yes. Will hotel group salespeople disappear? No, but having a sales force located at each property is an expensive proposition. Instead, since Convention Service Managers (CSM) coordinate and customize meetings coming to their specific properties, perhaps these CSMs could assume many of the previous roles served by hotel group salespeople. Remember that the business is increasing being delivered to the hotel doorstep by third-parties.

Perhaps displaced salespeople will migrate to selling multiple properties in a specific geographic area. For example, Marriott, Hilton and many other top-tier companies began experimenting with *Cluster-Selling*. Under this concept, the family of brands within each of the hotel corporations is represented in geographic areas. This is not universally practiced by lower tier hotel companies.

Addressing Research Question Two. What does the beginning to end buying/selling exchange process look-like today? And, how does it compare to a previously successful and traditionally practiced consultative relationship selling approach? Has the power in the buying/Selling process shifted to the Buyer? Yes, informational power has shifted to the buyer, thus sellers must adapt and parallel their selling with how buyers buy. Figure 2 outlines a combined or synthesis buying/selling model. For example, if buyers no longer receive cold-calls and prefer to locate potential vendors through social media, then sellers need to join and operate in the same discussion groups in which the buyers participate. By becoming content experts and giving valuable advice versus directly selling, these sellers will earn a reputation that will attract buyers. Additionally, sellers need to participate in content through writing Blogs. Note: this is generally the job of a marketing department, but in the hospitality industry, sellers often don't have this kind of help. Sellers need to adopt a *Pull* versus *Push* strategy.

Addressing Research Question Three. Do the two conceptual models – *Third-Party Intermediation Model* (Figure 1) and *Combined Buying/Selling Exchange Model* (Figure 2) correspond with current meeting buying/selling realities found in the industry? Yes, as well as any representative map correspond to reality. These models were initially conceived from a review of the literature. Then over the course of 21 interviews, they were iteratively refined. More research is needed, however, the author is satisfied that these models are fairly accurate and correspond closely with reality.

Implications

Salespeople and sales organization can significantly improve sales performance by more accurately aligning themselves with current and evolving buyer practices and preferences. By not aligning and evolving, implications for individual sales people, sales management, and their companies are painfully obvious. A sales force is an expensive operation. On a positive note, aligning with the changed environment is a ticket to competitive advantage.

Recommendations

For further research, the findings in this qualitative/exploratory study should stimulate a larger qualitative study.

For the potential obsolescence of and dismissal of salespeople working in individual hotel properties, this study should be a warning to prepare for a changed future.

For hotel management, sales and marketing organization within their individual properties deserves a deep rethinking. Specifically, how does one use their staff in new ways and aligned with the changed buying environment. Remember that the buyers call the shots – so adaption is imperative. And, at stake is competitive survival at a minimum.

For hospitality educators, it's time to rethink what you are teaching your students. The antiquated textbooks and other material available certainly will not help you. Maybe it's time to do externships and experience industry realities.

For all readers interested in the future of selling, changes outlined in this study will probably be replicated in other industries. So, be prepared.

METHODS TO EVALUATE AND COMPARE EFFICIENCY IN INFRASTRUCTURE AND TRANSPORTATION CONCESSIONS – AN EXPLORATORY ANALYSIS

**Felipe Da Silva Medeiros, Luiz Afonso Dos Santos Senna
and Christine Tessele Nodari
Universidade Federal Do Rio Grande Do Sul, Brazil**

ABSTRACT

The current paper shows recent researches on the transportation sector, focusing on performance measurements. We intent to discuss the most important methods used to measure and compare performances. We show the most used techniques to benchmark the transportation services' performance. This paper aims to discuss the use of these tools in order to evaluate the concessionaries of transportation infrastructure or services. It focus on the ways to perform measurements to detect performance impacts on the annual increase of the tax rates which concessionaries area allowed to charge. We present papers that use DEA (data envelopment analysis) method, stochastic frontier analysis and others, showing some advantages and disadvantages in the use of each one. Concluding, we propose a fast analysis of the "X" factor in order to review the concession contracts.

INTRODUCTION

The process of privatizing basic infrastructure services has been held in Brazil since the 1990s and is causing a significant impact on the availability of services such as: telephony, electricity and transportation. The whole population felt the impact of it. According to the current situation, private investments in infrastructure became very important to the country's continuous economic growth, representing an opportunity for both government and investors.

Based on the present scenario, regulations play an important role in order to improve quality of the services available. The contracts signed between the government and investors are regulation tool and play a crucial role in the process. The contracts set the duties of all the parts involved in the process and represent the main regulation system.

Once taking the contracts under consideration, it is possible to state that the development of concession contracts is a way to address enormous challenges to all: regulators, investors, government, researchers and, after all, to society as a whole. Due to such challenges, several studies have been done in order to indicate what would actually be a good contract. Many authors agree that it is demanding to develop tools for assessing concessionaires' quality and performance, so the outcomes would take to rewards or punishments (Senna and Michel, 2006; Hensher and Stanley, 2010; Longva and Stanley, 2010; Macário, 2010).

The question to be answered is: how would it be possible to evaluate and compare concessions, once, in general, they are inserted in absolutely different scenarios even when belonging to the same sector? Road controllers are a good example of it. It is difficult to compare the performance of a concessionaire which runs a major highway with many lanes going in different directions and one that is in charge of a bridge or of a small

highway with a mountainous topography. Moreover, it is worth finding ways to have the evaluation and comparison process, reflecting the revenues gotten from the investments done by private companies. It can destabilize the investments in process or, on the other hand, stimulate performances that go beyond the expectations.

Benchmarking methods can be useful tools in order to push concessionaries - investing in public infrastructure - towards higher efficiency rates. Competition, in real terms, is not attractive due to its high costs once improving the infrastructure of roads, ports, etc, demands huge investments. So, benchmarking can create an artificial competition process among concessionaries. Thus, using a tool capable to reduce the effects of the asymmetric information from concessionaries and regulators would encourage innovative behaviors, once the companies' profitability is linked to good rates of benchmark comparisons (Bogetoft and Otto, 2011). The current article seeks for ways to evaluate the performance of such concessionaries.

Through literature review and by analyzing contracts and regulatory agencies, the present paper allowed identifying how concessionaries' performances have been assessed and what has been done with the outcomes from such assessment.

The article was divided into four sections. Section 2 presents some assumptions on performance's indicators, quality and evaluation methods. Section 3 shows some applications of methods in use. The last section discusses conclusions about the points that demand detailed studies in order help meeting good methods for evaluating and comparing performances.

PERFORMANCE EVALUATION - INDICATORS AND METHODS

The association between productivity evaluation and quality control has been widely discussed and applied since the industrial age had started. This sector of the economy is where the bases of the existing techniques lay on. Since Ford's production system and the principles of Taylor (Scientific Management), production processes have been suffering direct influence from quality management and production techniques. After World War II lack of raw material, manpower and weather issues forced industries to produce in a much more efficient way (Juran, 1997). Service sectors, especially those concerning infrastructure, have been managed by the government and treated as a kind of social duty as well as have been seen by the industry as an activity that does not promote value adding and suffers from the slowness in applying quality management and production techniques. Some areas of excellence are emerging from the bases of modern concepts that address the addition of services to trading processes as well as to the recent privatization of some public sectors such as telecommunications, electricity and transportation (Juran, 1997; Silva et al., 2006; Macedo, 2012). New techniques have been used throughout the last decades in order to encourage service providers to improve their performance. Such case applies to airports that have been using "benchmarking" as a tool to push productivity increase (Graham, 2005). The techniques and their applications will be discussed in the following section.

Performance Indicators

When talking about productivity, it is understood that there is a relationship between inputs and products/services. Such simplistic viewpoint can hide the complexity behind the production processes as well as the different performance rates among companies. Differences are particularly significant when related to environmental management and quality in order to properly meet customers' demands. The dynamic scenario established by the modern globalized world brings up the task of measuring more complex performances strongly dependent on indicators used in the assessment process (Behn, 2003; Silva, 2006).

Performance indicators and quality is the spinal cord of measurement systems. It is crucial that indicators reflect the goals organizations are aiming at. So, the first step in order to achieve a good performance review lays on a clear definition of what goals should be measurable in terms of quantity and deliver time (Müller, 2003; Hensher and Stanley, 2010; Longva and Stanley, 2010).

Choosing good indicators as well as finding ways to get specific data are important items to be noticed when developing a system to measure performance rates. Due to the specificity of different sectors and companies, there are several techniques used to find proper indicators. Some of these techniques are: focus groups, brainstorming, QFD (Quality Function Deployment) and others. Although the current study does not aim to revise such techniques, the next section focuses on methods for evaluating and comparing companies' performances and processes.

Methods and tools to achieve performance analysis

Any company, no matter its size, deals with several inputs and outputs. Given the diversity of inputs and outputs involving production and services, it is possible to establish partial production measurements in cases when only part of the goods, services or supplies are taken under consideration throughout the companies' evaluation. Such measurements are known as Partial Factor Productivity (PFP) and allow a limited analysis of the effects caused by changes. Nevertheless, they are useful to identify - in time-, the immediate effects from changes in the production system (Aragon, 1995 apud Costa, 1996; Azambuja, 2002).

Moreover, several authors state that it is necessary to measure the impact of changes in productivity, once a single change in one of the processes can have an impact over the entire organization. The measurements known as Total Factor Productivity (TFP) globally assess the impact of changes and point out the disadvantages of not identifying specific impacts (Costa, 1996; Bonelli and Fonseca, 1998; Waters, 2002; Azambuja, 2002).

When it comes to evaluating the performance of concessionaires or service providers, such as transportation infrastructure, some authors use specific techniques to estimate cost functions as a way to compare different factors among them (Massiani and Ragazzi, 2008; Smmith, 2012), whereas others rather use production functions (Costa 1996, Azevedo et al., 2012). Yet, there are authors that believe in a broader relationship between inputs and outputs, they also consider some aspects related to the quality of the provided service and the infrastructure available (Azambuja, 2002; Diana, 2010). Other studies assess efficiency taking it under a specific focus. A good example of it is the technical efficiency - a correlation between the infrastructure available and the use of it (Scotti et al., 2012).

Differences appear because evaluation systems hold different means. Some of them aim to maximize profit or minimize costs. There are those that look forward to encourage quality improvements while others are after regulatory procedures. So, in the end, performance measurement systems help meeting some predefined targets and are not supposed to be - in any circumstance - a goal itself. The methods used for evaluating and comparing companies' performances regarding production or service providing, specifically for transportation infrastructure, are described below.

Data Envelopment Analysis (DEA)

Data Envelopment Analysis (DEA) is a nonparametric method based on mathematical programming and it is capable of evaluating technical efficiency when using just "quantities" as input. It combines economic efficiency using prices. Based on such analysis, evaluation noise factors are wrongly seen as inefficiency (Azambuja, 2002). Furthermore, the method allows DEA analyses over different products that hold different inputs. It is a model that aggregates measurements, what can be considered a limitation (Costa, 1996).

The method basically consists in defining decision making units (DMU). Such units will be evaluated for effectiveness. Their inputs and products will be checked by applying the DEA models in order to set maximum or minimum efficiency costs. As a result of the methods' various iterations, we ended up drawing an efficient frontier, a line on which all DMU's are considered pareto-efficient. Therefore, the farther the line goes, lesser efficient the assessed unit will be (Golany and Roll, 1989; Oum et al. 1992; Costa, 1996; Azambuja, 2002).

Stochastic Frontier Analysis

Stochastic frontier analysis' models assume that there are inefficiencies inherent to the processes. They cannot be controlled by the company, so each DMU is a set of inputs, inefficiency and random errors. The analysis results show the "approach fee" of each DMU to the frontier where the efficiency is in its maximum (Aigner et al., 1977; Azambuja, 2002; Diana, 2010; Smith, 2012).

Just as for the method DEA, in order to use the stochastic frontier analysis it is necessary to define the DMU's and to estimate one or more production or cost functions or other cost or production function that group up measurements of interest. Some authors believe that this method is better than the DEA when comparing efficiency, once it allows splitting efficient frontier deviations into random errors and inefficiency is found under company's control, furthermore, such method enables evaluating elasticity costs (Massiani and Ragazzi, 2008; Smith et al, 2010; Scotti et al, 2012).

Other Methods

We can use many other methods to evaluate and compare production units or service providers' performances. In fact, they can be adapted before being applied. Virtually, all multicriteria decision methods can be used for comparing efficiency, for example: GREY analysis, Malmquist index and different simple methods to compare predefined sets of indicators (Almeida and Rebelatto, 2005; Graham, 2005).

USES OF METHODOLOGIES

By means of an extensive literature review, the present section aim to identify what methods have been used by researchers in order to evaluate and compare performances from service providers, mainly those from the transportation sector. An important part of the transportation infrastructure sector is on the hands of private investors who explore it and provide services. The goal is to further identify – by analyzing some of the latest concession contracts - what methods have been used by the regulators to measure and compare the performance of the provided services.

DEA

The DEA has been widely used to compare efficiency rates among service providers from the transportation sector, mainly in Brazil. Several authors have used it in order to compare efficiency to operate highways (Azevedo et al., 2012; Clímaco et al., 2010), passenger transportation services (Silveira, 2008; Azambuja, 2002) and several other services provided by ports, airports and railways (Acosta et al., 2011; Gillen and Lall, 1997). Ferrari and Basta (2009) have proposed the use of the DEA methodology to introduce market competition and price-cap regulation on ports concession contracts, in Italy.

Stochastic Frontier Analysis

The stochastic frontier analysis is also widely used in researches regarding the transportation sector. Although it is not much used by Brazilian authors, several studies outside Brazil use such method in order to compare efficiency among service providers. The methodology was used to analyze the efficiency of airports (Diana, 2010; Scotti et al, 2012), of railroad industries (Smith et al., 2010; Smith, 2012), of passengers transportation (Novaes and Medeiros, 2008) and of highway operations performed under concession (Massiani and Ragazzi, 2008).

Other methods

Many other direct assessment methods have been used. We could say that, at this point, they fit the vast majority of published works. There are empirical methods that consider a group of complex indicators and compare levels attained by various companies in order to conclude about the efficiency on the companies that follow such measurements.

The current paper lists many works regarding the transportation sector, mainly due to passenger transportation services (Pezerico, 2002; Jansson and Pydoke, 2010; Medeiros and Nodari, 2011). It is assumed that in regards to its proximity to the user, to daily use, to the continuous operation and especially to the way the sector has evolved throughout the time, each company and every published study usually address a different type of quality control when providing the service.

The aforementioned situation has given rise to a large number of quality and performance indicators that simply cannot be compared when the target lays on performing “benchmarking” in the businesses. Local and structural issues must be considered. Once so far there was no interest in comparing efficiency among transport companies or transportation systems, nobody searched for evaluation unified methods. So it’s necessary to be done by transportation managing departments.

The present section brings up some concession contracts regarding highway’s management. Despite the fact that they list a set of technical parameters that define the quality of paving or marking, they do not address methods for evaluating concessionaires’ efficiency. This is the case of the second batch of Brazilian federal concessions and some Chilean contracts such as the "RUTA 5". The concessions for highway management given in the 1990s, in Brazil, are not parameterized neither foresees ways to measure performances.

Table 1 summarizes works that have used each method. It is easy noticing that articles using stochastic analysis are more recent, probably due to the upgrades on the concessions’ database over the past few years.

FINAL REMARKS

The literature review exposed in the current paper highlights the importance of efficiency analysis to companies from all sectors. Such analysis requires a good performance indicator system, in order to be effective. It also demands the use of appropriate benchmarking tools. Due to recent proposals for a massive privatization of the logistics infrastructure services in Brazil, measuring and comparing the management and the use of infrastructure's efficiency becomes critical. Using such a tool makes it possible to provide greater equity in the use of infrastructures and increase competitiveness to the Brazilian industry, as well.

Regarding markets that face constant competition, measuring and comparing efficiency as well as taking actions to increase productivity are key factors in order to keep the company in the market. Regarding markets such as the concession for infrastructure, which is a naturally monopolistic one, it is demanding that the regulatory agency ensures quality throughout services' providing and that it promotes companies' efficiency increase, generating equity to the use and billing of the service.

Thus, artificially inserting competition by using benchmark efficiency among different concessions, whether national or not, becomes a proper option. Developing efficiency factors to management, operation and use of infrastructures - in order to influence concessions' profit - encourages the search for high quality performances in the companies.

Therefore, identifying the best techniques to measure and compare performances in the companies becomes critical. The current study aimed to identify what are the proper tools to do so, and how they have been used by researchers and regulators. Steps ahead must be taken in order to detail the main methods, highlighting their advantages and disadvantages, as well as pointing out the proper methods for each situation and how to apply them in real operations.

PLANNING OF INNOVATION: A SOCIO-ECOLOGICAL VIEW

Maria Angela Campelo de Melo
Pontificia Universidade Católica do Rio de Janeiro, Brazil

ABSTRACT

Advocating the socio-ecological stance as a basis for planning for innovation, this paper extends to the inter-organisational level the concept of Innovatory Planning, a methodology that propitiates identifying and implementing technical and social changes required for an organization to absorb new technological processes and to meet the complex demands of turbulent environment. The analytical framework proposed combines the socio-technical approach, with the focus expanded to the inter-organisational level, from a socio-ecological viewpoint, and the adaptive planning perspective, that emphasizes the normative level and preconizes the adoption of an action learning posture which highlights participation, coordination, integration, sustainability and flexibility.

INTRODUCTION

This article, developed from a theoretical standpoint, aims at justifying the necessity of introducing in planning for innovation the socio-ecological perspective, giving primacy to multiple institutional arrangements as a basic element for survival and expansion in a globalized environment, characterized by high degrees of uncertainty, complexity and interdependency. In accordance with this view, the extension of the concept of Innovatory Planning (Melo, 1991; 2003) to the inter-organisational level is also preconized.

To construct the basis for this proposal, initially the elements of the socio-ecological perspective are characterized, and the origins and fundamentals of this concept are described. Then, the methodology of Innovatory Planning is presented, stressing its basis on socio-technical concepts and in the adaptive planning methodologies. An analytical framework is developed, combining the socio-technical approach, with the focus expanded to the inter-organisational level, in conformity with a socio-ecological vision, and the adaptive planning viewpoint. The article concludes showing in which ways the extension of Innovatory Planning to the socio-ecological level might contribute to improve the quality of the process of planning of innovation, considering the interdependency of the multiple actors involved in this process.

THE SOCIO-ECOLOGICAL PERSPECTIVE

In order to shown how the socio-ecological perspective can contribute for the innovation planning process, a theoretical basis, integrating the concepts of inter-organisational focus and socio-ecology, developed by the author elsewhere (Melo, 2012; Dias & Melo, 2012), is synthetized here. Upon this basis, it is showed how the adoption of the socio-ecological regulation mode becomes imperative, in face of the degrees of uncertainty, complexity and interdependency, characteristic of the phenomenon of innovation

As a broad area of inquiry, the idea of socio-ecology encompasses the relationships of the various actors in the environment. Here, it is applied in relation to the concept of organisational-ecology, as introduced by Trist (1976), based on the idea of inter-organisational domain, defined as the system to which one organisation belongs (Evan, 1966; Warren, 1967). In this way, instead of constituting the focus of analysis, with the environment characterized in terms of its purposes and functions, the organization is referred to the environment (Trist, 1976):

“By the term organisational ecology, however, I wish to refer not to a focal organisation and its organisation-set, but to the organisational field created by a number of organisations whose interrelations compose a system at the level of the field as a whole. It is the character of this overall field, as a system, which now becomes the object of inquiry, not the single organisation as related to its organisation-set.” (p.1)

More than three decades ago, Trist (1976, p.18) perceived the environment as “exceedingly complex and more interdependent - with the consequence that organisations must face the future under conditions of a higher level of uncertainty than that to which they have hitherto been accustomed.” He advocated that, due to the increasing saliency of turbulent conditions, a new organisational principle, alternative to the principle of bureaucracy, lying in the characteristics of systems of organisational ecology, was becoming mandatory. In face of this, he defended the relevance of organisational ecology in relation to institution-building, thus asserting:

“In order to control the turbulence generated in such a world, it is my submission that organisations in the middle level of society, between the macro and the micro, require strengthening. Further, that the function of organisations at this middle level is regulation, not production. And finally, that it is critical for our wellbeing that they be fashioned on ecological and democratic rather than on bureaucratic and totalitarian lines.” (p.18).

The socio-ecological regulation is based on the interdependency of organizations, submitted to the socio-technical principle of minimal critical specification (Herbst, 1974), i.e., a system of a higher level should determine, to its subsystems, only the essential elements required by the functioning of the whole system, leaving the specifications of the internal variables to each subsystem. It is worth noting that this principle is akin to the principle of subsidiarity, as proposed by the social doctrine of the Catholic Church. This type of regulation does not entail control, but rather articulation and dissemination of information.

Therefore, with the dimension of regulation, the socio-ecological perspective emerges, based on the interdependency of organisations, dynamic negotiation of roles and objectives and collaborative strategies (Melo, 2002). The most effective regulative processes for the inter-organisational domain are those which are designed to improve the degree of adaptability of the member organisations (Trist, 1981), thus opposing the bureaucratic regulation, characterized by external controls, hierarchy and centralization.

INNOVATORY PLANNING

This section summarizes the ideas concerning Innovatory Planning developed by the author in a research program during the last two decades, most of them already presented and discussed in different occasions (Melo, 1991, 1992, 2003, 2004, 2012). This methodology was conceived to define strategies, processes, methods, attitudes and postures appropriate for an organization facing technological innovation and its dual, social innovation (Melo, 1991). It embraces an action learning methodology that facilitates the identification and implementation of technical and social changes to help an organization to absorb the impact of new technological processes and to meet the complex demands of turbulent environments. It configures a special instance, developed to deal specifically with innovation, of Articulated Incrementalism, an adaptive planning methodology proposed by this author (Melo, 1977). As such, it was developed based on socio-technical principles and on the adaptive planning fundamentals.

A set of instruments and techniques for the implementation of this methodology, including the Idealized Project, Search Conferences, Theory of Real Options, the AIDA technique and Action Research, were presented at the 5th GBATA Conference (Melo, 2003), where the combined adoption of these methods and

instruments was preconized as an appropriate way to institutionalize a successful process of Innovative Planning.

Socio-technical Approach

The socio-technical approach, assuming that the organization is an open system, composed of technical and social subsystems that must be jointly optimized, (Emery; Trist, 1960) allows the formulation of management strategies appropriate for an integrated development of the organization, improving its performance. It is argued that a management system based on socio-technical principles provides a more effective interrelationship of the various business units, leading to the harmonic convergence of the organization's goals.

When introduced, in the middle of last century, the socio-technical approach adopted as levels of analysis the work unit, the organization as a whole or the macro-system. Trist (1981) expanded these analytical levels to cover the organisational ecosystem formed by organizations sharing a common action space, thus shifting the focus of analysis to a network of organizations, which, in principle, would more effectively assimilate technological and social innovations. As showed above, this new focus characterizes the socio-ecological perspective.

Adaptive Planning Methodologies

The adaptive planning approach perceives planning as a continuous learning process, which requires the participation and effective involvement of members of the organization, demanding coordination of actions and integration of different organisational levels, from a holistic view. It is characterized by the continuous appraisal of the actions implemented, leading to the constant redefinition of objectives and goals. The process of adaptive planning, to be effective, also requires a change of focus to the inter-organisational level, redefining of the role of planner as a networker, i.e., builder of networks of planning (Burns et al., 1983).

Adaptive planning starts at the normative level (Trist, 1976), requiring the participation of those affected in the discussion of the values involved and in the appreciation of the consequences of the actions taken. It constitutes a continuous learning process, characterized by flexibility and active adaptation. This type of adaptation demands an internal diversity appropriate to match the variety and complexity of the environment (Ashby, 1956) to deal with the challenges posed by it. Thus, the system has to present a repertoire of responses that is compatible with this complexity (Melo, 1977).

An adaptive planning process aims at the radical transformation of the system, intending to make it more and more compatible with its organisational domain. This kind of planning relies upon a socio-technical basis, and treats the social and the technical subsystems as mutually complementary, aiming at their joint optimization (Emery; Trist, 1960), thus rejecting any form of technological determinism (Melo, 2003).

To guarantee survival within a turbulent environment (Emery; Trist, 1965), it is necessary to consolidate innovative networks, linking organisations with shared responsibilities regarding the same action space (Friend; Jessop, 1969, Friend; Power; Yewlett, 1974). The consolidation of these networks can only be reached through efficient communication channels and well-designed articulative mechanisms (Melo, 1988, 1991, Melo; Melo, 1985) in order to propitiate the formulation and implementation of socio-technological strategies that meet the demands of those environments. For this, it is crucial to start the planning process at the normative level, addressing questions of values for all involved, which is a basic characteristic of the sociotechnical approach expanded to the socio-ecological perspective.

The effective involvement of the multiple actors that play an active role in the innovation phenomenon is also crucial to assure the continuity of the process, promoting the identification and the implementation of ways to deal with the factors that might affect the sustainability of the innovations designed.

The Innovation Process

Innovation is a complex phenomenon, which involves different actors which can have conflicting objectives, many times derived from irreconcilable *weltanschauungen*. Comprising a combination of phases and elements with diverse degrees of complexity, this phenomenon entails a very sophisticated process of planning, that contemplates the visions, behaviors and resources of all the instances involved. Consequently, this process can be conceived only as a learning one, displaying the flexibility required by the changing aspects of the environmental dynamics.

The innovation process, to be effective, demands a new focus, considering the inter-organisational dominion, for no single organization can deal alone with the complexity of interrelationships and uncertainty that characterizes the intricate 'meta-problem' (Chevalier, 1969) of innovation. The basic assumption is that technological innovations require social innovations and the best performance of the organization results from the adequate interaction of these factors.

An increase in the degree of organisational competitiveness, to be compatible with the three pillars of sustainability characterized in the triple bottom line proposal (Elkington, 1998), demands innovations, both technological and social. To evaluate whether the strategies of innovation are contributing to improve business performance, it is necessary to characterize the innovation required, in business management, by the constant changes in the macro environment and its impact on the innovation planning process, at the strategic level.

In this process, it is important to promote only carefully chosen innovation, privileging those advances which comply with social, economic and environmental sustainability requirements. This selection should inhibit the tendency to give primacy to innovation over all other values, as a consequence of 'Innovate or Perish' (Melo, 2004), a deceptive lemma for organizations, derived from the innovation imperative.

CONCLUSION

Innovatory Planning was presented as a basis for socio-ecological innovation which considers the diverse relationships of the inter-organisational domain. It adopts an action learning posture, facilitating the identification of innovative niches which make possible the formation and consolidation of networks of innovative action, in that domain. It is rooted in the socio-technical assumption that any organisation, being an open system, should manage both an internal and an external environment, playing an active role by seeking, environmental configurations that are more favourable to its action.

To make effective the planning process, the innovatory planning methodology was here seen as a useful instrument, within a context where socio-ecological regulation can strengthen the interrelationship between the main actors of the present organisational dominion in which innovation is a requisite.

Innovatory Planning entails a learning posture that can facilitate the identification of innovative niches which make possible the formation and consolidation of networks of innovative action, at the inter-organisational domain. The consolidation of innovative networks, with efficient communication channels and appropriate articulative mechanisms, was pointed as an essential element for survival within a dynamic environment. These innovation networks were identified as essential for the establishment of the process of planning of innovation.

The innovation process appropriate to integrate the diverse functions required by the contemporary social and economic environment, known as the knowledge society, requires the socio-ecological mode of regulation. In this perspective, institutions, organisations and groups involved in the *problematique* of innovation can act collaboratively and progress to find better adaptive ways of survival and development. There is a demand for associative and collaborative strategies, which may result in the formation of valuable networks, in relation to complex functions such as research and development.

This framework is expected to be encouraging for the formulation of strategies for collaborative activities and associations, bringing together industry and research institutions to develop programs favorable to the appropriate addressing of these issues. As a result, emphasis might be given to the endogenous contribution

of science developed within each country, compatible with the new paradigm of innovation and with the real needs of each society.

Innovatory Planning, conceived as a potent mechanism to reinforce active adaptation and learning, constitutes a change oriented methodology with a high degree of flexibility, here extended to be applied from a socio-ecological perspective, as a basis for enhancing the process of planning for innovation.

CHARACTERIZING VOLUNTEERS IN SPORTING MEGA EVENTS: THE CASE OF THE FIFA SOCCER WORLD CUP IN SOUTH AFRICA

Andile Mjiand, Tshwane University of Technology, South Africa
Surujlal J, Northwest University, South Africa

ABSTRACT

Mega sporting events need a number of activities to be properly coordinated if they are to be successful. These events require large numbers of human resources and invariably reliance is heavily on volunteers. Essentially, volunteers form the backbone in accomplishing the mega event logistics. Despite the foregoing, little research has characterized volunteers in sporting mega events from a South African perspective. This study addressed this issue by establishing university students' important motivational factors in terms of gender and gender with respect to age. To collect data, the 40-item Motivational Factors in Sport Volunteering Scale was used. In all 425 participants with ages ranging between 18 years and 25 years, responded fully to the administered instrument. Results indicated that similar numbers of females and males reflected the same motives for volunteering. This finding was replicated in terms of gender and age. A significant contribution of this study was the fact that it provides event managers with a better understanding with regards to who to attract, place and retain for mega sporting event volunteers.

INTRODUCTION

Sporting mega events take place over a short time span but are planned for long term political, social and physical consequences (Roche, 2000). In general, these events have mass appeal and attract a lot of visitors to the host country; and they have international significance (Getz, 1997). Typical sporting mega events include the Olympics, the Soccer World Cup, Cricket World Cups and the Rugby World Cup. The main feature of sporting mega events is that they are about unity of time, place and activity (Giannoulakis, Wang & Gray, 2008). Mega sporting events need a number of activities to be properly coordinated if they are to be successful. The coordination involves issues such as the promotion of the event; the coordination of activities; the management of multiple functions related to marketing, hospitality, the media, logistics and security. Significantly, these events require large numbers of human resources. For all intents and purposes the events rely heavily on volunteers. This means, by and large volunteers form the backbone of all operations in mega events. The reliance on volunteers is mainly because of the need for large numbers of people to assist in, and delivering various services associated with an event (Bang & Ross, 2009). Volunteers though do not replace the professional sport administrators and they are not meant to substitute them either. In many ways they need to be guided by sport administrators in delivering different services needed at sporting events. Volunteers therefore contribute towards building social capital, thereby making the community a better place for all (Connolly, 2002).

In essence, volunteers make up the majority of the human resources used in a sporting mega event. The conditions under which volunteers function in sporting mega events, contrast markedly with those of volunteers in other settings (Cuskelly, Auld, Harrington, & Coleman, 2004). This, in the view of Cuskelly et al. (2004) is because of the routinized elements such as limited number of days, inflexible deadlines and the fact that volunteers are required to complete a high number of hours over a short period of time. Volunteers are a critical resource because they provide event organizers with human resource capability that offers, sustains and expands the quantity and quality of the various services that an event has to offer (Strigas, 2003). Also, volunteers afford an organization the ability to provide services economically and therefore help in utilizing a limited budget effectively and efficiently (Cnaan & Goldberg-Glen, 1991). This is because they help offset the event costs and ease the budget on full time staff expenditure (Wong & Kwok, 2010; Cemalcilar, 2009). Giannoulakis et al.

(2008) posit that volunteers are undoubtedly one of the most essential resources involved in mega event logistics. Essentially, without their personal investment most sporting mega events would simply not be possible to hold (Auld & Cuskelly, 2001).

Problem Statement

Volunteering has benefits for both a hosting organization as well as for the individuals who volunteer. Volunteers are attracted by certain factors that are specific to the mega event. These factors may include a sense of national pride, uniqueness of the experience and the chance to contribute to the success of the event. Taking into account the importance of any sporting mega event to a country and the vital role that volunteers perform in such an event it is a challenge to recruit, train and retain the 'right' volunteers (Slaughter & Home, 2004). This is because of the huge cost of recruiting and training volunteers (Hollway, 2002). It is of paramount importance therefore to identify who volunteers. That is, who are the individuals who are willing to share their time, effort and resources to contribute to the success of an event? Literature shows that the phenomenon of volunteering and volunteerism has emerged as a field of study in the last decade (c.f. Chalip, 2000; Moragas, de Moreno, & Paniagua, 2000; Kemp, 2002; Green, & Chalip, 2004; Surujlal, & Dhurup, 2008). In fact, it is argued that "... little research has addressed the specific characteristics and experiences of individuals who choose to dedicate their volunteering time and effort ..." (Giannoulakis et al., 2008, p. 197).

South Africa is what can be called a 'sport mad' nation. This may be deduced from the fact that this country has hosted a number of mega sporting events between 1994 the year Nelson Mandela became president to date. Examples of these events include the Rugby World Cup in 1995; the Africa Nations' Cup in 1996; the Cricket World Cup in 2003; FIFA Soccer World Cup in 2010, Champions League T20 in 2012; and the Africa Nations' Cup in 2013. Of all the events, none has been as big as the 2010 FIFA Soccer World Cup. Hosting this sporting mega event was awarded to South Africa in May 2004. Importantly, this award meant that this country was the only one ever in Africa to be given this opportunity in FIFA's 101 year history (Fink, 2008). What is undeniable though is the fact that FIFA is a completely male-dominated organisation. For instance, of the FIFA executive committee, it is pointed out that the "... sad thing about the composition of this executive is that all the twenty - four members are males" (Machingambi & Wadesango, 2011, p. 152). In fact sporting bodies such as FIFA are said to be "... literally structured by codified rules of segregation, reminiscent of the same rules that once formally segregated blacks from whites (Anderson, 2009, p. 11). In this regard, Anderson (2005, p. 5) echoes that sport organizations "... so highly value orthodox masculinity that I have previously called sport 'a cult of masculinity'.

As has been indicated earlier, for sporting mega events to be successfully run, a number of volunteers are needed. It is important then that those who host these events should have a sense of who the volunteers are and what drives them into volunteering. On the basis of this, an attempt is made to characterize volunteers who participated in the FIFA soccer world cup hosted by South Africa in 2010. In particular, the aim was to establish which motivational factors were important to students both in terms of (i) gender and (ii) gender with respect to age. It was felt that this would provide sporting authorities with valuable information of who to target as volunteers when hosting events. So the research covered in this study should, as Baum and Lockstone (2007, p. 37) point out, be "... of value to mega sporting event organisers in maximising the value they can derive from effective use of volunteers." Also, as Hamidreza and Azadeh, (2012, p. S73) argue university students "... have a large impact on the general ideas at the communities; therefore, promotion of sport volunteering activities at the universities could develop the culture of volunteering in various parts of the communities." This research study is important from a South African perspective therefore because of the dearth of studies addressing this matter.

METHOD

Sample and Procedure

The population for the study was students from two universities in the Eastern Cape. Of the approximately 10 000 students, 1 000 were targeted through a convenience sampling method to participate in the study. Data collection took place in August 2011. Ten trained fieldworkers were employed to administer the questionnaire

on the university premises. Specific instructions were given to the fieldworkers to ensure that there was a balance between the genders in terms of participation in the study. It was also impressed on the fieldworkers that they should indicate to participants that all ethical considerations would be applied in the study. In this regard the field workers explained the nature of the study to students and requested their consent to participate. Participants were informed that they could withdraw from the study at any stage without any repercussion that their anonymity would not be compromised. Participants were requested to respond truthfully so that their answers would indicate what motivated them to volunteer in the 2010 FIFA World Cup. In most instances participants were requested to complete the survey in the presence of the fieldworkers. Four hundred and forty three questionnaires (response rate = 44.3%) were received.

Instrument

A questionnaire comprising two sections was used. Section A of the questionnaire requested the students to provide their biographical data. Four questions relating to gender, age, home language, the degree of study were included. Section B comprised 40 items of the Motivational Factors in Sport Volunteering Scale developed by Strigas and Jackson (2003) which sought the motives of volunteers. A seven point Likert type scale anchored by 1 = Not Important at all and 7 = Extremely Important (4 being neutral) was used to capture the responses of the participants. The scale comprised the *Material* factor (12 items) which related to incentives that allow sport volunteers to carry out a rational calculus of expected utility gain; the *Purposive* factor (8 items) which related to the desire of the volunteers to benefit with their actions the stated ends of the sport organization, and contribute to the sport event and community; the *Leisure* factor (8 items) which related to the individual's need for various leisure choices; the *Egoistic* factor (6 items) which related to volunteer's need to look after and / or take care of her/his own interest; and the *External* factor (6 items) which related to the extent to which volunteers are engaged to volunteering activities influenced by motives related to factors outside of the immediate control, like family traditions and significant others. A Cronbach alpha (α) reliability of 0.93 for the instrument was reported. Validity of the scale was ascertained by conducting a principal components analysis where five factors were extracted which accounted for 56% of the variance (Strigas & Jackson, 2003). Individually, the factors accounted for 29.2% (*Material*), 11.9% (*Purposive*), 5.7% (*Leisure*), 4.7% (*Egoistic*), and 4.5% (*External*) (Strigas & Jackson, 2003).

Data Analysis

Data were analyzed through the Statistical Package for Social Sciences (SPSS –version 20). To assess the demographic profile of the participants, frequencies and percentages were determined. To assess the reliability of the scores from the questionnaire, Cronbach's (1951) alpha was computed as a measure of internal consistency.

RESULTS

Biographical Data

Of the 1000 questionnaires administered 443 questionnaires were received. Of these questionnaires four hundred and twenty four ($n = 425$) were completed fully and therefore declared usable. The biographical data is presented in Table 1. Participants' ages ranged between 18 years and 25 years ($M = 20.57$; $SD = 1.84$). The table also shows that the students were in different study programs and spoke a variety of South African languages.

Table 1: Participants' biographical information ($n = 424$)

Category	n	%
Gender		
Female	157	36.8
Male	268	63.2

Education	64	15.1
Law	67	15.8
Psychology	63	14.8
Sociology	35	8.2
Natural science	65	15.3

Reliability and Validity of Students' Scores

Reliability of the scale was ascertained using Cronbach's alpha for internal consistency. The Cronbach alpha coefficient for the scale was 0.81 which is regarded as good (George & Mallery, 2003, p. 231). Validity was accepted *a priori* in this study. This is because the development of and determination of the factor structure of the scale was adequately described by Strigas and Jackson (2003). Furthermore, it is pointed out by Giannoulakis et al. (2008, p. 195) that:

- (a) the five factors included in the instrument (material, purposive, egoistic, external, and leisure) were adequately representing most of the volunteer dimensions identified in the review of literature; and
- (b) the instrument was capable of measuring the motivational patterns of sport volunteers in a valid and reliable way.

Importance with Respect to Gender

Here we wanted to determine the importance of volunteers' motives in participating in the 2010 FIFA world cup. As a recap, definitions of the different motives are illustrated in Table 1. Initially we focused on the *Material* subscale of the Motivational Factors in Sport Volunteering Scale. An example of an item from the *Material* subscale was: "I wanted to gain some practical experience toward paid employment." Figure 1a and Figure 1b show that about 49.7% of the females felt that this was not important to them. Similarly for about 49.4% of the males gaining practical experience toward paid employment was not the main issue. It is noticeable that for 35.0% (females) and 36.4% (males) volunteering was for *Material* purposes. That is, for these students the motive was related to incentives that they would gain for volunteering.

Figure 1a: Percentage distribution of females with respect to how important practical experience was to their volunteering in the 2010 FIFA world cup

Figure 1b: Percentage distribution of males with respect to how important practical experience was to their volunteering in the 2010 FIFA world cup

In terms of the *Purposive* subscale, an example of an item was: “Volunteering in the 2010 World cup would be worthy of my efforts and attention.” It may be observed from Figure 2a and Figure 2b that to about 66.9% of the females this was not important. Similarly to about 59.9% of the males volunteering would not be worthy of their efforts and attention. The figures reveal however, that for 15.9% (females) and 19.0% (males) volunteering was for *Purposive* reasons. That is, these volunteers did this in order to benefit with their actions, the stated ends of the FIFA 2010 organizing committee, and contribute to the sport event and community.

Figure 2a: Percentage distribution of females with respect to how important volunteering in the 2010 FIFA world cup would be worthy of their efforts and attention

With regards to the *Leisure* subscale, here an example of an item was: “I wanted to relieve the stress and the tension of everyday life.” Figure 2a and Figure 2b show that in terms of this subscale 14.0% (females) and 13.4% (males) indicated that *Leisure* reasons were of importance to them. This means that for these volunteers their motives for participation were related to individual’s need for various leisure choices. On the other hand, for about 71.3% of the females and about 69.1% of the males indicated that *Leisure* reasons were of no importance to them. This suggests that this group of students would not use volunteering to relieve the stress and the tension of everyday life, for instance.

Figure 2b: Percentage distribution of males with respect to how important volunteering in the 2010 FIFA world cup would be worthy of their efforts and attention

Figure 3a: Percentage distribution of females with respect to how important volunteering in the 2010 FIFA world cup would relieve the stress and the tension of everyday life

In terms of the *Egoistic* subscale, an example of an item was: “I wanted to challenge my abilities.” It may be observed from Figure 4a and Figure 4b that to about 69.7% of the females this was not important. Similarly to about 70.6% of the males volunteering was not meant to challenge their abilities. The figures reveal on the other hand, that for 11.5% (females) and 15.6% (males) volunteering was for *Egoistic* reasons. That is, these volunteers did this in order to look after their own interest.

With regards to the *External* subscale, here an example of an item was: “I wanted to continue a family tradition of volunteering in sport events.” Figure 5a and Figure 5b show that in terms of this subscale 29.2% (females) and 33.1% (males) indicated that *External* reasons were of importance to them. This means that for these volunteers their motives for participation were related to activities outside of the immediate control. On the other hand, for about 59.9% of the females and about 56.9% of the males indicated that *External* reasons were of no importance to them. This suggests that this group of students would not use volunteering to continue a family tradition of volunteering in sport events, for instance.

Figure 3b: Percentage distribution of males with respect to how important volunteering in the 2010 FIFA world cup would relieve the stress and the tension of everyday life

Figure 4a: Percentage distribution of females with respect to how important volunteering in the 2010 FIFA world cup was for them to challenge their abilities

Figure 4b: Percentage distribution of males with respect to how important volunteering in the 2010 FIFA world cup was for them to challenge their abilities

Figure 5a: Percentage distribution of females with respect to how important volunteering in the 2010 FIFA world cup was for them in continuing a family tradition of volunteering in sport events

Figure 5b: Percentage distribution of males with respect to how important volunteering in the 2010 FIFA world cup was for them in continuing a family tradition of volunteering in sport events

Importance with Respect to Age and Gender

Regarding volunteerism, with respect to age and gender Table 2 shows that in terms of the *Material*, *Leisure* and *Egoistic* reasons, more students who were 18 – 20 years old felt these were not important to them compared to their counterparts. For *Purposive* reasons that were not important to students, females in the 21 -23 years age group dominated while it was the 18 – 20 years age group for males. Similarly, for *External* reasons that were not important to students, females in the 21 - 23 years age group dominated while it was the 18 – 20 years age group for males.

Table 2: Frequency distribution (%) in terms of perceived importance of the Volunteer Motivation Scale subscales with respect to gender and age (n = 425)

IMPORTANCE		GENDER	AGE			Total
			18 - 20	21 - 23	24 +	
MATERIAL	Not Important	F	54(18.0)	47 (15.7)	11 (3.7)	112 (37.3)

DISCUSSION

In volunteerism some people derive benefit by experiencing a sense of social connection while others do not reveal this (Alessandrini, 2007). It is interesting to note that in the current study the majority of volunteers' motive to volunteer was in a sense to gain practical experience. This conclusion is reached from the fact that the volunteering students in general indicated that the motivational subscales were not important to them. In effect they were indicating that they were not motivated by *Material*, *Purposive*, *Leisure*, *Egoistic* and *External* motivations. These findings are consistent with those reported in a study on volunteering in disability sport in South Africa (Surujlal, 2010). In that study, Surujlal (2010) reported that a minority of volunteers expected to be rewarded for volunteering. This however, is in contrast to Malaysian findings where it was reported that more than 80% of the volunteers expected to be rewarded for volunteering. It is also a possibility that the volunteers did not volunteer for praise or attention but rather for interaction with others, personal achievement and contribution to the community. This may imply that the main reason for volunteering was driven by the sense of identity with their community (Costa, Chalip, Green, & Simes, 2006). It is argued that "... volunteering for an event could form a link to community, with the primary motivation being to support and facilitate the success of the event hosted by the community" (bang & Ross, 2009, p. 69). It is possible then that the participants of this study were motivated by the fact that they were supporting, and wanted to see the success of the FIFA 2010 World Cup hosted by their country. In recruiting volunteers it is critical that officials of mega sporting events should not underestimate the sense of community identification that volunteers tend to feel. In this regard it is pointed out that officials should therefore emphasize the notion of community involvement when recruiting volunteers (Williams, Dossa, & Tompkins, 1995).

CONCLUSION

Volunteers comprise a vital resource in sport events. Without their contribution many events could simply not have been staged. The results of the present study indicate that there is not much of a difference in motivation in terms of gender and age. The characterization of the students in terms of the results presented here is extremely encouraging. It is encouraging because if this characterization is typical of university students, then a sporting nation like South Africa may have a possible source of ready volunteers. A significant contribution of this study was the fact that it provided valuable information about university student volunteers in mega sporting events. The information is important for two reasons. Firstly, it provides event managers with a better understanding of whom they could targeted as volunteers. This can be of great assistance in attracting, placing and retaining them. Secondly, university students have the potential to play an influential role of encouraging volunteerism in communities from which they come. An important aspect of this issue is that the students can help sustain the notion of volunteerism among their communities.

It is worth acknowledging that this study which followed an *ex post facto* design had inherent limitations. Firstly for instance, compared to the total population in the targeted universities the students who participated may not have been as representative. This may be because for our purposes we ensured equitable gender and course of study representation for example. Secondly, on the balance of probabilities there is a possibility that some participants did not volunteer in the 2010 FIFA World Cup. This suggests then that some of the information, although valuables, was about how the 'non-volunteers' viewed volunteerism. It would be interesting to see if replicating studies would yield similar results as reported here. It is recommended therefore

that studies that focus on volunteerism among university students should be carried out in order to disprove or validate what has been reported here.

PICKUP AND DELIVERY PROBLEM WITH FUZZY TRAVEL TIMES FOR SUPPLY CHAINS IN SEMICONDUCTOR MANUFACTURING

Chun-Mei Lai and Cheng-Che Chen
Far East University, Taiwan

ABSTRACT

This study considers a practical pickup and delivery problem with fuzzy travel times for semiconductor supply chain (FPDP-SSC). Since FPDP-SSC involves constraints on fuzzy travel times, product/vehicle compatibility, pickup and delivery, and vehicle capacity constraints, it is more difficult to solve than the classical pickup and delivery problem. We formulate a fuzzy mathematical programming model to minimize total travel times for the FPDP-SSC. Based on extension principle, the lower and upper bounds of the fuzzy total travel times at possibility level α are calculated. From different values of α , the membership function of the objective function can be constructed. Since total travel times is expressed by a membership function instead of a crisp value, more information can be provided.

INTRODUCTION

As a semiconductor supply becomes widespread and the competition pressure is very fierce, the cross-company supply-chain operations are even more complicated such that a semiconductor manufacturer needs to integrate distribution in supply-chain networks to increase their competition edge and profitability. The development of effective and efficient tools for logistics management has therefore attracted a great attention from both practical applications and theoretical research on the field of supply chain management (Dondo *et al.* 2008; Manzini and Bindi, 2009).

With a complex supply chain structure, transportation and distribution activities emerge as one of the central issues owing to their complexity and costs. Lee *et al.* (2003) tackle the vehicle capacity planning for transportation service providing by a Singapore local logistic company. The problem can be classified as VRPTW (vehicle routing problem with time windows) with outsourcing decisions. In this paper, an advanced artificial intelligence method of tabu search heuristic is proposed for solving the problem. Karabuk (2007) deals a transportation problem for a textile manufacturing supply chain. The transportation problem involves constraints on pickup and deliveries, multiple depots, time windows, and full truckload (TL) or less than a truckload (LTL) and is solved by defining sub-problems. The proposed approach unfolds in stages which are solved to optimality and the solution one stage is the inputs to the next. Hamedi *et al.* (2009) propose a multi periods mixed integer non-linear programming model for the distribution planning for natural gas supply chain. A hierarchical algorithm was presented to solve large scale problem in reasonable time. Manzini and Bindi (2009) propose a combined mixed-integer programming model with cluster analysis, heuristic algorithms, and optimal transportation rules for design and optimization of a multi echelon and multi level production/distribution system.

Rupp and Ristic (2000) present a distributed planning methodology for semiconductor manufacturing supply chains. The developed system is based on an approach that leaves as much responsibility and expertise for optimization as possible to the local planning systems while a global coordinating entity ensures best performance and efficiency of the whole supply chain. Chiang *et al.* (2007) presented an empirical supply chain model to catch the relationship between the supply chain configuration and performance matrices. Dondo *et al.*

(2008) consider the multiple vehicle time-window-constrained pickup and delivery problem (MVPDPTW). In this paper, many-to-many transportation requests, pure pickup and delivery tasks, heterogeneous vehicles and multiple depots are taken into account and solved by an exact MILP mathematical formulation. For large-scale problems, a local search improvement algorithm is also presented. Dondo et al. (2009) further consider a more general vehicle routing problem in supply chain management (VRP-SCM), which better resembles the logistics activities to be planned at multisite manufacturing firms by allowing multiple events at every location. In such a definition, both capacitated vehicle routing problem and the pickup-and-delivery problem can be regarded as particular instances. An MILP mathematical formulation is proposed for solving the VRP-SCM.

In this study, we investigate the practical pickup and delivery problem with fuzzy travel times, which is often found in real-world practice, particularly, in semiconductor manufacturing supply chains. With a comprehensive supply chain structure, the semiconductor manufacturing supply-chain network consists of mask houses, wafer fabs, IC packaging plants, and warehouses. Sites among each other are connected by transport. Distribution activities (hereafter referred to as requests) arise from delivering wafer among fabs due to capacity backup, delivering mask from mask house to fabs, delivering material from warehouses to fabs, delivering wafer to packaging plants, delivering finished-goods to warehouse, delivering finished-goods to customers, etc.

In semiconductor factories, highly capacity utilization and efficiently production scheduling are essential due to the intensive capital investment. Requests failed to arrive within prescribed time period may result in capacity idle and even deferral delivery. In practice, determination of the travel times between two sites is very difficult, because there usually is considerable uncertainty due to factors such as the traffic conditions, incidents, breakdowns, and the variability in activity patterns, which in turn impact on travel times. Generally, the determination of travel times between two sites usually contain fuzziness owing to imprecise measurements or described by linguistic variables, such as “between 35 to 40 minutes”, “around one hour”, and so on. In such cases, travel times can be regarded as fuzzy variables. Since conventional deterministic solution techniques cannot solve the vehicle routing problems in uncertain environments, fuzzy variables can be used to tackle these uncertain parameters. Therefore, taking the fuzziness of travel times into account is of importance when planning vehicle routes and schedules for semiconductor-manufacturing supply chains.

Liu and Kao (2004a) consider the network flow problem with fuzzy arc lengths. Yager’s ranking method is adopted to transform the fuzzy network flow problem to a crisp one, and then the conventional streamlined solution methods are applied to find solutions. Zheng and Liu (2006) consider the fuzzy vehicle routing problem with time window and propose a chance constrained programming model with credibility measure to find the optimal solutions. Zheng et al. (2011) deal with a real-life urban pickup and delivery problem with consideration of time-dependent fuzzy velocity of vehicles. Alfa-Cut-Set algorithm is applied to calculate the fuzzy arriving times and a modified tabu search is then used to solve the problem. Zarandi et al. (2011) propose a simulation-embedded simulated annealing procedure to solve the multi-depot capacitated location-routing problem with fuzzy travel times.

In this study, the FPDP-SSC is investigated by taking into account fuzzy travel times, product/vehicle compatibility, pickup and delivery, and vehicle capacity constraints. The deterministic vehicle routing problem cannot cover real-life contexts when travel times are fuzzy variables (Liu and Kao, 2004a; Zarandi et al., 2011). Taking the merits of Liu and Kao (2004b) with modifications, a pair of mathematical programs will be formulated to calculate the lower and upper bounds of the fuzzy total travel times at possibility level α . From different values of α , the membership function of the objective function can be constructed. Since total travel time is expressed by a membership function, more information can be provided for decision making. The vehicle routing problem in semiconductor supply chain can be more applicable for the real-world applications.

PROBLEM DESCRIPTION

The FPDP-SSC may be defined as follows. We are given a vehicle fleet in order to serve a set of requests. The road network is represented by a graph $G = (V, E)$, where $V = (v_0, \dots, v_n)$ is a vertex set and $E = \{(v_i, v_j) : v_i \neq v_j \wedge v_i, v_j \in V\}$ is an arc set. Vertex v_0 denotes a depot at which the routes of K vehicles start and end. The set of vertices (v_1, \dots, v_n) specify the possible pickup and/or delivery sites. In practice,

determination of the travel times between two sites usually contains fuzziness because of imprecise measures or described by linguistic variables. Without loss of generality, we assume travel times \tilde{t}_{ij} are fuzzy numbers, since crisp values can be treated as degenerated fuzzy numbers.

Requests are known in advance. Each request specifies the product (mask, wafer lots, or die lots) and its amount, the pickup site, and the site to be delivered. Each request needs to be served by a single vehicle transporting lots from a specified pickup-site to a specified delivery-site without any transshipment. To fulfill the requests in the semiconductor-manufacturing supply chain, this study considers the more general pickup and delivery problem with fuzzy travel times in semiconductor manufacturing supply chains (FPDP-SSC). Since the FPDP-SSC involves fuzzy travel times and constraints on product/vehicle compatibility, pickup and delivery, and vehicle capacity constraints, the nature of the FPDP-SSC problem makes the problem unique and differentiates it from those reported in the literatures.

A set of requests are given in advance. Each request specifies the product type (mask, wafer lots, or die lots) and its amount, the pickup site ($\in V$), the delivery site ($\in V$). In the FPDP-SSC, each request have to be transported entirely by the same vehicle (pairing constraint), and pickup operation has to be served before its corresponding delivery operation (precedence constraint). Furthermore, the capacity of a vehicle can never be exceeded after visiting a site (capacity constraint).

There is one depot with fixed numbers of vehicles. On a daily basis, each vehicle starts from the depot, visit a number of sites along the selected route, and returns to the depot. Moreover, in order to protect products from vibration during transportations, some vehicles are with special facilities dedicated for 8" wafers, some are dedicated for 12" wafers, whereas others are open for all types of products. At each visit, the vehicle can perform pickup, delivery, or combined pickup and delivery without violating vehicle capacity and product/vehicle compatibility restrictions.

For the fleet of K vehicles, some vehicles are with special facilities dedicated to carry 8" wafers, some are dedicated for 12" wafers, while other vehicles are open for carrying all products. When assigning requests to vehicles, product-type must conform to the vehicle facility. In order to optimally manage the complicated distribution systems, transportation activities between sites are coordinated by allowing multiple activities at each site. In this way, two or more vehicles may visit a given site to perform pickup and/or delivery operations, and vehicle routes may include several stops at the same site. Note that, the capacity of a vehicle can never be exceeded after visiting a node.

FUZZY MATHEMATICAL PROGRAMMING MODEL

We first define $V = \{v_j | v_0, v_1, \dots, v_n\}$ containing $n+1$ nodes in the supply chain environment, in which node v_0 representing the depot node while remaining J nodes (v_1, \dots, v_n) representing n sites to be visited. Let \tilde{t}_{ij} be the travel time from site v_i to site v_j . Travel time \tilde{t}_{ij} is assumed to be a fuzzy number. $F = \{f_k | k = 1, \dots, K\}$ is defined as the fleet of homogeneous vehicles containing a set of K vehicles. We also define $A = \{0, 1, 2\}$ as the set of type-code, in which code 0 representing general type, code 1 representing 8" wafer and code 2 representing 12" wafer. Let c_k ($c_k \in A$) be the vehicle-type code of vehicle f_k . Let T be the time-length of the planning period and W be the predetermined vehicle capacity.

We define $R = \{r_q | q = 1, 2, \dots, Q\}$ containing Q requests to be scheduled in the planning period. Each request r_q is associated with a product-code d_q ($d_q \in A$), with $d_q = 1$ if request r_q dealing with 8" wafer, $d_q = 2$ if request r_q dealing with 12" wafer, and $d_q = 0$ otherwise. Since each request have to complete both pickup and delivery operations in this planning period, we also define an operation set $O = \{o_i | i = 0, 1, 2, \dots, I\}$ containing $I+1$ operations ($I = 2Q$). In which o_0 represents initial state. Each operation o_i contains only one

operation, pickup or delivery. In such a case, a request r_q contains pickup and delivery activities, would correspond to two operations, one operation, o_i ($i = 1, \dots, Q$), for pickup-operation of request r_q and the other operation, o_i ($i = Q + 1, \dots, 2Q$), for delivery-operation of request r_q . Each operation o_i is associated with a request r_q ($\in R$), product-type code d_q ($\in A$), lot size n_q , a visit-site s_i ($\in V$), and a pickup-or-delivery code e_i . Let e_i be the pickup-or-delivery code, with $e_i = 1$ if operation o_i ($i = 1, \dots, Q$) is a pickup-operation, and $e_i = -1$ if operation o_i ($i = Q + 1, \dots, 2Q$) is a delivery-operation.

Let cw_{ik} be the variable representing the upper bound on the load of vehicle f_k upon completing operation o_i . Let x_{ik} be the variable indicating whether the operation o_i is scheduled on vehicle f_k , with $x_{ik} = 1$ if operation o_i is scheduled on vehicle f_k , and $x_{ik} = 0$ otherwise. Let y_{ijk} be the precedence variable defined on two operations o_i and o_j scheduled on vehicle f_k , with $y_{ijk} = 1$ if operation o_i precede operation o_j (not necessarily directly), and $y_{ijk} = 0$ otherwise. Let p_{ijk} be the direct-precedence variable defined on two operations o_i and o_j scheduled on vehicle f_k , with $p_{ijk} = 1$ if operation o_i direct precede operation o_j , and $p_{ijk} = 0$ otherwise.

To find a route for each vehicle so as to visit the customers which minimizing the total travel times without violating the product/vehicle compatibility and capacity restrictions, we consider the following fuzzy mathematical programming model.

$$\text{Minimize } \sum_{k=1}^K \sum_{i=0}^I \sum_{j=0}^I p_{ijk} \tilde{t}_{(s_i)(s_j)}$$

s. t.

- (1) $\sum_{i=0}^I \sum_{j=0}^I (p_{ijk} \tilde{t}_{(s_i)(s_j)}) \leq T, \quad \text{for all } k,$
- (2) $\sum_{k=1}^K x_{ik} = 1, \quad \text{for all } i = 1, \dots, I,$
- (3) $(x_{ik} - x_{jk}) \leq M |r_i - r_j|, \quad \text{for all } i, j, k,$
- (4) $(y_{ijk} + y_{jik}) - x_{ik} \leq 0, \quad \text{for all } i, j, k,$
- (5) $(y_{ijk} + y_{jik}) - x_{jk} \leq 0, \quad \text{for all } i, j, k,$
- (6) $(y_{ijk} + y_{jik}) - (x_{ik} + x_{jk} - 1) \geq 0, \quad \text{for all } i, j, k,$
- (7) $y_{ii^*k} - M(y_{ijk} + y_{ji^*k} - 2) \geq 1, \quad \text{for all } i, j, k,$
- (8) $y_{ijk} - p_{ijk} \geq 0, \quad \text{for all } i, j, k,$
- (9) $\sum_{i \neq j} p_{ijk} \leq 1, \quad \text{for all } i, j, k,$
- (10) $\sum_{i \neq j} p_{jik} \leq 1, \quad \text{for all } i, j, k,$
- (11) $\sum_{i=0}^I x_{ik} - \sum_{i=0}^I \sum_{j=0}^I p_{ijk} = 1, \quad \text{for all } k,$
- (12) $(e_i - y_{ijk}) + (x_{ik} + x_{jk} - 2) \leq M |r_i - r_j|, \quad \text{for all } i, j, k,$
- (13) $x_{ik} c_k |d_i - c_k| \leq 0, \quad \text{for all } i, k,$
- (14) $cw_{ik} \geq (cw_{jk} + n_i e_i x_{ik}) - M(1 - p_{jik}), \quad \text{for all } i, j, k,$
- (15) $0 \leq cw_{ik} \leq W, \quad \text{for all } i, k,$

- (16) $cw_{0k} = 0$, for all k ,
 (17) $x_{0k} = 1$, for all k ,
 (18) $y_{i0k} = 0$, for all i, k ,
 (19) $c_k \in \{0, 1, 2\}$, for all k ,
 (20) $d_i \in \{0, 1, 2\}$, for all i ,
 (21) $x_{ik} \in \{0, 1\}$, for all i, k ,
 (22) $y_{ijk} \in \{0, 1\}$, for all i, j, k ,
 (23) $p_{ijk} \in \{0, 1\}$, for all i, j, k .

The objective function seeks to minimize the total traverse time. Travel time \tilde{t}_{ij} is a fuzzy number. The constraints in (1) control the upper bound on the completion time of each route. The constraints in (2) guarantee that the operation o_i is scheduled on one vehicle exactly once. The constraints in (3) ensure that operation o_i and o_j need to be scheduled on the same vehicle ($x_{ik} = x_{jk}$) when two operations o_i and o_j are belong to the same request ($r_i = r_j$). The number M is a constant, which is chosen to be sufficiently large.

The constraints in (4)~(6) ensure that one operation can precede another ($y_{ijk} + y_{jik} = 1$) if two operations o_i and o_j are scheduled on the same vehicle f_k ($x_{ik} = 1$ and $x_{jk} = 1$). The constraints in (7) ensure that the operation o_i precedes operation o_{i^*} ($y_{ii^*k} = 1$) when the operation o_i precedes operation o_j ($y_{ijk} = 1$) and the operation o_j precedes operation o_{i^*} ($y_{ji^*k} = 1$). The constraints in (8) ensure that operation o_i could precede operation o_j directly ($p_{ijk} = 1$) only when $y_{ijk} = 1$ and operation o_i could not precede operation o_j directly ($p_{ijk} = 0$) if $y_{ijk} = 0$. The constraints in (9) ensure that at most one operation o_j could be scheduled after operation o_i directly for all the operations scheduled on the vehicle f_k . The constraints in (10) ensure that at most one operation o_j could be scheduled precede operation o_i directly for all the jobs scheduled on the vehicle f_k . The constraints in (11) state that there should exist $N-1$ directly-precedence variables, which set to one, on the schedule with N operations.

The constraints in (12) ensure that pickup-operation o_i precedes delivery-operation o_j ($y_{ijk} = 1$ and $e_i = 1$) when operations o_i and o_j are belong to the same request. The constraints in (13) ensure product/vehicle compatibility. Operation o_i can scheduled on vehicle f_k only when product-type code equals to vehicle-type code or vehicle is for general purpose ($x_{ik} = 1$ if $d_i = c_k$ or $c_k = 0$). The constraints in (14) define vehicle load cw_{ik} upon operation o_i is completed by vehicle f_k . The constraints in (15) control the upper bound on the load of the vehicle.

THE SOLUTION PROCEDURE

Taking the merits of Liu and Kao (2004b) with modifications, a fuzzy mathematical program based on extension principle can be solved as follows.

In the FPDPS-SSC, assume that all the travel times are triangular fuzzy numbers defined as Equation (24) and the membership function $\mu_{\tilde{t}_{ij}}$ is shown in Figure 1.

$$(24) \quad \tilde{t}_{ij} = [t_{ijl}, t_{ijm}, t_{iju}], \text{ for } i, j = 0, 1, 2, \dots, n.$$

The α -cuts of the fuzzy travel time \tilde{t}_{ij} are represented as

$$(25) \quad (t_{ij})_{\alpha} = \left[(t_{ij})_{\alpha}^L, (t_{ij})_{\alpha}^U \right] \\ = \left[\min_{t_{ij}} \left\{ t_{ij} \in S(\tilde{t}_{ij}) \mid \mu_{\tilde{t}_{ij}}(t_{ij}) \geq \alpha \right\}, \max_{t_{ij}} \left\{ t_{ij} \in S(\tilde{t}_{ij}) \mid \mu_{\tilde{t}_{ij}}(t_{ij}) \geq \alpha \right\} \right],$$

where $S(\tilde{t}_{ij})$ is the supports of \tilde{t}_{ij} .

Figure 1. A membership function of triangular fuzzy number.

Let p_{ijk} be the direct-precedence variable defined on two services, i and j , scheduled on route k , with $p_{ijk}=1$ if service i direct precede service j , and $p_{ijk}=0$ otherwise. Total travel times Z would be as equation (26). Intuitively, if the travel time is fuzzy, the total travel times Z becomes fuzzy as well.

$$(26) \quad \tilde{Z} = \min. \sum_k \sum_i \sum_j p_{ijk} \tilde{t}_{(s_i)(s_j)}$$

$$(27) \quad \text{s.t. } \tilde{t}_{(s_i)(s_j)} x \leq A,$$

$$(28) \quad \begin{aligned} g(x) &\leq B, \\ x &\geq 0 \end{aligned}$$

where $g(x) \leq B$ are crisp constraints.

Based on extension principle (Yager, 1986; Zadeh, 1965; Zimmermann, 1996), the lower bound and upper bound of the α -cuts of \tilde{Z} can be calculated via the following programs:

$$(29a) \quad Z_{\alpha}^L = \min_{(t_{ij})_{\alpha}^L \leq t_{ij} \leq (t_{ij})_{\alpha}^U} \left\{ \begin{aligned} &\min \sum_k \sum_i \sum_j p_{ijk} \tilde{t}_{(s_i)(s_j)} \\ &\text{s.t. } \tilde{t}_{(s_i)(s_j)} x \leq A \\ &g(x) \leq B \\ &x \geq 0 \end{aligned} \right.$$

$$(29b) \quad Z_{\alpha}^U = \max_{(t_{ij})_{\alpha}^L \leq t_{ij} \leq (t_{ij})_{\alpha}^U} \left\{ \begin{aligned} &\min \sum_k \sum_i \sum_j p_{ijk} \tilde{t}_{(s_i)(s_j)} \\ &\text{s.t. } \tilde{t}_{(s_i)(s_j)} x \leq A \\ &g(x) \leq B \\ &x \geq 0 \end{aligned} \right.$$

According to Equations (29a) and (29b), the membership function $\mu_{\tilde{Z}}$ is constructed as:

$$(30) \quad \mu_{\tilde{Z}} = \begin{cases} L(z), & (Z)_{\alpha=0}^L \leq z \leq (Z)_{\alpha=1}^L \\ 1, & (Z)_{\alpha=1}^L \leq z \leq (Z)_{\alpha=1}^U \\ R(z), & (Z)_{\alpha=1}^U \leq z \leq (Z)_{\alpha=0}^U \end{cases}.$$

A mathematical programming solver Lingo can be used to solve the fuzzy programming model. $L(z)$ and $R(z)$ are the left and right shape functions of $\mu_{\tilde{Z}}$, respectively. Numerical method can be used to determine the solution for $(z)_{\alpha}^L$ and $(z)_{\alpha}^U$ at various α values and approximate the shapes of $L(z)$ and $R(z)$ (Liu and Kao, 2004b).

CONCLUSIONS

In this study, we considered the pickup and delivery problem with time windows and fuzzy travel times for semiconductor supply chains (FPDP-SSC), a practical generalization of the vehicle routing problem, and often found in real world practice, particularly, in the IC manufacturing industry. The FPDP-SSC involves constraints on fuzzy travel times, product/vehicle compatibility, pickup and delivery, and vehicle capacity constraints, therefore it is more difficult to solve than the classical pickup and delivery problem. The objective is to find a set of routes and schedules for the vehicles at minimum travel distance without violating product/vehicle compatibility, pickup and delivery, driver duration, and vehicle capacity constraints. A fuzzy mathematical programming model is presented to resolve the FPDP-SSC. Based on extension principle, the lower and upper bounds of the fuzzy total travel times at possibility level α are calculated. From different values of α , the membership function of the objective function can be constructed. Since total travel times can be expressed by a membership function instead of a crisp value, the vehicle routing problem in semiconductor supply chain can be more applicable for the real-world applications.

SHALLOW FINANCE AND CENTRALIZED GOVERNMENTS – THE VICIOUS CIRCLE OF SOCIO-ECONOMIC BACKWARDNESS

Mehdi Mohaghegh
Norwich University, USA

ABSTRACT

Why is it that the ancient societies of the Middle East and North Africa with their thousands of years of civilization and generous endowment of natural resources have such a difficulty placing their societies on the path to economic prosperity, modernity, and democracy? The purpose of this paper is to answer this question by arguing that the Middle Eastern countries are generally characterized with autocratic governments and shallow financial systems. These two characteristics that get hardened by enforcing each other create socio-economic backwardness in the region by forming a vicious circle from which the countries of Middle East have such a hard time to break out.

INTRODUCTION

The purpose of this paper is to explain that: 1) not only the existence of centralized governments, corruption, and shallow finance are the major barriers to economic development but together they constitute a vicious circle of socio-economic stagnation that is so difficult to overcome, 2) outside intervention and top-down political and economic reforms cannot be viable and effective in breaking this vicious circle, and 3) only grass route changes in the developing countries of the Middle East combined with free-trade and unthreatening political and trade relations with the industrialized nations is the proper way of breaking this vicious circle.

The neo-classical financial management theories are used to explain that: 1) the finance in the countries of the region is “Shallow” or “Repressed”, and 2) the shallowness of finance has caused severe inefficiency in utilization of scarce resources leading to sluggish economic growth and slow advancement toward modernity and democracy in the area. Repressed finance is the means by which the corrupt officials of the region’s autocratic regimes obtain monopoly rent from certain economic activities that are under their direct control. Shallow finance, then provides the means and the necessary conditions for the existence and continuation of corrupt and tyrannical governments in the Middle East. These governments tend to avoid the kind of reforms in their economies that would lead to deepening of finance and rapid economic growth on the one hand and the loss of their windfall earnings on the other. This research further reveals that the emergence and continuation of oppressive regimes in the region is also the result of centuries of stalemate in the evolution of politics in the area. Such a stalemate is caused by the existence of religious zeal and an abundant amount of petro-dollars combined with the strategic location of the region that has invited the intervention in the region of colonial powers. The first section of the paper is devoted to a brief review of the evolution of socioeconomic systems in the West. Such a study will provide the standards against which the economic and social developments in the Middle East can be compared and contrasted. Upon such a comparison one will be able to understand the nature of the vicious circle of socio-economic stagnation in this strategically important part of the world.

Renaissance and Reformation Movements in the West

Despite its natural riches and exceptional geographic and strategic location, the movement toward an all-inclusive economic progress, modernity, and democratic form of government in the Middle East has been

intermittent and slow. The success of these nations in achieving socio-economic advancements is still in doubt despite the recent political shake ups in the region which are wishfully titled the Arab Spring. A brief history of economic and social developments in the West can be instrumental in understanding the nature of the barriers to economic growth and adverse conditions in the Middle Eastern countries that prevent these nations from establishing highly efficient market economies that would lead to improvements in the general well-being of their people.

In his book, *The Moral Consequences of Economic Growth*, Benjamin Friedman (2005) provides a chronological description of how the accumulation of scientific discoveries combined with a new economic outlook unleashed a rapid rate of economic growth in the 18th Century Europe that spread around the globe and is continuing to do so to this date. The new economic outlook resulted from a new and different interpretation of the tenets of Christianity by “Reformists” and from the innovative ideas put forward by “Enlightenment” thinkers. Friedman also explains how faster economic growth in a society characterized with free-market capitalism can lead to greater social, political, and moral developments in that society. A summary of the views expressed by Friedman should start from his observation in history that the praise for less extravagant life and admiration for those who adhered to self-denial was a continual theme in Christian Europe until “Renaissance.” Renaissance which refers to the rich development of Western Civilization initially appeared in Italy at the beginning of 14th century and spread all over the Western Europe during the next two centuries. The incredible developments in science that resulted in commerce and economic expansion in Italy and other European countries, led to rapid progress in scholarship, literature, and the arts. All of these provided the background for having a new view of the world. Renaissance also brought a new meaning to individual expression, self-consciousness, and worldly experience. During renaissance, people in the emerging nation states of Europe began engaging in exploration and a revolution in commerce started.

On another front, the “Reformation” which is the term used to signify the desire for change within the church started in parallel with Renaissance. Reformed Protestant thinking that paved the way for the new ideas that culminated later in the “Enlightenment” thoughts emphasized the scientific discoveries and the general education throughout the society. At the same time, due to efforts made by theologians such as Luther, Calvin and other reformists the emphasis on the individual and its study of ancient texts increased. The Reformation ultimately led to freedom of dissent. Luther started his open attacks on doctrines and authority of the church on October 17, 1517 and his insistence on reading the Bible made the individual to assume greater responsibility for his own salvation. In 1536, Geneva became the centre for the teaching of John Calvin who was considered the greatest theologian of Protestantism. In England, Henry the VIII issued the act of Supremacy in 1534 which rejected papal control and created the National Church of England. In the meanwhile, Calvinistic thoughts were still strong in England and caused further reforms. In summary, Reformation, and its outcome, Protestantism, changed the outlook and created a dynamism that has continued to exert influence to the present day. This movement with its emphasis on personal responsibility and individual freedom; its refusal to take authority for granted; its effect on breaking the hold of the church upon life and the consequent secularization of life and attitudes changed the world tremendously.

The Enlightenment Movement, Economic growth, and Democracy

Reformation and Renaissance’s intellectual outlooks and their associated cultural manifestations led to the emergence of a new movement called the “Enlightenment.” By the 18th century people were witnessing the unending series of scientific discoveries and inventions and were benefiting from commodities manufactured from practical applications of these scientific advances. This created a positive view in the society that the scientific progress that had been achieved could indeed continue and accumulate over time. Also some thinkers came up with this idea that economic growth and rising living standards could cause public attitudes and political institutions to evolve in manners that improve the *moral character of the society*. Such an idea with a convincing explanation of how this process comes about was primarily the intellectual product of a group of 18th century thinkers such as Adam Smith and Anne Robert Jacques Turgot who became known as members of “*Enlightened Movement*”. Through their writings these leaders showed that education and scientific discoveries combined with discipline, hard work, thrift, patience, division of labor, and specialization are conducive to greater productivity in a free-market economy. Also, from the support that Calvin and his followers gave knowingly or unknowingly to the development of commerce and manufacturing activities, it can be argued that

the Reformed Protestant denominations undoubtedly accepted, rather than resisting, the major institutions of the dynamic economic world such as division of labor, specialization, trade, wage labor, banks and credit. The vital Smith, Turgot, Mandeville, and other Enlightenment thinkers played in the development of commerce and industries is brilliantly expressed by Friedman (2005, p. 40) who summarizes their views on commerce and industrialization as: "Rather than worrying about how to suppress individuals' insatiable appetites, as the Stoics of ancient Greece had done, or simply railing against them as countless religious sects had, Mandeville, Smith, and their followers believed that commerce would harness those appetites to serve the society as a whole. Just as insatiable curiosity drove the quest for scientific discovery, insatiable material wants drove the economic machine." Also a counter argument to the medieval religious injunction that all economic activity must be for the common good was made that, under the arrangements imposed by commerce, economic activity driven by self-interest *was* for the common good. Friedman (2005) goes on to explain that the enlightenment thinkers recognized that commerce can reward some important personal traits such as honesty, order, reliability, punctuality, discipline, and enthusiasm to be helpful and friendly toward one's fellow citizens and as a result can intrinsically create these traits in the citizens of a country. These are human characteristics that religions including Christianity and Islam have not been able to completely promote in human societies. Even passing of laws in a society cannot guarantee that majority of citizens try to uphold these very important human traits. In a commercial world and in a free society, individuals who adopt these and other similar personal characteristics could achieve greater success both financially and spiritually. The society as a whole will also be served in the form of greater output, less criminal acts, and greater spirit of cooperation as its citizens gradually acquire these traits.

Smith, Turgot and their followers also realized that the improvement in productivity and rising of incomes in commercialized societies could cut down on human efforts that were necessary for feeding, clothing, and sheltering of a given population. The released time from subsistence activities could, then be used by individuals to engage in other activities such as reading, writing, education, creating the artifacts, discussing the policy issues and participating in the society's governing institutions. In reasoning this way, Smith and other Enlightenment thinkers foresaw much of the thinking about political democracy that emerged over the next century. It is important to emphasize that Smith, Turgot, and their contemporaries did not suggest that the increase in economic growth and rising incomes necessarily lead to the development of the above traits in members of a society and its progress toward democracy. They saw these developments in individuals' behavior and outlooks, as well as the implications they drew for equality and democracy, as a consequence of "commerce" itself and its industrialization outcome. But considering the effects that rising incomes have on the further development of these traits reinforces the above original argument (Friedman 2005).

The Development of Financial Systems in the Industrialized Nations

Modernization and economic development in the European Countries and the United States could not proceed without swift and steady deepening in their financial systems. Almost all the wealthy countries of the world are characterized with high levels of financial development. The financial intermediaries in these societies play important roles in direct and indirect finance. Experience shows that markets in general are highly efficient in the allocation of resources and are very effective at coordinating the behavior of millions of firms and families in any economy. Financial markets are especially important because they price economic resources and allocate them to their most productive uses. Lending and borrowing involve transaction costs, like the cost of writing a loan contract, and information costs, like the cost of investigating the trustworthiness of a borrower. Financial institutions exist to minimize these costs. These institutions perform several important roles in a mature economy. They pool the resources of small savers; provide safekeeping and recording services; offer access to payment system; provide liquidity and ways to transfer and diversify risk; and collect and process information in manners that reduce information costs. Financial markets require superior information to work well. When the cost of obtaining that information is excessive, they cease to function. There is also information asymmetry in the market which means the issuers of financial securities know much more about their performance and business prospects than investors and potential lenders. The asymmetric information leads to the problems of *adverse selection* and *moral hazard* that cause serious hindrance to the operation of financial system and flow of funds from savers to investors. A sophisticated financial system in an advanced economy resolves these problems by providing more information for investors. Transparency laws combined with industry regulations and screening and rating provided by credit agencies persuade investors that firms' stocks and bonds are of high

quality and are worth the price paid for them. In most industrialized nations, financial deepening has taken place by maintaining relatively high and steady real interest rates within comparable categories of bank deposits and loans and by eliminating undue reserve requirements, interest ceilings, and mandated credit allocations on the one hand, while stabilizing the price level through appropriate macroeconomic measures on the other. It is generally accepted by economists that countries which liberalize their financial systems to an efficient level and their monetary authorities induce the expectations of a low and steady rate of inflation, do normally experience a high rate of growth in their economies. Most recently, the countries such as Malaysia, South Korea, Sri Lanka, Singapore, and the Philippines provide historical evidence in support of this view (McKinnon, 1986). Patrick (1966) argues that the increased supply of financial services in response to demand may not be automatic, flexible, or inexpensive in underdeveloped countries. We will go beyond this argument and discuss in the next section that some developing countries like the ones in the Greater Middle East have made their economic development even more lethargic by following the types of monetary and fiscal policies that have repressed their financial industries to the point of making them an impediment to economic growth.

Market Economy and Democracy in the Greater Middle East.

In the 21st century, not even one of the Muslim nations of the Middle East has thoroughly experienced the above path to socioeconomic development. Islam is the common faith practiced by the people in the entire region. Can the excesses of Islam be blamed for the region's sluggish socioeconomic development? The truth is that Islam has never downplayed the role of trade in the economy. After all, Prophet Muhammad himself is said to have been an honest and successful merchant. This positive outlook toward trade in Islam has been more than offset by its negative influence on economic growth and capital accumulation in the region. Issawi (1982) divides the negative influence of Islam on the economy into two effects. He argues that 1) Islam, as a conservative religion, justified and supported the existing forms of governments and the status quo, and therefore it has continuously subdued the emergence of other creative intellectual, social, political, and economic forces. 2) Islam, as an egalitarian and interventionist religion, has been a hindrance to rapid economic growth and accumulation of wealth throughout the Middle East.

The first influence is supported by the fact that Islam maintained and built upon the totalitarian regimes that existed in the region in the 7th century when it began dominating the area. Even the revolution in Iran in 1978 and the recent socio-political upheavals (Arab Spring) in the region have proven ineffective in eliminating the reactionary forces of Islam that are at work to reestablish and maintain the centralized and oppressive governments in the region. Issawi (1982) argues that, in contrast to the Western Roman Empire, the Sassanian and Byzantine Empires did not break down following the defeat of these two superpowers by Arabs in the early Middle Ages. Arabs soon succeeded in establishing a strong and a fairly centralized government similar to the collapsed regimes in Byzantine and Persia. In Issawi's words: "Whereas in Western Europe the ground was cleared for the growth of numerous and vigorous independent centers of power and activity—Church, city states, feudal principalities, universities, guilds, and other associations—in the Middle East the continued power of the state with its centralized apparatus stifled such developments" (Issawi, 1982, p.170). Issawi goes on to explain that in the Middle East there have not been strong local governments: the municipal autonomies have always been limited, and the entire state machinery has remained in the hands of kings, soldiers, bureaucrats, and clergies whose main objectives have been to raise enough taxes and tariffs to finance wars and meet their salaries and other expenses. The centralized nature of governments in the region also explains the precariousness of property. In Issawi words (1982, p. 171) "from the early caliphate on, the history of the region is replete with accounts of the confiscation of property of merchants, officials, and others; similarly, with few exceptions, landed estates did not remain in the same family for many generations. No student of European history can doubt the importance of security of property in the rise of capitalism, and its absence goes a long way to explain the lack of a parallel development in the Middle East." It is also important to consider that the colonization of the Middle East by Western powers and the flow of petrodollars to the regimes after the discovery of oil in the region in the 20th century further enforced the existence and continuation of centralized governments in the area. The concentration of political powers in the hands of a few autocrats, theologians, and military leaders has resulted in rigid state bureaucracies that make it difficult for producers to anticipate enough certainty in the economic environment and enjoy sufficient autonomy to set up institutions that could further their interests and expand their economic base, thereby enlarging the productive capacity of the economy.

In the opinion of the author of this paper the leaders of enlightenment movement were right when they assumed that the improvement in the standards of living and having some free time to spend on matters other than working to attain a level of subsistence are necessary for the public attitudes and political institutions to evolve in manners that improve the moral character of a society. The centralized governments dominated by clerics have prevented or at least slowed down the process of industrialization, economic growth, and uniform development of moral characters such as discipline, honesty, moderation, endurance, and thriftiness in the Middle Eastern societies. Democratization of the governments in the region has also been postponed because of the dominating influence of the highly corrupt public sectors and lack of vibrant private enterprises and free-market transactions in these countries. As it was discussed in the above, manufacturing commodities and participating in free-market transactions requires negotiation, bargaining, and eventual compromise and engaging in these activities provides the conditions for the development of democracy.

In summary, the reappearance and continuation of centralized governments following the emergence and domination of Islam in the Middle East has slowed down the process of commercialization, industrialization, and democratization in the region. Besides, Islam, at least in the way it has evolved over the past 14 centuries, resembles the Pre-reformation Christianity that did not suppose people to have personal responsibility and individual freedom. Muslims have always been forced to take systems of authority for granted and accept the hold of Muslim kings, Military leaders, and Clerics upon their lives. As we saw earlier in this paper, the “Reformation” in Christianity emphasized personal responsibility and individual freedom. Its refusal to take authority for granted, and its effect on breaking the hold of the Church upon life and the consequent secularization of life and attitudes changed the Western world tremendously. A similar reform movement in Islam is long overdue.

The review of history in this section revealed that commerce and free-market capitalism in a less-regulated and transparent society can induce discipline, honesty, capital formation, industrialization, and economic growth. These changes are the necessary conditions for the development of tolerance and democracy in a society. What the countries in the Middle East really need is a less government involvement in economic affairs, a much larger dosage of private sector activities, and a high degree of financial deepening. The first two remedies are clear enough; financial deepening requires some clarification which is discussed in the next section.

Financial Repression in the Middle Eastern Countries

History shows that autocratic governments in the Middle East cannot last without monopolizing of the major economic activities and controlling the oil industry in their countries. The access to petrodollars by some and foreign aid by others combined with money raised through tariffs and inflation taxes provide these governments with enough resources to finance wars, meet the salaries of their soldiers, and enforce the security of their autocratic regimes against the opposition forces from within and without. They have also used religious zeal which is enforced and enhanced by clerics to silent dissent. In addition, they adhere to economic populism to cling to certain privileges in banking, imports, exports, credit, and government contracts. Economic populism used by governments in the region leads to “shallowness of finance.” Shallow or “repressed” finance which is normally associated with corruption at all levels of government lead to low rate of economic growth, severe inequality in the distribution of income, and extreme poverty for the unprivileged groups in the society.

Edward Shaw (1973) explains that shallow finance occurs in an economy where the government distorts certain financial prices such as interest rates and foreign exchange rates in an attempt to clear the excess demand and excess supply in many other markets. The disequilibrium in the markets is usually the result of the government interventionist policies in the economy. The ultimate aim of such policies that are intensively used in the Middle East is to satisfy the interests of certain classes or groups of individuals such as, soldiers, civil servants, traditional merchants of bazaar, clergies, etc., that help maintaining the hegemony of governments over their tyrannized populations. The governments are constantly at work to bring into balance the disequilibrium in the different markets in these economies. The disequilibrium in the markets have are brought into balance by distorting the financial prices like the interest and foreign exchange rates and by the use of other policies such as rationing, price controls and taxing through inflation, etc. Where the finance is shallow the holders of financial assets including money are not rewarded adequately via real growth in their portfolios. The real rate of interest on their money balances becomes zero or even negative. In that case the demand for financial assets becomes

repressed by low real rates of interest and the supply of primary securities is repressed by credit rationing. Shallow finance in the Middle Eastern countries is also associated with overvaluation of domestic currencies in the financial markets. Shallow finance ultimately leads to demanding a premium on domestic balances in terms of foreign balances as well as a premium in present balances on future balances. It encourages consumption and importing and discourages saving and exporting. The ultimate result of these will be a slow economic growth and unequal distribution of income. Deepening of finance refers to elimination of distortions in relative prices in the financial markets and beyond. The following summarizes the way finance is repressed and the economic and social outcomes of it in the Middle Eastern countries.

1. Generally, the countries of the Middle East have repressed real financial growth in their economies through manipulating prices in all markets especially the markets for financial assets. The government interventions include the creation of an on-going, positive, and variable inflation rate together with stipulating loans and deposit rates at banks and other institutions of organized financial market. These policies have led to excess supply of primary securities that result from the existence of investment opportunities and shortage of savings to finance them. The policy of controlling prices combined with chronic and uncertain inflation rate created by the governments in the region have made the rationing of credit among borrowers inevitable. A major harm that these policies can cause is the reduction in the capacity of financial industry to provide savings for investments. This ultimately reduces productivity and economic growth.
2. Borrowers denied credits and savers subject to very low or negative real rate of return in the organized market may come together in the curb markets where interest rates are excessively high. The savers may even accumulate financial assets abroad through capital flight despite the existence of severe foreign exchange controls. Investors, on the other hand, may find the very expensive and short-term foreign credits an unavoidable substitute for domestic funds. All of these reduce economic growth and make the level of income lower than what it could be if there was less manipulation of financial prices and a more appropriate monetization policy.
3. Financial repression prevents the use of interest rate to discriminate between investment alternatives. It eliminates the chance for creating of a financial structure that would welcome the appearance of new investment firms and innovative investment projects. Shallow finance reduces the number of competing proposals for the disposition of savings. In this respect, the contrast with liberalized financial markets can be remarkable. In liberalized financial markets, savings flow through many channels that are subject to the scrutiny and discipline of relative price, into the innovative and profitable projects that will add to economic growth and lead to higher levels of income.
4. A high rate of unemployment in the Middle Eastern countries is partly caused by financial repression. Distorted interest rates make less capital to be available to some industries while a lot of it would be supplied to the repetitive projects of established firms, governmental enterprises, and traditional trading firms. This problem is exacerbated when low real rates of interest that reduce savings combine with relatively high minimum-wage rates to cause that labour and capital are combined in wrong proportions. Savings flow to capital-intensive production even though labour is plentiful and capital is scarce in these countries.
5. Distribution of income becomes more and more unequal as the governments in the Middle East reduce relative prices for domestically produced food and primary products. Raw materials are made cheap for centrally located and capital- intensive industries. These industries do also benefit from credits at low rates and cheap imports. Imports of primary products gain priority for foreign exchange and become cheaper substitutes for domestically produced products. A very small portion of relatively high skilled labour gains employment at capital-intensive industries which are generally supported by low rates of interest, inexpensive prices for domestic inputs, and preferential or low rate of foreign exchange. The high minimum wage for industrial workers, the amenities in the cities and the push factors in the countryside draw rural workers into unemployment and into the slum areas around the cities. The results of these policies will be again a slower economic growth and greater inequality in the distribution of income. Government budget deficit will grow as a result of devoting more funds to welfare and security programs.

6. The repressed financial systems in the Middle East cause a slowdown in the development of long-term direct finance apparatus in the region. Stock Exchanges may exist, but they trade in few issues of a handful of Government Corporations or predominantly foreign owned trading corporations. The domestic value of physical assets is too little for creating diversified portfolios. The attraction of investing in the bonds, stocks, and other securities abroad are too strong compared to the costs and risks in a domestic security exchange. The long perspectives of investors and savers that are necessary conditions for establishing and the smooth functioning of security exchanges are too unclear because of uncertainties about inflation rate or public policies regarding foreign trade and taxes. In summary the repressive financial systems slow down economic growth and the accumulation of physical capital and postpones the creation of a complex system of law, accounting, and sophisticated facilities of trading that are the necessary conditions for the development of stock exchanges.
7. Oil industry in many of these countries provides a sizable amount of foreign exchange. This causes that the monetary authorities would not see any inappropriateness in setting low or negative real deposit rates and overvalued exchange rates. The governments create high and variable rates of inflation when petrodollars become a big portion of their budget and they use them to pay for huge subsidies to their supporters or spend the petrodollars on armament, infrastructure, and importation of machinery, equipment and primary products. The negative or low real deposit rates and overvalued exchange rates facilitate access of domestic investors to foreign savings: domestic savings and petrodollars are exported in capital flight.

In summary, the centralization of government combined with shallow finance has made the economic growth in the Middle Eastern countries very slow while it has worsened the inequality in the distribution of income as evidenced by the recent uprising of unemployed and poverty stricken sub-groups of people in these societies. A higher rate of economic growth is a necessary condition for improvement in the living standards in these countries. The improvement in standards of living and enjoyment of greater leisure, in their turn, are necessary for public attitudes and political institutions to evolve in manners that improve the moral character of these societies and make democracy a viable form of organizing the political system.

The autocratic form of government in the region is associated with an entrenched civil service that does not embrace new ideas and has been reluctant to step aside for market forces. As Shaw (1973, p.15) explains "Groups that benefit from monopoly rents of import licenses, credit and investment permits, tax concessions and cheap supplies of goods and services from government enterprise, urban concentration around subsidized industrial enclaves, and shifts in terms of trade against domestic agriculture have a stake in excess-demand regime." In these societies, the excess demands in different markets can be cleared by using shallow finance. Shallow or repressive finance is, in its turn, responsible for the slow down in the economic growth and improvement living conditions of people that can ultimately bring up changes in public attitudes and lead to emergence of more sophisticated political systems. The bottom line is that the Shallow finance and centralized governments in the Middle Eastern countries act like a vicious circle of political and economic backwardness.

What is to be done?

The ineffectiveness of the revolution in Iran, the Arab Spring, and the invasions of some Muslim countries by the US and its allies in democratization of governments in the Middle East is a clear indication that reactionary forces in the region cannot be deactivated by using coercive actions. This failure reveals that foreign invasions and political pressures from abroad and from within these societies cannot break down the vicious circle of political and economic backwardness discussed in this paper. If autocracy cannot be replaced with democratic form of government through coercive measures then, the shallow finance that facilitates the existence of autocratic regimes and enforces the hegemony of the entrenched civil service and clergies over the society should be terminated. The U.S. and other industrialized nations should avoid the useless wars and their antagonistic actions against the tyrannical regimes of this strategically important part of the world. The success in bringing the renegade and autocratic governments of the Middle East into the family of peace-loving nations depends on acceleration of economic growth and greater equality in the distribution of income in these countries.

The hegemonic form of governments in the Middle East cannot last for long if individuals in these countries especially the young people would experience steady increases in their incomes so that they would not

need to spend their entire time to work for subsistence living standards. If this happens, the individuals will be left with some spare time for engaging in the activities that enhance their consciousness, personal responsibility, and individual freedom. Only in that state of well-being and mental comfort will they not take authority for granted and will long for freedom and ask for their rights for political participation. As the experience with China has shown, making peace with the tyrannical governments, interaction with them through trade, and invest in their economies can break down the vicious circle of socio-economic backwardness explained in this paper. This is a less costly method and a much better way of bringing the countries of Greater Middle East into the family of responsible nations.

CONCLUSION

The purpose of this paper is to show that the Middle Eastern countries are generally faced with two interdependent barriers to socio-economic development. These barriers that get hardened by enforcing each other have made it so difficult for these nations to place themselves on the path to democracy, modernity, and economic prosperity. The first of these two barriers is the existence of autocratic governments in the region that are supported by petro-dollars, backed by conservative clerics, and afflicted with corruption at all levels of decision making process. The second barrier to socioeconomic development is the existence of shallow finance in these societies. In simple terms, the financial systems in these countries are not deep enough to lead to appropriate investments and efficient allocation of capital among different industries. The depressing of finance by governments of these countries will also make it difficult for business organizations to reduce or transfer their risks to other parties who are more capable of bearing such risks. This work will also investigate the underlying causes of these two barriers to economic development and explains why the leading industrialized nations have not succeeded in bringing the ancient nations of the Middle East which are so generously endowed with natural resources and are located in a strategically important part of the world to the family of modernized and economically prosperous nations. This study leads to the conclusion that the establishment of democracy and complete adoption of free-market system of organizing economic activities should come from within these societies and not from without. It is only when people in these traditional societies enjoy a higher standard of living and are ready to embrace modernity and democracy that these two great achievements of human societies will be adopted throughout the region.

TECHNOLOGY IDENTIFICATION AND ETHICAL PERFORMANCE MANAGEMENT: REMOLDING LOCAL GOVERNMENT SERVICE DELIVERY THROUGH E-GOVMONET TECHNOLOGY

Jane Reikantsemang Mokgele and Nafta Mokate Lehobye
Tshwane University of Technology, South Africa

ABSTRACT

Although South Africa is evidently bedeviled with the poorest of service delivery, there is still some kind of hope about which this situation can be rescued. Despite the lack of implementation of recommendations on non-service delivery going on, SA has gone as far as dismally failing for uncountable occasions to ensure responsiveness to communities' basic needs. This study argues that e-GovMoNet can reconstitute and restore SA's best image within the global local governments by implementing its connectivity to other governments. With this articulation, it is hoped she can accomplish this milestone by showing the importance of this technology through print literature reviews. It does this by describing this technology based on its artificial intelligence and code of conduct within the e-practice milieu. To best address this conundrum and thus strongly arguing for the implementation of e-GovMoNet, this paper shows reasons why this technology is imperative in SA and should thence be allowed. Upon the given discovery, the researcher fills strongly innate for its implementation.

INTRODUCTION

While much is made of the need for business to be reliably and effectively connected to ICT systems in order to fulfill its purposes, certainly not the same level of attention is focused on the public sector in SA local government context. However, SA government, with its mandate to manage and deliver various services to millions of the people (the Constitution of RSA, 1996), has just as pronounced a need (Brown and Dekker, 2003; W3schools, 2010). That is something of which this paper is acutely aware (White Paper on Local Government 1998; Bearing Point, 2007). Consequently, the local government should draw from its range of connectivity solutions and services; proven in the most demanding of business environments, to deliver for its public sector clients, but in the end still fails to deliver. It may be argued that this is as a result of promotion of conflict of interest experienced for so long in SA by senior officials leading to poor service delivery. What might be a solution to this failure to deliver anyway? This paper therefore argues for the implementation of the e-GovMoNet. This argument will be illuminated through the reviews of literature in a more pragmatic manner so as to describe e-GovMoNet and to explain how this technology can best solve the problem of corruption and that of poor service delivery in SA local government concurrently, as a whole.

THEORETICAL UNDERPINNINGS

This paper looks into how efficient service delivery through e-government may be achieved. Arguably, this achievement can only be accomplished by, according to prevailing SA circumstances, e-GovMoNet. This literature focuses essentially on the reviews of the aftermaths of not implementing the e-GovMoNet and the rules of conduct by local government management. The research question is therefore why the local government should still persist on the old system of governance while proven so inefficient.

What is e-GovMoNet Technology?

First of all it is desirable to define the e-GovMoNet. According to Dirane and Lehobye (2011) concurring with Ari-Veikko Anttiroiko and Mätkiä, (2009), the term ‘e-GovMoNet’ (electronic government) refers to the use by government agencies of Information and Communication Technologies (ICT) that have the ability to transform relations with citizens, businesses, and other arms of government as another form of government business network (**Kroes, 2010**). The ICT system that this paper focuses on is thus e-GovMoNet, short for electronic government monitor network. It is about using the tools and systems made possible by ICT to provide better public services to citizens and businesses (W3schools, 2010). Every local government member becomes a watch-dog on another within the network by constant monitoring and reporting as a means of providing the feedback. ICT systems are already widely used by government bodies, just as in enterprises (Rankhumise and Rugimbana, 2010), but e-Government involves much more than just the tools. Effective e-Government also involves remolding organizations and processes, and changing behavior so that public services are delivered more efficiently to the people who need them most. Implemented well, e-GovMoNet enables all citizens, enterprises and organizations to carry out their business with government more easily, more quickly and at lower cost (Angeles et al., 2001). In this paper, attention is therefore drawn on e-GovMoNet as e-government ICT tool and yard-stick that the SA government should adopt in order to monitor and measure the bases for poor service delivery, and thus, of corruption (Thorpe, 2009). E-GovMoNet may also be used to counter all forms of mal-administrations committed by any member of municipality, at local government, including national levels. More than just that, if one looks at the local government level, the municipalities are permitted to apply for spectrum and licensing to self-provide (Gartner Group, 2000). That is a valuable opportunity for municipalities to deliver a whole new layer of services to the residents who fail within their sphere (**Kroes, 2010**). As we know, SA government is divided into three spheres: national, provincial and local (Koh and Prybutok, 2003). Across all three of these spheres, government has as its challenge the administration, management and the execution of service delivery to meet the needs of the people (Urdiales et al., 2009). This is what this paper means by the term ‘corruption’. It is precisely owing to these realities that this paper is able to provide meaningful solutions (Olivier, 2009).

Kew concepts here are communication and collaboration, and in particular, are terms emerging as the tools that allow for more effective governance. Whether it is policing, home affairs, health or any one of the many other government departments, communication and collaboration are essential to co-ordinate and execute against service delivery mandate (the Constitution of RSA, 1996; Shailendra and Sushil, 2007). Furthermore, Chapter 6 of the Local Government: Municipal Systems Act (Act 32 of 2000) determines the importance of measuring performance. It can thus be argued therefore that this paper is also against this background thence this study was conducted in order to evaluate progress made to date in implementing performance management systems in the study area and also drew lessons for improving performance in local governments (Indiatimes, 2009). Other than with other numerous researches that have this far been conducted on this subject, this particular study was conducted to essentially provide a solution to the problem of poor service delivery, and thus, corruption, in SA through the implementation of e-GovMoNet (Nixon and Rawal, 2010). Having described e-GovMoNet, how would it fit within the SA context?

South African Situation and Artificial Intelligence (AI)

E-GovMoNet should be implemented and if not, then the motive of not implementing should be made very clear through processes of accountability and checks and balances in order to understand the mission and focus of individual government departments (the Constitution of RSA, 1996). But once the e-GovMoNet is implemented, it would then be easier to examine where and how it can add value (Kaylor et al., 2001), for example, pointing to prison department, we look at the points plan that government has mooted from the improvement of the national prison system. Executing on that plan requires resources and capabilities with which e-GovMoNet can help (West, 2008a). While it is not necessary to delve into that plan *per se*, the point here being that as it does with its private sector clients, e-GovMoNet makes a point of understanding strategic requirements (Newcomer, 2007). That, in turn, allows the government to draw from its capabilities to deliver value. We also look at government from a cluster perspective. For example, the justice cluster cuts across several departments as it executes its mission of serving justice: there is the police, the judiciary, the correctional services, and the social services. These organizations must work together (Agarwal and Ventaka Ramana, 2007). By understanding the processes that run through these organizations, the tough point and the information exchanges (United Nations Department

of Economic and Social Affairs, 2010), e-GovMoNet can provide solutions that eliminate duplication of effort and spend to achieve more value from the limited resources available (Kushchu and Kuse, 2003). This means that this technology, arguably fits well within the SA context and it is absolutely, perhaps even urgently, needed. Given the SA context, how then will the SA government know they are to implement the right technology, in case they really do?

Regarding AI, the e-GovMoNet goes a way far beyond connectivity and extends into artificial intelligence from information. Connecting and exchanging information in the justice provision field means holding cells and prisons need not act independently of one another (Lehobye, et al., 2011; Mokgele, 2012). An inmate may move around; why, if they are in Pretoria one week and in the Western Cape the next, should the prison warder or any other person seeing them not have access to their full prison history (Poslad, 2009)? E-GovMoNet, not only facilitates better treatment, but it also eliminates the potential for abuse of the system such as for example, receiving more medications than necessary (Mitchell, 2009; Maswanganyi, 2010). That in itself indicates the importance of e-GovMoNet, and thus, Artificial Intelligence (AI). AI is that very capability harnessed from technology that makes human lives easier. While services that e-GovMoNet provides are technocentric and built on the premise of using available technology and resources to maximum benefit that is just one aspect of the value it creates, AI becomes even more imperative. Voice over Internet Protocol, Internet access, unified communications, cloud computing – are all necessities of technologies and connectivity, and thus IA through e-GovMoNet (West, 2008b). But creating value from this technology depends on having some vision, some insight and thus, AI (Vignarajah, 2010). The understanding of business requirements and how these translate into technology needs is an effective way of creating an immediate value while driving sustainable long-term benefits (Mokgele, 2012). Information and the funding programmes supporting initiatives to improve public services in the field of e-Government on European Union (EU) policies is available online accessible from Society thematic portal at http://ec.europa.eu/information_society/soccul/egov/index_en.htm. But again, what would then be the aftermaths in case there are some failures in implementation?

Failure to Implement

While the hurdles facing e-Government are great, the consequences that would follow from failure to implement e-GovMoNet in particular are vastly more severe (Accenture, 2006). Given the SA context, some of the consequences that flow from not having e-GovMoNet may include: (1) continued increase in the transaction cost of government services; (2) the inability of the government to react in a timely fashion and increasingly swifter-moving world; (3) the government's diminished capacity to provide basic public services to the population; (4) access to government only for the wealthy; and (5) the relative decline of the United States in the face of the globalization of political and economic activity (Fenwick, et al., 2009). However, according to a new global research report by Accenture (Accenture, 2006) and hence, e-GovMoNet, governments that lead the public sector in customer service are focused on developing sophisticated, interactive and transactional capabilities on par with the best of the private sector (Coonan, 2006). In the report, Accenture finds a new trend whereby governments are reinventing their customer service delivery programs (Martin et al., 2010) in order to help build greater trust—and this is redefining the relationship between citizens and their governments...’ (Agarwal and Ventaka Ramana, 2007).

E-GovMoNet and the E-Practice

This section provides a brief statistical scenario within e-practice. For economic activity to be sustained over-time, government, in one way or another must provide the context that enables market transactions and precludes destructive abuses. The power of e-GovMoNet, rapid communication, and the conversion of wealth from ownership of physical property to intangible property (Lehobye, 2010) means governance must be different. Probably the current biggest threat to e-governance is the change in the speed of market transactions over a while. Fifty years down the line, legal and illegal transactions involving tangible property were slowed, and sometimes made impossible, by the time, effort, and costs necessary to consummate them (Post and Johnson, 1996). In the late 1960s and early 1970s, a record trading day on the Johannesburg Stock Exchange was defined as 31 million shares. By comparison, the average trading volume in January 2009 was 5,370 million shares per day, or 173 times greater than a record day in the early 1970s, and this would be 90 percent worse compared to

other countries (Benefits Report, 2009; UN Report, 2009; United Nations Department of Economic and Social Affairs, 2010).

Given the brief scenario above, it should now be seen that the e-GovMoNet proves perfectly imperative. The e-Practice.eu portal can also help put all these statistics to an end. The e-practice may be accessed from e-Practice.eu portal hosts, an array of exciting communities which gather members with common interests, offering messaging, blogging, calendar and document sharing tools as well as networking opportunities and SA should not be an exception (Nixon and Rawal, 2010; Vignarajah, 2010). This is available online from <<http://www.epractice.eu>>. This portal also functions more or less the same as e-mail messaging system. Communities are open and help e-Practice.eu users to connect even better with other e-government peers to share knowledge and news and most importantly, to monitor one another (Atkinson and Castro, 2008). This will also be an incentive to and help rural connectivity in order to benefit from the use of e-government within the SA rural territories (Atkinson and Castro, 2008). Any e-Practice.eu registered member government can start a community or voluntarily join one (Center for Democracy and Technology, 2009). However, all communities have their specific guidelines, the information of which is available and retrieved online in February 25, 2011 from <http://www.epractice.eu/sites/default/files/import/community_documents/Rules_of_Conduct.pdf>. It is now imperative to now examine the rules of conduct as guidance on e-government practitioners by virtue of their e-GovMoNet membership.

Rules of Conduct

As a rule of thumb and further than just e-Practice, a friendly and pleasant atmosphere with the community should be maintained. In order to accomplish this, the municipalities should have a portal which should also implement some basic rules of conduct such as Batho Pele initiative, which may be updated from time to time without previous notice. All visitors who participate and use the communities and site facilities would be expected to read and agree with these rules and policies and not to break any of them. Batho Pele, literally meaning 'people first', and is an SA government initiative that prioritizes the people to make sure that quality service is rendered (Urdiales et al., 2009). This has never being put into praction but was only a theoretical word of mouth. For the SA local government portal to be community-efficient through e-GovMoNet, if connected, the following five aspects would have to be kept abreast (Gartner Group, 2000).

Inappropriate Content

The following to be kept abreast are deemed to constitute inappropriate content and are against the community-efficient viability on the e-GovMoNet (Singel, 2007). Posting such content to e-GovMoNet may result in account suspension or banning as well as the removal of the offending posts:

- Posts or images of a defamatory, abusive, vulgar, hateful, harassing, obscene, profane or threatening nature. This includes any messages or material ethnically, racially, religiously or sexually offensive, insulting or demeaning;
- Posts or images that violate any laws or regulations;
- Explicit advertising of products or services without the municipality's prior consent or the adequate context (i.e. in the case of a thread discussing Tools & Technology). Advertising your company can be done through your Personal Profile;
- Registering to solely post/endorse/promote for one's own personal gain;
- Discussion of illegal activities such as software and movie piracy and other intellectual property infringement (Lehobye, 2010);
- Posting one's or other people's personal contact information (i.e. telephone numbers, addresses etc) on any publicly viewable forums.
- Anything else deemed inappropriate by the local government; and
- Links to any of the above.

Expected Behaviour of Members and Suggestions for Better Posting

- Keep all contributions within the appropriate community area of interest;

- Use short, concise titles. When posting documents or blog entries, it is a good idea to use a short yet informative title, so it is not too long and other community members know what your message is about;
- Please make an effort to communicate oneself as clearly as possible;
- Community members are welcome to post messages and announcements in any of the portal's official languages (see language policy of SA public service);
- Refrain from using foul or offensive language (Becker, 2009);
- All content posted by users express the views of the author, and ePractice.eu will not be held responsible for any message;
- Treat all other community members in a respectful and courteous manner at all times, even in the event of disagreements;
- Visitors to the site who are not recognised Administrators, portal Staff Members or Community Facilitators with full credentials should not pose as the aforementioned ranks through the use of 'administrator', 'staff member' or "facilitator" in their Member's name, avatar or e-signature (Chiger, 2002); and
- While these rules cover most common situations, they cannot anticipate everything. Consequently, they reserve the right to take any actions they deem appropriate to ensure these forums are not disrupted or abused in any way (Scherer, 2005).

The above quote of conduct can certainly have such a positive impact on SA scheme of reference to the attitudes in respect of communities and performance management within the e-government. The right to close or ban, temporarily or permanently, any user's account without previous notice as we deem necessary is reserved. Should anyone feel to have been treated unfairly by e-GovMoNet facilitators or a community facilitator, one may appeal directly to e-GovMoNet facilitators. When contacting, please provide the e-mail address one used to sign up. The suspension of portal members is not discussed with the general public.

METHODOLOGY AND SUGGESTED SOLUTIONS

SA Local Government should be involved in the use and analysis of e-Government to achieve the said objective and recommendations through the implementation of e-GovMoNet (OECD, 2003). This idea is backed by the European Observatories Network having evolved to e-GovMoNet (Kushchu and Kuscu, 2003). Since the local government counsel-provide, the e-GovMoNet should partner with them (local government) to allow them to effectively deliver connectivity as a service to their residents. This paper strongly believes therefore that EU's e-GovMoNet is able to assist in creating solutions that optimize available spectrum, while delivering the billing and management systems to ensure that viable service is created and maintained, and should thus, be implemented. The EU community is stronger today and with this kind of transformation they focused their efforts on solid and clear objective grounds (Satyanarayana, 2004). It can now be seen that it is indeed more about using these tools and systems which have been made possible to provide better public services to citizens and businesses (Sinrod, 2004). If e-GovMoNet can be implemented, this would prove to be a long-term solution to SA poor service delivery problem and its concomitant corruption (Schrier, 2008). One may even be tempted here to indicated that lip-service strategy of top government officials as a whole has no room anymore for corrupt practices they used to persue at the expense of tax-payers' money. Given its performance's situational circumstances, what would SA really still be waiting for if not just going for e-GovMoNet at one stride (Public CIO, 2006)?

Regarding methodology adopted, this was a qualitative paper having adopted a descriptivist research method. Through this method, the paper described through discussions and reviews scholarly contributions, e-government as it is applied in Europe and other such countries. In order to ultimately correct this situation on service delivery once and for all, this paper argued for the implementation of e-government and came up with reasons why this approach would best address this conundrum (Olivier, 2009). The main objective of this paper was to restore SA's best image within the global local governments by implementing its connectivity to other governments through the e-GovMoNet. That objective was accomplished by showing the importance of this technology through organized literature review. It did this by describing e-GovMoNet technology based on artificial intelligence and code of good conduct within the e-practice environment. It also indicated the pervasiveness of e-GovMoNet based on its artificial intelligence. This paper showed reasons why e-GovmoNet technology is imperative in SA and thence, why it should be allowed. For the e-government online communities, this paper also provided rules of conduct as guidance on local government practitioners (people and performance

management) within e-practice environment and as a technological measure to help put an end to poor service delivery and corruption in SA (Centre for Democracy & Technology, 2009). It also went on to clarify the concern that the adoption of e-government by SA to curb the ongoing failures of service delivery and corruption by its local governments as an absolute necessity. This paper, unlike many others on SA poor service delivery deliberations, as stated earlier on (Magubane and Khalo, 2010); put the record straight without dilly-dallying. In order to arrive at this point head-on, perhaps by hitting the nail on the head.

CONCLUSION

In order for SA to remould and restructure its service delivery and eradicate corruption to be efficient and forget about the lip-service and self-enrichment through existing corruption (Cordella, 2007), measures have been suggested as a point of departure to this eventuality (Center for Democracy and Technology, 2009). Batho Pele initiative is a better basis through which e-GovMoNet can be implemented and used as a lens to monitor even corrupt government activities (Chiger, 2002; Schrier, 2008). It was shown to be another means and the yardstick to have SA government monitored by peer governments online to account and ensure checks and balances for the benefit of the people on the grassroots (Deloitte Research – Public Sector Institute, 2000; Gartner Group, 2000). Based on the concern that the adoption of e-government by SA to curb the ongoing failures of service deliveries by its local governments being an absolute necessity; should now be seen to be an obvious reality (**Kroes, 2010**). This reality has been arrived at by defining and providing rules of conduct as guidance on people management on e-practice for the e-government online communities (Bearing Point, 2007). But finally in this way, the Local Government: Municipal Systems Act 32 of 2000 and Local Government: Municipal Structures Act 117 of 1998, Local Government: Municipal Finance Management Act 56 of 2003 including the Municipal Planning and Performance Management Regulations, R 796 of 24 August 2001 will not be infringed. If this be the case therefore, the necessity of the adoption of e-GovMoNet would indeed be an absolute necessity to curb the ongoing failures of service deliveries and corruption by SA local governments and for managing the people inclined with these responsibilities (OECD, 2003; European Commission's E-Government, 2010). Most important than anything else, remolding local government service delivery and corruption through e-GovMoNet, will for the masses of SA, be the milestone achievement of all times.

DECENTRALISATION AND LOCAL GOVERNANCE: SERVICE DELIVERY IN RURAL AREAS OF SOUTH AFRICA

Ngoako Mokoele
University of Limpopo, South Africa

ABSTRACT

The purpose of this paper is to investigate the decentralisation and local governance in the provision of service delivery in rural areas of developing countries including South Africa. The country has legislations that provides for community participation in decisions regarding services and development. Despite the adoption of various legal and policy frameworks, the process of community participation is somewhat flawed. It is evident that service provision should consider community participation as fundamental principles in addressing different needs of society including adequate supply water, sanitation, housing and other basic services. Community participation, most importantly, the inclusion of women in decision making demonstrates the type of governance where decisions are decentralised from the national to local spheres of government. Studies highlighted that decentralisation of local governance could improve the implementation of service delivery for community at large, more specifically to the rural poor in geographically marginalised areas of South Africa. The paper argues that decentralisation of local governance in the provision of service delivery has the potential to contribute for poverty alleviation in rural areas. It revealed that in rural areas of South Africa some social groups such as women and minorities are still marginalised and discriminated in decision making. Thus, the local governance in the provision of public service delivery has been facing a huge challenge in promoting the levels and quality of community participation in decision making.

INTRODUCTION

Effective provision of public services in rural areas has a potential to resolve the problems of poverty that has persisted for many centuries (Mubangizi, 2007; Darkey and Visagie, 2012). Community participation, accountability, transparency and efficiency are the fundamental principles of decentralisation of local governance in public service delivery in rural areas. The community should form a central part in decision making on public service delivery in order to decentralise power and authority from the national to the local sphere of government. The participation of community within local governance makes the municipality to be accountable and transparent during the provision of service delivery. The problem of service provision is the decentralisation process which has engulfed most developing countries (Hampwanye, 2005). Decentralisation of local governance in the provision of public service delivery involves community participation in decision making. The decentralisation of local governance encourages the stakeholders to play a major role during planning and design of service delivery in rural areas. This arrangement of decentralisation of local governance meant the shift of service provision from the national to the local government so that all the stakeholders take part in resolving the perpetuation of poverty (Hampwaye, 2005). However, the decentralisation of local governance in the provision of public service delivery without community participation has deleterious effects in the capacity to resolve the problems of poverty in rural South Africa.

Since public service delivery aims to resolve the manifestation of poverty within the country, the affected community should form a central part in planning and design of service delivery. Thus, the local government and the community should work together in the quest to resolve the perpetuation of poverty and service delivery backlogs. Decentralisation of local governance promotes participatory governance within the local municipality.

Of paramount importance, an interactive relationship between the local municipality and the local community is paramount in the capacity to alleviate poverty in rural areas. The purpose of the paper is to investigate the decentralisation of local governance in public service delivery in rural South Africa. The paper probes the following aspects: decentralisation: conceptual framework, the legislative framework that promote community participation in South Africa, participative governance systems in rural South Africa and decentralisation of local governance in public service delivery.

DECENTRALISATION OF GOVERNANCE: CONCEPTUAL FRAMEWORK

The concept of decentralisation of local governance is comprehensive and takes many forms such as delegation, devolution, privatisation of public services and deregulation (Firman, 2010, Faguet, 2013; Joshi, 2013). Basically, decentralisation is concerned with the transfer of power, authority and responsibility from the national government to the local sphere of government in order to make the community to participate in the local governance. Thus, decentralisation promotes participatory governance. The concept of decentralisation enhances accountability, efficiency and transparency through the participation of and monitoring of decision making in the planning and design of service delivery (Heller, Harilal and Chandhuri, 2007, Firman, 2010; Faguet, 2013). During the decentralisation, the inclusion of previously marginalised and backward groups in various activities of the local municipality helps to accommodate the voice of the community. The involvement of the community in the municipal activities could improve the provision of service delivery and reduces protests.

Decentralisation is aimed at improving the provision of service delivery by involving the stakeholders in local governance (Ababio, 2004, Heller *et al.*, 2007, Ghuman and Singh, 2013; Joshi, 2013). The community are the main stakeholder within local government during service delivery planning, design and execution. The promotion of participatory governance within the local municipality was to put the key stakeholder at the centre of governance. In some counties, the concept of decentralisation is interpreted beyond the transfer of authority within government and thus, includes the mutual sharing of power, authority and responsibility amongst all the stakeholders especially the local community in local governance (Ababio, 2004, Ghuman and Singh, 2013; Joshi, 2013). Thus, community participation is paramount within local governance. This shows that decentralisation promote community participation in the governance of the local government to improve service delivery. The inclusion of stakeholders in local governance integrates the views of the community during the provision of services in rural areas. Decentralisation promotes bottom up approach in service delivery planning in rural areas. The local government and the communities share the responsibilities and authority during service delivery planning in the quest to resolve the manifestation of poverty on rural areas.

DECENTRALISATION: INTERNATIONAL EXPERIENCES

During the period between 1970 and 1980 integrated rural development programme was characterised by centralised approaches of planning and execution in Central Himalaya (Joshi, 2013). Communities did not influence decisions during planning, design and execution about service delivery. This top down approach rarely resulted in a sustainable service delivery. This shows that communities as the main stakeholder did not take part within local governance. The lack of community participation in the governance of service delivery in rural areas makes the capacity to resolve poverty to remain a pipe dream. Though the motivating factors of decentralisation vary from country to country, the underlying philosophy remains the same (Joshi, 2013). The underlying philosophy of decentralisation is to improve public service delivery and bringing governance to the people (Ghuman and Singh, 2013; Joshi, 2013). Decentralisation has emerged as a dominating paradigm in Asia since 1990s (Ghuman and Singh, 2013). The adoption of decentralisation by countries shows the commitment to improve service delivery and resolve the perpetuation of poverty.

However, the results of decentralisation of governance differ from one country to country. Ghuman and Singh (2013) stated that decentralisation resulted in the improvement of service delivery of other counties. However, in some countries, decentralisation resulted in the breakdown of services and centralisation in service delivery was reintroduced (Firman, 2010, Faguet, 2013, Ghuman and Singh, 2013; Joshi, 2013). These simply indicate that the process of decentralisation does not yield the same outcomes in all countries due to the diversity

and uniqueness of each individual country. In many cases, the local communities are not involved during planning, design and execution of service delivery (Ghuman and Singh, 2013; Joshi, 2013). The lack of community participation in service delivery has profound deleterious effects in the capacity to resolve the perpetuation of poverty in rural areas.

LEGISLATIVE FRAMEWORK FOR COMMUNITY PARTICIPATION IN SOUTH AFRICA

The involvement of the community within the local government is recognised by the South African government as a fundamental tool to resolve the persistence of poverty in rural areas. Since 1994 the South African government has enacted legislations that provide for community participation to resolve the marginalisation and discrimination of communities in decision making. The Constitution of the Republic of South Africa, 1996 as the supreme law, White Paper on Local Government, 1998 and Municipal Systems Act, 2000 were enacted to promote community participation in local government. South African government promote decentralisation of local governance “to honour the freedom charter’s provision that The People Shall Govern” (Mzimakwe and Reddy 2008: 627). The decentralisation of local governance is imperative in the provision of public service delivery. The Constitution of the Republic of South Africa, 1996 and Municipal Systems Acts, 2000 encourages participation in the decision making and thus, promoting participative governance.

The Constitution of the Republic of South Africa, 1996

Decentralisation of local governance encourages the community to participate in matters that concerns them. Section 152 (e) of the Constitution clearly indicates that one of the developmental roles of local government is to encourage the involvement of the communities and community organisations in matters of local government (Ababio, 2004). The involvement of the community in decision making and matters of the local government demonstrates participative governance (Vatala, 2005). The Constitution in its preamble aims to heal the past division and establish a society based on democratic values and improve the quality of life for the citizens of South Africa. The aim to improve the quality of life for all the citizens of South Africa through service delivery should encompass participation in decision making. The Constitution promotes a bottom up approach where South Africa citizens form part in decision making process.

The thinking that encompasses a bottom up approach within a local government in decision making demonstrates the decentralisation of governance in the provision of public service delivery (Hampwaye, 2005, Mubangizi, 2011; Joshi, 2013). The bottom up approach promotes community participation in decision making which is imperative in the fight against poverty in rural South Africa. Darkey and Visagie (2012) stated that section 26 (1-3) and 27 (1) (a-b) of the Constitution of the Republic of South Africa, 1996 prioritises the provision of public service delivery such as provision of water, housing, sanitation facilities, education and electricity. The decentralisation of local governance in the provision of public service delivery demonstrates the commitment of the South African government to resolve the persistence of poverty in rural areas.

Municipal Systems Act, 2000 and community participation in local government

In the past, the apartheid government was characterised by a strong focus on central planning and control over decision making in South Africa (Vatala, 2005). There was a clear policy of neglect towards many areas where population is predominantly none-white. This demonstrates that the type of governance system that was practiced prior 1994 was centralised at the national sphere of government. However, since 1994 the South African government has placed emphasis on community, grassroots initiatives and participation focused on improving service delivery in rural South Africa (Vatala, 2005). Section 16 (1) of the Municipal Systems Act, 2000 states that, a municipality must develop a culture of municipal governance that complement representative government with a system of participatory governance. Furthermore, section 16 (1) (a) of the Municipal Systems Act, 2000 states that municipality must create a condition for the local community to participate in the decision making. This shows the importance of the involvement of the community in decentralising local governance. Chapter 4 of

the Municipal Systems Act, 2000 outline the guideline of implementing active community participation in the provision of service delivery.

Decentralisation of local governance in public service delivery is the cornerstone in the fight against poverty in rural South Africa. This involves the participation of all stakeholders within the local government to resolve the persistence of poverty and marginalisation of the poor communities in South Africa. The Municipal Systems Act, 2000 identify the importance of communities to prioritise their needs in the Integrated Development Plan (IDP) (Vatala, 2005). The local government uses the IDP as a tool to resolve the problems of poverty and put the community at the centre of service delivery planning in rural areas of South Africa (Section 16 (1) (a) (i) of the Municipal Systems Act, 2000). The community is able to participate in the decision making in the provision of service delivery.

Decentralisation of local governance in public service delivery is imperative for the community because it has the potential to improve their well-being and reducing the persistence of poverty (Hampwaye, 2005, Mubangizi, 2011, Ghuman and Singh, 2013; Joshi, 2013). The IDP is derived from section 56 (2) (a-b) of the Local Government Municipal Structures Act, 1998 (Vatala, 2005). The IDP is a communication tool that is derived and owned by the community. In the Municipal Systems Act, 2000, section 17 (2) (d & e) states that there must be consultative session with locally organised community organisation, and where appropriate, traditional authorities and report to the local community. This type of governance makes the community to be aware of municipal activities (Hampwaye, 2005). The more the local government consult and report to the community creates a good working relationship which reduce the risks of service delivery protests. Community participation is of paramount importance in the quest to fight poverty. Thus, decentralisation of local governance that integrates community participation and local government in public service delivery has the capacity to resolve the problems of poverty in rural South Africa.

The Constitution of the Republic South Africa, 1996 and the Municipal Systems Act, 2000 has clear guideline of putting the communities at the centre of the provision of service delivery. This legislative framework promotes participation in local governance structures. The decentralisation of governance in public service delivery is adopted as a tool to resolve the service delivery backlog and alleviate poverty. However, despite the inclusion of participation within the Constitution and MSA, 2000, there is still lack of community participation in the local government (Manala, 2010). Thus, the lack of community participation in local governance demonstrates the mismatch between the legislative framework and what is happening at the grassroots.

Despite the promotion of decentralisation of local governance in South Africa's public service delivery, the ruling party (ANC) is having problems in the implementation of these legislations in the local government (Manala, 2010). As a result of the lack of community participation in the public service delivery, poverty in many rural areas is still persisting (Hampwaye, 2005; Manala, 2010). Thus, it is imperative that local governance should promote participative governance in local government. It is stated in the Municipal Systems Act, 2000 that community participation should be at the centre of decision making as it promotes efficiency in public service delivery which has the potential to resolve the problems of poverty in rural areas (Thompson and Nleya, 2008).

PARTICIPATIVE GOVERNANCE STRUCTURES IN RURAL SOUTH AFRICA

In developing countries, "participation is seen as critical to increase the overall capacities of citizens, strengthening fragile democracies, improve quality of governance and countering the influence of organised groups" (Heller *et al.*, 2007:627). The involvement of the community in the decision making is imperative in the provision of public service as it promotes participative governance in local government (Hampwaye, 2005, Mubangizi, 2007, Manala, 2010, Mubangizi, 2011; Darkey and Visagie, 2012). According to De Villiers (2005), local municipality should not only provide services to the community but also spearhead socio-economic development with the involvement of the local community. Community participation in local government put the local people at the centre of service delivery provision in rural South Africa. In this case, the community forms a central part in the governance of service delivery. Participative governance creates an environment for the

community to decide about their service delivery (Manala, 2010). Mubangizi (2007) argues that community participation in local governance promote efficiency in the provision of public service delivery in rural South Africa.

Participative governance in local government involves reporting, consultation and participation of the concerned community (Manala, 2010). This system of governance allows the community to own and participate in the provision of public service delivery. Mubangizi (2007:4-5) argues the “that the emphasis on efficiency in service delivery for community development is prescribed by neo-liberal; market-oriented norms and values are inconsistent with popular community participation as prescribed by theories on people centred development”. Thus, the pursuance of efficiency in public service delivery which is dictated by market-oriented norms and values could easily erode the concept of community participation in local government. The exclusion of community participation in the governance structure creates a problem in the provision of public service delivery in rural areas. As a result, lack of reporting, consultation and community participation create the problems of service delivery protest within the local government (Manala, 2010; Darkey and Visagie, 2012).

However, in Sedibeng Local Municipality, the councillor was reportedly taken hostage by protesters demanding service delivery (Manala, 2010; Darkey and Visagie, 2012). This demonstrates that the community is not given report back about the status of service delivery in their community. Poverty remains a thorn in South African rural areas. OR Tambo District Municipality has largest concentration of poverty in South Africa, with a large percent (70-80%) earning less than R1500.00 per month while 35-50% having no income at all (SANRAL, 2012). This shows a serious problem with poverty as a result of a lack of service delivery in Rural South Africa. The exclusion of community participation in public service delivery has deleterious effects the capacity to resolve poverty within rural areas (Thompson and Nleya, 2008). Thus, the concept of decentralisation of local governance with reference to community participation is imperative in public service delivery.

CHALLENGES OF COMMUNITY PARTICIPATION IN LOCAL GOVERNANCE

Community participation is one of the cornerstones of effective, transparent and accountable local governance (Nzimakwe and Reddy, 2008). Decentralisation of governance puts the community at the centre during the provision of service delivery planning and design. The involvement of the Community in local governance is profound in honour of Freedom Charter’s provision that The People Shall Govern (Nzimakwe and Reddy, 2008). The provision that the people shall govern demonstrates that community participation in local governance is indispensable in the quest to resolve the service delivery backlog and manifestation of poverty in rural areas. However, decentralisation of local governance has encountered challenges in the capacity to promote municipal democracy and improve service delivery in rural South Africa. In many municipalities in South Africa, ward committees are the linkage between local government and the community (Nzimakwe and Reddy, 2008). Ward committees are made of people 10 or less depending on the municipality. This is due to the view that communities are homogeneous in nature. However, the use of ward committees during community participation neglects the heterogeneity nature of the communities. Thus, the small numbers of ward committees are not representative of the communities. The diversity of needs within the community is not integrated in the IDP (McEwan, 2003, Ababio, 2004, Nzimakwe and Reddy, 2008; Mubangizi, 2011).

The local government continue to make decisions for the communities due to the ward committees that do not know their roles (Nzimakwe and Reddy, 2008). This demonstrates that, regardless of the decentralisation of governance and promotion of community participation in municipalities, local government continue to be the central decision makers in service delivery planning. According to Nzimakwe and Reddy (2008: 677), “the ward committees were not discharging their developmental mandate in terms of enhancing participatory democracy to the local sphere”. If the ward committees do not discharge their developmental mandates to the local sphere, community participation cease to exist. The shortcoming of ward committees is that it takes a form of self serving action that leads to clashes in the diversity of interest within the community (Ababio, 2004; Nzimakwe and Reddy, 2008). The interests of the community are served within the local municipality.

Decentralisation of authority from the national sphere of government to the local sphere of government was promoted in order to improve the level of service delivery provision in South Africa (Ababio, 2004; Ndzimakwe and Reddy, 2008). However, decentralisation of local governance has encountered with many challenges regarding community participation in the governance of the municipal activities in rural areas. Local municipality uses ward committee members as a form of community involvement in rural areas. In South African local municipalities, ward committees are viewed as a communication linkage between the municipality and the communities (Ababio, 2004; Ndzimakwe and Reddy, 2008). The ward committees represent the views of the community during planning and design of public service delivery in rural areas. The participation of the community representatives in the municipal activities promotes participatory governance (Firman, 2010; Faguet, 2013). However, this kind of community participation comes with many deleterious effects in the quest to resolve the service delivery backlog and poverty in rural areas. In most cases, the ward committees do not report to the community concerning municipal activities. Of paramount importance, the ward committees do not carry out the mandates given by the community to the local municipality (Joshi, 2013). This creates a gap between the community and the municipality during service delivery planning and design. Despite decentralisation of local governance, rural community remain voiceless in service delivery planning and design.

The lack of capacity from the ward committees creates a huge problem during planning and design of service delivery (Ababio, 2004). Local municipality continue to be the decision makers for public service delivery due to the lack of capacity from the ward committees. Regardless of the decentralisation of local governance in decision making process, power is still centralised within the local municipality (Firman, 2010; Faguet, 2013). Thus, community participation that was stated in the Constitution of the Republic of South Africa, 1996 and Municipal Systems Act, 2000 cease to exist in rural areas. In cases where ward committees participate in decision making, the question remains that: do their voices matter during planning and design of service delivery in rural areas? The marginalisation of communities during service delivery planning creates a lot of frustration, which subsequently leading to violent protest (Mubangizi, 2007). Violent protests within the municipality are perpetuated by the lack of consultation, reporting and the involvement of the community in the governance. Thus, decentralisation of governance without the involvement of the community has deleterious effects in the capacity to resolve the perpetuation of poverty in rural areas.

DECENTRALISATION OF LOCAL GOVERNANCE IN PUBLIC SERVICE DELIVERY

The South Africa's democratic dispensation has, in the past years progressively created the opportunity that considered previously disadvantaged marginalised and discriminated members of the societies to take part in the decision making (Nengwekhulu, 2009). The government of South Africa has expanded the public service delivery through the process of decentralisation of local governance to resolve the perpetuation of poverty within rural communities (Hampwaye, 2005; Mubangizi, 2011). This process of decentralisation of local governance encourages the community to be at the centre of decision making. The engagement of the community in the public service delivery it is imperative in the fight against poverty in rural South Africa. The public service delivery has the potential to resolve the perpetuation of different forms of poverty in rural areas. However, despite the range of poverty alleviation strategies that were adopted in South Africa and opportunity for participation in governance, the poor remain marginalised in decision making loop in service delivery planning (Nengwekhulu, 2009; Mubangizi, 2011). The governance system where the community does not form the central part in decision making in public service delivery has a deleterious effect in the quest to fight poverty within rural South Africa.

Even though, there has been improvement in the level of service delivery in South Africa, the problems of poverty, acute shortage of housing, poor high health services and falling standards of education are still manifesting in democratic South Africa (Nengwekhulu, 2009). Thus, decentralisation of local governance is of paramount importance in decision making to promote the participation of the community as they are the main stakeholder in the local municipality. Community participation requires the local government to consult the concerned community in all matters that affects them. It is imperative to decentralise local governance so that the community take charge of their own service delivery provision (Hampwaye, 2005, Mubangizi, 2007, Nengwekhulu, 2009, Mubangizi, 2011; Darkey and Visagie, 2012). Public service delivery to poorer community

has become a focus point of local government strategies to resolve of poverty (Thompson and Nleya, 2008). The provision of water, housing, sanitation and electricity remain the centre in resolving the persistence of poverty. However, despite the provision of public service delivery (water, sanitation and electricity), poverty has not decreased in the margin in the township ad rural areas (Darkey and Visagie, 2012). Thus, the persistence of poverty within the rural communities in spite of the provision of public services demonstrates a gap between the local government and the community. Community participation is not fully been integrated in public service delivery within the local government (Hampwaye, 2005, Manala, 2010, Derkay and Visagie, 2012). The lack of community participation in service delivery indicates that local government has not decentralised governance to the community.

CONCLUSION

Decentralisation of local governance in rural areas improves the capacity of local people to participate in decision making. However, decentralisation encountered many challenges with regard to participation of stakeholders within local governance. The main stakeholder within the local governance does not participate fully during municipal activities and service delivery planning and design. South Africa's local municipalities use ward committees during service delivery planning and design. In many cases, lack of capacity, lack of clear functions, self serving and loss of interest from the ward committees creates a huge problem in the quest to resolve the perpetuation of poverty in rural areas. Thus, the local government continue to make decision on service delivery during the IDP meeting. The notion of decentralisation of local governance remains a pipe dream in most of the local government in South Africa.

However, interactive participation within local government should be adopted in order to give the community a central role to play in the decision making processes. The Interactive Community Participation in Local Governance (ICPLG) should be the key during the provision of service delivery in rural areas. ICPLG will improve the relationship between the community and the local government. The local government continuously consult and report to the communities on the municipal activities. Thus, ensures that the communities are aware of the municipal activities and thus, reduces the possibilities of service delivery protest within the local municipality. ICPLG is a good way of decentralising local governance within South Africa's local Municipalities.

AN ANALYSIS OF THE ROLES AND RESPONSIBILITIES OF THE DIFFERENT ACTORS IN THE IDP PROCESS: THE CASE OF THE MPUMALANGA PROVINCE, SOUTH AFRICA

S.K. Mokoena

Tshwane University of Technology, South Africa

ABSTRACT

In the 1990s, South Africa has adapted the concept of integrated planning from strengthening international trends towards holistic and more sustainable development, and was seen by the country as an appropriate method of beginning to address the deficiencies and injustices of apartheid planning. It was stressed that a new system of municipal planning should ensure the participation of communities, address most urgently the citizens' basic needs, aims to disintegrate unjust special or institutional patterns of privileged, and be focuses on service delivery. These ideas gradually developed into the new concept of Integrated Development Plan (IDP). In 2000, the government passed the Local Government Municipal Systems Act (Act 32 of 2000), which requires all Districts and Local Municipalities to prepare IDPs. The IDP is aimed at integrated development and management of the area under the jurisdiction of the municipality and is developed in terms of its allocated powers and duties. According to the Act, the municipalities are required to prepare a five-year strategic plan that is reviewed annually in consultation with local communities and other stakeholders in the municipality. The IDP seeks to promote integration by balancing the social, economic and ecological aspects of sustainability without compromising the institutional capacity required in implementation. The IDP is seen as a local pathway to sustainable development in South Africa, and it is used to foster more appropriate service delivery and infrastructural development by providing the framework for economic and social development within a municipality and, by implementation, it facilitates poverty relief. The associated planning process is meant to arrive at decisions such as the design of appropriate municipal budgets, land management, the promotion of local economic development and institutional transformation in a consultative, systematic and strategic manner. The findings of this paper reveal that there is a lack of adequate understanding of the impact of IDPs in local development of the communities. It is indicated that the proper consultation between the municipalities and the actors does exist.

INTRODUCTION

According to the Constitution of the Republic of South Africa (Act 108 of 1996), Local Government is required to serve a political representative function with active community participation in order to achieve improved service delivery, social and economic development and a healthy environment. It is the responsibility of any municipality to give priority to meeting local needs through service delivery, local economic development, special planning and health care planning (RSA, Section 153, 1996). The main aim of the IDP, as stated in Section B of the White Paper on Local Government (1998), is to enhance service delivery and fight poverty through an integrated and aligned approach between different role-players and stakeholders. For the purpose of this paper, the concept Developmental Local Government is used within the context which ensures that all communities have access to basic services; everyone participates in decision making and planning; local economy grows; job opportunities increase; and local resources are used wisely to improve the quality of life for everyone, now and in the future (The Planact, 2001).

EXPLANATION OF THE IDP

According to the IDP Guide Pack Integrated Development Planning is a process through which municipalities prepare a strategic development plan, for a five year period. The Local Government: Municipal Systems Act (Act 32 of 2000) defines the IDP as a single inclusive and strategic plan for the development of the municipality that links, integrates and coordinates a municipality's sector specific plans; aligns the resources and capacity of the municipality to the overall development objectives of the municipality; forms the policy framework on which annual budgets rest; and informs and is informed by similar development plans at national and provincial development plans. In other words, the IDP is participatory planning process aimed at integrating sectoral strategies, in order to support the optimal allocation of scarce resources between sectors and geographic areas and across the population in a manner that promotes sustainable growth, equity and empowerment of the poor and marginalized (The Planact, 2001).

Based on the above, it can be argued that integrated means not one sector only (for example, housing), but bringing together all relevant sectors, issues and concerns as a whole. It also means the collective efforts of the national, provincial and local government together with, inter alia, individual residents, the private sector, non-governmental organizations and other stakeholders must be harnessed. However community participation is required for IDP (Befile, 2009).

The Policy Paper on IDP (DPLG, 2000) states the following six broad roles of IDP:

- Provide a strategic framework for municipal management, budgeting, delivery and implementation;
- Ensure political accountability and continuity;
- Facilitate interaction, engagement, communication and the building of alliance;
- Transform local government into a vehicle for development;
- Promote socio-economic development; and
- Help municipalities devise holistic strategies for alleviating poverty and creating livelihoods.

In this connection, the White Paper on Local Government (1998) reaffirms the fact that IDPs are planning and strategic frameworks to help municipalities to fulfill their developmental mandate. They ensure the alignment of resources with objectives, integration of planning, the prioritizing of essential aspects, sustainability, the prioritizing of poverty alleviation and that scarce resources are utilized where they will make greatest impact on improving the general welfare of society. The fact that IDPs are reviewed annually makes them incremental, relevant and responsive to changing environments and circumstances.

Section 26 of the Local Government Municipal Systems Act (Act 32 of 2000) state that an IDP must reflect the following:

- The municipal council's vision for the long term development of the municipality with special emphasis on the municipality's most critical development and internal transformation needs;
- An assessment of the existing level of development in the municipality, which must include an identification of communities which do not have access to basic services;
- The council's development priorities and objectives for its elected term, including its local economic development aims and its internal transformation needs;
- A spatial development framework which must include the provision of basic guidelines for a land use management system for the municipality;
- The council's operational strategies;
- Applicable disaster management plans;
- A financial plan, which must include a budget projection for at least the next three years; and
- The key performance indicators and performance targets determined in terms of Section 41.

The above section of the act serves to illustrate the significance of IDP in terms of prioritising key community needs through an integrated approach. In addition, the constitution (1996) state that a municipality must structure and manage its administration and budgeting and planning process to give priority to the basic needs of the community and to promote the social and economic development of the community; and participate in national and provincial development programmes.

THE IDP PROCESS

The process undertaken to draft an IDP consist of the following five phases as outlined by the former Department of Provincial and Local Government (2000):

➤ **Phase 1: Analysis**

During this phase, information is collected on the existing conditions within the municipality. It focuses on the types of problems faced by people in the area and the causes of these problems. The identified problems are assessed and prioritised in terms what is urgent and what needs to be done first. Information on availability of resources is also collected during this phase. At the end of this phase, the municipality will be able to provide an assessment of the existing level of development; details on priority issues and problems and their causes; and information on available resources.

➤ **Phase 2: Strategies**

During this phase, the municipality works on finding solutions to the problems assessed in phase one. This entails the developing a vision – the vision is a statement of the ideal situation the municipality would like to achieve in the long term once it has addressed the problems outlined in phase one; defining developmental objectives – development objectives are clear statements of what the municipality would like to achieve in the medium term to deal with the problems outlined in phase one; development strategies; development strategies – once the municipality has worked out where it wants to go and what it needs to do to get there, it needs to work out how to get there. A development strategy is about finding the best way for the municipality to meet a development objective; and project identification – once the municipality has identified the best methods for achieving its development objectives it leads to the identification of specific projects.

➤ **Phase 3: Projects**

During this phase, the municipality works on the design and content of projects identified during phase two. Clear targets must be set and indicators worked out to measure performance as well as the impact of individual projects.

➤ **Phase 4: Integration**

Once all projects have been identified, the municipality has to check again that they contribute to meeting the objectives outlined in phase two. These projects will provide an overall picture of the development plans. All the development plans must now be integrated. The municipality should also have overall strategies for issues like dealing with AIDS, poverty alleviation and disaster management. These strategies should be integrated with the overall IDP. These integrated programmes are typical medium to long-term plans.

➤ **Phase 5: Approval**

This is the final phase, during which IDP is presented to the council for consideration and adoption. The council may adopt a draft for public comment before approving a finalized IDP. The table below present the planning participation phases.

Planning phase	Methods for participation
Analysis	Community meetings organised by the ward councilor Stakeholder meetings Surveys and opinion polls (getting views on how people feel about a particular issue)

Strategies	IDP Representative Forum Public debates on what can work best in solving a problem Meetings with affected communities and stakeholders Representation of stakeholders on project subcommittees
Projects	
Integration	IDP Representative Forum
Approval	Public discussion and consultation with communities and stakeholders
Monitoring and implementation	IDP Representative Forum

The municipal actors for the category B Local Municipalities are discussed below as stipulated in the South African legislations and interpreted and analysed by the researcher:

THE MUNICIPAL ACTORS, ROLES AND RESPONSIBILITIES

It is significant to state that the general role of the municipal actors is that of decision making. The roles and responsibilities are normally distributed to the following identified actors within a municipality in the IDP process; firstly, the Municipal Council – has the responsibilities to consider and adopt a programme for the planning process and approve the IDP. The fact of the matter is that the municipal council is accountable to the public on the utilization of public resources. Secondly, the Executive Committee or Executive Mayor or Committee of Appointed Councillors – amongst other things, this actor is responsible for the overall management, coordination and monitoring of the process and drafting of an IDP. This actor has to decide on the programme for the planning process. Furthermore, the responsibilities include nominating persons to be in charge of the different roles, activities and responsibilities of the process and drafting of an IDP. The third actor becomes the councillors – it is evident that councillors should link the planning process to their constituencies by organising public meetings which will enhance community consultation and participation. Councillors are responsible to ensure that budgetary functions and the relevance of annual business plans are incorporated to an IDP in terms of its alignment with the provincial and national department budgets. The fourth actor is the municipal Manager and/or IDP Manager – has to do with the preparation of the programme for the planning process. It is argued that he/she will undertake the overall management and coordination of the planning process to ensure effectiveness and efficiency. He/She must ensure that the planning process is participatory and implementation orientated and is aligned with sector planning requirements. The fifth actor becomes the Head of Departments and Officials – have roles to provide relevant technical, sector and financial information for the analysis phase and identification of projects and the drafting of projects proposals of the municipality. They are responsible for the preparation of the integrated phase. In regards to the approval phase, it is argued that they are responsible for preparing amendments to the draft IDP for submission to the municipal council and the Member of the Executive Council (MEC) for Co-Operation Government and Traditional Affairs (COGTA) for alignment.

CIVIL SOCIETY ACTORS, ROLES AND RESPONSIBILITIES

It should be taken into cognizance that the general role of the civil society actors is to represent the interest of the communities, to inform, negotiate and comment on the decisions made by the municipal council. In this case, the roles and responsibilities of the civil society actors are found in all stakeholders, interest groups and affected parties – they represent their interest and contribute knowledge and ideas in the planning process. It is a common knowledge that they must conduct meetings and workshops with their constituencies to prepare for the planning activities to give priority on matters affecting them. Representatively on the participatory process in IDP forms an integral of the planning process in local municipality. They further have responsibilities to participate in the designing of project proposals and to ensure that the annual business plans and municipal budget is linked to the IDP. As a result, they discuss and comment on the draft IDP and monitor the performance during the implementation period. These issues are also handled by structures such as IDP Forum and IDP Steering Committee.

PROVINCIAL GOVERNMENT ACTORS, ROLES AND RESPONSIBILITIES

The general role of the provincial government is to give feedback to the municipalities on matters of the IDP progress, such as, compliance with the legal and policy requirements, methodological aspects of planning, feasibility and viability of the proposed projects and programmes and decision making process. The provincial government actors can be identified as follows: firstly, the COGTA Department – has to do with the establishment of the logistics such as procedures, coordination of the intergovernmental system, strategies, projects and integrated programmes between district municipalities and provincial sector departments. This department is monitoring the process followed by the municipalities in this category. It further assists municipalities in the planning and drafting process of the IDP. The department is also responsible to facilitate the resolution of disputes between a community and the municipality and between municipalities. Secondly, the Sector Departments – (for example, the Department of Water and other departments which must be consulted towards the preparation of the planning process of the IDP) has responsibilities to contribute relevant information on the provincial sector department plans, programmes, budgets, objectives strategies and projects in a concise and accessible manner. It further has roles to contribute sector expertise and technical knowledge to the formulation of the municipal strategies and projects. Moreover, it must participate in and be bound by the decisions of the provincial management system of coordination.

SUPPORT PROVIDERS ACTORS, ROLES AND RESPONSIBILITIES

It is argued that the general role of these actors is to assist in the planning and the drafting of outputs for the municipal council and the stakeholders to make better decisions more efficiently. The first actor is the Facilitators and/or Planners internal or external to the municipality including PIMS Centres – has to provide methodological guidance to the planning process and facilitate planning workshops and group activities. They undertake special studies in support of the planning phases at Local Government. Moreover, they support the management of the IDP and in the alignment procedures between the municipalities and spheres of government. The second actor is the Development Advocates or Non-Governmental Organisations (NGOs) or Resource persons – their roles include amongst other, providing support to organised and unorganised groups, organisations and institutions to contribute in the planning process. The third actor is the Service Providers – their responsibilities is to provide information on their service investment programmes, implementation of plans, etc. and promote the process of mutual alignment with the municipalities in this category. The last actor is the Technical Experts, Consultant and NGOs – they have responsibilities to prepare specific and product related contributions in supporting and documenting the outputs of the analysis phase, strategic phase, project phase and integrated programmes of the IDP.

CONCLUSION

In conclusion, both the Constitution and the Local Government: Municipal Systems Act clearly stipulates that the municipality must mobilize the involvement and commitment of its stakeholders by establishing an effective participatory process. The IDP is a very interactive participatory process which requires involvement of number of stakeholders as discussed in the text above. It is evident that the IDP is a good tool and if it can be implemented properly, the ongoing community unrest would stop. The researcher does acknowledge the fact that most of the municipalities would be confronted with some challenges, however they can do much better when it comes to better the services they render to communities.

AN ANALYSIS OF THE XENOPHOBIC ATTACKS EXPERIENCED BY SOUTH AFRICA: THE CASE OF THE MPUMALANGA PROVINCE

S.K. Mokoena

Tshwane University of Technology, South Africa

ABSTRACT

Since the demise of the then Apartheid regime transcending to new democratic governance, South Africa experienced a proliferations of foreigners into the country as asylum seekers and general non documented immigrants inhabiting our country. Many of these foreigners integrated themselves with the demographic of South African community. Judge Jody Kollapen asserted that South Africa consist of unequal society meaning that the gap between the have and the have not is greater. Evidently are the high levels of unemployment in South Africa and the competition against resources by the society. In May 2008, widespread violence against foreigners broke out in Alexandra. The International Organization for Migration (2009) report assert that “in its wake, 62 people, including 21 South Africans, were dead; at least 670 wounded; dozen of women raped and at least 100 000 persons displaced and property worth of millions of Rand looted, destroyed or seized by local residents and leaders”. There are general affirmations and observations by media and foreigners that South Africans are xenophobic. Hence in the contrary the South African Government asserts that South African are not xenophobic, however attacks of the foreign nationals is perpetuated and motivated by criminal activities. There is a need to establish what caused these attacks on foreign National leading to insecurity in South Africa to a certain extent. This case study is ensued to investigate and impart knowledge on the manifestation of the xenophobic attacks. Although much research has been done on xenophobia in the world minimal information about South Africa’s xenophobic attacks is available. There is a need to build on the existing body of knowledge to prevent future conflict and to impart knowledge about xenophobia.

The purpose of this paper is to explore which factors were responsible for the manifestation of the xenophobic attacks. The Mpumalanga Xenophobic attacks case study is ensued to establish factors which lead to the manifestation of the xenophobic attacks.

INTRODUCTION

Five years ago, South Africa was shaken by the outbreak of a wave of violence. This violence was purely targeted to foreign nationals irrespective of the fact that the South African Constitution (1996) outlines the vision of an equality-based society and in its preamble; it states that “South Africa belongs to all who live in it, united in our diversity”. Despite these constitutional provisions, a range of civil organisations, human rights actors and academics have observed ongoing patterns of crimes specifically targeting people on the basis of their race, nationality, religion, sexual orientation or other such factors. Such crimes, known internationally as hate crimes, undermine social cohesion and have traumatic impact on victims (Breen and Nel, 2011).

Harris (2001) argues that xenophobia and economic exploitations are not peculiar to South Africa and the literature has proven that it has been the worldwide phenomenon. These xenophobic attacks are selective in nature with black foreigners representing the common victims of hostility. Global trends indicate that xenophobia is predominantly in the countries undergoing transition with the tendency of government to conflate foreigners with crime. However currently there is no evidence at our disposal supporting the latter statement implicating the South African government conflating bases for escalation of crime as perpetuated by the presence of foreigners. It should be taken into cognisance that many of the foreigners ascend to South Africa for different reasons of which some will be discussed later on this paper.

For the purpose of this paper, the concept “xenophobia” will be defined in the context within which it is used in the paper. Xenophobia is defined as a strong dislike of foreigners (South African Oxford School Dictionary, 2008). In this context, it should be noted that the xenophobic experiences in South Africa had some elements of hatred and fear coupled with physical abuse which translated to be a scapegoat for social challenges confronting the country.

LEGISLATIVE FRAMEWORK ON MIGRATION

The researcher would like to acknowledge the fact that the country does have policies governing migration without deliberating on their contents. Perhaps for the purpose of this paper, it is suffice just to mention them as follows:

- Allies Control Act of 1991;
- Allies Control Amendment Act of 1995;
- The Green Paper on International Migration of 1997;
- The White Paper on Refugees of 1998 (enacted in April 2000); and
- The White Paper on International Migration of 1999.

The above mentioned legislations serve to justify the fact that the government had to contextualise immigration policies within the South Africa’s political transition from apartheid to a democracy governed by constitutional equality (Sign, 2011).

RESEARCH DESIGN AND METHODOLOGY

The research design used on this paper was in accordance with the qualitative approach. Garbers (1996: 283) state that the objective of qualitative research is to promote better self-understanding and increase insight into the human condition. He further argues that in qualitative research the emphasis is on improved understanding of human behavior and experience and researchers try to understand the ways in which different individuals make sense of their lives and describe those meanings. In qualitative research, empirical observation is important as researchers need to study real cases of human behavior if they are to be in a position to reflect on human condition meaningfully and with clarity. The fact that this paper was conducted within a social sciences context or setting, the selected methodology was appropriate for probing in depth the complexities involved and explored the reasons of these xenophobic attacks in the Mpumalanga Province through observation and existing literature which is purely secondary source dealing with violent collective behavior. The qualitative research method applied in this paper was appropriate as it enabled the researcher to interact closely with the subjects in their natural settings.

XENOPHOBIA IN CONTEXT: THE SA EXPERIENCE

As it has been alluded above, violence against foreign nationals in South Africa was noted as a major social challenge as far back as 1998. Breen and Nel (2011) argue that some of the trends of xenophobic violence are (i) indiscriminate mob violence against all foreign nationals in a particular area; (ii) attacks, intimidation or specific looting campaigns targeting foreign owned business; and (iii) individual attacks on foreign nationals. The literature on this topic indicate that the attacks on foreign nationals have received prominent and high level attention in 1998, whereby the South African Human Rights Commission (SAHRC) and the United Nation High Commission for Refugees (UNHCR) convened a consultative conference where they adopted a Braamfontein Statement, which read thus:

“No one, whether in this country legally or not, can be deprived of his or her basic or fundamental rights and cannot be treated as less than human. The mere fact of being an [alien] or being without legal status does not mean that one is fair game to all manner of exploitation or violence or to criminal, arbitrary or inhuman treatment. Foreigners in our midst are entitled to the support and defence of our law and constitution. Our Constitution states that we seek to construct a society where “human dignity, the achievement of equality and the advancement of human rights and freedoms” are abiding values. The Bill of Rights confers certain

rights to “everyone”. These are the rights to equality, human dignity, the right to life, freedom and security of the person, and the right not to be subject to slavery, servitude or forced labour. [The] manifestation [of xenophobia] is a violation of human rights. South Africa needs to send out a strong message that an irrational prejudice and hostility towards non-nationals is not acceptable under any circumstances. Criminal behaviour towards foreigners cannot be tolerated in a democratic society”. (SAHRC, 1998).

The above statement serves to illustrate the fact that violence of any kind, in this case, xenophobic attacks cannot be tolerated. In a statement made by the Minister of Police, Mr Nathi Mthethwa, in 2010, categorically stated that violence against foreign nationals can be described as criminality perpetuated by criminal elements (Polzer and Takabvirwa, 2010).

In this connection, the researcher would like to make reference very briefly to the “Frustration-Aggression Theory” as an attempt to convey a particular point. This theory assumed that aggression was always a consequence of frustration. For instance, the theory suggests two dogmatic views of the relationship between frustration and aggression. Aggression behavior is always preceded by frustration and creates readiness for aggressive behavior (Ladd, 2007). According to Barash *et al* (2002), the hypothesis of frustration-aggression is explained as the increase of frustration due to human goals not being met. For example, when human beings seek certain goals (such as food, services, political freedom) and are unsuccessful in their quest, it may result in increased frustration, which most likely would result in conflicts.

The Frustration-Aggression Theory was later modified to recognise that frustration creates a state of readiness for aggression that is an emotional state of anger and environmental factors are necessary for the aggression to manifest into conflict. Individual’s experiences and societies’ experiences have been recognised as exerting powerful influence on the relationship between frustration and aggression (Brash *et al*, 2002).

Ladd (2007) and Barash *et al* (2002) criticised this theory as being too simplistic towards the understanding of humanity and its dynamics. They argue that although frustration may result because of discrepancies between the expected need and actual reality, societal structures prevent frustration from turning into aggressive behavior. The South African society were frustrated because of their basic service-delivery needs were not met by the government. In addition, they felt that local residents are not preferred for employment; instead the foreign nationals get employment easier.

The above arguments is supported by most literatures, amongst others, include Harries (2001) argues that many African scholars argue that xenophobia is used as a scapegoat for social ills left by the apartheid regime. During the apartheid era South Africans were inhabited and welcomed by the fellow African countries. In the contrary after South Africa gained freedom many foreigners descended to South Africa for number of reasons such as employment, asylum seekers or war in their respective countries since South Africa is part of the United Nations Member State. It can be argued that apartheid insulated South African citizens from nationalities beyond South Africa. In this context foreigners represented the unknown to South Africans. The interface between previously isolated South Africa and the unknown foreigners created a space for hostility to develop: “When a group has no history of incorporating strangers it may find difficult to be welcoming” (Morris, 1998:1125).

Furthermore, it can be argued that scapegoating has largely emerged through social theory and it locates xenophobia with the context of social transition and change. Hostility against foreigners has been explained in relation to limited resources such as housing, unemployment, education, health care which generated high expectation during South Africa’s transition from autocratic regime to democratic governance (Tshitereke, 1999). Peberdy argues that foreigners in South Africa are represented as a threat to nation (Peberdy, 1999). This notion is further supported by Tshitereke (1999:4):

“In the post-apartheid epoch, while people’s expectations have been heightened, a realization that delivery is not immediate has meant that discontent and indignation are at their peak. People are more conscious of their deprivation than ever before.... This is the ideal situation for a phenomenon like xenophobia to take root and flourish. South Africa’s political transition to democracy has exposed the unequal distribution of resources and wealth in the country”.

Perhaps the most obvious, is the fact that South Africans still tend to see themselves as separated from the rest of the African continent and, combined with many years of isolation, do not easily identify with other Africans. Increased migrant and refugee flows to South Africa since 1994 has meant that foreigners are now much more visible.

In fact, xenophobia is conceptualized in terms of frustrations and relative deprivation. This argument is supported by Harris (2002) by arguing that relative-deprivation theory suggests that a key psychological factor in generating social unrest is a sense of relative deprivation. In the contrary Political Scientist Annette Seegers argues that 'frustrations breeds anger, yet angry people do not always commit violence, instead they could turn their anger inwards and commit suicide. In the South African context people release their anger on that frustration scapegoat usually on non-national minorities.

It is also necessary to map the 2008 violence against the state of social cohesion in South Africa during that period. Since 1994, government and other sectors of society have promoted an inclusive society, and a consistent call for unity for all society has dominated the public discourse. There are a number of indicators that are used to measure social cohesion, some of them being the strength of South Africa's democracy, the vitality of civil society and trust and tolerance among citizens as well as national identity. The government's Fifteen Year Review Report, published in October 2008 observes that social cohesion is under more stress than it was in the past years.

Bekker *et al* (2008) have observed the following during these attacks:

- Government and state official reactions underline denial of both the extent and the serious nature of the outbursts. Ministers and officials denied that the outbursts (in Alexandra and then Diepsloot and elsewhere in Gauteng) were of a xenophobic nature and that they were related to one another. Two alternative explanations were offered. The first was that the perpetrators were 'criminals' and the second that there was a 'third force' at work. A national minister was quoted as stating that the violence would be over within a week.
- Other early explanations found in the press that structural causes raised repeatedly included failure of government policies, such as service delivery, failure to address crime, collapse of border controls and unsuccessful diplomacy toward Zimbabwe; the high unemployment rate particularly for young urban black men; and the failings of the police (whether from lack of resources or poor training). In addition, evidence for widespread sentiments of xenophobia among poor urban residents was reported on often.
- More sophisticated analyses were made by certain officials and experts: 'residents of Alex have been living in inadequate housing... a veritable pressure cooker. The tipping point: perceptions of foreigners jumping the housing queue... Dissatisfaction ... has taken on the face of immigrants...'
- The main result of some press scan of explanations is the predominance of external structural causes in the explanations. Little attention was given to factors directly related to individual outbursts themselves and equally little to the meaning residents gave to local issues. No explanation that raised the issue of risk aversion as a factor in target selection or the reversal of humiliation through collective action was found in the scan.
- Explanations using external structural causes as their main thrust fell overwhelmingly within the relative deprivation approach. Here, perpetrators are viewed as frustrated individuals (due to unemployment, poverty, lack of services, perceived unfair competition, etc) who convert this frustration into aggression. There is a tendency accordingly to view these perpetrators more as victims than as antagonists. One example falling within the resource mobilization approach – where perpetrators were perceived to be putting up 'a rugged disdainful resistance' to government - was identified above.
- During the initial period of the series of outbursts, government (and others) tended to give reductionist one-factor causes we have called 'riff-raff' and 'agitator' explanations. Later, explanations became more complex and sophisticated and the role that mass media played in the spread of the outbursts became an issue. Most later explanations however employed 'recipe analysis' – apportioning guilt on a proportional basis – and the main reason for this is probably the fact that explanations remain at the structural contextual level, external to the local circumstances of each individual outburst and accordingly lacking any understanding of local conditions and how local residents themselves understand their situation.

Perhaps for the purpose of this paper, it would be suffice to show the places where this violence erupted during the first ten days as documented by Bekker (2008) as follows: During the first period of ten days, starting on 10 May 2008, 61 violent events took place. 50 of these 61 events took place in Gauteng:

- Gauteng: Actonville, Alexandra township, Amakauwusi informal settlement, Benoni, Berea, Central Johannesburg, Choba informal settlement, Cleaveland informal settlement, Daveyton, Diepsloot informal settlement, Dikathole informal settlement, Dukathole informal settlement, Ext 5 informal settlement in Germiston, Ext 9 informal settlement in Germiston, Hillbrow, Jeppe, Jerusalem informal settlement, Joe Slovo informal settlement, Katlehong, Klipfontein View, Kopanong, Kya Sands informal settlement, Lusaka informal settlement, Makausi informal settlement, Malvern, Mandleni informal settlement, Marathon, Mashimong, Mayabuye, Mpilisweni, Olifantsfontein, Phiri, Ramaphosa, Reigerpark, Siyhalala informal settlement, Tedstoneville, Tembisa, Tshiavelo, Vosloorus, Vusimusi, Zamimpilo, Zandspruit informal settlement, Zenzele informal settlement .
- Western Cape: Fisantekraal, Malmesbury.
- Eastern Cape: Motherwell township, Walmer township.
- Northern Cape: Mafikeng.
- KwaZulu-Natal: Embalenhle, Cato Crest, Dalton.
- North West: Kanana [in Gauteng on the filing system list (at Tembisa Township, Jhb)].
- Mpumalanga: Lebohang ['Lebogang' on filing system list].

THE MPUMALANGA EXPERIENCE

Based on the above, the province did experience the xenophobic attacks on foreign nationals on minimal scale compared to the Gauteng Province. It further spread to areas like Balfour, Matsulu and Secunda just to mention a few. On news24 in 2009, it was reported that 20 foreign nationals sought safety in Balfour police station. The manner in which the attack on foreign nationals would start as a protest by communities against poor service delivery and translate to the looting of shops of foreign nationals and other criminal activities that would target the foreign nationals. For instance, in May 2008 at Embalenhle, the Evander police reported that two shops and a car belonging to a Somalian businessman had been burnt to ashes (www.iol.co.za). The fact of the matter is that violence results to criminal activities irrespective of the place where it is happening. The continuous community strikes on lack of or poor service delivery against government institutions and the strikes in the workplaces clearly shows that there is anger and frustration of the people of South Africa.

CONCLUSION

In conclusion, the researcher has observed that anger and frustration has resulted into aggressive behavior in this case. The South African society were frustrated because of their basic service-delivery needs were not met by the government. Furthermore, there were accusations that foreigners were involved in criminal activities, were responsible for high food prices, for taking jobs from locals, for seducing local women, and for occupying local RDP houses. It was the society's belief that foreign nationals have supernatural powers reflected in their ability to make money. Finally, it should be taken into consideration that that South Africa is striving to live according to the country's constitutional preamble which read thus; "We, the people of South Africa, recognize the injustice of our past; honour those who suffered for justice and freedom in our land; respect those who have worked to build and develop the country; and believe that South Africa belongs to all who live in it, united in our diversity!"

STAKEHOLDER VIEWS ON THE PRINCIPAL AS A MANAGER IN A SCHOOL PROJECT

Genesis T. Molepo and Andile Mji
Tshwane University of Technology, South Africa

ABSTRACT

This study explores school stakeholder's perceptions on a school principal as a project manager in a school project in selected schools in Ngaka Modiri Molema District. Participants were 65 in all comprising 13 principals, 13 teachers and 39 parents who were school governing body members. There were 31 women and 34 men with ages ranging between 21 years and 55 years ($M = 35.4$; $SD = 9.6$). Participants indicated their views on a Likert type scale on views about the principal as project manager. As the scale was author developed, validity and reliability of scores from the scale are reported. Results indicated that three subscales emerged, where participants saw the school principal as (a) a project organiser (b), a project leader and (c) a project time manager. Further, in spite of the powers given by governmental authority, school stakeholders felt that principals should be project managers within schools. It is recommended that further studies should be conducted to determine the efficacy of the questionnaire used here in other contexts and samples.

INTRODUCTION

A project is a temporary endeavour undertaken to create a unique product, service, or result. Projects have a purpose. They also have clearly-defined aims and set out to produce clearly-defined results. Their purpose is to solve a "problem", and this involves analysing needs beforehand. Suggesting one or more solutions, a project aims at lasting social change. Project management is commonly associated with building big bridges, roads, railway lines and big dams. It is a phenomenon relating to activities that could be undertaken in a number of fields such as engineering, information technology, business, industrial processes and education. Project management may be defined as "... a methodical approach to planning and guiding project processes from start to finish ... the process guided through five stages: initiation, planning, executing, controlling and closing" (Project Management Institute, 2000, p. 134). Based on this definition, one may deduce that project management applies in many enterprises. For example in schools project management may be needed for the installing security system, starting a garden to alleviate hunger or building of a new laboratory or library. In implementing a project, it is apparent then that those who do this, should have necessary competency for the projects they undertake to succeed. The problems associated with project management notwithstanding, in South Africa legislation allows projects to be run within school context. In fact, the South African Schools Act 84 of 1996 (the Act) introduced governing bodies within schools and granted them the responsibility to oversee certain activities (Department of Education 1996). The main objective of the Act was to promote representative participation in schools. By establishing governance structures meant to contribute to the democratization of the country (Grant-Lewis, & Naidoo, 2004). In order to promote the representative participation, the Act dictated that parents should form majority of the governing body where one would take the chairmanship position in meetings while the principal would be an ex officio member (Department of Basic Education [DoBE], 2011). This Act effectively allows school governing bodies to be responsible for their schools' projects.

Theoretical Framework

Project management is a multistep process including planning, putting the project plan into action, and measuring progress and performance. It includes the identification of project requirements, establishing the objectives of the project, taming the restrictions, and keeping the expectations and requirements of the major

stakeholders in mind. **Project management**, then, is the application of knowledge, skills and techniques to execute projects effectively and efficiently. It's a strategic competency for organizations, enabling them to tie project results to business goals and thus, better compete in their markets. It brings together a set of tools and techniques performed by people to describe, organize, and monitor the work of project activities. It is the process of integrating everything that needs to be done as the project evolves through its life cycle in order to meet the project's objectives. This means that the project team should see to it that the project delivers what is expected. So the project team should have knowledge of the life cycle of a project since without that knowledge; the project may be derailed. Managing projects requires a great deal of time, skill, and finesse. There are many sides to project management and this is what makes it so interesting and demanding. What is required therefore is the project team's application of knowledge, skills, tools and techniques to project activities. Project management provides people with tools that can improve their ability to plan, implement and manage activities to accomplish specific organizational goals. It is also a goal-orientated management style that places a premium on building collaborative relationships among a diverse cast of characters. Project management is commonly associated with building big bridges, roads, railway lines and big dams. One needs to mention that project management can also be used for doing good deeds and solving problems social problems. This can be seen in a school situation whereby a school community takes on a project to build a new classroom, a school library, a school vegetable garden, a school laboratory, tiling of classrooms, fencing a school yard, renovating classrooms etc. Project managers are expected to take an uncertain event and make a certain promise to deliver. They are also expected to do this within a specified time and within a limited budget.

A project manager is a person who manages the project processes and applies the necessary tools and techniques to carry out the project's activities. Every project comprises of processes, even if it employs a slipshod approach. Project manager plans, schedules, motivates and control. They manage temporary, non-repetitive activities to complete a fixed life project. Project managers create a project team and organization where none existed before. They should decide what and how things should be done instead of simply managing set processes. They must meet challenges of each phase of the project life cycle, and even oversee the dissolution of their operation when the project is completed. They must work with a diverse troupe of characters to complete projects. They are typically the direct link to the customer and must manage the tension between customer expectations and what is feasible and reasonable. They provide direction, coordination and integration to the project team, which is often made up of part-time participants loyal to their functional sub-contractors who do not necessarily share their project allegiance (Atkinson, 1999). What is important therefore is for management to continuously support the project and ensure that staff makes it a priority until it is successfully completed. Regarding direction, if the project manager is not there to constantly give direction to the project, chances are that the project will not achieve the intended goals. What is important therefore is to stick to the initial project plan. About coordination, project coordination generally refers to planning and managing multiple tasks simultaneously. Coordination is essential for a business that deals with two or more related projects. A project coordinator often holds different roles and responsibilities, depending on the industry and the business size. It is important that those who commission a project should clearly spell out what they want. This is important because if that does not happen then those who are working on the project may produce what they think is required which in fact may be a misunderstanding because initial orders were vague. About integration, integration management is an element of project management that coordinates all aspects of a project (Project Management Institute [PMI], 1992).

Project integration, when properly performed, ensures that all processes in a project run smoothly. Integration management will produce a series of deliverables. These deliverables include the project charter, project plan, and preliminary project scope statement. A project cannot run on itself without staff members and all the necessary stakeholders taking serious interest in looking into whether the project is in line with what was initially envisaged (PMI, 2000). According to Morris (1994:25) project management is the process of integrating everything that needs to be done as the project evolves through its life cycle in order to meet the project's objectives. Here, this means that the project team should see to it that the project delivers what is expected. So the project team should have knowledge of the life cycle of a project since without that knowledge; the project may be derailed. The overall responsibility of the project manager is to achieve the project's objectives within the time, cost and quality, performance and any other constraints imposed by the sponsor (Gardiner, & Stewart 2000). The project manager has to work closely with the sponsor with respect to staffing requirements and funding availability. Such a person is responsible for completing the project on time, within budget and meeting the quality criteria and requirements. It is important for those who are in charge of projects to possess the

requisite skills to see these through. Skills are about “... an ability that can be developed which is manifested in performance ... an ability to translate knowledge into action” (Odusami 2002, p. 61).

Figure 1: Project management skills consist of the combined skills from these three areas (Adapted from Method 123: Empowering managers to succeed, 2013)

In fact it has been opined that project managers should be encouraged to work toward the development of leadership skills that “... include the ability to monitor and track project scope, project time, project cost, and project quality” (Sumner, Bock & Giamartino, 2006, p. 48). Further, it has been argued that when managers follow appropriate processes and utilize the correct tools and techniques then chances of project success will be high (Belzer 2001). The on-going responsibilities of the project managers includes among others that they must manage and influence the expectations of the key stakeholders, especially the project sponsor. They have to respond to the changing requirements of the project as it progresses through its life cycle. They have to serve as the principal point of contact between the sponsor, management and contributors. Such a person should understand the importance of organizational politics and how to make them work for project success Cleland (1986). They should keep the sponsor and senior management well informed of progress in all phases of the project and alert them to the problems especially if these could have an impact on the project achieving its business objectives. The project managers have to provide motivation and leadership skills throughout the project. They have to establish and develop teamwork between participants and convene and chair meetings as appropriate (Cornwall, Musyoki, & Pratt, 2001). Such people have to ensure that the project structure is working as intended and make or force timely decisions to ensure the project’s success. As a project manager one has to recommend termination of the project to the sponsor if necessary and also manage sub-contractors. They have to follow the known **Project Management Life Cycle**.

Figure 2: The Project Management Life Cycle (Adapted from Method 123: Empowering managers to succeed, 2013)

South African Context and Basis of the Study

The South African Schools Act (Department of Education, 1996) apportioned responsibilities to governing bodies to oversee certain activities within schools. This effectively allowed governing bodies “... to maintain and improve the school’s property, and buildings and grounds occupied by the school ...” (DoBE, 2011). So among other activities, governing parents were mandated to oversee the finances of schools. Governing bodies are “... democratically elected and reflect parent, educator, non-educator staff and, in secondary schools, learner constituencies. Parents have a majority stake in order to ensure ... a greater voice (Dieltiens, 2005, pp. 9 - 10).

This means that chairmanship of meetings is a role taken up by one of the parents with the principal serving as an *ex officio* member. Effectively the legislation was meant to enhance parental involvement and contribution to "... whole school development" (van Wyk, 2004, p. 50). In a sense, the legislation afforded governing bodies the ability to identify projects and work on accomplishing them. So, governing body members are expected to identify the tasks that the statutes allow them to provide leadership in (Knight, 1993). In a school situation, a project may involve building a perimeter wall, constructing additional classrooms or setting up and running a school garden. One important aspect in running a school project is making sure that it is completed successfully. Successful completion is a prerequisite in many ways because if a project fails that may impact negatively on the finances of the school. In a related manner it is argued that the process of managing a project "... revolves around good planning, organising, directing, and controlling resources for a relatively short-term objective" (Kerzner, 2009, p. 4). Also, if projects are to be successful it is important that they are undertaken by good teams led by competent leaders. An inherent problem with school governing bodies is that members have a three year office term. This may impact negatively on school projects. In fact it is argued that running school projects may be complicated by the fact that relationships "... must be renewed or re-established every three years when the new SGB is elected or sometimes even more frequently when there is a new principal in the school" (Heystek, 2004, p. 311).

In South African schools, as policy directive, one of the parents is effectively expected to assume the leadership role whenever a project is to be undertaken. For all intents and purposes however this is not the case. The fact of the matter is that governing bodies comprising selected teachers, students and parents do not necessarily possess the requisite skills to run school projects. About this matter it has been argued that "... a considerable proportion of teachers are not sufficiently qualified or trained and they lack the competences to either implement ... policies capably or take part in the decision-making processes in the school (Swanepoel, 2008, p. 42). Regarding parents in the school governing body meanwhile, other potential problems also persist. For instance, because of its historical past, South Africa has a majority of adults who are not educated. Mncube (2007, p. 129) for example lists some of the problems as "... the lack of clear demarcation between the roles of the teaching staff and those of the school governing body (SGB), lack of time, lack of confidence from some parents, ... lack of training which results in lack of knowledge of the Act and roles and responsibilities ..." It is the very adults, who as school governing body members are expected to be in charge of and lead projects at schools. From personal experience too, and in communicating with contemporaries, in most instances the leadership role in projects is not assumed by one of the parents. Our experience has shown that in most instances school projects are actually conceptualised, led and managed by the principal. In this study we wanted to determine the views of school stakeholders in respect of, who really assumes the role of project leader at schools? We felt that answering this question was significant for two reasons. First, the official (government) understanding is that parents are in charge. Providing a researched view would therefore give an indication of what pertains on the coal face so to speak. Second, we were of the view that poor parental education and experience was the main hindrance with respect to project running skills. This knowledge we argued would be valuable in ensuring that systems are put in place to train the parents for the roles they are expected to assume at schools.

METHOD

Participants

The targeted population comprised of teachers, principals and school governing body (SGB) members from one region of the North West province. The region has 128 schools including primary, middle and high schools. This means that there were 128 principals, about 1 500 teachers and approximately 750 SGB members. While the number of SGB members is for those still serving schools, in this study this number could be even more because past members were also included. So as long as a person had been an SGB member they were then considered as eligible for the purpose of this study. To select participants, simple random sampling was used. The first aim was to select a sample of approximately 10% of the schools in the population. The 10% was seen to be an ideal number considering that the population of 128 schools would in essence have meant that there were 2 378 eligible participants. That number of participants would be difficult to reach. In selecting the 10% of the schools a table of random numbers was used and 13 schools were finally included in the study. Specifically, each school was given a number ranging from 1 to 128. The numbers were then defined in the Research randomizer (2011)

which generated different sets, and set 5 was selected. In selecting the 13 schools, this meant that automatically the 13 principals were selected. In selecting teachers from each school, the researcher assigned numbers from 1 to n (where n was the number of teachers in a particular school) and the Research randomizer (2011) was used to select one. Three SGB members representing each school were also selected in a similar manner as the teachers. This means that the sample was made up of 65 participants, comprising 13 principals as well as 13 teachers and 39 SGB members. Participation by all individuals was voluntary because the purpose of the study was clearly explained to all possible participants. All questions and queries were addressed to their satisfaction. Examples of questions asked included (a) "... will you put my name in your report?" (b) "... will you report what I say to the department of education?" and so on. Following this process, it was indicated to the participants that if they so wished they could decline to participate. Those who consented to participate were then requested to sign a consent form.

Instrument and Procedure

In this study both qualitative and quantitative methods of collecting data were utilized. In essence this was a mixed methods study. It is averred that the goal "...of mixed methods research is not to replace either of these approaches but rather to draw from the strengths and minimize the weaknesses of both in single research studies ... " (Johnson, & Onwuegbuzie, 2004, pp. 14 - 15). In a similar vein, it has been pointed out that when the two methods are used in combination, the weakness of one could be balanced by the strength of the other (Breakwell & Millard, 1995). The aim of utilising both qualitative and quantitative methods here was to use these as some form of triangulating findings. This means that one method was used in some aspects of the study to verify and corroborate participants' assertions and views in the other method. A questionnaire comprising two sections was used to collect data. The first section requested the participants to provide biographical data in terms of age, gender, highest academic qualification and work experience. The second section determined the views of stakeholders on the principal as a school project manager.

RESULTS

Biographical Data

Participants were 65 teachers, principals and school governing body members. Table 2 shows the biographical data that the participants were requested to provide. It may be observed from the table that the majority of participants were men. Participants' ages ranged between 21 years and 55 years ($M = 35.4$; $SD = 9.6$). The table further reveals that the majority (56.9%) of the participants had completed either a diploma or a degree and higher. It is worth noticing that most of the teachers (53.8%) had teaching experience of 9 years or less. Where the teaching experience ranged between 5 years and 21 years ($M = 11$ years; $SD = 4.9$). With respect to SGB members, a majority (66.7%) had work experience of 15 years or more where experience ranged between 5 years and 22 years ($M = 14.3$ years; $SD = 5.4$).

Table 1: Biographical information of the participants (N = 65)

Category		N	%
<i>Gender</i>			
	Women	31	47.7
	Men	34	52.3
<i>Age</i>			
	20 – 29	27	41.5
	30 – 39	13	20.0
	40 +	25	38.5
<i>Highest academic qualification</i>			
	Grade 12	28	43.1
	Diploma (e.g. Diploma in primary education)	22	33.8
	Degree or higher(e.g. B.A. or B.A. Honours)	15	23.1
<i>Position held in school</i>			
	Educator	13	20.0

Principal	13	20.0
School governing body member	39	60.0
<i>Teaching experience (Teachers)</i>		
5 – 9	14	53.8
10 – 14	4	15.4
15 - +	8	30.8
<i>Work experience (SGB Members)</i>		
5 – 9	13	33.3
10 – 14	6	15.4
15 - +	20	51.3

Deliberations on the Principal as a Project Manager in a School Project

In establishing the reliability of the views about the principal as a project manager (VPPM) Cronbach's (1951) alpha as a measure of the internal consistency of scores obtained from the scale was computed. To establish the validity of the VPPM two processes were followed. First the researcher requested three academics to provide expert opinion on the scale. Second, exploratory analysis was computed where the scale scores were subjected to a principal components analysis. Firstly, the internal consistency of scores from the questionnaire were determined and the value of alpha was found to be .75 [95% CI: $\alpha = .65 - \alpha = .83$]. This alpha value was adjudged to be fair since it is greater than .70 and less than .80 (Cicchetti, 1994). So participants' scores on the VPPM were adjudged to be reliable. Initially face validity was established by giving the VPPM scale to three academics. The researchers explained to the academics what the scale was developed for. Following this the researchers then requested the three to provide expert opinion on any issue they observed about the scale. The first recommended input was about changing the researchers' four point scale into a five point scale. Regarding this issue the researcher had four rating points for the scale namely, 4 = Strongly Agree, 3 = Agree, 2 = Disagree and 1 = Strongly Disagree. The academics suggested that a fifth rating point be added. The researcher duly added the rating point named 5 = I don't know. In the original scale the researchers had divided the questions into four areas each with its heading. In doing this, the researchers thought that the questions were about (a) project management, (b) principals' pressure from other duties, (c) the principal as a resource provider, and (d) the principal as a human resource manager. Regarding the four areas the researchers were advised to remove these. The academics argued that if principal components analysis was to be conducted then the headings should be derived from resulting factors. Finally, the academics requested a change in a few item statements. For example, an initial statement was: *The principal is often seen at the project site for checking on the project progress*. This statement was changed to read: *The principal frequently visits the project site to check on progress*. After all this process, the academics certified that they were happy with the resultant scale. In this instance face validity of the scale was accepted.

Content validity was further assessed through principal components analysis (PCA) which was computed with the aim of exploring the data. Firstly, a varimax rotated matrix with eigenvalues greater than unity indicated a five factor solution. This solution had a total explained variance of 68.1%. However an inspection of the resultant components for the five factors did not make theoretical sense. So the next step was to explore a four and a three factor solution. The three factor solution appeared to make better theoretical sense. Table 2 shows the structure coefficients of the three factor solution on views about principals on project management. The three factors had eigenvalues of 3.71, 2.67 and 1.93 respectively as well as accounted for 51.95% of the variability in the scores. It has been suggested that researchers should run reliability tests on all resultant factors before using them in subsequent analyses (Reynaldo & Santos, 1999). It was on this basis that a test of the internal consistency of the scores from each of the three factors was determined. The internal consistency scores of Factor 1 was .78 [95% CI: $\alpha = .69 - \alpha = .85$], for Factor 2 it was .72 [95% CI: $\alpha = .61 - \alpha = .81$] and for Factor 3 it was .69 [95% CI: $\alpha = .57 - \alpha = .79$]. So in essence the three factors were found to be fair and acceptable (Cicchetti, 1994). Because the three factor solution had reliable scores from the scale, content validity was also accepted based on findings of the exploratory analysis.

Table 2: Structure coefficients from principal components analysis of the views about principals on project management functions, three-factor model (N = 65)

	Factor
--	--------

	1	2	3
1. Assists new workers on the project with his knowledge	.824		
2. The principal ensures that there is a conducive atmosphere for the project to be a success	.738		
3. The principal is considered as the most important part of the project	.663		
4. The principal organizes enough funds well on time for the smooth running of the project	.654		
5. The principal is knowledgeable about project management and channel all resources towards efficient and effective use in a project	.563		
6. The principal provides meaningful staff development opportunities (workshops and in-service training on project management)	.503		
7. The principal has a good understanding of what project management is all about		.769	
8. The principal is able to advise other stakeholders on related project issues		.737	
9. The principal is readily accepted as the project manager by members of the project team		.713	
10. The principal frequently visits the project site to check on progress		.633	
11. The principal is able to observe the project and give feedback to all stakeholders (at least on monthly basis)		.539	
12. Unscheduled visits by members of the Department of education officials and parents often disrupts the principal's plans			.784
13. The principal's activities are thorough and the project does not interfere with his daily schedules			.775
14. The principal's office is often flooded by educators and learners' matters hence taking his project management time			.738
15. Promotes quality in the project at all times			.521
16. Attends to project worker's problems promptly and objectively			.326
α	.78	.72	.69
Eigenvalues	3.7	2.7	1.9
Variance (%)	23.2	16.7	12.0

Views about the Principal as a Project Manager

An inspection of the items from principal components analysis led the researcher into naming the factors in terms of the principal as: *a project organiser* (Factor 1, six items), *a project leader* (Factor 2, five items) and *a project time manager* (Factor 3, five items) of project management activities. The analysis of the views about the principal on project management, were based on the three established factors.

The principal as a project Organiser

Table 3 shows the measures of central tendency and the standard deviations of the items statement relating to the principal as a project organiser. The table shows that the responses were consistently clustering around a score of four.

Table 3: Measures of central tendency and standard deviations relating to the six items of the principal as a project organiser (N = 65)

	Item 1	Item 2	Item 3	Item 4	Item 5	Item 6
No response	5	5	5	5	5	
Mean	4.20	4.33	4.13	4.13	4.13	4.12
Median	4.00	4.00	4.00	4.00	4.00	4.00
Mode	4	4	4	4	5	4
SD	1.08	.68	1.00	.91	1.02	.94

In all the six item statements, a majority of participants agreed or strongly agreed that the principal was a project organiser. As an illustration of this contention, Figure 3 provides a rating of the item statement: *The principal*

provides meaningful staff development opportunities (workshops and in-service training on project management). It is observable from the figure that 86.7% were of the view that the principal was a project organiser.

Figure 3: Percentage distributions of participants on an item about the principal as a project organiser

Table 4 shows the measures of central tendency and the standard deviations of the items statement relating to the principal as a project leader. Similarly as in the previous instance Table 4 shows that the measures of central tendency were around a score of four. In all the five item statements, a majority of participants indicated that they agreed or strongly agreed that the principal was a project leader.

Table 4: Measures of central tendency and standard deviations relating to the five items of the principal as a project leader (N = 65)

	Item 1	Item 2	Item 3	Item 4	Item 5
No response	5	5	6	6	5
Mean	3.90	4.43	4.07	4.31	4.33
Median	4.00	5.00	4.00	4.00	4.50
Mode	4	5	4	5	5
SD	1.10	.72	1.10	.91	.86

Table 5 shows the measures of central tendency and the standard deviations of the items statement relating to the principal as a project time manager. The table shows that the responses were consistently clustering around a score of four. In all the five item statements, a majority of participants agreed or strongly agreed that the principal was a project time manager.

Table 5: Measures of central tendency and standard deviations relating to the five items of the principal as a project time manager (N = 65)

	Item 1	Item 2	Item 3	Item 4	Item 5
No response	5	5	5	5	5
Mean	3.85	3.70	3.83	4.20	4.12
Median	4.00	4.00	4.00	4.00	4.00
Mode	4	4	4	4	4
SD	1.26	1.25	1.25	.99	.92

As an illustration of this view, Figure 5 provides a rating of the item statement: *The principal's office is often flooded by educators and learners' matters hence taking his project management time.* It is observable from the figure that 75.0% were of the view that the principal was a project time manager.

DISCUSSION

The results presented here have shown that the participants were relatively mature individuals most of whom (58.5%) were 30 years or older. They were fairly educated with 56.9% in possession of a diploma or higher qualification. Also, 58.5% had good work experience because they reported that they had been working for 10

years or more. The interviewees were asked, “What is your view of the principal as a school project manager?” Here the interviewees saw the principal as an ideal person to manage school projects on two accounts. In the first argument the interviewees indicated principals are leaders so the responsibility for projects must be with them. The second argument endorsing principals as school project managers was based on the fact that they were the representatives of the department of education where they were. Excerpts from the interviews illustrate this. For example Respondent 17 answered the question by stating: “...the principal as the head of the school has to be the project manager in her school ...because the principal is seen as a manager in the school, therefore no one is seen to have as much authority as the principal. It is therefore the principal's call to be the project manager”. Respondent 24 supported Respondent 37 sentiments by stating that: “...principals are project managers in their schools because they are the leaders ... the principal is viewed as the ‘department on the spot’ ... he is the one who looks into the interest of the department, therefore no one else should be the project manager in the school than the principal”. Similarly Respondent 47 stated “...principals have love for their schools ... know the mission and vision of their school and they are at the school to see to it that everything in the school is implemented. It is therefore very important that the principal becomes the manager of the school projects”.

Figure 4: Percentage distributions of participants on an item about the principal as a project leader

On the issue of the projects managed by principals achieving desired outcomes, the interviewees were asked, “Regarding projects managed by your principal, were the desired outcomes achieved?” Here a mixture of responses was received. In some instances the desired outcomes were achieved while in others they were not. The following excerpts illustrate this. To contextualise her answer, Respondent 15 talked about poverty around the school. In this regard she mentioned how learners came to school hungry leading to a project to start a school garden. She then intimated, “...the desired outcomes were reached since our learners got fresh products from our garden ... we then had a new fence and a house.” Asked what the house was for, she revealed “... for an educator to live in because we wanted him to guard the garden and the school premises.” On the other hand, Respondent 18 indicated: “No.” On further probing he related an instance where the school was to build a science laboratory. He reported “... the project did not achieve its desired outcomes ... we ran out of funds ...it was also taking too long to complete the laboratory”. He was then asked what he thought was the reason things happened this way? His response was “I don’t think everybody had experience on the budget and how long the project would take.” It was also reiterated in the face-to-face interviews here that principals were inclusive when dealing with project management issues. It was further reported that desired outcomes of projects were achieved in some instances while in others they were not achieved. Respondents also indicated that it did not matter if team members did not have a clue about project management. In fact they felt it was the duty of the principal to teach other project management members. The latter view about the principal is perhaps the reason some projects were reported to fail. Most importantly, this view goes against project management functions that include conducting a feasibility study, good communication, and risk management for example. It has been argued here that when these functions are not addressed the likelihood of the failure of projects gets enhanced. This study in a way has inherently illustrated how stakeholders believe that principals should be responsible for the management of projects in their schools. The fact of the matter though is that principals, educators and SGB members do not necessarily possess the requisite skills to run projects. In fact, schools of education or even the department of education do not provide pre-service or in-service training for those charged with overseeing

projects in schools. The researchers therefore are of the view that the guidelines recommended from this study will be invaluable to (a) education authorities, (b) school principals who in general are project leaders and (c) SGB members who should not be assumed to know all processes within schools because the law affords them the right to be part of these.

The main authorities in this study were identified to be the department of education and universities' departments of education. The Department of Basic Education (DoBE) should prepare lifelong learning programs geared to assist the stakeholders in running projects at school. The DoBE may introduce in-service training meant to provide skills to all those who are already in the field. This also suggests that whenever parents become SGB members they will have to attend such in-service training. The expectation here is that the department needs to budget for and organise all the necessary arrangements including the expertise to run the training. The DoBE may advise departments of education within universities to introduce modules that address issues relating to running projects at schools. In essence the universities may offer for instance an Advanced Certificate in Education (ACE) with specialisation in school project management. It is important therefore that the training and skilling of the principals should also be incentivised in order to encourage them to participate in school projects. The results of this study notwithstanding, some suggestions for further research are provided. This study was conducted in one district in the North West province. It would be interesting to determine whether similar findings would be established in other districts or in other provinces. Such findings will be important in endorsing what has been reported here and helping in building the knowledge base in this area. In this study reliability and content validity of the views about the principal as a project manager was reported. It would be useful to determine whether similar findings as reported here for reliability and validity, would be attained in other contexts. Using exploratory factor analysis it was reported that participants saw the principal as a project (a) organiser (b) leader, and (c) time manager. It is suggested that further research should be conducted to see if these three variables will still be identifiable.

Limitations

It has to be stated that even if the sample of this study was randomly selected, the results presented here are in no way meant to be generalised to all schools in the North West province for instance. This is said since we are mindful of the fact that schools may be in the same province but conditions in those schools cannot be the same. With hindsight the researchers feel that it would have added value to have interviewed the participants. The researchers acknowledge this as a limitation because interviews may have illustrated what participants exactly meant in reporting that... *the principal is viewed as the 'department on the spot'* ...for example. It is worth pointing out that project management is a vast field of study on its own hence this paper may not be seen as comprehensive in any way. Because of this, the researchers' aim was to illustrate how complex project management is and it was therefore important that such an endeavour be left to the school principal since he is more knowledgeable than other SGB members.

IDENTIFYING COMMUNITIES FOR DEVELOPMENT IN POST SOUTH AFRICA: MISSING THE TARGET

Mochechela Maria Mologade
University of Limpopo, South Africa

ABSTRACT

The purpose of this paper is to demonstrate that in its developmental approach, the South African government uses a “one- size- fits- all” approach to communities without considering the differences in community characteristics. South Africa has since post 1994 experienced a variety of unrest in which communities demonstrated their concerns and dissatisfactions about service delivery while others were dissatisfied about the municipal jurisdictions and borders. The State has defined itself to be a developmental state that seeks to work together with communities for the realisation of its development objectives. Communities are heterogeneous; as such a single approach by government to address development issues in communities with different characteristics creates a confusion of their targeted clients. Community participation and identification of a community for development are requisites to the realisation of the expected development. One of the responsibilities of the local government is to provide services to the community and to encourage community participation in order to achieve the required development. This paper argues that South Africa has since its democratic dispensation failed to identify communities for development and it also emphasises the importance of defining and identifying communities for the realisation of the expected development.

Key words: Community, Community participation, Local government, Development

INTRODUCTION

According to Blair (2000) the promise of local government is that by building popular participation and accountability into local governance, the local government will be responsive to the needs of the communities and improve its service delivery. In South Africa the different spheres of government (namely national, provincial and local government) were established each with its distinctive and interrelated responsibilities. It is a legal requirement that municipalities involve communities in the affairs of local government. Thus, Section 152 of the Constitution of the Republic South Africa 1996 and Municipal System Act 32 of 2000 confirm the rights of communities to be involved in local governance by encouraging the involvement of communities and community organisations in the matters of local government. In fulfilling this constitutional responsibility, section 16(1) of the South African Municipal Systems Act 32 of 2000 requires each municipality to develop a culture of municipal governance that complements formal representative government with a system of participatory governance. This system of participatory governance serves to encourage and create conditions for local communities to participate in the affairs of the municipality. Section 153 of the Constitution of the Republic of South Africa, 1996 states that “a municipality must structure and manage its administration and budgeting and planning processes to give priority to the basic needs of the community and to promote the social and economic development of the community”. Therefore, the responsibility of promoting community participation and local socio-economic development lies with local municipalities.

Blair (2000) states that local government is regarded as a meaningful authority given to local units of governance so that they are accessible and accountable to the communities, who enjoy political rights and freedom to participate in the issues of local government. Blair (2000); Gaventa (2002) and Devas & Grant (2003) continue to indicate that local government has a number of responsibilities which are accountability, promote community participation, and performance in service delivery. Based on the above point, it is important

for the local government to identify the type of community they are accountable to, so that they can be able to respond to the needs of the local communities.

According to Davids, Theron and Maphunye (2005) community participation is an essential part of human growth, which is the development of self-confidence, pride, initiative, responsibility and cooperation. Theron (2008) and Todaro (2006) state that participation is a means to further human capabilities and other goals of development. Therefore, it can be confidently argued that community participation is a backbone of making any development endeavor a success and at the same time a means of empowering and investing in communities. Tosun (2000) argue that the involvement of the public in a developmental process has two considerations, which are philosophical and pragmatic. The philosophical consideration is related to the political theories of democracy that people have the right to be involved and allowed to make their views heard to the decision makers on matters affecting their lives. Whereas the pragmatic considerations are related to the failure of plans and decision making process which could not correctly determine and identify the development needs of the community. A philosophical consideration therefore emphasises the importance of community identification in the quest of responding to the development needs and expectation of the local communities. The purpose of this paper is to demonstrate that in its developmental approach, the South African government uses one- size- fits- all approach to communities without considering the differences in community characteristics. That is the government employs the same approach to address development issues in communities with different characteristics and different development issues. It is against this background that this paper argues that South Africa has since its democratic dispensation failed to correctly identify communities for development and it emphasises the importance of defining and identifying communities for the realisation of the expected development.

THE CONCEPT OF COMMUNITY PARTICIPATION

Community participation as a concept is significant in order to understand its importance and the hindrances to successful community participation. Community participation is accepted and supported by many scholars such as Davis *et.al* (2005); Tosun (2005); Nyaupane, Morais & Dowler *et.al* (2006) and Redzuan & Aref (2008) as a strategy for development. However, these scholars also content that there are different interpretations, terms and processes used to clearly state what community participation is, and consequently, this implies that there is no agreement and a commonly shared definition among these scholars on what community participation means.

According to Redzuan and Aref (2008) the level of participation's influence and control of decision-making, actions and outcomes can however serve as key to different description of community participation. Aucamp (2009) states that the levels of participation differ widely according to the nature of the intervention and the knowledge and abilities of those affected by the activities taking place. On the contrary, Tosun (2005) argue that the absence of a standardised and formal processes and procedures to community participation maybe desirable, since the attempts to have these procedures and processes have proved to severely limit the flexibility needed in the development process. Redzuan & Aref (2008) and Aucamp (2008) state that even though there are no formal procedures and processes that should be set for community participation, but it is necessary to have a category as stated that the level of participation and influence of the participants may help in describing to a certain level what community participation entails.

Since community participation is regarded as an ambiguous and a vague concept, it is recommended that each researcher define community participation to suit their study and the sector in which they are discussing community participation. Therefore for the purpose of this paper, the definition which will be adopted is the ones by Tosun (2005) and Redzuan & Aref (2008) which perceive community participation to be, a process whereby the residents of a community are given a voice and a choice to participate in issues affecting their lives. According to the above definitions it can be asserted that community participation as a tool and strategy exists to encourage communities to be in charge of the development processes and activities taking place in their areas by deciding on how they want their resources to be used for their own development.

STATUTORY FRAMEWORK FOR COMMUNITY PARTICIPATION IN SOUTH AFRICA

In an attempt to operationalise community participation, South Africa has legislation to support the manner in which community members can with government process. South Africa has a well-established policy and legal framework for community participation and empowerment. Section 152 of the Constitution of the Republic of South Africa of 1996 sets out the directives and objectives of local government which are as follows:

- To provide democratic and accountable government for local communities;
- To ensure the provision of services to communities in a sustainable manner;
- To promote social economic development;
- To promote a safe and healthy environment; and
- To encourage the involvement of communities and community organisations in the matters of local government

DPLG (2009) clearly states that municipalities have a legal obligation to encourage community participation in the local government issues, how the municipality operates and functions. The White Paper on Local Government of 1998 in the quest of encouraging community participation, states that participation by communities has to be encouraged at four levels which are:

- As voters, to ensure maximum democratic accountability of the elected political leadership for the policies they are empowered to promote. This point relates to political participation where community members are encouraged to participate as voters or members of organised political structures.
- As citizens who express, via different stakeholder associations, their views before, during and after the policy development process in order to ensure that policies reflect community preferences as far as possible. Communities are encouraged to participate through organised community organisations in processes of policy development which will affect their lives if approved implemented.
- As consumers and end-users, who expect value-for-money, affordable services and courteous and responsive services. Community members are encouraged to voice out their concerns on issues of service delivery and development since they are the end users of the services provided by the local government.
- As organised partners involved in the mobilisation of resources for development via business, non-governmental organisations and community based institutions. This element encourages community members to participate through organised and recognised community organisations, non-governmental organisations and through institutional channels of participation such as IDPs to participate in development processes affecting their lives.

It can be said that there is enough legislation set to specifically address the issue of community participation and to encourage communities to participate in the issues of development and local governance which affect their lives. The provision for legislation on community participation has been set to accommodate all community members and community organisations within the municipal borders at different levels.

THE CONSTRAINTS OF COMMUNITY PARTICIPATION

South Africa has good legislation available to encourage communities to participate in development initiatives. However, despite the available legislation, there are constraints which need to be dealt with for improved community participation. Even though community participation is highly recommended and desirable by its proponents it has its constraints and barriers which need to be dealt with to make it a success. Gaventa and Valderrama (1999) point out that the gap between the promises of improved community participation through local government and the everyday realities of the politics of participation necessitates the need to understand the constraints and dynamics to community participation in the local governance.

Power relations

Community participation in most cases is more about power and the influence of the social actors, where those who occupy higher positions in the community, in government and politics get invited to community meetings where important decisions will be made on behalf of all the communities. For example Devas & Grant (2003) and Gaventa & Valderrama (1999) state that control by the government over decisions and about the nature and structure of participatory channels at the local level restricts the influence of the traditional decision-making bodies in the local affairs. McEwan (2002) in her study *“Bringing government to the people”: Women, local*

governance and community participation in South Africa” indicates that evidence of elite co-operation exist in Cape Town in areas like Kommatjie, where affluent people are heavily involved in the local forums and they control the direction of resource use.

Participatory skills

Participation by community members to some extent requires some level of participatory skill as participatory processes become more complex and requires different type of skills such as knowledge, experience, leadership, and managerial capabilities. This barrier also relate to issues of local communities not receiving support from researchers, government departments and institutions within the communities. Tosun (2005) asks a question which if not answered it will always be a barrier to community participation, “Do the community members have the motivation and are they ready to participate in the process of development?” The lack of participatory skills by community members affect their confidence and as such they end up abandoning their responsibility of participating in issues of development which at the end are the ones affected and live with the decisions taken. Gaventa and Valderrama (1999) for example emphasised the importance of having some level of skills in participation by indicating that “the inability of local government officers to translate local needs into technical proposals of high quality standards provided and excuse for bureaucrats in higher levels of administration to disregard district plan on the situations where local communities have provided their inputs.

Political will

Problems over political alignment are evident in Cape Town where Community Based Organisations in townships such as women’s groups and residents’ associations have found themselves at loggerheads with the local council because of their political affiliations. Despite the formal channels of participation in place and open for all community members and the community organisations no approval for projects can get through the “other” party dominated council (McEwan 2002). Gaventa and Valderrama (1999) argue that the absence of a strong and determined authority in providing opportunities for community participation at the local level, as well as the lack of political will by local government officials to enforce the legislation that has been created for the purpose of enhancing community participation retard and hinder the process of community participation.

Lack of consultation from the side of local government

According Stiglitz (2002) participatory processes must entail open dialogue and active community participation and requires that communities have a voice in the development decisions that affect them. McEwan (2002) in the interview with the representatives of the South African Civic Organisation in Langa Township in Cape Town indicates that it became clear that the relationship between the civic organisations and local government is problematic and hinders the socio-economic development process. The local government often does not consult with the civic structures which represent a large number of community members, especially women, and does not recognise the role of Community Based Organisations which are accused of being anti-development.

The level of participation

Strengthening participation in local governance requires the strengthening of direct community involvement in decision making by communities in development processes, through institutional channels of participation in place such as Integrated Development Planning (IDP) forums and ward committees. Even though these channels of participation are in place, and there is also legislation that encourages community participation through organised community organisations these channels are not being used by the local communities. (Nyaupane *et.al* 2006). Agrawal & Gibson (1999) believe that one element that makes community participation to be a success is their common interests and shared norms, but at the same time they too can become a constraint where norms become an obstacle to those interested in participating in development processes such as women and youth because of their social standing in their communities.

Insufficient financial resources at the local

A common barrier for community participation in decision making found in many studies such as *Participation, Citizen and Local Government by Gaventa and Valderrama (1999)* was the control of financial resources by higher levels of authority and the minimal resources available for local activities. Lowndes, Pratchett & Stoker (2001) and Redzuan and Aref (2008) identified lack of financial resources, lack of trained human resources and high cost of participation as one of the barriers of community participation. Nyaupane *et.al* (2006) supports the above statement by indicating that local communities may not have the investment knowhow or even the infrastructure necessary to take on the initiatives in development processes. This means that even if there can be a high level of participation of communities in decision making processes, but resources be owned by the few elite or by external forces, community participation will have minimal or no impact in terms of economic development.

WHAT MAKES THE COMMUNITY?

Barnett & Crowther (1998) states that the concept of community is elusive, for example, he indicates that Hillary (1955) listed 94 definitions of community whose common denominator was that they all dealt with people. Bell & Newby (1971) hold that community is a “God word” and has at times escaped the intellectual rigour, being perceived either as a lost ideal past or as a future to be aspired to”. Agrawal & Gibson (1999); Billings (2000) and Blaikie (2006) hold that the concept of community is the source of much debate in literature and it is rarely defined with precision. Flint, Luloff & Finley (2008) state that communities can rarely be characterised as homogeneous groups of likeminded people. Community arises through concerted actions of locals who are tied to a place by their shared values, concerns, interests and actions. Flint, Luloff & Finley (2008) assert that community is conceptualised as a process of place oriented social interactions that express shared interests among residents of a local society and are expressed in prevailing local narratives.

Based on the above deliberations it can be concluded that the concept of community goes beyond being understood in geographical aspects only, but rather be understood as a concept that encompasses a number of characteristics which among others include: emotions; culture; shared norms and values; religion; ethnicity and different actors sharing the same territory. It is important to indicate that the definition in this regard defines a community as people sharing a physical space, and to some extent sharing the same values and interests. Based on the complex nature of the concept of community, it is therefore critical for the government to have a model and a system in place which will enable them to identify communities for development.

IDENTIFYING COMMUNITIES FOR DEVELOPMENT

The concept of community is complex and vague, as such, it is critical for the government to identify communities for development. In its quest to improve community participation, South Africa has a formal legislation to support the process of community participation, and for this to be realised, a need to identify a community for development becomes very important. The Constitution of the Republic of South Africa of 1996 recognises and defines communities in the confined of a geographical setting or location. The position of the Constitution about the community puts municipalities in a very difficult position since communities are not and cannot be defined only using the geographical or territorial limit only, but should also recognise the different characteristics within a particular community. Agrawal & Gibson (1999) and Blaikie (2006) indicate that community needs to be understood in three aspects which are: community as a spatial unit; as a homogeneous social structure; and as a set of shared norms. The White Paper on Local Government of 1998 requires active participation by communities at four levels namely as voters; as citizens; as consumers; as well as organised partners (*Supra* 3). Section 16(1) of the South African Municipal Systems Act 32 of 2000 requires each municipality to develop a culture of municipal governance that complements formal representative government with a system of participatory governance.

MODEL(S) OF COMMUNITY IDENTIFICATION

Communities are a complex system and a complex term to defined and understood. But, at the same time are very crucial for community participation and development initiatives to be realized. For development initiatives and community participation to be realized, a community for development needs to be identified and defined. Government is faced with a challenge of identifying a community so as to provide services to the relevant communities. There is therefore a need to recommend and identify a model(s) for community identification which will enable the government to identify communities for development and to provide services to the relevant communities. Three models of community identification will be discussed below, which are Locality Development, Social Planning and Policy Change and Social Action and System Advocacy.

Social Planning and Policy Change- is orientated towards policy solutions, changing or passing laws or regulations to address problems or conditions such as development problems. Particularly those problems which are identified by officials or leaders from within the community or outside the community. These policies should be determined through a participatory process that involves everyone who will benefit from the policies or will be affected by the policies. This model often involves people with expertise from outside the community working with the community members on the strategy and planning (Buckley 2012; and Berkowitz 2013).

Social Action and System Advocacy- this model is based on the assumption that there is strength in numbers. By banding together and taking action, ordinary people gain political and economic power to create change. Social action is often important and mostly used where serious inequity exists and there is no will on the part of those in power to correct the situation. The group disadvantaged by a situation, through a collective action, can gain and exercise power and bring about a more equitable distribution of official attention and resources (Berkowitz 2013).

Locality Development- it serves as a base for organising and is often aimed at community-wide issues that affect everyone, such as development challenges. To be effective, Locality Development process should be inclusive and participatory, that is, all sectors of the community should be included as full participants in all phases of addressing community issues and working towards achieving a common goal and a better life. The Locality Development approach assumes that communities are not the same, but diverse. Diversity here refers to more than skin color and background; it encompasses different opinions, political stances, income, attitudes and many more factors that make communities to be diverse (Hardcastle & Powers 2004; and Berkowitz 2013).

FACTORS TO BE CONSIDERED WHEN IDENTIFYING A COMMUNITY

Community situations are unique; some situations affect some segments of the community, whereas in some cases situations affect all members of the community. Thus, it is important to identify a community which is or will be affected by a situation and respond to the situation and to the relevant communities. Locality Development is an inclusive process and who to be included in a particular identified community for a development intervention is determined by the situation or the problem at hand. To identify a community, Locality Development Approach recommends the following:

- Interest in the effort or intervention- government need to identify a specific segment of the community which is interested in a particular development intervention;
- Demographic profile of a community such as age, race, gender, ethnicity, language, religion; income-demographic profile is very important since it allows the government to understand the type of communities they are dealing, their background and sometimes it could even allow them to understand the development challenges communities are facing;
- Geography which may include different people from different communities, but form one ward- a situation may affect different people from different communities, for example, in South Africa there are wards which are made of number of communities, it is important to also consider the geographic area of the people who are or will be affected by the development intervention;
- Class identification- is a matter of attitudes, personal history and factors such as income and social standing in the community. This element helps to understand the type of people the local government is dealing with, their perceptions of development initiatives taking place and also the influence they may have in the community;

- Culture- it may be linked to the ethnic or racial background and how the community believe in doing things; and
- Organisations and institutions- within communities there are various institutions and organisations such as NGOs, churches, hospitals, universities and political organisations which should be considered when identifying a community since they may have a certain influence and even resources and knowledge for the success of the development initiatives (Hardcastle & Powers 2004, and Berkowitz 2013).

STEPS TO LOCALITY DEVELOPMENT

To identify and understand a community, local government can follow the suggested steps below.

- Get to know the community; identify the reasons that the community is willing to organise; recruit community members to the effort or intervention; build a communication plan; encourage leadership from the community from the beginning; create a structure to help the community accomplish its goals; define the most important issues that relate to the community's overall concerns; develop a strategic plan; implement the plan; and continually evaluate and monitor the work (Hardcastle & Powers 2004, and Berkowitz 2013).

The above steps emphasises the importance of understanding the community by understanding their history, how community members relate to one another, to establish a common ground in the community which will bring the community to work together as a collective. The steps also indicate the importance of having a communication system which will enhance the relationships among the community members and make an effort that the development initiative is owned by the community, which will create a sense of ownership in the communities and boost their confidence in the system.

Locality development is a facet of community organising which its emphasis is on building an infrastructure of relationships, processes and systems that makes it possible for the community to solve its own problems and respond to its own needs through planning, action and advocacy; Social planning and policy change use the political and other systems to create policies that work towards improving the quality of life for all citizens; and Social action and systems advocacy engages citizens in understanding and building power, and using it to advocate and negotiate for the interests of the community needs (Hardcastle & Powers 2004, Buckley 2012 and Berkowitz 2013). Based from the above discussed models of community identification, Locality Development approach is a recommended approach for the government to use to identify communities for development, mainly because it provides a methodology to be followed when identifying a community for development. It is also relevant to address issues that affect the community at large; it is an inclusive process that encourages active participation by all members of the communities who will benefit or be affected by the intervention.

CONCLUSION

Local government is a sphere of government that is closer to the people and charged with the responsibility of promoting community participation. For the local government to be able to act on its mandate of encouraging community participation, it is important that the local government define the kind of community they serve. Government should be in a position to state clearly if they serve people who they define as voters who hold the local government accountable to promote policies they are elected to promote and placed the government in power; as citizens or organised community organisations who have a say in how policies should be developed and implemented; as consumers and end-users who expect value-for-money, affordable and responsive services, who are able to voice their concerns on issues of service delivery if they are not satisfied; and finally communities as organised partners involved in mobilisation of resources for development via businesses, NGOs, and community based institutions and participating through institutional channels of participation in place such ward meetings and Integrated Development Planning processes. For the government to be able to identify a community for development, Locality Development model can be used to help with that process and enable government to respond to the correct community. The Locality Development model is recommended because it provides a methodology to be followed when identifying a community, and it is an inclusive and participatory model that encourages community members to actively participate in their development initiatives in their communities.

THE STRATEGIC IMPLICATIONS OF ALLIANCES FOR THE INTERNATIONALIZATION OF FIRMS IN EMERGING COUNTRIES: THE CASE OF TOTVS

Sylvia T. de A. Moraes and T. Diana L. van Aduard de Macedo-Soares
Pontifical Catholic University, Brazil

ABSTRACT

The aim of this article is to present the results of research which identified opportunities created by the alliances formed by Totvs, a leading Brazilian firm, to further its internationalization. The study adopted a relationship network perspective using relational constructs. The results suggest that alliances generate more opportunities than threats for Totvs's international expansion, with the most important being those entered into franchises with resellers and into agreements with suppliers. This article seeks to contribute to research on the influence of alliances on firms' internationalization using a network theory approach and also provide support for strategic decision-making regarding alliance management in a global context.

INTRODUCTION

The 1990s, following the trade liberalization adopted by some developing countries, especially in Latin America and Asia, witnessed a sharp increase in investments in the software industry. In Brazil's case the sector achieved revenues of US\$7.7 billion in 2001, having recorded double-digit growth in revenues during the previous decade, albeit still heavily concentrated in the domestic market (Arora & Gambardella, 2005; SOFTEX, 2009). However, although Brazil as a whole is still a relatively insignificant software exporter, (in 2009 exports accounted for only 4.8% of total IT industry revenues), some of the sector's companies stood out due their rapid growth and internationalization process (SOFTEX, 2009). This is somewhat surprising given that high technology industries are not very common in developing countries (Arora & Gambardella, 2005).

Since the BRICS acronym was formulated by the economist Jim O'Neill, head of global economic research at Goldman Sachs, in a 2001 study, attention has increasingly been drawn to Brazil's growth process, with internationalization being one of the most frequently debated topics. The software industry has achieved a preeminent position among sectors due to the proliferation of internationally competitive firms in emerging countries such as India and China (Veloso, Botelho, Tschang, & Amsden, 2003). Indeed, there are many references in the international strategy literature to these two countries, but few mention Brazil, especially in relation to the information technology sector. Few studies have been published on Brazilian IT companies dealing with the implications – in terms of opportunities and threats – of these firms' alliance networks for their strategies. The present study sought to identify the opportunities created by alliances for the internationalization of Totvs, Brazil's dominant software firm in the domestic market.

Totvs' main business is the development and commercialization of the right to use applications, mainly corporate management systems or ERP (Enterprise Resource Planning). The company has roughly 5.500 direct employees, distributed in six subsidiaries, as well as more than 52 franchisees and over 40 alternative distribution channels in Brazil. In 2011, Totvs had nearly 26 thousand clients, added an average of 280 new customers per month and had recorded double-digit growth for 21 consecutive quarters, achieving sales of R\$1.3 billion. It had a 53.1% share of the ERP market in Brazil and 34.5% in Latin America, making it the sixth company in the world in terms of revenues (US\$ 409 million) and the first as regards growth (34.9%) (Cosentino, Haberkorn, & Cícero, 2001; Totvs Day, accessed at the www.totvs.com.br website 02/01/2013; Exame, 2012).

In its quest to become a leading player in the Brazilian market, Totvs, since 1993, has been investing in strategic alliances and merger and acquisition processes with domestic firms, which enabled it to become the leading company in the Brazilian software market in 1999. In international terms Totvs is present in 15 countries in Latin America with more than 400 customers and 300 employees in the region. It also has a franchise in Portugal and Angola, with more than 50 clients outside Latin America distributed in eight countries (Cosentino, et al., 2001; Totvs Day, accessed at the www.totvs.com.br website on 02/01/2013).

RESEARCH METHOD AND THEORETICAL FRAMEWORK

This article used the case-study method given that it involves research into a contemporary phenomenon which needs to be investigated in its specific context to be fully understood (Yin, 1989). Case studies should be used to confirm a theory or achieve deeper knowledge of an extremely important case (Yin, 1989; Eisenhardt, 1989). Considering the huge success achieved by the firm in recent decades, which is even more significant given the fiercely competitive nature of a sector that has powerful global players, and together with the fact that it was one of the first in this industry to initiate international activities, this case's value cannot be understated.

In order to ensure information consistency and limit biases, the data presented in this article was collected from various sources, thus permitting triangulation. Two types of interviews were undertaken with Totvs executives, with one using open questions (2 interviews) and the other a structured questionnaire (3 respondents). The documental research involved the collection of information from the specialized media (71 articles), company documents for investors (2 reports on the company website), as well as the book about the company written by its chief executive.

Relationships between firms are valued when there is cooperation and greater profitability is a direct consequence of the strengthening of the commitment to this relationship (Holm, Eriksson, & Johanson, 1996). This conclusion highlights the importance of the relational perspective, i.e., that pertaining to relationships – notably alliances and other ties such as those forged through mergers and acquisitions – for an understanding of the success factors of firms which use relationships to obtain a global presence (Gulati, Nohria, & Zaheer, 2000).

Due to the strong presence of networks in business nowadays, notably in the IT industry, it is fundamental for companies to incorporate this relational view into their strategic management (Gulati et al., 2000), analyzing the context of the focal firm and all its inter-organizational relations from the perspective of the network that they configure at various levels, including global ones (Hoffmann, 2007; Macedo-Soares, 2011).

By considering the resources provided by alliances and other relationships from this perspective it is also possible to obtain a deeper view of the ease with which a firm obtains its resources, technology, markets and information through its relationship network as well as the opportunities that appear within other objectives, which may lead it to share risks or outsource part of its value chain (Gulati et al., 2000).

In line with the previous considerations, the research decided to choose the Global SNA Framework (Macedo-Soares, 2011) as a conceptual framework for analyzing the impact of strategic alliances in Totvs' internationalization process, focusing at the software industry level. This framework helps to analyze and manage the strategies of firms which compete globally in alliances and networks, seeking to assess their dynamic strategic fit from both a global and relational perspective. It comprises three components: (a) a methodology or set of steps to conduct the analysis of the global strategic network; (b) reference lists to help data /information collection; (3) a conceptual model to map the focal firm's ego-net, which encompasses the firm and its main alliances within its wider value network.

Below are presented the main concepts underlying the above-mentioned framework, so that it may be fully understood. Although the theme at issue – firms' alliances and relationship networks and their strategic implications – lends itself to a much deeper analysis, the research opted for a briefer account in order to simplify the text.

MAIN CONCEPTS

A central concept of the research is strategic fit, i.e., a strategy is said to have fit when it is able to benefit the forces constituted by organizational resources, minimizing weaknesses to such an extent that the firm is able to exploit the opportunities and reduce the threats emanating from the environment (Barney, 1996; Hofer & Schendel, 1978). Macedo-Soares (2002; 2011) argues that strategic fit implies leveraging the forces constituted not only by the firm's internal resources but also those conferred by the firm's alliances and network, thus enabling it to exploit both global macro-environmental opportunities and those offered by the alliances and network, minimizing threats posed by both the global macro-environment and the network.

Another central concept is that of alliances the definition of which was based on Gulati (1998) as voluntary arrangements between two or more firms which may include co-development, sharing or exchange of products, services or technologies. Alliances were considered strategic when they contributed directly to the focal firm's competitive advantage (Macedo-Soares, 2011). Alliances were identified according to Contractor and Lorange's (1988) typology of linkages which is based on their degree of intensity and interdependence. Linkages were thus classified running the following gamut from high to low ends: mergers & acquisitions – M&A, independent joint ventures, cross equity ownership, minority equity investment, joint Research and Development - R & D, production, or marketing, franchise alliances, know-how or patent licensing, agreements (marketing, manufacturing, supply, services, distribution). Apart from M&A, the other linkages were considered to be alliances when they met our definition of alliances based on Gulati (*ibid*). In accordance with (Gulati et al., 2000), a strategic network was defined as a set of relationships with other firms, whether or not in the same industry, whether domestic or international. Given that the research at issue in this article sought to understand the contribution of alliances to a firm's internationalization process, it was fundamental to map its strategic network and the opportunities and threats it may provide. Thus, alliances were analyzed from a network theory perspective, using two concepts: ego-net and value-net. The definition of ego-net draws on Knoke's (2001) egocentric network concept as the net represented by the focal firm, its main relationships with partners and main relationships between partners in the context of its value-net. For Brandenburger and Nalebuff's (1996), the value-net includes all actors (partners and non-partners) as well as the interdependencies which influence the distribution of power between strategic actors and the focal firm and consequently its capacity to capture significant value for the firm's competitive advantage.

In the next section we present the results of the research which followed the steps of the Global SNA methodology, beginning with the characterization of firm strategy. To undertake this the research used: (a) Mintzberg's (1995) typology – differentiation by price, brand/image, support, quality/design or non-differentiation; (b) the classification of strategies as Global, Multi-domestic, Transnational or Global Multi-Business based on Harzing (2000) and Koza, Tallman and Attay (2011).

RESULTS

Characterization of Strategy

According to the replies to the structured questionnaires and information obtained in specialized magazines, Totvs uses a strategy of product differentiation by quality and design. The leading characteristic of the Totvs product is its ability to be adapted speedily to customer processes, in contrast to its main competitors who seek rather to alter processes to better adapt their software. This strategy is in line with the firm's decision to concentrate on small and medium firms (SMEs), as reported by the Director for International Market Operations: "We operate in the middle of the pyramid.....we have been doing this for 30 years...in the SMEs, where you have a larger number of firms with considerable software purchasing power".

Most interviewees defined Totvs' strategy as Transnational – i.e. a firm which operates globally but customizes its products to local market needs (Hitt, Ireland & Hoskisson, 2009), and one interviewee defined it as Global – supply of standardized products in key global markets through integrated operations which follow directives determined by head office (Harzing, 2000; Koza, et al., 2011). Although the basic product is entirely

developed in the country where headquarters are located, its above-mentioned characteristics of flexibility and customization permit an easy adaptation to local needs.

However, the research, based on company documents (2012 4th Quarterly Report, accessed at the Totvs website www.totvs.com.br on 02/01/2013), chose to categorize the company as Multi-domestic. Although it plans to enter key global markets (e.g. U.S.A.) and has a clear strategy to become a global benchmark (Totvs Day, accessed at the website www.totvs.com.br on 02/01/2013), its international sphere of operations is still strongly focused on the Latin American market. According to Totvs' International Market Operations Director: Looking ahead to 2015, it is the region of the planet that is going to grow the most in our segment... We still haven't managed to build the market share in Latin America that we have in Brazil and we want to achieve this before conquering a very distant frontier. We also made a study to examine our growth possibilities in southern Africa (Angola, Mozambique and South Africa) if we were to grow there 30% or 40% a year, in 5, 10 years we would not even achieve the equivalent of 0.5% of the US market. So the United States has become strategic for us because of its strength, and as it is beginning to grow again like a developed country it is once again a target for us. (...).

In fact a choice that in the past would have been quite natural due to regional ties, the language, nowadays it's logical to bet on Latin America because everyone is coming here. All the continents that have internationalized companies are choosing Latin America or want to choose Latin America as their number one focus because of these growth rate percentages....

According to information given by Totvs' International Market Operations Director, marketing and operational decisions are decentralized, usually defined at hubs: "(...) nowadays we have a really cool marketing structure and a strategy for each country, not just a strategy for overseas operations, but a specific one for each country". In the following section, following the steps of the Global SNA methodology, we present the results regarding the strategic implications of macro-environmental factors, verifying whether they constitute real or potential opportunities or threats.

Strategic Implications of Macro-Environmental Factors

Macro-environmental factors were analyzed in terms of their implications especially for Totvs' international strategy, drawing largely on Austin's (1990) constructs, as follows:

- Political factors: an opportunity identified in the research was the possibility of the Brazilian government establishing a partnership with Totvs to take advantage of the leading position attained by the firm in 2011 when it conquered the 6th position in the global ranking of ERP firms. This fact may benefit the exploitation of the Brazil brand in the software industry, an achievement that has been pursued by Apex since 2009 when it created the Brasil IT+ project with the aim of enhancing global recognition of Brazil as a center of excellence in the IT sector. (Available at www.apexbrasil.com.br/brasilit. Accessed on 03/25/2012).
- Economic factors: the global recession represents a threat to the good performance of Totvs' operations throughout the world. In 2012 the company decided to reduce its operations in Portugal and Mexico and cancelled two initiatives that were being planned for Australia and India. (Totvs Day, accessed at the www.totvs.com.br website on 02/01/2013, Exame Melhores e Maiores, 2012).
- Socio-cultural factors: Competing with local companies requires an understanding of the specific characteristics of local culture. According to Totvs' Customer Service and Relations Vice –President, the latter could potentially pose a threat for the company:

The great difficulty we had...(is that)..the legal part isn't difficult, the problem is culture. Now the cultural part is not explained, you won't find how it functions exactly anywhere in writing. Example: in Brazil if you produce ERP software one has to take into account pre-dated checks, but pre-dated checks aren't covered by law anywhere, on the contrary this practice is forbidden.

On the other hand, if we consider the fact that the main target of Totvs' internationalization strategy is Latin America, the region's cultural proximity and Brazil's favorable image here obviously constitute opportunities for its expansion in these markets. Below we share the research's results for the third step of the GLOBAL SNA methodology.

Strategic Implications of the Main Global Actors

This section presents the opportunities and threats constituted by the main actors as they perform their strategic roles in the global software industry. We based ourselves mainly based on the constructs of Porter (1980) and Brandenburger and Nalebuff (1996). In the case of clients, as they belong mainly to the SME segment (Totvs Day, accessed at the www.totvs.com.br website on 02/01/2013; a Totvs institutional presentation accessed at the www.totvs.com/ri website on 02/06/2013), and thus have less financial resources, the high cost of change which the customer has to support to modify his ERP software was considered a threat. Although a positive factor in the domestic market it is a negative one in the international one: “The fact that we are market leaders, and the fact that the guy has made a big investment, helps retention. But the guy considers cost and the cost of substitution is very high”, said Totvs’ International Market Operations Director.

Another, albeit incipient, opportunity identified by the research was constituted by Totvs’ international expansion through new businesses developed in partnership with international customers: “we can see, for example, a customer who is originally from Mexico, taking us to Colombia, a Portuguese guy taking us to Angola, a Chilean taking us to Peru, along with their expansions”, according to Totvs’ International Market Operations Director.

As regards suppliers, the ones most mentioned by interviewees and in replies to the structured questionnaires were data base suppliers, such as Oracle, Microsoft and IBM, but who, excluding IBM are also Totvs’ competitors as they commercialize ERP software and should therefore be classified as a threat. Totvs’ main competitors are SAP in Brazil (Revista Exame, Melhores e Maiores, 2012) and Microsoft in Latin America, two large multinational companies who can represent serious threats for Totvs, due both to their financial capacity and strong brands. In small Latin American countries, Microsoft has achieved a high degree of penetration with its products, precisely among SMEs, hampering Totvs’ moves in the region. According to Totvs’ International Market Operations officer:

They are not able to establish themselves in Brazil, we don’t let them. We don’t compete with them here (...) with the exception of Microsoft. We have strong competitors in each country, who are local competitors and there are the big ones who like to operate at the top of the pyramid. I would say that SAP is our big competitor at the top of the pyramid, Oracle is fragile in Latin America and there are the tiny ones in each country. In the middle of the pyramid I would say that our big international competitor is Microsoft.

However, the differentiation of Totvs’ product may be considered a real opportunity – mainly in relation to Microsoft’s offering – as it permits greater customization flexibility, a benefit that is highly valued by small firms. Totvs’ International Market Operations Director said:

Our differential... in relation to product and technology (is), flexibility. Perhaps we are one of the most flexible tools in the market. There is also the great advantage that in the case of SAP you have to go to Germany to customize. This flexibility is very important. If you know to use it surgically to make a difference in the guy’s business, it’s a killer.

The research did not identify threats from new entrants, given that small software developers, due to the high cost of developing a complete and integrated solution, are usually only able to serve a specific function of the firm without ensuring a good level of communication with the other applications. Solutions that can be considered substitutes were not classified in the structured questionnaires as a threat. ERP software replaces manual processes or products developed internally. In both cases, the cost is usually much greater than buying from a company with Totvs’ scale. With respect to possible complementary actors, it is important to mention that business consultants, which deal very actively with competitors (SAP, Oracle, Microsoft), do not take part in the implementation stage of Totvs customers’ project. However, Totvs uses partnerships with consultants to localize their product in a specific country, thus speeding up the acculturation process: “... in fact we hire a consulting firm for each country so that they can teach us the ropes in terms of localization” as mentioned by the Customer Service and Relations Vice-President.

Another important complementary partnership created recently by Totvs, was between the Research and Development Unit in Silicon Valley – the Totvs Lab (Valor Econômico, 10/04/2012, Exame Melhores e Maiores, 2012), and two local universities – Stanford University and San Jose State University (SJSU) – whose role will be to detect trends and monitor developments in the US management software market and middleware

platforms. (Totvs Blog, 10/25/12 at <http://www.suporte.totvs.com/web/guest/blog>; Accessed on 02/07/2013). Another actor who could be identified as a source of opportunity is constituted by Government Bodies, represented here by the National Brazilian Development Bank (BNDES). A partner of Totvs, it invested 40 million BRLs in the company in 2004, acquiring a 16% stake. In 2007 it made a new investment in Totvs, this time amounting to 400 million BRLs: “Of all investments made by the BNDES, this is one that makes the most sense”, according to Sergio Lazzarini, a professor at Insper whose research focuses on the government’s role in the economy. (Exame Melhores e Maiores, 2012). According to Totvs’ International Market Operations officer, “the BNDES intends to establish a partnership with Totvs along the lines of its successful partnership with Embraer”. As mentioned above, this partnership could lever Totvs’ international business, as well as improve international perceptions of the Brazil brand in the IT industry. The next section presents the results for the steps of the Global SNA methodology pertinent to the relational perspective.

Strategic Alliances and TOTV’s Ego-Net

So as to facilitate the analysis of the strategic implications of alliances in Totvs’ internationalization process, the researched mapped these alliances using the Global SNA Framework (Macedo-Soares, 2011) model. Besides its other advantages, this model constitutes a useful tool for the visual identification of the strategically most significant ties and the importance of the focal firm within its global value net. With this view, it is possible to identify unexploited opportunities, revealing possible new strategies that the firm could exploit. It should be emphasized that to use this model the firm does not necessarily have to operate globally, merely needing to belong to an industry that is important in the global market.

The model uses different colors and forms to represent the constructs defined by Galaskiewicz and Zaheer (1999) and Gulati et al. (2000) for the following dimensions of the network: (a) structure – represented in terms of the number of ties/linkages (high or low) by density; (b) composition – represented in terms of the volume of resources and status, by the size and form of network members; (c) tie/linkage modality, represented by strength of connections (strong or weak) and by the nature of ties, represented by the thickness of connecting lines and the direction of arrows: collaborative, or opportunistic or exploitative. When their nature is collaborative, there are arrows at both extremes, and when opportunistic, or exploitative, the arrow points to the partner who is at a disadvantage. The model also indicates the intensity of the linkage by colors, using the full rainbow spectrum, where red indicates high intensity – merger/acquisition or joint venture and purple is used for lower intensity – agreements.

The replies to the structured questionnaires show that the main partners were suppliers, re-sellers and complementors. Customers and government entities were also cited, but as less important, as well as some of Totvs crucially important competitors such as Oracle and Microsoft, given that they have the databases with which Totvs software needs to interact. The documental investigation and interviews also evidenced that Totvs has preferred the franchise model to expand its territory, both domestically and internationally, although for a certain period of time it used acquisitions to expand in the domestic market. (Revista Exame and Valor Econômico, 2006, 2008, 2009, 2010). For this reason its partnerships with resellers may be considered the strongest tie in terms of the international reach of the Totvs ego-net. According to Totvs International Market Operations Director, during the process of establishing an international partnership, the firm follows a guiding principle to ensure that a channel may grow and intensify its ties with Totvs until becoming owner of a territory. Partners are chosen from companies which are already established and whose business complements Totvs’, such as, for example, firms that sell and distribute hardware, which usually aspire to becoming software vendors with their higher margins. Thus, this tie has a dynamic characteristic as it achieves greater density over time.

Another important characteristic of this alliance concerns its nature which the research classified as collaborative, given that Totvs makes initial financial investments to lever the beginning of these firms’ operations. According to Totvs’ International Market Operations officer: One of the main reasons a channel goes bust outside Brazil, is the problem it has financing itself during the first months or the first year. So we organize a mixed team to prepare it to manage the project, but give it part of the revenues to pay the rent and water and electricity bills. This is crucial for the birth and survival of the channel during the first year.

As regards the factors that motivated the setting up of alliances, the most frequent replies in the structured questionnaires were closer commercial relations, cost sharing and the reduction of entry costs to new markets. The latter, if we consider the aspects of the international operation, was often mentioned in interviews as alliances with resellers – and possible future franchisees – permitting entry to a new territory without the cost of creating an own structure.

Another important alliance identified in the research concerns the intention to narrow ties with multinational clients in order to increase the company's reach (Exame Melhores e Maiores, 2012). This strategy was confirmed in an interview with the International Market and Operations officer who revealed that Totvs was creating the position of business facilitating agent - an international market salesperson - whose role would be to incentivize domestic salespersons to seek cross selling outside Brazil through customers who already had a significant presence in its international units. According to the International Market Operations officer: One of the 187 actions is the creation of the AVN, a business facilitating agent, who is an International Market seller. He keeps on pushing sellers who have account relationships in Brazil to do cross-selling outside Brazil. We have a study showing that 5% of our base in Brazil that has a unit abroad is a Totvs customer. There is a great opportunity to be exploited here.

Another important alliance identified in the research was the one established between the Totvs' new R&D unit in Silicon Valley and two American universities – Stanford and San José State University. Although it is still classified as one of lower intensity/interdependency, its importance for Totvs' strategic objective of becoming a global benchmark justifies its mapping in Totvs' ego-net. According to Totvs' International Market Operations Director:

An interesting thing is that we have Chinese, Thais, Russian, Indians, a pile of people working, to help us ... in this internationalization culture...it's a branch of our Brazilian technology team. There are 14 different nationalities. ...We hired Stanford to validate our roadmap, in other words, everything we think today and in the future in terms of technology and applications is presented twice year to a team of PhDs from Stanford and San Jose State and they validate our roadmap and bring the most modern news from the cutting edge to criticize ours.

The links with competitors represented in the model refer to Totvs' acquisition of two competitors - RM and SIPRO - that enabled the company to gain entry to Portugal and Mexico, respectively (Revista Exame, 2006). Based on the information collected in interviews and documents, the research mapped Totvs' ego-net, highlighting especially its international alliances, considering only the main types of alliances with each actor, as shown in Figure 1.

Figure 1 – Totvs's ego-net, highlighting international alliances.

Below we present the research's results regarding the strategic implications of Totvs' international alliances that were analyzed after mapping the company's ego-net.

Strategic Implications of TOTV's International Alliances

Tables 1, 2 and 3 show the opportunities and threats constituted by Totvs's international alliances at industry level, respectively, for each one of the three network dimensions contemplated in the research: structure, composition and tie modality.

Table 1 – Structure of Totvs's alliance network.

Dimensi on	Constru cts	Results	Industry Level	
			Opportunities	Threats
Alliance Network Structure	Density	<ul style="list-style-type: none"> - Average with complementors - High with suppliers - High with resellers (franchisees). 	<ul style="list-style-type: none"> - Increase presence in new countries - Access to technological information of global partners. 	<ul style="list-style-type: none"> - Risk of sharing confidential information with complementors (Microsoft), ordinary customers and suppliers.
	Scope	<ul style="list-style-type: none"> - Local with resellers - Restricted and Global with suppliers and complementors. 	<ul style="list-style-type: none"> - Facility of global expansion. 	<ul style="list-style-type: none"> - Difficulty to expand geographically due to the greater density of regional competitors (Microsoft)
	Position of Centrality in the network	<ul style="list-style-type: none"> - Central with resellers and suppliers - Peripheral with complementors 	<ul style="list-style-type: none"> - High centrality provides bargaining power with resellers 	<ul style="list-style-type: none"> - The peripheral position of complementors puts Totvs in a less favorable competitive position. - Risk of decline in performance due to weak arrangements with complementor partners

The research made evident that alliance networks with complementary partners are restricted and peripheral in relation to scope and centrality. Since its main complementor partners are those firms that make their databases available and provide consulting, Totvs needs to establish alliances with the main players to ensure that its software has solutions that are compatible with technological platforms of the greatest number of clients. However, these firms, such as Oracle and Microsoft are large global companies, and this is compounded by the fact that they also have ERP software that competes with Totvs's products. Totvs is thus in a vulnerable position in these specific alliances.

Alliances with suppliers are more favorable to Totvs, given that despite being global players they do not compete with the company, thus facilitating its geographical expansion. As seen above, alliances with resellers are the most important and generate more opportunities for Totvs. However, as the partners chosen are always small companies, there is a risk that international units will have a weak financial performance or even fail, as revealed in an interview with Totvs' International Market Operations Director: "One of the most important reasons for a channel outside Brazil failing is the difficulty it has financing itself during its first months or the first year."

Table 2– Members of Totvs's global alliance network

Dimensi on	Constructs	Results	Industry Level	
			Opportunities	Threats
Composi- tion of Global Network	Identity/ Status of Firm	<ul style="list-style-type: none"> - Strong and successful (6th. in world ranking). 	<ul style="list-style-type: none"> - Easy to obtain partnerships in new geographical markets in the LA region. 	
	Identity/ Status of partner	<ul style="list-style-type: none"> - Rich in distinctive resources; global complementors 	<ul style="list-style-type: none"> - Opportunity to access distinctive resources of partners with global experience. 	<ul style="list-style-type: none"> - Resellers with a weak status and identity can be a complicating factor to face competition from stronger

		and suppliers and local resellers.		competitors. .
	Volume and ease of access to partners' resources	- Abundant and easy with suppliers. - Satisfactory and easy with resellers and complementors..	- Opportunity to develop more enduring and innovative relations.	
	Compleme n-tarity of all partners' resources	- A High complemen-tarity with complementors and resellers.	- Positive exchanges for both sides of the partnership.	- Some alliances with complementors who are also competitors can lead to conflicts or breaches of confidentiality.

The analysis of the members of Totvs's network made evident various opportunities, highlighting positive and bilateral exchanges. However, in the Latin American region, which nowadays is the main focus of Totvs's strategy, there is an important competitor – Microsoft – which has already conquered most of the territory, raising the question as to whether these alliances with small resellers will be able to face up to a big competitor like Microsoft.

Table 3 – Tie modalities of Totvs's global alliance network.

Dimens ion	Construct s	Results	Industry Level	
			Opportunities	Threats
Tie Modalities	Strength of connections	- Strong with resellers, complementors and suppliers.	- Opportunity for greater productivity of the industry	- Risk of losing access to a world class database
	Nature of ties	- Collaborative with resellers, complementors and suppliers.	- Opportunity for positive long-term actions which benefit not only partner firms but also the industry and external environment.	
		- Explorative with complementors and suppliers. - Exploitative with resellers	- Explorative partners explore new opportunities and create an environment that favors innovation.	- Exploitative partnerships can hinder or impede innovations.

From the analysis of the tie modalities of the ego-net, due to the strong and collaborative characteristics Totvs's ego-net, we found opportunities for the expansion of productivity and innovation in the ERP software industry. An example of this is the recently created alliance with Silicon Valley universities, which act as complementors in Totvs's network. As regards the nature of these ties, one should highlight the exploitative aspect identified in alliances with resellers, hindering the development of joint innovation. The next section presents a broad outline of the latest results of Totvs's performance, following the GLOBAL SNA methodology.

TOTV's Performance

In its 2012 annual report Totvs indicated that the company continues to consolidate its position as leader in Brazil and Latin America. Its net revenues totaled R\$1.437 million in 2012 (+12.4% in relation to 2011), with EBITDA of 26.7%, 260 basis points more than in 2011. Net revenues on international sales grew by 22.1% in 2012, increasing from R\$16.627 million to R\$20.306 million. During the same period, the firm's EBITDA increased by 39.0%, reducing losses by R\$6.087 million. These gains in efficiency, despite the devaluation of the

BRL in 2012, are the consequence of the initiatives taken during the year, based on the new plan for the internationalization of the Company's operations, aimed at achieving an EBITDA equilibrium by the end of 2014. The company has a more significant presence in Latin America, with franchisees in Mexico, Argentina, Uruguay, Paraguay and Chile. It also has units in Portugal and Angola and products in Porto Rico, the Dominican Republic, Venezuela, Peru, Nicaragua, Guatemala and El Salvador. Recently TOTVS was recognized by the consulting firm Interbrand as the 23rd most valuable brand in Brazil in 2012, appearing for the first time in its history among the 25 most valuable brands of the study.

DISCUSSION

Assessing the Fit of Totvs's Industry-Level Internationalization Strategy

Although it has been participating in the international market for 15 years, Totvs has made little progress where its internationalization process is concerned, especially in comparison with the company's impressive and consistent results in the domestic sphere.

In 2012, the company reviewed its international strategic positioning, establishing an international directorate and deploying various strategic actions, with some already showing positive results in 2012. The most important were: (a) closure of some of its own units (Mexico and Portugal), adopting a franchise model, and reformulating its cost structure; (b) changing the scope of offerings, focusing on vertical products with better growth potential and which are easier to adapt to local markets; (c) reformulating target markets, focusing more on the US market without neglecting Latin America, an obviously attractive market for a Brazilian software company. In terms of market segment, Totvs would continue to focus on SMEs in specific industries, which is compatible with its choice of target market, full of medium-sized firms with considerable software purchasing power.

Another important decision was to create the Silicon Valley unit, which has a team of designers, scientists and engineers from various countries such as Brazil, USA, China, Russia and India and whose aim is to study trends and develop innovative products focused on cloud computing, social media, big data and mobile. This unit will also have the important role of identifying and strengthening partnerships with local companies and start-ups that wish to expand globally, especially in Latin America. This unit has already begun important alliances with local universities that will orient Totvs's team of scientists in relation to technological trends. These decisions and actions are compatible with the objectives defined by the company regarding its operations in the international market: achieve the break-even point in terms of EBITDA in 2014 and account for 3 to 5% of total revenues in 2016.

In sum, this research identified relational opportunities that were very important for the firm's strategic decision-making regarding internationalization. It was possible to show that Totvs has been trying to find the right path towards success in the international market and that its quest for alliances has formed one of the pillars of this undertaking, visible both in its use of collaborative partnerships with small local businessmen and the more sensitive alliances with global actors such as Oracle, Microsoft and IBM.

Thus the use of the relational perspective was crucial in this study, illustrating the importance of performing strategic analyses from both the traditional (i.e. non-relational) and relational perspectives, in a complementary fashion. Table 4 presents a comparison between the traditional analysis and the one that adopts a relational perspective.

Table 4: Comparison between research's results respectively from the traditional and the relational perspectives.

Traditional Ananlysis	Relational Analysis	Implication
<u>Real Threat</u> Size and bargaining power of the main ERP competitors.	<u>Potential Opportunity</u> Alliance with BNDES which could increase Totvs's investment capacity.	<u>Potential Opportunity</u>
<u>Real Threat</u> Difficulty of adhering to the	<u>Real Opportunity</u> Alliance with local companies and	<u>Real</u>

commercial and cultural rules of each country.	businessmen provides a competitive advantage as regards acculturation and identification.	<u>Opportunity</u>
<u>Potential Threat</u> Big global competitors with greater technological innovation capacity.	<u>Real Opportunity</u> Alliance with American universities.	<u>Real Opportunity</u>
<u>Real Threat</u> Global recession especially in Europe.	<u>Potential Opportunity</u> International expansion through the indications of multinational customers.. <u>Potential Opportunity</u> Establish alliances with large consulting firms to deploy Totvs's solutions and expand territorially	<u>Potential Opportunity</u>

CONCLUSIONS AND RECOMMENDATIONS

This article presented the results of a study that examined the strategic opportunities provided by Totvs's alliances for its international expansion. Although the research concluded that the strategy is appropriate in terms of Totvs's objectives in international markets, it is still possible to list some potential opportunities that could be exploited by the company. More specifically, we should highlight the alliances with complementary firms such as the Big 5 (business consultants) or with some suppliers like IBM. These partnerships could produce positive results in Totvs's geographical expansion, as these firms possess a broad and global network of clients. Another important partnership would be with governmental bodies (for example with APEX), in order to publicize Brazil's competence in the software industry, thus improving perceptions in potential markets. Totvs has become aware of the potential opportunities achieved by forming strategic alliances. This awareness will be fundamental in preparing the company for its strategic intents.

Our study helped confirm a fact already evidenced in other studies of the technological sector (Macedo-Soares & Mendonça, 2010): namely that alliances create more opportunities than threats, on occasion even mitigating potential threats, especially non-relational ones, as shown in Table 4. By the same token, it fulfilled its objective of providing lessons for software firms through the analysis of Totvs's strategic fit at industry level. Applying the Global SNA Framework to the case of Totvs demonstrated that the inclusion of the relational and global perspectives in the analysis of a firm's strategy – which competes globally through alliances - enriches the analysis and consequently provides a more complete view on which to base strategic decision-making. As to future research, we suggest carrying out a similar analysis in the case of other software firms in Brazil as well as in other emerging countries. As this industry is very dependent on innovation it would be interesting to confirm whether global alliances reduce the threats related to the technological lag which is so common in less-developed countries.

IMPACT OF PRICE ELASTICITY ON DEMAND FOR MEDICAL EXPENDITURE IN SOUTH AFRICA: AN ECONOMETRIC APPROACH

Teboho Jeremiah Mosikari and Itumeleng Pleasure Mongale
North West University, South Africa

ABSTRACT

The rising cost of medical care is a course for concern for most governments throughout the world. There has been a growing concern among policy makers both in developed and developing countries regarding the rapidly increasing national spending on rising medical care costs. The purpose of this paper is to analyze the impact of price elasticity on demand for medical expenditure in South Africa by utilizing time series data from the South African Reserve Bank and Statistics South Africa. This study will help the policy makers to carry with the idea of helping the poorer section of the South Africa community with reduction of the medical cost by implementing initiatives like NHI throughout the country. The model is estimated by using the cointegrating vector autoregressive (CVAR) framework. The findings show that all the variables have unit roots and cointegration was found emphasizing the presence of a long run equilibrium relationship. The results indicate also that in the long run in line of expectations that price for medical expenditure is inelastic.

INTRODUCTION

The rising cost of medical care is a course for concern for most governments throughout the world. There has been a growing concern among policy makers both in developed and developing countries regarding the rapidly increasing national spending on medical care and rising medical care costs (Mocan, Tekin and Zax, 2004). According to Nahata, Ostaszewski and Sahoo (2005) both public and private expenditures on health care are rising faster than any other sector in the U.S. economy. Further evidence to this fact is provided by Xu, Evans, Carrin, Aguilar-River, Musgrove and Evans (2007) who maintain that millions of people around the world are prevented from seeking and obtaining needed health care each year because they cannot afford to pay the charges levied for diagnosis and treatment. This can lead to financial hardship and even impoverishment because people are too ill to work. The other side of the coin, less well understood, is that many of those who do seek medical care suffer financial catastrophe and impoverishment as a result of meeting these costs. This occurs in both rich and poor countries. World Health Organisation (WHO, 2008) indicates that uncontrolled commercialism which undermines principles of health as a public good is one of the trends that undermine the improvement of health outcomes globally.

Changes envisaged for the US and South Africa have similarities both suffer from escalating health care costs, poor outcomes for expenditure on health care, and fragmentation of services (van Niekerk, 2010). According to Stassen (2012) private medical insurance is a luxury less than one in five (16 percent) South Africans can afford, and it is not getting any cheaper. Studies reveal that in 1981 a household with one working member paid about 7 percent of its income to medical scheme contributions, by 1991 this portion had increased to 14 percent, rising further to 20 percent by 2001, and by 2007 stood at 30 percent. As developing country South Africa is also faced with the challenge of escalating medical care costs. Since health care is very essential and the economy is unable to sustain rapid growth in medical expenditure, a debate regarding the strategies which can be used to help those who cannot afford is raging on. The South African government is planning to introduce the National Health Insurance (NHI) with the intention to bring reform that will improve service provision. NHI will ensure that everyone has access to appropriate, efficient and quality health services. The

expectation is that it will promote equity and efficiency so as to ensure that all South Africans have access to affordable, quality healthcare services regardless of their socio-economic status. It is also touted to be an innovative system of healthcare financing with far reaching consequences on the health of South Africans (NHI, 2011). According to Schaay, Sanders and Kruger (2011) in terms of the burden of disease, life expectancy in South Africa is currently 53.9 years for males and 57.2 years for females. Although South Africa spends more per capita on health than any other African country 8.7 percent of its gross domestic product, it is one of only twelve countries in the world where child mortality has increased since the Millennium Development Goals (MDGs) baseline was set in 1990.

South Africa has four concurrent epidemics, a health profile found only in the Southern African Development Community region. Poverty-related illnesses such as infectious diseases, maternal death, and malnutrition, remain widespread and there is a growing burden of non-communicable diseases. HIV/AIDS accounts for 31 percent of the total disability-adjusted life years of the South African population, with violence and injuries constituting a further cause of premature deaths and disability (Coovadia, Jewkes, Barron, Sanders and McIntyre, 2009). Elasticity measures are particularly useful because they focus on the relative magnitudes of changes rather than the absolute. As such, elasticity measures are free of units of measurement. This characteristic makes them particularly useful for comparing demand responses across products, countries and individuals (Ringel, Hosek, Vollaard and Mahnovski, n.d.). According to Shafirin (2009) most experts believe that health care demand is fairly inelastic. If you are sick, you will not be very price sensitive. Other studies also find that patients are fairly insensitive to changes in health care prices. For instance, the RAND Health Insurance Experiment found that the price elasticity of medical expenditures is (-0.2) inelastic.

According to Liu and Chollet (2006) more recent research has estimated the demand for insured health services to be inelastic with respect to price. Most estimates of the price elasticity of demand for health care services in general (or total spending) are about -0.2. Estimated price elasticities differ by type of service, but the differences are not generally large. For instance; insured consumers may cut back on their overall health spending by 2 percent in response to a 10 percent increase in the price of health care (net of insurance coverage). Price-induced changes in demand have been attributed more to changes in the probability of using any care than to changes in the amount of care used once it is accessed. Low-income consumers are more sensitive to changes in the price of care. Consequently, they may be more likely to experience adverse consequences from higher cost-sharing.

Several researchers have been investigating the determinants of health care demand such as (e.g. Manning, Newhouse, Duan, Keeler, & Leibowitz, 1987; Wedig, 1988). Other researchers such as Gruber and Lettau (2004) focus on the the impact of tax subsidies on the firm's decision to offer insurance, and on conditional firm spending on insurance. According to Mocan, et, al (2004) a significant amount of research has been devoted to the investigation of the determinants of the demand for medical care in developing countries. The issue is especially important for developing countries which face an increasing demand for health services, coupled with a lack of funds to finance the health care system due to adverse macroeconomic conditions.

Although there several studies that have paid attention to areas like the elasticity of demand for health care. Most of these studies do not use current econometric approaches of using times series analysis, which is the intention of this study. To our knowledge very few studies have done analysis of impact of price elasticity on demand for medical expenditure in South Africa. This study will help the policy makers to carry with the idea of helping the poorer section of the South Africa community with reduction of the medical cost by implementing initiatives like NHI throughout the country.

Catastrophic health spending is not caused simply by high-cost medical procedures or interventions. A relatively small payment can mean financial catastrophe to a poor person or household, forcing them to reduce other basic expenses such as food, shelter, or their children's education. Similarly, large health care payments can lead to financial catastrophe and bankruptcy even for rich households (Xu et al., 2007). Against this background the purpose of this study is to answer the following questions:

- What are the effects of price elasticity on demand for medical expenditure in South Africa?
- What are the determinants of demand for medical expenditure in South Africa?

More specifically the paper has this specific objective:

- To analyzes the impact of price elasticity on demand for medical expenditure

- To identify the determinants of price elasticity on demand for medical expenditure in South Africa.

These objectives will be achieved by the application of CVAR framework. The findings of this paper are expected to further increase the call for subsidizing the poor with medical expenditure by speedy implementation of NHI.

The remainder of the paper is as follows: Section 2 describes the research methods which includes data and model specification. Section 3 deals with empirical results, section 4 presents the discussion of the results and Section 5 is the concluding remarks.

RESEARCH METHOD

Data and Model Specification

The study uses time series set to examine price elasticity on demand for household medical expenditure in South Africa during 1970-2011. This paper considers four variables: household expenditure on medical services, household disposable income, consumer prices on food, consumer prices on education, and consumer prices on medical health. Data is obtained the South African Reserve Bank (SARB) and Statistics South Africa (SSA) online. It should be noted that the limitation to this investigation is the problem of consistency of data obtained from various sources which had to be attuned to the needs of the study. The study estimates the following multivariate model:

$$MDS = F(HDY, PRFD, PRIH, PEDC; \varepsilon) \quad (1)$$

where

MDS is the household medical expenditure,
 HDY is the household disposable income,
 $PRFD$ is the consumer prices on food,
 $PRIH$ is the consumer prices on health spending,
 $PEDC$ is the consumer prices on education and
 ε is the disturbance or error term.

The disturbance term is included because almost always variation that comes in from sources such as measurement error, incorrect functional form, or purely random and totally unpredictable occurrences. The current study admits the existence of such inherent unexplained variation “error” by explicitly including a stochastic error term in the model.

UNIT ROOT TESTING

One problem with time series data is that independent variable can appear to be more significant than they actually if it has the same underlying trend as the dependent variable. This causes non-stationary variables to appear to be correlated even if they are not. Therefore the current study needs to test for stationarity conditions of variables in order to avoid spurious regression. The stationarity of the variables is investigated by employing the unit root tests developed by Augmented Dickey and Fuller (1979). The unit root tests are calculated for individual series to provide evidence as to whether our variables are stationary and integrated of the same order. The test is conducted under the assumption that the residuals may be serially correlated. Formally the test is based on the following equation:

$$\Delta Y_t = \alpha_0 + \delta Y_{t-1} + \alpha_1 t + \sum \beta \Delta Y_{t-1} + \varepsilon_t \quad (2)$$

Where

ε_t is a white noise, α_0 is an intercept (constant) whereas δ , β and α_1 are coefficients.

The number of lagged differenced terms is often determined empirically, the idea being to include enough terms so that the error term is indeed serially uncorrelated. In practice, the appropriate lag may be set, for instance based on minimising the Akaike Information Criterion (AIC). The second step is to test for cointegration among those variables using the Johansen’s (1988) methodology.

JOHANSEN COINTEGRATION

Cointegration theory is a revolution in theoretical econometrics, which has created a lot of interests and uses by economists. The layman may define cointegration as a long-term stable relationship between two or among many variables: something like “equilibrium” among those variables exists. The literature indicates that there are many tools such as Engle Granger cointegration and Durbin-Watson (D-W) cointegration to be used for cointegration, but this current study adopt Johansen cointegration method. The generalisation of the Johansen procedure is as follows:

$$\Delta y_t = \sum \Pi_i \Delta y_{t-i} + \Pi y_{t-n} + \varepsilon_t \quad (3)$$

Where $y_t = (k \times 1)$ vector of variables $(\beta_1 y_{t-1}, \beta_2 y_{t-2}, \dots, \beta_n y_{t-n})$, ε_t is independent and identically distributed n -dimensional vector with mean zero and variance equal to matrix $\sum \varepsilon_t \Pi(\alpha \beta)$ is the number of independent co-integration vectors, and Πy_{t-n} is the error correction factor. The Johansen procedure relies on the rank of Π and its characteristics roots. If rank $(\Pi) = 0$, the matrix is null (no cointegration) and equations in vector y_t are a common VAR in first differences. If Π has full rank $(\Pi = k)$, the vector process is stationary and the equations in y_t are modeled in levels – $I(0)$. If rank $(\Pi) = 1$, there is evidence of a single cointegrating vectors in Johansen’s cointegration procedure is applied to this study. These tests are:

Trace test

$$\lambda_{\text{Trace}}(r) = -T \sum \ln(1 - \lambda_i) \quad (4)$$

Maximum eigenvalue test

$$\lambda_{\text{max}}(r, r+1) = -T \sum \ln(1 - \lambda_{r+1}) \quad (5)$$

Where $\lambda_{r+1}, \dots, \lambda_n$ are the $(k-r)$ smallest estimated eigenvalues. In both tests, λ represents the estimated values of the characteristics roots obtained from the estimated Π matrix, and T is the number of observations. The trace test attempts to determine the number of cointegrating vectors between the variables by testing the null hypothesis that $r = 0$ against the alternative that $r > 0$ or $r \leq 1$ (r equals the number of co-integrating vectors). The maximum eigenvalue tests the null hypothesis that the number of co-integrating vectors is equal to r against the alternative of $r+1$ co-integrating vectors. If the value of the likelihood ratio is greater than the critical values, the null hypothesis of zero cointegrating vectors is rejected in favor of the alternatives.

EMPIRICAL RESULTS

Table 1 below summaries the descriptive statistics of the variables in their level form. These elementary descriptive are reported only as an indication of the nature of the raw data to be used in the analysis.

Table 1: Descriptive statistics of the variables used

	MDS	PEDC	PRFD	PRIH	HDY
Mean	35233.19	24.93357	48.74595	47.05286	417534.7
Std. Dev.	23858.64	33.36016	40.31239	42.67513	495410.3
Observations	42	42	42	42	42

Table 2 reports ADF for test statistics for logarithm levels and first difference of the variables under study. The stationarity of the variables is investigated by employing the unit root test invented by Dickey and Fuller (1979). The ADF results indicate that the null hypothesis of non-stationarity cannot be rejected for any variables in the level form. However, the variables are in first differences under the same assumption of intercept and most of them become stationary at 1 percent level of significance. The second step is to test for presence of cointegration among variables using the Johansen’s (1988) methodology. The lag length of the level vector autoregression system has been determined by minimising the Akaike Information Criterion.

Table 2: ADF results at levels and first difference

Series	Test on	Lag length	ADF test statistics	Probability
<i>Log_MDS</i>	Levels	0	-0.1209	0.9402
	First difference	1	-5.185***	0.0001
<i>Log_HDY</i>	Levels	0	-3.668***	0.0084
<i>Log_PRFD</i>	Levels	0	-2.1318	0.2338
	First difference	0	-5.3364***	0.0001
<i>Log_PRIH</i>	Levels	0	-1.2069	0.6624
	First difference	0	-5.0036***	0.0002
<i>Log_PEDC</i>	Levels	0	-1.7576	0.3956
	First difference	0	-6.4227***	0.0000

Notes: the lag length is specified using the Schwarz Information Criterion (SIC). ADF test statistics and significance level: * = 10 %, ** = 5%, *** =1%.

The results of both the unrestricted Cointegration tests of the Trace and the Maximum Eigen value tests are presented in Tables 3 and 4 respectively. The first column of each table gives tests for hypothesized number of cointegrated equations and second column reports the corresponding trace statistics and/or Max-Eigen statistics generated. On the other hand, the third columns report the critical values at the five per cent levels whereas the last column reports the probability values of each test.

Table 3: Unrestricted Cointegration test Rank Test (Trace)

Hypothesized No. of CE(s)	Trace Statistic	0.05 Critical Value	Prob.**
None *	211.22	69.81	0.000
At most 1*	109.95	47.85	0.000
At most 2*	59.61	29.79	0.000
At most 3*	22.59	15.49	0.003
At most 4*	8.30	3.84	0.004

Trace test indicates 5 cointegration equation(s) at the 0.05 level

* denotes rejection of the hypothesis at the 0.05 level

**Mackinnon-Haug-Michelis (1999) p-values

In Table 3 the trace test indicates that there are 5 cointegration equations at 5 percent significance levels. This is realised by comparing the trace statistics and the critical values. In this case the trace statistics of all equations are greater than the critical values, for example, 211.22 is greater than critical value of 69.81. This process is done until the study finds that at most 5 cointegrating equation trace statistics of 8.30 is greater than critical value of 3.84. The presence of the cointegrating equations confirms the existence of the long run relationship among the variables involved.

Table 4: Unrestricted Cointegration test Rank Test (Maximum Eigen value)

Hypothesized No. of CE(s)	Max-Eigen Statistics	0.05 Critical Value	Prob.**

At most 3 *	14.29	14.26	0.049
At most 4 *	8.30	3.84	0.004

Trace test indicates 5 cointegration equation(s) at the 0.05 level

* denotes rejection of the hypothesis at the 0.05 level

**Mackinnon-Haug-Michelis (1999) p-values

The maximum eigenvalue test in Table 4 above also indicates the existence of five cointegrating equation at 5 percent level of significance. This shows that long equilibrium relationship exist among all the variables under study (household expenditure on medical services, household disposable income, consumer prices on food, consumer prices on education, and consumer prices on medical health). Since the presence of cointegration has been confirmed by the Johansen cointegration test results, the next step is to verify the existence the existence of the short run economic relationship among the variables by applying vector error correction mechanism (VECM), not the ordinary VAR. According to Hurley (2010) VECM is a special type of restricted VAR that is introduced in this paper to correct a disequilibrium that may shock the whole system and to study the interaction between the variables in the system. The added advantage of this procedure is that direction of the causality test can be established through this model, since, unlike the standard Granger causality test, VECM takes into consideration an additional channel of causation through the error correction mechanism (ECM) term. The ECM is included to investigate the dynamic behaviour of the model, that is, the dynamics of the short run and the long run.

Table 5: Vector Error Correction Estimates

ContEq1	-0.5896 (0.0883) [-6.6782]	-0.0945 (0.1719) [-0.5497]	-0.5301 (0.5278) [-1.0043]	-0.1698 (0.4520) [-0.3756]	-1.5955 (2.5075) [-0.6363]

The estimation of VECM requires that the model selects the lag length, the number of lags in the model has been determined according to Schwarz Information Criterion (SIC). According to the lag length that minimises the SIC is 1, see Appendix A. The first part of Table 5 above presents the estimates of the cointegrating equation in the long run while the second part shows the rest of error correction model. The first row in the second part presents the speed of adjustment coefficient for each variable under investigation, their standard errors and the t-statistics. Adamopoulos (2010) indicates that the size of the error correction term (EC) shows the speed of adjustment of any disequilibrium towards a long run equilibrium state. The adjustment coefficient of cointegration (ContEq1) of -0.5896 is approximately 58 percent for household medical expenditure. This estimated coefficient of EC of -0.5896 is statistically significant with the theoretically correct sign (negative sign) and a high *t*-statistic of -6.6782.

It is expected to be negative for equilibrium to be restored and it confirms that there is no problem in the long run equilibrium relationship between the dependent and the independent variables. The adjustment coefficient of household disposable income is 9 percent, the average price for food is 53 percent and the average price for health services is 16 percent. This means that about 58 percent the disequilibrium in household medical expenditure is corrected per year and only about 9 percent of the disequilibrium is corrected every year by the change in household disposable income.

Table 6 below presents some very interesting results. It shows that some of the coefficients are highly significant in their t-statistics and have expected signs both in long and short run. This paper will discuss each variable one by one. To start with, in the short run household income is -0.41, but considering the variable in the long run the coefficient is 0.42. From the results one may conclude that medical health expenditure is a normal good. The theory regarding income elasticity of demand for medical expenditure says that as your income increases, it implies an increase in your budget line ultimately allows you to consume more of goods that enhance health.

Price plays important role in determining the demand for a particular product. For this study it shows that consumer price for health products is negative at -0.633 in the short run, in which it is significant. This results are true in the sense that household may be price sensitive in the short run in terms of medical expenditure, but that will not last for long. Observing the long run of the variable it indicates that prices for health products is 0.417 and is significant in terms of its t-statistics. This finding in the long run is in line of expectations that price for medical expenditure is inelastic. The theory suggests that the demand for health expenditure is generally estimated to be price inelastic, meaning that individuals do not strongly reduce the amount of health spending in response to an increase in price.

Table 6: Estimation Results of the ARDL Model

DLOG_HDY	-0.417388	-0.954102
C	5.455850	2.248660
R-squared 0.992408		
Adjusted R-squared 0.990130		
S.E. of regression 0.066252		
Sum squared resid 0.131679		
Log likelihood 57.56780		
F-statistic 435.7064		
Prob(F-statistic) 0.000000		

The food prices and education expenses are included in this analysis to give an indication of opportunity cost. Understanding opportunity cost means is to forfeiting other resources to gain other resource. Here the study tries to get to know how individuals react when faced by critical spending decision between two competing products. In considering the effect of food prices in the short run the coefficient is 0.277, which is not according to expectations. In contrast in the long run the variables react according to expectations at the value of -0.45. This finding suggests that individuals may reduce their medical expenditure when faced by high demand of food expenditure. Similarly, this is observed when considering the effect of consumer prices on education.

DISCUSSION

The study investigated the impact of price elasticity on demand for medical expenditure in South Africa. To our knowledge, this is the first paper that analyses the impact of price elasticity on demand for medical expenditure in South Africa by using an econometric approach. The order of integration was tested by the application of the ADF unit root test. The results indicate that the null hypothesis of non-stationarity cannot be rejected for any variables in the level form but stationarity was only achieved after first differences. The cointegration test results indicate the existence of a stable long run relationship between household medical expenditure and its determinants. Both the trace statistics and maximum eigenvalue statistics reject the null hypothesis of no cointegration. Based on the cointegration results, there is evidence to conclude that the regression is not spurious. Since all the three hypotheses are rejected, that is, the hypothesis of no cointegration, the hypothesis of one cointegrating relation and the hypothesis of two cointegrating relationships, the conclusion is that none of the variables contain stochastic trends, because that is the only way there could be as many cointegrating relationships as variables. The presence of the negative ECM coefficient and the fact it is also significant serves as evidence for the existence of a cointegration relationship among the variables of the household medical expenditure function. It also points out to the presence of long term causal relations between the dependent variable and the independent variables.

CONCLUDING REMARKS

South Africa is currently facing a severe medical cost crisis. This study is concerned with the impact of price elasticity on demand for medical expenditure in South Africa. The following questions were considered: What are the effects of price elasticity on demand for medical expenditure in South Africa? What are the determinants of demand for medical expenditure in South Africa? In relation to these research questions some conclusions can be drawn from the above results. The study concludes that in the long run prices for health products is inelastic and is significant. The findings also show that major determinants for medical expenditure are price of medical health, household disposable income and consumer price on food in terms of their coefficients. Based on the findings of the study we recommend that the policy makers should carry on with the idea of helping the poorer section of the South Africa community with reduction of the medical cost by implementing initiatives like NHI throughout the country.

TALENT MANAGEMENT IN SOUTH AFRICAN UNIVERSITIES OF TECHNOLOGY: WOMEN IN LEADERSHIP

M. Mothsekga-Sebolai and E. J. van Rooyen
Tshwane University of Technology, South Africa

ABSTRACT

Talent management is an integrated strategic and deliberate activity, which directs how organizations source, attract, select, train, develop, retain, promote, and deploy employees. The concept Talent Management is not new, nor foreign to the management lexicon. Internationally many management scientists and practitioners have engaged in the research and study thereof and many case examples exist as far as its successful implementation in organizations. Essentially the concept evokes images of organizations that manage through their strategic, tactical and functional decision-making processes, human capital capacity to achieve their unique goals and objectives. The research done on the value of such systems implemented within particular organizations, consistently uncovers benefits in critical developmental and economic areas. However, upon seeking to effectively implement such methodologies, it may be prudent to consider talent management practices as a means to achieving goals and objectives in a particularly organisation-specific context. Therefore, in South African universities of technology the need exists to also apply talent management practices seeking not only to install and retain the most qualified and valuable staff but also to put a strong emphasis on their development and to harness their inert potential. This paper reflects and reports on a longitudinal research project undertaken among South African universities of technology, to establish the current state of implementation and practice thereof. The research project comprises essentially a desktop survey of secondary research, augmented by comments and observations from the researchers (as participant observers), which hail from this sector. It concludes with a preliminary model, presented for critique and comment.

INTRODUCTION

It is often stated that people are an entity's greatest asset. It is often claimed that proper talent management or human capital management may contributively assist leadership development in organizations. Naturally, the accompanying questions are also as to "what is a good leader" and "what is leadership" in the context of particular types of organizations. This article seeks to re-enter the debate of the relationship between talent management and leadership development but attempts to redirect the focus toward talent management and leadership development among women in South African universities of technology. The article serves to initiate a concise explorative qualitative research investigation on the current state of women talent development and proposes a management model by which to approach this challenge. Some secondary research is presented and a participant researcher position is taken from which observations are made. It heralds a further step in a research process in this regard.

TALENT MANAGEMENT IN SOUTH AFRICA

It is not surprising that, with so much emphasis being placed on human resource management, and the need for a unique South African human capital development model, that new thinking in this regard may transpire frequently. Charlton (1993) mentions that it is necessary to conduct extensive research to inform on the development of a relevant (valid) leadership (development) model for South Africa.

The approach widely termed “talent management”, which incorporates the development of staff, has emerged and Maritz (in Meyer & Botha, eds., 2004: 421) mention that the challenges faced by South Africa and South African organisations necessarily forces organisations to reorganise themselves to become more pro-active in identifying, engaging and maintaining talent. South African organisations are increasingly experiencing a “shortfall in executive leadership talent due to increased competitiveness, black economic empowerment and anticipated growth...” (Maritz in Meyer & Botha, eds., 2004: 421).

In the case for talent management, especially among women, it is implied that a strategic and focused approach should be taken. Much emphasis is placed not only on hiring (acquiring) great talent within an organization, but also to retain and develop existing talent in order for an organization to achieve its particular women empowerment goals. Broadly speaking talent management is seen as encompassing all processes involved in planning human resource requirements, acquiring these resources through recruitment and hiring practices, developing and training the talent acquired and aligning the talent to the entity’s strategic goals to achieve the desired end results. According to Pillay, Subban & Qwabe (2008: 313) talent management is a “strategic intervention to help sustain and retain skills, thus improving performance. The management of talent is a business process and like any business process it converts inputs into outputs”.

Furthermore, Maritz (Meyer & Botha, eds., 2004: 422) claim that an approach entitled Strategic Talent Management may improve organisational performance: “Human resource and business perspectives must be integrated and senior manager must have the authority and skill to lead their organisations in the war for talent”. However, talent comprises more than merely the pool of employees in an organisation; it represents the whole of the existing sets of skills and capabilities that this pool of (in this case selected categories) employees’ human resources possesses. The principles of talent management inform on the true nature of this approach and are *inter alia* as follows:

- It is a belief that the creation and maintenance of a diverse and multi-level pool of excellent talent forms an integral part of the whole of the organisation’s strategy.
- It is important to be cognisant of the existing pool of talent prevalent within the organisation at any given time.
- It is an on-going process of optimising talent, which never stops.
- It places the individual on centre stage: It focuses on development of self-awareness, experiential learning, building individual strengths, coaching and continuous support.
- The talent pool comprises all levels of the organisation, thereby adding depth and strength to the organisation’s strategy (Maritz in Meyer & Botha, eds., 2004: 423).

According to Rothwell (2013), “Talent Management” is currently in the south African context a notion in search of a meaning and comprises a process of integrating efforts to attract the best, develop and retain the best. He identifies two approaches of talent management:

1. Traditional Talent Management programmes which focus on attracting, developing, training and positioning; and
2. Technical Talent Management focuses on attracting, developing, retaining, positioning and transferring the knowledge of their best high-level professional employees.

It is however not only the private sector that competes for the best minds and talent, as the public sector and the quasi-autonomous sector inclusive of universities of technology and other institutions of higher learning, too find themselves in a “war” for the best talent to ensure the achievement of their objectives. Universities of technology fall within this industrial and sectoral context. Since universities of technology reside under the guardianship of the South African Department of Higher Education and Training, women empowerment within the context of talent management receive high-level scrutiny; the Minister of Higher Education and Training has recently expressed concern that a combined total of R37,9 billion has been spent through the Sector Education and Training Authorities (SETAs), has between 2000 and 2010 but skills development in general still fall short of the demand from the Country’s growing economy. Government therefore is considering new regulations, which is set on improving the effectiveness and efficiency credentials of grants recipients. An important spinoff of such improved regulatory regime should be that targeted funding should be made to structured workplace

learning and experience to enhance strategic talent management processes. The new model will require that organisations ensure that 80% of discretionary grants by SETAs are earmarked for expenditure to address the scarce and critical skills and in particular focused on designated groups such as women (ETQA Officer, Education, Training and Development Practices SETA, Undated Letter).

Kim supports this viewpoint in that he states that “government is often at risk for brain drain, particularly in developing and transitional economies. Poorly planned government staff cutbacks, an aging work force, and competition from the private sector contribute to the brain drain in government.” (Kim, 2008: 638). In general Kim (2008) laments the state of skills development in South Africa and expresses concern that strategic skills development that will support transformation are ineffective. In its document called the Strategic Framework: Vision 2015 HRD Resource Pack the Department of Public Service and Administration in South Africa identified capacity development initiatives as the *first pillar* on which it will build the capacity of the public service. It states that “capacity development is at the centre of HRD as a profession” and that “interventions related to capacity development sought to identify strategic interventions which could add the highest value to the public infrastructure for developing the capacity of people” (DPSA, 2008: 12). The main focus of the capacity development strategies identified in the *first pillar* is leadership development management strategies and it is on this area within talent development that this debate seeks to focus.

An organisational human resources strategy for leadership development

Any well-structured organisational strategy and associated business plan and processes provide direction for the modalities associated with a human resources strategy for such an organisation. A human resources plan in the conventional sense includes processes associated with selection, appraisal, development and rewards for performance. The implication however, is that the appropriate people need to be selected, and such people should be appraised and subsequently their development needs and performance rewards should be aligned to particular competencies and behaviour (Charlton, 1993: 173).

These processes are however dependent on the organisation’s ability to identify specific competencies among its selected (in this case women) group, which form the basis of organisational success. The question may therefore be posed as to what constitutes a good (women) leader in an organisation? Which skills, craft or knowledge do we need to achieve our goals and objectives? What type of attitude and behaviour are appropriate? Such identified competencies will then in turn inform on which (developmental) interventions should be made to ensure or enhance organisational success.

The roles of leadership development

Leadership development performs a number of roles. According to Conger and Benjamin (1999) therefore, leadership development:

- prepares people for leadership roles and it contributes to the improvement of the effectiveness of those already in leadership positions;
- serves to promote acceptance of the vision, values, and mission of a collective by those occupying positions in which leadership is exercised, and it seeks to ensure that those in leadership positions are committed to their realisation;
- is used as a strategic intervention through the use of action learning, task forces etc., which ensures that learning is utilised in order to help the organisation adapt to change; and
- develops leadership skills throughout the organisation to create a *community of leaders*.

The first two roles and the fourth one are in agreement with popular definitions of leadership; while the third role indicates that leadership development can also constitute a direct intervention aimed at bringing about change.

UNIVERSITIES OF TECHNOLOGY

A university of technology such as the Tshwane University of Technology (TUT) in South Africa in particular, seeks to remain in touch with and responsive to the needs of its environment and community, be it the labour market, its students, its stakeholders or civil society in general. South African universities of technology are appreciative of the fact that they are located within a state constituted on the principles of developmentalism. Therefore, community engagement is encouraged in both a formal manner, such as interactions that are linked to the curriculum (work-integrated learning or service projects), and a non-formal manner, such as partnering with the community in outreach activities. What especially sets a university of technology apart from a traditional university is its focus on innovation and entrepreneurship, through to commercialisation. In this respect, the Tshwane University of Technology advances its entrepreneurial flair and informs its curricula by promoting cutting-edge research and innovation – activities that are governed by a need for application or problem-solving and which, ideally, lend themselves to commercialisation. Research and innovation are seen as dynamic trans- and multidisciplinary processes that rely on partnerships and networks that collaborate to come to fruition. A university of technology emphasises teaching and learning through means of cutting-edge technology. Technology in this regard, is defined in its broadest sense as the efficient and effective application of expertise. The processes of technological innovation, technological transfer and the commercialisation of technology form the basis of all educational activities at TUT. Yet, to fulfil their respective missions and visions, universities of technology require skilled and experienced staff and the acquisition, retaining and development of such staff is dependent on a comprehensive regulatory framework as well as necessary organisational directives. It thus stands to reason that women empowerment should form integrally part of such institutions' staff development and leadership and management strategies.

Applicability

It may be postulated that the roles of leadership development discussed *supra* are applicable not only to business organisations, but also to the development of leadership in the public sector and quasi-autonomous entities such as higher education institutions. For instance, the development of women leadership in universities of technology aims to prepare them for leadership roles, and provides them with the skills they need to further higher education in the country. It emphasises the importance of leadership work such as creating values, vision and mission that guide an organisation to achieve its goals. It may initiate change by helping students to apply what has been learned within society.

Fulmer and Goldsmith (2001: 317) in their research into the best practices in leadership development found that the best programmes:

- build awareness of external challenges, emerging strategies, organisational needs and how to meet those needs;
- employ learning tools that helps to recognise potential external change, envision the organisation's future, and focus on actions their organisations can take to create its envisioned future;
- tie leadership development programmes to solving important, challenging business issues
- align leadership development with performance assessment, feedback, coaching and succession planning; and
- assess impact of the leadership development process on individual behavioural changes and organisational success.

In research to establish what some outstanding organisations do to develop leaders for the future, conducted by Vicere and Fulmer (1997), it was found that such organisations tend to differentiate between *leaders* and *management*. This however, is not a novel finding (Kotter, 1990). Yet, a leader's role is to anticipate the future and to introduce the changes required for coping with the perceived future state – which entails providing direction through vision, mission and innovative strategy – and they focus on providing the required knowledge and skills through their programmes. Moreover, they emphasise the values that should guide others and the organisation, and provide for the development of interpersonal skills. For assessment, 360-degree feedback is used to provide participants with insight and to give direction to, and motivation for change. They also create opportunities to apply what has been learned within the organisation. The findings of both studies have implications for different types of organisations.

Current state of women leadership and women in leadership positions

The current gender imbalances in this area has been highlighted by a variety of pieces of legislation, reports etc. The efforts of government to identify the gap were welcome and applauded. The White Paper on Higher Education published in 1997 states that “the composition of staff in higher education fails to reflect demographic realities”. Black people and women are severely underrepresented, especially in senior academic and management positions. In addition the South African Employment Equity Act, 1998 (Act 55 of 1998) expresses itself as far as the redress is concerned as far as historical imbalances are concerned. The purpose of the Act is to achieve equity in the workplace by:

- a. Promoting equal opportunity and fair treatment in employment through the elimination of unfair discrimination; and
- b. Implementing affirmative action measures to redress the disadvantages in employment experienced by designated groups, in order to ensure their equitable representation in all occupational categories and levels in the workforce.

The issue and concern of lack of vehicles to address the issue of women development were also raised in Report of the Ministerial Committee on Transformation and Social Cohesion and the Elimination of Discrimination in the Public Higher Education Institutions (November 2008). The issue was also highlighted as a matter of concern in the country’s Educational National Plan (July 1997).

According to the Higher Education Management Information System (HEMIS) the number of female academics grew by 182 individuals per annum over the period 2001-2010 from 5560 in 2001 to 7353 in 2010. The growth is positive but still inadequate; hence the purpose of this paper to interrogate the relatively slow growth trajectory and progress of women into senior positions in South African tertiary education institutions. The figure below provides statistics on the number of men and women in the South African academia. Only professors, deans and senior lecturers are considered in this case.

Table 1: Headcount of academics by gender and rank (2002, 2006 & 2010)

Rank	2002			2006			2010		
	Women	Men	Total	Women	Men	Total	Women	Men	Total
Professor	292	1670	1962	383	1658	2041	480	1601	2081
Associate Professor	313	917	1230	517	1137	1654	594	1186	1780
Senior lecture	1422	2404	3826	1680	2458	4138	1867	2437	4304
Lecture	3070	3032	6102	3134	3020	6154	3547	3333	6880
Junior lecture	444	377	821	491	412	903	482	366	848
Total	5541	8400	13998	6205	8685	14974	6970	8923	15893

(Taken from: The SABPP Women’s Report 2012:14)

The table confirms that despite government efforts to address the issue, factors exist that prevent women’s upward mobility to higher positions in academic institutions. Some factors, which may contribute thereto may include:

- Lack of leadership commitment when it comes to employment equity even if it is driven by a legal compliance.
- Slow progression and advancement of women. Efforts by staff development, promotion policies etc. failed to close the representivity gap.

A Ministry of Higher Education and Training’s Committee on Transformation and Social Cohesion and the Elimination of Discrimination in Public Higher Education Institutions was repeatedly told by institutions that funding for staff development and, more in particular, for nurturing and mentoring black staff members to take up level positions, was either inadequate or ineffectively expended (see reference to this matter *supra*). For this reason, the recommendations that dedicated programmes and funds be availed for staff development. Such funds

could be provided as part of the state subsidy through the SETA-processes to higher education institutions and matched by institutional funding. The provision of earmarked funds should be based on the submission of institutional plans that address the question of staff development.” (Report of the Ministerial Committee on Transformation and Social Cohesion and the Elimination of Discrimination in Public Higher Education Institutions: 30th November 2008. Final Report).

In the above context the researchers as participant observers have noted that South Africa has 23 institutions of higher education; seventeen universities and six universities of technology. And consequently, as a case in point, the Tshwane University of Technology as the largest university of technology in South Africa and the African continent should act as a strategic leader in the quest for women leadership development. The Tshwane University of Technology reflects the following statistics:

Figure: 1 Size of the University

UNIVERSITY	NUMBER OF FACULTIES	NUMBER OF DEPARTMENTS	NUMBER OF STUDENTS
TUT	7	57	52168
TOTAL	7	57	52168

Figure: 2 Top Executive positions

Position	Women	Men
Vice Chancellor	1	-
Deputy Vice Chancellor	-	3
TOTAL	1	3

Current research is still underway to establish overall the equity breakdown of Tshwane University of Technology, which will be revealed once a comprehensive process of appointments are complete by end-2013 for executive-level contract positions. However, current observations as to the relative ineffective absorption of women into executive positions may point towards factors such as a lack of an integrated strategy and associated implementation model to further the objectives of Government with regards to women advancement. An additional factor may be that many women who do elect to enter into academia, do so with due cognisance of their additional responsibilities as mothers and domestic concerns. Academia is regarded as an occupation which tends to by virtue of its architecture be construed as an opportune position for such women. Once however, executive or more supervisory level opportunities arise, women find that their flexibility is compromised. If in the research this postulation is proved as an additional factor, it would indicate that not only leadership and skills development interventions need attention but also finding ways in which to seek means which to accommodate women and address such challenges.

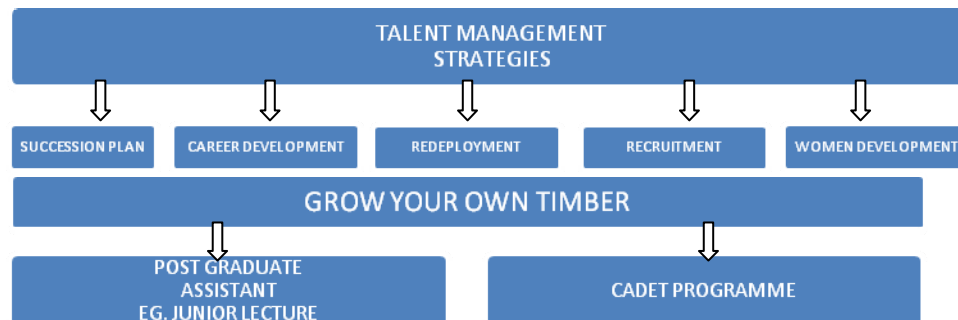

PRELIMINARY MODEL FOR INTEGRATED TALENT MANAGEMENT IN UNIVERSITIES OF TECHNOLOGY AND CONCLUSION

Following is a model which as a preliminary intervention to improving women leadership development as part of a comprehensive talent management strategy, may contribute to this challenge in South African universities of technology. Each of the elements in the following model is set on addressing the challenge of women advancement from a particularly functional perspective. It should be noticed that it is necessary to have particular strategies concerning succession planning, career development, redeployment, recruitment and specific women development.

Over and above a strategy to attract appropriate staff from outside, and especially from the educational sector and industry as well as the direct economy (bearing in mind the vocational and applied sciences nature of a university of technology), the “grow your own timber” concept finds bearing. Candidates should be identified, subjected to assessment center formalities and processes and thereafter carefully nurtured and mentored, thus exploiting their potential.

The cited model makes allowance for young graduates to be provided with academic and administrative positions on different levels, starting at even the lowest such as junior lecturer in the case of an academic candidate and thereafter to subject such candidates to a “cadet programme”, which is carefully designed to attend to the leadership and other skills sets required by the organisation in the context of its needs, the industry as well as broad based women empowerment.

Table 1: Talent Management Strategies

In addition the services of organisations such as the Higher Education Resource Services organisation (HERS-SA), which was founded to address the critical shortage of women in senior positions in higher education sector, may be utilised. The purpose of the academy is to address critical shortage of women in senior positions in the Higher Education Sector in South Africa. HERSA-SA academy offers a variety of activities such as, short professional development workshops, networking opportunities, awareness raising interventions to women currently employed or possessively the potential to be employed at the senior management level, creating an avenue for talent management pool. The workshop and mini workshops takes place annually.

In particular, two HERS-SA services are deemed as important being, *to ensure that structured and targeted development is provided* and *to assist to formulate gender-sensitive human resources policies and practices wherein training strategies may be achieved*. It should be mentioned that an implementation strategy for gender empowerment should generally assist in building a rigorous monitoring and evaluation system for women empowerment interventions, carry buy-in from all stakeholders and key decision makers, include extensive coaching and mentoring practices and make provision for strategy governance through the establishment of a steering committee and a Taylor-made include competency model.

This paper sought to introduce the current research which the authors have embarked upon in an attempt to address the current critical shortfall concerning women representivity in universities of technology in South Africa. The research project is currently still underway and final conclusions and recommendations are not due for some time still. However, this paper is an attempt to share as well as to solicit information concerning this topical issue with an international audience. Any comments and would be well-appreciated.

FINANCIAL COSTS AS A BARRIER TOWARDS STUDENT EDUCATION IN AN EMERGING MARKET

Lorraine Motlhabane and Nicolene Barkhuizen
North-West University, South Africa

ABSTRACT

This paper addresses the predicament of finance costs incurred mostly by needy students when borrow from financial institutions or use institution's credit facility to further their higher education (HE) studies. A survey was developed and distributed to students (N=225) studying Personal Finance at a South African Higher Education Institution. The results indicate that many students are least informed about the conditions under which incur these costs and thus susceptible to exclusion risks. Consequently finance costs are termed silent barriers to higher education students' access and success.

INTRODUCTION

Access to higher education is under threat in South Africa because of the extra burden created by finance costs. These costs tend to jeopardize the democratic government promise to fund needy students up to undergraduate level. Kader Asmal, the former education minister, had vowed to aid needy students financially as he said it was crucial for meeting the government's statutory commitments of redressing inherited inequalities. In addition he wanted to enhance the expansion of higher education access to fulfill personal growth and developmental goals befitting a democratic society (DoE & DoL, 2003, 13).

The process was necessary to make up for inherited injustices, highly skewed privileges and opportunities which were based on racial and gender disparity in HE system (Cloete, Maassen, Fehnel, Moja, Gibbon, and Perold, 2006). The government's funding had since been established under National Students Financial Aid Scheme (NSFAS) though it is not free yet as needy students must still pay a portion of the utilized funds together with finance costs incurred. NSFAS together with the other two commonly used funding methods such as, the financial institutions loans (Eduloan) and HE institutional credit facilities do attract finance cost which is the subject of this paper. Johnstone, (2005) describes finance costs as extra charges to people with immediate needs but utilize resources of others, committing to future repayments plus additional fees, including penalties to compensate for earlier access. Del Rey and Verheyden (2011) assert that these costs occur due to ex-post moral hazard, perhaps because their negative impact to students who lack cash to pay upfront for their educational needs. The price tag is dependent on the period over which the debt is left unpaid or non compliance to credit terms.

Sadly only a few are aware of the timing and the conditions under which they incur finance costs or choose the cheapest method, thus failing to minimize or avoid these costs altogether. Worse still affected students suffer in silence, confirming the Trachtman, (1999)'s conclusion that discussing money matters is a taboo subject to many societies. Belsky and Gilovich (2009, p. 18) regards knowledge to be the best medicine for many of our ills; however students disempowered self by choosing to ignore financial matters that affect them (even when conditions are attached to a contract). The financial woes are thus perpetuated when they could be minimized when the subject of finance is openly discussed, to enable leaning from each other's past mistakes. This paper will focus on the challenges faced by students who borrowed money to gain access but lacked resources to continue their studies (Cele, 2008; 2009). In recent years HE institutions' demand settlement of outstanding balance as a condition for the following year's registration and many who struggle to comply fall

victim to exclusions. The burden is increased by the extra costs incurred when credit terms that formed part of their finance contract are not adhere to.

LITERATURE REVIEW

South African students, including NSFAS beneficiaries, are still subjected to finance costs which kick in the moment a student sign for a loan. Higher education minister Nzimande placed a limit on interest charged to student loans, starting from the year 2011 (Mahlangu, 2011, Sastudy, 2011). The new developments however do not quantify the real benefits for beneficiaries to understand, especially those with loans from prior periods who must still complete their studies. South African public expenditure on higher education increased substantially over the years (Pillay, 2010), although there is less positive effect on students' enrollment and success rate (Bergh and Fink, 2008).

Literature addressed the subject of financial illiteracy, highlighting the consequences and risk of uninformed financial decisions, (Lusardi and Mitchell, 2005), but little was said about how the finance costs inflate the borrowed amounts and how these costs impact on borrowers especially to the poor. The fact that they are least likely to obtain favorable credit terms, paying higher interest for market borrowing and insurance, than rich parents do (Cigno and Luporini, 2008, Abhijit and Duflo, 2010) is adding fuel to fire. Justifications for the disparities in borrowing terms between the rich and the poor are said to be as a result of the latter's inability to provide sufficient collateral as well as compensation for administration cost, for exposing lenders to higher non-payment risk (Menkhoff, Neuberger and Rungruxsirivorn, 2010). These costs silently affect people who are not sufficiently educated in finance or those who take things for granted. It confirms Lusardi's (2010) survey results which found that the majority of Americans' financial capabilities paint a bleak future. The financial incapacities result in failure to plan for predictable events like children's college education and providing for unexpected events or emergencies. Authors universally advocates the importance of financial knowledge as foundational, without which the health and well being of the society threatens to be eroded (Kezar, 2002; Morton, 2005; Godfrey, Illes & Berry, 2005). Contrary Illiteracy levels were found to be widespread among the young and old indiscriminative of the person's economic status, education standard and college graduates including those majoring in accounting and business (Lusardi and Mitchell, 2006; Rosacker, Ragothaman and Gillispie, 2009). The threads seem more realistic as Lusardi and Mitchell, (2006); Rosacker, Ragothaman and Gillispie's, (2009) research found widespread financial illiteracy levels among the young and old. The results were indiscriminative of the person's economic status, the education standard and college graduates including those majoring in accounting and business studies. ed, in these groups were.

Employers, governments and NGO's in many countries have undertaken initiatives to enhance financial literacy. Fox, Bartholomae and Lee (2005) found the need for financial education among Americans to be demonstrated with alarming rates of bankruptcy, high consumer debt levels, low savings rates, and other negative outcomes resulting from poor family financial management and low financial literacy levels. The conditions might have induced the saving campaigns and rigorous finance education and training of American government's in partnership with business, including high school course and investment knowledge (Lusardi and Mitchell, 2006; Peng, Bartholo-mae, Fox and Cravener, 2007). Japan and the Swedish pension privatization program also offered insights into possible roles for financial literacy (Lusardi and Mitchell, 2006; Loyns Palmer, Jayaratne and Scherpf, 2006) however the efforts still failed to improve the consumers' financial behavior. In other areas, trainees' subsequent behavior was unclear after acquiring skills in financial education (Mandell and Klein, 2009).

Literature's inability to diagnosis the root causes of financial woes do not presents the traps in ways that are explicit enough to caution people in their decision making. The fact that casual financial decisions not only severely impair on the individual's future but includes that of their families and the community at large (Howlett, Kees & Kemp (2008) and Loyns, Palmer, Jayaratne & Scherpf, (2006) demand a radical change to personal finance education. developments have brought little progress to personal financial literacy and maturity Linking the diagnoses with the effect is important enough to deter individuals from being causal about financial decisions. It is necessary to alter the notion that classifies finance as the subject of the elites, the wealthy or those tightfisted. As Peng, Bartholo-mae, Fox and Cravener, (2007) found financial experiences to be positively

associated with savings rates, perhaps being open about the subject can help individuals to reap the value of learning from each other's experiences and averts the future recurrence of similar mistake.

METHODOLOGY AND RESEARCH DESIGN

The research aimed to investigate the impact of finance costs to students' ability to successfully complete their studies and how these costs can be minimized or eliminated. A questionnaire was designed to enable collection of quantitative data. The study could stimulate the investigation of the actual causal factors contributing to financial crisis that prevents many students from successful completion of studies. The respondents were undergraduate students ($N=225$) studying Personal Finance at a South African Higher Education Institution. This study follows a descriptive format with results displayed in terms of frequencies and percentages.

The study was induced by students' enquiries, unsettled by the unexpected increase of their debt which threatening their ability to continue their studies in following years. Many continue to be excluded on financial grounds (Letseka, Cosser, Breier and Visser, 2010; Cele, 2008; Cele, 2009) because Institutions demand settlement of prior year's debt as a pre-condition for the following academic year's registration. The relaxation of exclusions laws are some of the demands cited as reasons for continued disputes and students' unrest at different higher education institutions across the country (Plaatjie, 2008, Yang, 2011; London Assembly, 2011, Luescher-Mamashela, 2011).

RESULTS

The results of the research are presented in Table 1 below. From Table 1 it is evident that the respondents are generally uninformed about the financial implications of their studies. For example 73.8% of the respondents indicated that they are uninformed about their FUNDISA education investment, 75.11% indicated that they are not aware of the credit terms and conditions of their funding. In addition the respondents also indicated that they did not have sufficient knowledge to assist them with their choice of funding. The majority of the students also indicated that they are not aware of the penalties of non-compliance with financial funding. Finally more than half of the respondents indicated that they had to take a break in their studies because of financial reasons.

Table 1: Results of the Study

Questions and Categories	Frequency	Percentage
How is your higher education studies funded?		
Family income / credit/ Facility of Institution	78	34.67
Government fund/ partial loan	71	31.56
Full bursary / grant	34	15.11
Private financial institution loan	42	18.67
How informed are you about FUNDISA education investment?		
Well informed	31	13.78
Less informed	28	12.44
Uninformed	166	73.78
Do you know if family invested in the fund?		
Yes	19	8.44
Unable to judge	21	9.33
No	185	82.22
Aware of funding/loan /institutional credit terms & conditions?		
Yes	23	10.22
No	169	75.11

Not applicable	33	14.67
Knowledge helped in finance option choice?		
Yes	21	9.33
No	175	77.78
Not applicable	29	12.89
Do you/will you be able to comply with loan/funding requirements?		
Not always /default sometimes	88	39.11
Always/ try my best to comply	33	14.67
Unable to judge if I would meet the requirements	85	37.78
Not applicable	19	8.44
Are you aware of non compliance/default interest/penalties?		
Yes	18	8.00
No	138	61.33
Not applicable	69	30.67
Did you ever have a break in studies due to financial reason?		
Yes	126	56
No	72	32
Break for other reason	27	12

Table 2 below shows an analysis of the funding structure and interest of a student loan

Study year	Fund amount	Rebate	Interest %	Interest Amount	Year total	Balance owing
2009	35140.28	4889.08	7.6%	208.88	2317.61	32568.81
2010	28360	2836	5.2%	115.66	1350.61	26874.58

The results in Table 2 showed that irrespective of the Irrespective of the rebate (subsidy) of R2836: 2010; (R4889.08 - 2009), it caters more for the annual interest than reduce the loan burden of the student.

Table 3 below shows an analysis of the Total interest and Penalties that students should pay as a result of not meeting their financial obligations. The results clearly shows the negative impact on student's finances as a result of not being able to pay the requested amounts on time.

DISCUSSION AND CONCLUSION

Higher education institutions have a significant role to play in a nation's wealth with its hard-edged capacity to foster intellectual capital, economic growth, stimulate development and innovation in a 'knowledge economy'. However student access to higher education is under threat in South Africa because of the extra burden created by finance costs. This paper addressed the predicament of finance costs incurred mostly by needy students when borrow from financial institutions or use institution's credit facility to further their higher education (HE) studies. Since the government's promise of free education up to undergraduate level to needy students has not been realistic to many; the students and their families resort to alternative financing methods. Inability to make sense of financing method's terms and conditions inflated costs which tamper with the very objective to complete studies. The cost of accessing education in South Africa was tested against three common finance methods. These are the government's National Students Financial Scheme (NSFAS), private finance such as (Edu-Loan, bank loans etc.) and the Institutional Credit Facility. The Finance costs (include: interest, administrative fees and defaulter penalties), increase the burden of credit users, however ignorance limit their ability to minimize or eliminate these costs.

The results indicate that many students are least informed about the conditions under which incur these costs and thus susceptible to exclusion risks. Consequently finance costs are termed silent barriers to higher

education students' access and success. In addition the results also showed the additional financial costs incurred by students due to a lack of understanding and subsequent mismanagement of student funding.

Table 3 Analysis of the total interests and penalties payable by students

Total Owing Mid year R	Interest charges Mid year R	Penalties/ fees late registration R	Payment R	Date Paid	Total owing year end R	Interest charges year end R	Total interest & penalties R

In conclusion the results of this study highlighted financial costs as a barrier towards further education of students in Higher Education Institutions. This information is useful to the relevant stakeholders such as higher educational government to redress student access policies and subsequent management of study costs. In addition the results of this research also showed that students should be educated as to how to manage the funds received for studying more effectively. South Africa is a developing country that is continuously being criticised for its low market efficiency and human development. The country thus cannot afford to lose future talent employees due to a mismanagement of student access and funding to higher education institutions.

PROFILING NON-USERS OF E-GOVERNMENT SERVICES: IN QUEST OF E-GOVERNMENT PROMOTION STRATEGIES

Mercy Mpinganjira and Phineas Mbango
University of Johannesburg, South Africa

ABSTRACT

Developments in information technologies are providing a lot of opportunities for organisations to diversify their service delivery channels. However, the success of new channels largely depends on their acceptance by intended users. This paper aimed at profiling non-users of e-government services in an effort to explore factors that need addressing in trying to promote usage of the channel. Data used in the analysis was collected from a total of 161 non-users of government services in Gauteng using a structured questionnaire. The results show that while lack of experience using the internet may be a contributing factor to non-usage of e-services among some citizens, the majority of non-users were experienced enough with the internet. The results also showed that non-users did not have very strong favourable attitude towards e-government services. Demographic factors were found to be insignificant in explaining differences in attitude among different groups of non-users. The implications of the findings on efforts aimed at promoting use of the internet as a delivery channel for government services have been highlighted in the paper.

INTRODUCTION

Wide appreciation exists of the opportunities to organizations created by developments in information technology, the internet in particular. Chau and Lai (2003) noted that the internet has compelled organizations in various business and service sectors to support their products or deliver their services online. While economic reasons commonly dominate reasons for adoption of e-services by private business organizations, adoption of e-government is often driven by both economic and social benefits. Some of these social benefits include the need to promote universal access to government services, increased transparency in government dealings and reduce corruption. According to the United Nations (2008), there are five main successive stages of e-government revolution. These are, in order of sophistication, the emerging stage, the enhanced stage, the interactive stage, the transactional stage and the connected stage. They described the stages as follows:

Emerging stage – As the first stage in the evolution process, this stage is characterized by government's online presence comprising mainly of a web page and/or official website and provision of mostly statistics information.

Enhanced stage – This stage is characterized by provision of more information online by government on government policy and governance. Links to archived information are also put in place thus allowing citizens easy online access to such things as government forms and reports.

Interactive stage – Apart from the features associated with the emerging and enhanced stage, the interactive stage is further characterized by online government presence that allows for government officials to be contacted for example through e-mail. In the interactive stage, government contact details including email, fax, telephone numbers and physical address are provided online.

Transactional Stage – The stage is characterized by two-way online interaction between government officials and citizens. During this stage citizens are able to conduct all stages on a transaction online. For example, citizens may be able to apply and pay for identity documents, passports or birth certificates online.

Connected Stage - This is considered the most sophisticated stage in the e-government evolution process. Among other things, it is characterized mainly by connections between government departments. In order for this to be possible, issues of interoperability have to be taken care of.

A quick review of e-government sites in Africa shows that most countries are still in the early stages of e-government development with most of them not providing transactional services. Despite this, the presence of official government websites often containing a wide range of information for almost all African countries bears testament to the fact that African governments have widely embraced the concept of e-government.

RESEARCH PROBLEM AND OBJECTIVES

While African governments have clearly embraced the concept of e-government, one challenge that most of them face is how best to ensure universal access and increased use of the services to its citizens. Stahl (2005) noted that while private businesses have the choice as to the type of customers to target their e-services to, governments are by mandate expected to serve each and every one of its citizens. Governments thus need to find ways of ensuring that as many people as possible are able to access e-services. Efforts aimed at ensuring increased use of e-government services need to pay particular attention to current non-users of the services with the aim of understanding them better. A good understanding of this group of citizens can enable government come up with better programs for targeting them with the aim of growing number of citizens making use of e-government services. This study aims at contributing to this understanding by examining the demographic profiles of non-users of e-government services in Gauteng, South Africa. The specific objectives of the paper are to (a) examine demographic characteristics (age, gender, education, income status) associated with non-use of e-government services (b) examine levels of experience with using the internet among non-users of e-government services (c) investigate the relationship between demographic characteristics of non-users of e-government services and their attitude of e-government services and (d) highlight the implications of the findings on efforts aimed at promoting use of e-government services among non-users of e-government services.

LITERATURE REVIEW

In marketing, it is commonly agreed that the key to customer satisfaction is in understanding their needs and providing products that meet identified needs. In practice, it is however difficult to come up with products that appeal to all customers. It is for this reason that companies often divide customers into different groups before deciding on how to target them. This process of dividing up a market into smaller and distinct groups of customers with similar needs or other characteristics that make them respond in a similar way to marketing efforts is referred to as market segmentation. It is important to note that while private organisations often have a choice as to which group of customers to target, the public sector by its mandate is supposed to be at the service of every customer. In such cases market segmentation is not aimed at helping decide on which groups to target at the exclusion of others but rather to help better understand the needs and characteristics of different groups of customers so as to help develop programs that better target them.

The market segmentation process involves a number of steps one of which is deciding on the segmentation base to use in dividing up a market. While there are several factors that can be used to segment markets, demographic factors tend to be more commonly used than most other factors. Demographic segmentation involves dividing up a market based on such factors as age, gender, race, income and education. Some of the reasons why demographic factors are commonly used in segmenting markets are because demographic information tends to be readily available and also because people in different demographic groups tend to be associated with different factors that make them behave differently. It is thus not surprising that studies on e-service adoption often include demographic variables as important factors worthy examining in trying to understand why some people adopt or do not such services.

James et al (2009) noted that many studies report differences in attitude towards new technologies between people in different demographic groups. One important characteristic of attitude is that it is relatively enduring which means that they persist over time unless something happens or is done to change them (Mpinganjira, 2012). It is important to note that attitude is commonly considered a factor of critical important in behavioural studies. This is due to the fact that as a measure of degree of favour or disfavour a close relationship

often exists between attitude and behaviour. As noted in the objectives, this paper profiles non-users of e-government services. Gender, age, income and education are the specific demographic variables of interest.

Gender – In most African societies including South Africa, women account for a larger percentage of the population compared to men. Despite this, many studies especially those conducted in developing countries often report lower levels of usage of information technologies among women than men (Wahid, 2007). Psychological differences between men and women may explain the differences that often exist between them in terms of use of technology. Koochang, (1987) observed differences in attitude towards technology between men and women. The hypothesis being put forward in this study is that:

H1: There are significant differences in attitude towards use of e-government services between male non-users and female non-users.

Age – Young people of today are undoubtedly growing up in a technological environment that is significantly different from that of their parents. In many areas students are being introduced to computers right from primary schools and in worst cases in high school. This was not the case for most people who studied their primary and high school levels prior to mid 1990's. It is thus not surprising that many studies report high usage levels of internet among younger people than among older people (Naseri and Elliot, 2011). One would thus expect high familiarity with internet in general among young people than older people. At the same time one would expect high levels of familiarity with internet to make one have favourable attitude towards adopting internet based services such as e-government. The following hypothesis will therefore be tested in the study:

H2: Younger non-users of e-government services have significantly higher levels of experience with using the internet than older non-users.

H3: Older non-users of e-government services have significantly more negative attitude towards e-government services than younger non-users.

Level of education - Most of the information and services available online are in English. For most people in Africa, English is not their first language. This means that for one to be able to use the internet they need not only to be able to read and write their first language but also have a good command of English. This often entails attaining higher levels of education. Nasri (2011) noted that people with higher levels of educational attainment are likely to also have an aptitude for computers. This may be due to growing use of internet in educational institutions as well as in offices of formal employment. Education is also important in that the knowledge one gets through it can serve as input in producing the ability for one to be familiar with how the internet works as well as services made available using it. For this reason this study proposes that:

H4: There is a significant positive relationship between level of education and experience with use of internet among non-users of e-government services.

H5: There is a significant positive relationship between level of education and attitude towards use of e-government services among non-users of e-government services.

Income – A report by Zickuhr and Smith (2012) noted that income levels remain a strong predictor of internet use. A number of factors may explain this. First is the strong correlation that often exists between education levels and income levels. In most societies high levels of education is associated with high levels of income and since high levels of education is associated with increased use of internet, the same will be the case with income. A related factor is the issue of access to internet infrastructure. Many people in Africa access the internet at office. High costs associated with accessing internet at home is a likely contributing factor to less people accessing internet from home. At the same time it should be noted that it is not everyone who has the privileged of having a computer with internet access at the office. Such privileges are often not made available to low level employees in organisations. The hypothesis put forward in this regard are that:

H6: There is a significant positive relationship between level of income and attitude towards e-government services among non-users of the services.

H7: There is a significant positive relationship between level of income and one's experience with use of internet among non-users of e-government services.

RESEARCH METHODOLOGY

This paper is based on part of a larger study on e-government. The focus of the paper is on non-users of e-government services provided over the internet by main stream government departments. Data used in the analysis was collected from a total of 161 respondents using a structured questionnaire. The study was conducted in Gauteng, South Africa. Gauteng was considered ideal location mainly because of its cosmopolitan nature. As the main economic hub of South Africa, Gauteng attracts people from all areas of South Africa. The views of the sample drawn from this area can thus also be seen in a way as views that take cognisance of what is happening not only in Gauteng in terms of e-government services but also in the different areas where the different people come from.

Non-probability sampling in the form of quota sampling was used to guide in selecting respondents. The aim was to get respondents from different groups based on such factors as gender and race. Respondents to the questionnaire were approached in different locations including offices and shopping malls and asked to respond to the questionnaire. Constructs of interest in this analysis include age, gender, level of education, level of income, level of experience using the internet and attitude towards e-government. Age, level of education level of income as well as level of experience using the internet were all measured as categorical variables that are ordinal in nature. These variables were treated as ordinal scales. Gender was measured as a nominal scale as respondents had to indicate by ticking either male or female. Attitude towards e-government was measured as a construct made up of five items. A five point Likert scale with 1 = strongly disagree, 2 = disagree, 3 = neither agree/nor disagree, 4 = agree and 5 = strongly agree was used to measure each item. Cronbach alpha was used to test the reliability of the attitude towards e-government services construct. The results showed an alpha coefficient of over .8 which means that the scale was highly reliable. Statistical Package for Social Science (SPSS) was used to analyse all data collected using the questionnaire.

RESULTS AND DISCUSSION

Presented in table 1 are background characteristics of the respondents in the study. According to the statistics the respondents were relatively evenly spread on gender with 85 of the respondents being male while 76 were female. Percentage wise this represents 52.8 male and 47.2 percent female. Just over half of the respondents (54 percent) were less than 30 years of age while a total of 11.2 percent were 50 years and above. Those between the ages of 30 and 39 years old were 18.6 percent of the sample was 16.2 percent of the sample was between the ages of 40 and 49. It can thus be said that in terms of age the sample was largely younger in age with those below the age of 40 making up a total of 72.6 percent.

Educational level statistics show that the majority of the respondents can be considered to be moderately educated. Only 2 respondents representing 1.2 percent of the sample can be considered of low level education. These 2 indicated primary school as the highest level of education achieved. On the higher end, only 35 respondents had a bachelors degree and above. These presented a total of 21.8 percent of the respondents. 80 respondents representing just below half (49.7 percent) of the sample had high school as their highest level of education. This group was in terms of size followed by a total of 44 respondents (27.3 percent) who had a diploma as the highest qualification. Those with high school and diploma as the highest qualification together consisted of 77 percent of the sample.

When it came to income level measured as gross monthly income, the statistics in table 1 show that 38 respondents representing 23.6 percent were receiving an extremely low income of no more than R 1,000 per month. Actually a total of 73 respondents which represents 45.3 percent of the sample were in the low income group as their gross monthly income level was no more than R 5,000 per month. A total of 48.4 percent were in the middle income group earning gross monthly incomes of between R 5, 001 and R 20,000. Only 3 respondents representing 6.3 percent of the respondents were high income earners earning more than R 20,000 per month. Thus the sample consisted of mostly low and medium income earners.

Table 1: Non-users background characteristics - Descriptive statistics

	<i>Frequency</i>	<i>Percentage</i>
<i>Gender</i>		
Male	85	52.8
Female	76	47.2
<i>Age</i>		
Less than 30 years	87	54.0
30 to 39 years	30	18.6
40 to 49 years	26	16.2
50 to 59 years	13	8.1
60 + years	5	3.1
<i>Highest level of education</i>		
Primary School	2	1.2
High School	80	49.7
Diploma	44	27.3
Bachelors degree	32	19.9
Masters and Doctorates	3	1.9
<i>Income level (gross monthly income)</i>		
R0 – R1,000	38	23.6
R1,001 – R5,000	35	21.7
R5,001 – R10,000	35	21.7
R10,001 – R20,000	43	26.7
R20,001 – R30,000	7	4.3
Over R30,000	3	1.9
<i>Level of experience using the internet</i>		
None	9	5.6
Beginner	33	20.5
Intermediate	80	49.7
Advanced	39	24.2

Also presented in table 1, as part of the background characteristics of the sample, is the respondents perceived level of experience with using the internet. Respondents were in this case asked to indicate their level of experience with the internet by marking any of the four options given namely none, beginner, intermediate or advanced. The findings show that only 9 respondents representing 5.6 percent of the sample had no experience with the internet. This means that over 90 percent of the non-users of e-government services had some experience with the internet. The results actually show that 73.9 percent of the respondents considered their experience with the internet to be either intermediate or advanced. This shows that the majority of the respondents had the skills necessary for them to make use of online government services.

Table 2: Attitude towards e-government – descriptive statistics

	<i>Mean</i>	<i>Std Deviation</i>
- Using internet to accesses government services is a good idea	3.83	1.10
- I like the idea of using e-government services provided through the internet	3.83	1.12
- Using e-government services provided through the internet is a pleasant idea	3.77	1.09
- Using e-government services provided through the internet is an appealing idea	3.74	1.15
- Using e-government services provided through the internet is an exciting idea	3.77	1.19
Overall attitude towards e-government services	3.79	1.02

Table 2 presents findings on attitude towards provision of government services using the internet channel. One important characteristic of attitude is that one can measure its strength. Strength refers to one's level of favourability or unfavourability towards an attitude object. Since a five point scale, ranging from strongly

disagree to strongly agree was used to measure attitude in this study, mean values need to accordingly be interpreted as follows: values of less than 1.5 = strong levels of disagreeing; 2 or to the nearest of 2 = disagreeing; 3 or to the nearest of 3 = neutral (neither agree nor disagree); 4 or to the nearest of 4 = agree while 5 or to the nearest of 5 denotes = strong levels of agreement. According to the results in table 1, the mean values for the five items used to measure attitude towards e-government were between 3.74 and 3.83. The overall mean value was at 3.79. Although the values do not indicate very high levels of favourability towards e-government services they nevertheless show that in general non-users of e-government services have a favourable view on provision of government services using the internet.

Spearman rank correlation was done in order to test above hypotheses 2 to 7. The results according to table 3 show an inverse relationship between age and level of experience with using the internet (correlation coefficient = $-.176$). The results further show that correlation was statistically significant at 0.05 level of significance. Thus according to the results hypothesis 2 which states that younger non-users of e-government services have significantly higher levels of experience with using the internet than older non-users is hereby accepted. The results in table 3 also show an inverse relationship between age and attitude towards e-government services (correlation coefficient = $-.142$). This means that positive attitude towards e-government was associated more with younger people than with older people. However the correlation coefficient was not statistically significant. Thus hypothesis 3 stating that older non-users of e-government services have significantly more negative attitude towards e-government than younger non-users is not accepted.

In terms of correlation between level of education and experience with use of internet, the results show a positive but statistically insignificant relationship between the two variables (correlation coefficient = $.009$; $p > .05$). Hypothesis 4 which states that there is a significant positive relationship between level of education and experience with use of internet among non-users of e-government services is hereby not accepted. The results also show a positive but statistically insignificant relationship between level of education and attitude towards use of e-government services (correlation coefficient = $.090$; $p > .05$). Hypothesis 5 stating that there is a significant positive relationship between level of education and attitude towards use of e-government services among non-users of e-government services is thus also not accepted.

Table 3: Correlation Analysis

		<i>Attitude towards e-government</i>	<i>Level of experience with internet</i>
<i>Age</i>	<i>Correlation coefficient</i>	$-.142$	$-.176^*$
	<i>Sig (2-tailed)</i>	$.073$	$.026$
	<i>N</i>	161	161
<i>Level of education</i>	<i>Correlation coefficient</i>	$.009$	$.090$
	<i>Sig (2-tailed)</i>	$.913$	$.254$
	<i>N</i>	161	161
<i>Level of income</i>	<i>Correlation coefficient</i>	$.057$	$.204^{**}$
	<i>Sig (2-tailed)</i>	$.470$	$.010$
	<i>N</i>	161	161

Table 3 also presents results of the correlation analysis between level of income and attitude towards e-government services as well as experience with use of internet. The results show a positive but statistically insignificant relationship between level of income and attitude towards e-government services (correlation coefficient $.057$; $p > .05$). Hypothesis 6 which states that there is a significant relationship between level of income and attitude towards e-government services among non-users of the services is thus hereby not accepted. The results however show a statistically significant relationship between level of income and experience with use of internet at 0.01 level of significance. Hypothesis 7 stating that there is a significant positive relationship between level of income and experience with use of internet among non-users of e-government services is thus accepted.

With gender being a categorical variable testing for differences in attitude towards e-government between male and female respondents was done using independent sample t test. The results as presented in table 4 show that although male non-users had more positive attitude towards e-government services (mean = 3.91) compared to female non-users (mean = 3.65) the differences were not statistically significant. Thus according to

the results hypothesis 1 stating that there are significant differences in attitude towards use of e-government services between male non-users and female non-users is hereby not accepted.

Table 4: Differences in attitude towards e-government - Independent Sample T-test

	<i>Descriptives</i>			<i>T-Test for equality of Means</i>			
		<i>Mean</i>	<i>Std. Deviation</i>	<i>T</i>	<i>Sig. (2-tailed)</i>	<i>95% confidence interval of the Mean</i>	
						<i>Lower</i>	<i>Upper</i>
<i>Gender</i>	<i>Male</i>	3.91	1.02	1.640	.103	-.054	.580
	<i>Female</i>	3.65	1.01				

CONCLUSION AND RECOMMENDATIONS

From the findings a number of conclusions can be drawn and recommendations made with respect to level of non-users experience with the internet as well as the relationship between demographic background characteristics of non-users and their attitude towards e-government services. In terms of level of experience with the internet, the study shows that the majority of the respondents had medium to high levels of experience with using the internet. As internet skills are a prerequisite for anyone to make use of e-government services, it can be concluded that lack of experience with the internet cannot be used to explain non-usage on e-government services among the majority of the respondents. For people with good internet skills, promotion efforts need to therefore include other factors that may be preventing citizens from taking up usage of available services. For example, government may need to intensify its awareness campaigns so as to make sure that more people are aware of available services. At the same time government needs to pay attention to people with limited or no internet skills. This can be addressed through intensification of efforts aimed at making internet accessible to communities. As the study showed significant relationship between level of experience and age as well as income levels, special measures need to be put in place to make sure that training opportunities are being taken up by all people lacking the skills including older people as well as those from low income backgrounds.

From the findings it can also be concluded that while attitude is often considered a factor of great importance in trying to understand behaviour, the findings of this study show weak relationship between the two. This is evidenced by the fact that in general the respondents showed positive attitude towards e-government. Furthermore, the findings did not show statistically significant relationship between attitude and background characteristics of age, level of education and level of income nor did it show significant differences in attitude between male and female respondents. What this means is that amongst the non-users of e-government services, demographic factors are not good predictors of strength of attitude towards e-government. Public officials aiming at promoting use of e-government services need to understand differences in non-user attitude by exploring other factors that may explain attitude such as levels of trust associated with use of the internet to access government services. Such efforts would also help in finding factors that can be addressed on capitalised on in building on current favourable attitude towards e-government services.

North West University, South Africa

ABSTRACT

This paper examines the role of export diversification on economic growth in South Africa. The study uses annual time series data for the period covering 1980 to 2010. The Vector Error Correction Model (VECM) is employed to determine the effects of export diversification on economic growth. Possible factors that affect export diversification considered as independent variables in this study include gross capital formation, human capital, real effective exchange rate and trade openness. The results of the study reveal that export diversification and trade openness are positively related to economic growth while real effective exchange rate, capital formation and human capital have negative long run relationships with economic growth. The study recommends the continual implementation of trade liberalisation by the South African government. The South African government is also encouraged to promote the production of a diversified export basket through subsidisation and promotion of innovation and production of new products.

INTRODUCTION

The role played by export diversification on economic growth on a country's economy has raised much debate recently in the field of economics. The on-going debate is central on whether export diversification actually plays a role in the growth of the economy. Subjective evidence suggests that there are almost no current developed countries with extremely high levels of export concentration (Agosin, Alvarez and Bravo-Ortega, 2009). It is argued that export diversification makes countries less vulnerable to adverse terms of trade shocks by stabilising export revenues (Brenton, Newfarmer and Walkenhorst, 2007). This makes it easier to channel positive terms of trade shocks into growth, knowledge spill-overs and increasing returns to scale, creating learning opportunities that lead to new forms of comparative advantage (Brenton, *et al.*, 2007).

In most developing economies, the import substitution strategy has failed to promote the industrialization process. This led to export diversification failing to occur, as was expected, while the productive systems suffered a lot from high trade barriers and distorted relative prices (Nouira, Plane and Sekkat, 2009). Building new comparative advantage in new non-traditional exports, including labour intensive manufactures, still remains a crucial objective for small economies. Manufactured exports are believed to support sustained overall economic growth for several reasons, such that the demand for manufactured goods increased more with income increasing than the demand for primary products. Hence, growth prospects for a country's exports are increased by specializing in manufacturing. Policy makers may use export diversification as a source of economic growth in cases where the size of the domestic market is small and the existing export basket is concentrated in products that have inelastic demand. In such circumstances, diversification into non-traditional exports opens up new opportunities and new markets for firms (Chandra, Boccardo and Osorio, 2007). More so, traditional exports are particularly vulnerable to exogenous shocks and face limited demand due to low income elasticity and declining terms of trade. Diversifying away from traditional exports is expected to raise growth rates and lower their variability (Samen, 2010).

In the 1950s to 1970s, the South African import substitution strategy was perceived to have no significant contribution to growth of the country. Due to that perception, additional measures were proposed to provide a further stimulus to export manufacturers. However, all these changes did not lead to South Africa experiencing export oriented growth. Instead, the increased economic isolation of the country and perceived threats from the international community to the survival of the economy of South Africa led to further import substitution investment. This time the import substitution was based on the strategic industry argument. Though this strategy was not justified on economic grounds but was on the perceived environment of economic warfare, the strategy was successful. It saw South Africa increasing production on products such as armaments, synthetic rubber, diesel engines and further extensions to the petrochemical industry, consequently leading to the growth of the economy (Du plessis, *et.al*, 2000). According to the world exports and imports data from United Nations (UN) for the period 1962 – 2000 it can be concluded that South Africa as an exporting economy has in the past experienced diversification levels which first increased, declined. At the same, the economy was becoming relatively more concentrated in exports between 1980 and 1995. The period of export concentration coincided with the period when South Africa was facing high levels of sanctions due to the apartheid regime. This was followed by an increase in export diversification during 1996-2000 (Naudé and Rossouw, 2008).

Edwards and Elves (2005) indicate that there was a slow but clear upward trend in the growth of non-gold commodity exports although it was slower in the 1970s than in the 1980s. Over the entire period, gold export volumes declined due to the collapse of gold prices and hence these non-gold commodities were basically the only source of export growth. That being the case Naude and Rossouw (2008) pointed out that South Africa experienced significant vertical export diversification since 1988, with the share of primary commodity exports declining from 71.8% to 46.2% from late 1980s to 2002. Real GDP has increased by 54% over the two decades and the real exchange rate was at a similar level in both years. In fact, the economy had become significantly more closed for reasons that are not attributable to either the exchange rate or economic growth.

The central objective of the South African trade policy has been to reduce the country's dependence on primary products, in particular the heavy dependence on gold, in the export basket. Total exports showed a trend of declining export concentration (more diversification) between 1996 and 1999. Petersson (2005) argues that this was largely due to a significant decline of non-monetary gold exports and the resulting decline of export concentration in aggregate of primary goods, crops and nonmonetary gold. In all the years but 2000, specialisation indices of the aggregate of primary and crops were in the range 0.048 to 0.068. The minor differences were largely caused by fluctuations in the export values of platinum and other metals of the platinum group. Export concentration of manufacturing products increased slightly up to 1993, followed by two years of declining specialisation and stagnation with minor fluctuation between 1996 and 2003. After the apartheid era South Africa abandoned the ISI strategy and became open to the international community and was able to sell its exports in a freer environment. This saw an increase in the production of products such as armaments, synthetic rubber, diesel engines and further extensions to the petrochemical industry, consequently leading to the growth of the economy (Du plessis, *et.al*, 2000). Trade liberalisation and the lifting of sanctions in the early 1990s were expected to promote trade growth. The central issue is whether these policy changes have produced sustainable export-led growth and diversification into non-traditional products? The second important question is whether diversifying into non-traditional export products was accompanied by economic growth and whether there is still potential for export-led growth in South Africa.

This paper is organised as follows; subsequent to this introduction section is a section on the overview of export diversification and economic growth in South Africa. Following the overview, is the theoretical underpinnings and empirical evidence that support this study. Methodology and analytical issues are discussed in section Four. Section Six reports the main findings of the study whilst the last Section concludes the paper.

AN OVERVIEW OF EXPORT DIVERSIFICATION AND ECONOMIC GROWTH IN SOUTH AFRICA

Faulkner and Loewald (2008) identify one of the central objectives of the South African government macroeconomic policy as to maximize the economic benefits that accrue due to globalization. This was to be achieved by increasing the foreign demand of the country's exports hence enabling excessive inward flow of foreign currency and capital into the economy. However, this could only be achieved if the country's exports

were more diversified to an extent that export instability could be reduced. In other words, the government aimed for export diversification by providing for a broader base of sustained export growth and less vulnerability to volatile world prices. In response to this, the government came up with supporting measures to promote other exporting industries which were facing competitive disadvantages in the foreign market, in the form of export subsidies. Figure 1 shows the trends of export diversification and economic growth in South Africa since 1980.

Figure 1: Export diversification and economic growth trends (1980-2010)

Source: SARB, 2012 and WTO, 2012

Figure 1 shows that on average, the increases in export concentration are associated with declines in economic growth though the relationship seems to be weak. From the early 1980s to 1986, the export concentration index was well below 0.3, suggesting high levels of export diversification. During the same period economic growth was very volatile ranging from more than 6% in 1980, to -1.85% in 1983. The main reason behind such experiences mainly lies with the volatility of the Rand due to the exchange rate regime adopted by the government during that time and high levels of political instability (Faulkner and Loewald, 2008).

In 1987 the South African export basket became more concentrated with the index increasing with more than 100% to 0.56 in 1987 from 0.26 in 1986. During the same year, economic growth also increased by a larger margin from 0.02% in 1986 to 2.10% in 1987. The larger part of growth in the economy was a direct result of increased production in minerals enhanced by favourable gold prices in international markets during the year (Edwards and Golub, 2004). Export concentration also increased significantly by 17.29% to 0.33 in 1989 from 0.28 in 1988. High concentration in a few exports products was caused by high barriers to trade that dominated the South African trade and industry policy. Associated with that export concentration increase, was a dramatic fall in GDP growth to less than 3%. Odhiambo, (2009) identified the causes of the dramatic decline to include trade and financial sanctions, political unrest, and debt crisis, which negatively affected prospects for substantial capital inflow especially from abroad.

Export diversification increased from 1994 to 1996, averaging 0.47. This period was also associated with extensive trade liberalisation, which saw the reduction in tariff lines and levels, the abolishment of trade sanctions and achievement of political stability. Although trade openness increased due to extensive trade liberalisation during the period of 1997 to 2010, the export concentration index averaged 0.55, and reached the highest of 0.59 in 2008. The 2008 export concentration index was relatively high suggesting that the South African export basket was becoming less diversified.

THEORETICAL UNDERPINNINGS AND EMPIRICAL EVIDENCE

Some of the theoretical underpinnings that support this paper are among others; the Linder hypothesis which was developed by Linder (1961) who hypothesize those nations with similar demands would develop similar

industries. The Prebisch Singer hypothesis (1950) which argues that, the terms of trade between primary and manufactured products deteriorate over time. Countries that export primary goods that do not have the means to manufacture goods to export will lose in the long run as their goods will become relatively cheaper than the manufactured ones. Apart from trade theories, growth models were also used in support of this paper. The endogenous growth theory sees diversification of exports from primary commodities into high skilled, high technology goods desirable because trade in these products allows for more scope for growth through productivity gains than traditional commodity exports. There are more opportunities for spill over effects in manufactured trade than in primary commodity trade.

A number of studies paid attention the relationship between export diversification and economic growth particularly in developed countries. Results from some studies showed that there is positive relationship between export diversification and economic growth whilst results from some studies found no relationship between the two variables. Studies that found positive relationships are among others; Hesse (2008), Agosin (2007), Arip, Yee and Karim (2010), Nowak-Lehmann (2006), Petersson (2005), and Brenton and others (2007). Studies that found a negative relationship between export diversification and economic growth are among others; Nicet-Chenaf and Rougier (2008) and Aditya and Roy (2009). They argue that too much export diversification may be detrimental to the economy.

METHODOLOGY AND ANALYSIS

To estimate the role of export diversification on economic growth in South Africa, this study uses a vector autoregression (VAR) model. A time series data set is created to estimate the relationship between the variables. Data was obtained from the South African Reserve Bank (SARB) online statistical query publications and World Trade Organisation website. To estimate the relationship between export diversification and economic growth the study modifies the model used by Arip, Yee and Karim (2010). In this study, GDP is explained by the normalised-Hirschmann index (measure of export diversification), stock of human capital, capital expenditure, real effective exchange rate and trade openness as shown by the following equation.

$$LnGDP_t = \beta_0 + \beta_1 LnNHI_t + \beta_2 LnHUM_t + \beta_3 LnCAP_t + \beta_4 LnREER_t + \beta_5 LnOPEN_t + \varepsilon_t \dots \dots \dots (1)$$

Where $LGDP$ =logarithm of gross domestic product per capita, NHI =Normalised-Hirschmann Index, $LHUM$ =logarithm of human capital formation, $LCAP$ = logarithm of capital formation, $LREER$ =logarithm of real effective exchange rate, $LOPEN$ = logarithm of trade openness β_0 =intercept and $\beta_1, \beta_2, \beta_3, \beta_4$ and β_5 = coefficients of the independent variables.

DEFINITION OF VARIABLES

$LGDP$ is the logarithm of real GDP. It represents the real domestic output in billion rands produced in South Africa adjusted for inflation. $LNHI$ refers to the Normalised Hirschmann Index, and is a way of measuring the extent of export diversification. The NHI is included in the model because it measures how diversified South African exports are (see Naudé and Rossouw, 2008). $LHUM$ is the logarithm of the stock of human capital. The stock of human capital refers to the skills, competency and experience vested in a country's labour. $LCAP$ is the logarithm of capital expenditure. Capital expenditure in this study represents fixed capital formation expressed in billion rands. $LREER$ is the logarithm of the real effective exchange rate of the rand. It is the weighted average of the Rand in relation to the basket of other South Africa's main trading partners. $LOPEN$ is the logarithm of trade openness. Trade openness shows the extent to which a country is involved in international trade activities with the rest of the world. ε = Error term, which represent the influence of omitted variables in the specification of the model.

MAIN FINDINGS

To avoid the possibility of drawing up conclusions based on statistically spurious relationships, all data series were tested for stationarity. The Phillips-Perron and Augmented Dickey-Fuller unit root tests were used and test results are presented in Table 1. For the most part, both the Phillips-Perron and the Augmented Dickey-Fuller results suggested that the null hypothesis of the presence of unit root in the variables in levels could not be rejected at 1% significance level indicating that the variables are non-stationary in levels. However, when the

variables are first differenced the null hypothesis of the unit root in each of the series was rejected at 1% significance level. Therefore it can be concluded that all the variables are integrated of order one.

Table 1: Unit Root Tests Results

	GDP	NHI	CAP	HUM	REER	OPEN
ADF						
<i>Level</i>	-1.691	-2.132	-2.507	-1.866	-3.045	-3.128
<i>First Difference</i>	-4.043***	-6.588***	-4.184***	-3.225**	-4.255**	-4.481***
PP						
<i>Level</i>	-0.980	-4.298**	-1.192	-1.288	-2.560	-3.622**
<i>First Difference</i>	-4.835***	-11.527***	-3.493**	-3.252*	-4.737***	-5.680***
***, ** and * represent significance levels at 1 %, 5 % and 10 % respectively.						

COINTEGRATION TESTS

Given that variables in this study are integrated of the same order, cointegration tests are performed to determine the existence of a long-run equilibrium relationship amongst the variables. Cointegration of variables means that the linear combination of the variables is stationary even though the individual variables will be non-stationary. The Johansen's (1991, 1995) maximum likelihood approach was used to test for cointegration. It can be deduced that an essential prerequisite in conducting the Johansen co integration tests and estimation of any VAR system is the selection of an optimal lag length. In this study, the optimal lag length was made by examining the lag structure in an unrestricted VAR originally specified with three lags and using VAR lag order selection criteria.

Table 2: Lag Order Selection Criteria

Lag	LogL	LR	FPE	AIC	SC	HQ
0	106.1874	NA	3.14e-11	-7.156242	-6.870770	-7.068971
1	281.8630	263.5134	1.56e-15	-17.13307	-15.13476*	-16.52217
2	338.1612	60.31952*	5.43e-16	-18.58294	-14.87180	-17.44841
3	398.5212	38.80283	3.55e-16*	-20.32294*	-14.89897	-18.66478*
*Indicates lag order selection by the criterion, LR: sequential modified LR test statistic (each test at 5% level), FPE: Final prediction error, AIC: Akaike information criterion, SC: Schwarz information criterion, HQ: Hannan-Quinn information criterion						

The Johansen cointegration technique used in this study also requires an indication of the lag order and the deterministic trend assumption of the VAR before performing cointegration tests. The information criteria approach is applied as a direction to choose the lag order. In this study, the selection is made using a maximum of 2 lags in order to permit for adjustments in the model and accomplish well behaved residuals. Table 2 presents results for the lag length selection criteria which show that sequential modified LR test statistic and the Schwarz information criterion selected 2 lags and 1 lag respectively, while the other information criterion selected 3 lags all the criteria selected 1 lag. Therefore, the Johansen cointegration test is performed using 3 lags.

Table 3: Cointegration Rank Test (Trace)

Hypothesised No of CE(s)	Eigenvalue	Trace Statistic	0.05 Critical value	Prob**
None*	0.879012	174.7334	95.75366	0.0000

At most 4	0.207222	6.958543	15.49471	0.5825
At most 5	0.016175	0.456611	3.841466	0.4992
Trace test indicates 2 cointegrating eqns at the 0.05 level, *denotes rejection of the hypothesis at the 0.05 level, **MacKinnon-Haug-Michelis (1999) p-values				

Table 4: Cointegration Rank Test (Maximum Eigenvalue)

Hypothesised No of CE(s)	Eigenvalue	Max-Eigen Statistic	0.05 Critical Value	Prob**
None*	0.879012	59.13780	40.07757	0.0001
At most 1	0.772498	33.87687	41.45665	0.5662
At most 2	0.728854	27.58434	36.54276	0.4527
At most 3	0.665194	21.13162	30.63769	0.3017
At most 4	0.207222	6.501931	14.26460	0.5497
At most 5	0.016175	0.456611	3.841466	0.4992
Max-eigenvalue test indicates 2 cointegrating eqns at the 0.05 level, *denotes rejection of the hypothesis at the 0.05 level, **MacKinnon-Haug-Michelis (1999) p-values				

Results from the much stricter Johansen cointegration trace test Table 3 reflected that at least two cointegrating equations exist at 5% significance level. The null hypothesis of no cointegrating vectors is rejected since the trace (test) statistic of 115.59 is greater than the critical value of approximately 69.81 at 5% significance level. However, the maximum eigenvalue test in Table 4 revealed that there is one cointegrating equation at 5% significance level. The null hypothesis of no cointegrating vectors is rejected since the max eigen statistic of 59.13 is greater than the critical value of 40. Therefore, it can be concluded that there are two significant long run relationships between the variables (using trace test results). Since variables can either have short or long run effects, a vector error correction model (VECM) is used to disaggregate these effects.

Table 5: Results of the long run cointegration equation

Variable	Coefficient	Standard error	t-statistic
Constant	-10.35165	-	-
GDP(-)	1.000000	-	-
NHI(-)	0.462022	0.11557	3.99790
REER(-)	-0.543505	0.09686	-5.61137
OPEN(-)	0.058409	0.22618	0.25825
HUM(-)	0.195425	0.08014	2.43849
CAP(-)	0.311734	0.08966	3.47681

The long-run effect of export diversification and other factors that are affect export diversification and growth can be illustrated as in equation 4.

$$GDP_t = -10.352 + 0.462NHI_t + 0.195HUM_t + 311CAP_t - 0.544REER_t + 0.058OPEN_t, \dots \dots \dots (2)$$

From equation 4 it can be deduced that HUM and CAP have a positive long run relationship with GDP. The results suggest that unit increases in HUM and CAP lead to an increase in GDP by approximately 0.195 and 0.311 respectively. In addition, NHI and OPEN have positive relationship with GDP in the long-run. The results in Table 5 suggest that a unit increase in NHI increases GDP by approximately 0.462%. The positive relationship between NHI and GDP is in consistence with theoretical under suggestions which argue that increased export diversification also increases GDP. On the same note, a unit increase in OPEN also causes increases in GDP of about 0.58%. According to the theory, openness can either have a negative or a positive relationship with GDP depending on the whether the trade has got relatively more exports to imports or vice-versa. REER has a negative coefficient in equation 4, meaning that an increase in the real effective exchange rate (depreciation) causes a decrease in GDP. A percentage decrease in the value of the rand, causes approximately 0.05841% increase in GDP.

Table 6: Error correction results

Variable	Coefficient	Standard error	t-statistic
DLGDP(-1)	0.084387	0.15637	0.53966

DLNHI(-1)	3.041284	0.77943	3.90192
DLREER(-1)	-0.361619	0.47613	-0.75950
DOPEN(-1)	1.074700	0.25073	4.28622
DLHUM(-1)	0.258141	0.55550	0.46470
DLCAP(-1)	0.399790	0.32489	1.23053

The coefficient of GDP is approximately 0.084 implying that the speed of adjustment is around 8.4%. In other words of the variation from the equilibrium for GDP, only 8.4% is corrected for annually. The correction happens during the time when the variable is moving towards equilibrium. This means that there is slow speed of adjustment of GDP which maybe reflect little pressure on the variable in restoring to the equilibrium in the long run due to any disturbance. The speed of adjustment is however not statistically significant with a t-value of around 0.5397. The slow speed of adjustment of GDP maybe interpreted as that there are other variables other than the ones specified in the model that affects GDP such as Interest rates, monetary policy, fiscal policy and demographic factors.

Diagnostic checks are also very important in the model because they validate the parameter evaluation of the outcomes achieved by the model. This is mainly because any existence of a problem in the residuals from the estimated model automatically translates into the inefficiency of the model leading to the estimated parameters being biased. The VAR model was subjected to diagnostic checks in this section. The fitness of the model was tested in three main ways. Firstly, serial correlation is tested using the language multiplier (LM) test, followed by the White test for heteroskedasticity and finally the Jarque-Bera for normality test. Diagnostic test results are shown in Table 9. Results presented in Table 7 suggested that there is no serial correlation, there is no conditional heteroskedasticity, and there is a normal distribution in the unemployment model.

Table 7: Diagnostics test results

Test	Null hypothesis	t-statistic	Probability
Lanrage Multiplier (LM)	No serial correlation	9.263	0.613
Jarque- Bera (JB)	There is a normal distribution	0.525	0.769
White (CH-sq)	No conditional heteroskedasticity	566.07	0.268

CONCLUSIONS AND POLICY RECOMMENDATIONS

A number of policy implications can be deduced from the results and conclusions of this study. Based on the results of this study the South African government can be advised to continue engaging implementing trade liberalisation policies. The presence of a significant long run relationship between export diversification and economic growth implies that increased diversification in exported goods contribute positively to the growth of the economy. In other terms the South African government can embark on a policy in which it can subsidise small to medium scale firms that engage in the innovation and production of new products. The support to such firms will increase future possibilities of a diversified export basket for the country.

More so, the South African government should also take into consideration that trade openness is also a very important growth contributor. Hence, policy makers may be advised to also give positive attention to potential exporters and importers. In other words, the government can engage in export subsidisation and create policies such as reducing import tariffs and duties to create a more free trade environment. The country can also enhance trade openness by being involved in economic integration through joining of trade blocks. However, this must be done with caution due to the fact that increased trade openness and globalisation makes the economy to be more vulnerable to global shocks such as financial crisis and credit crunches occurring it the trade partners. The South African policy makers can also utilise the empirical findings of this study in influencing the level of growth in the country. Though the model used in the study did not consider all other factors that affect the growth of the economy.

INTERACTION BETWEEN SOCIALLY RESPONSIBLE INVESTMENT (SRI) SECTOR AND SELECTED MACROECONOMIC VARIABLES IN SOUTH AFRICA

PF Muzindutsi and TJ Sekhampu
North-West University, South Africa

ABSTRACT

The South African Socially Responsible Investment (SRI) Index was launched in 2004 in order to encourage JSE listed companies to comply with issues of environmental, economic and social sustainability. This study analysed the effect of private consumption, employment growth rate, government expenditure, gross domestic investment, import and exports on the SRI Index. Using a co-integration test, error correction model and Granger causality test, the study found a joint long run effect of these macroeconomic variables on the SRI Index. It was only private consumption which had a significant short-run effect on the SRI Index. In general, there was a two way causal relationship between the SRI Index and the selected macroeconomic variables. This study concluded that Sustainable SRIs play an important role in the development of the South African economy.

INTRODUCTION

The world is currently facing various socioeconomic challenges related to climate change, global warming, epidemic diseases (such as HIV/AIDS), poverty, food insecurity and unbalanced societies. In assisting the society to address these challenges, companies and investors are channeling their capital towards investment strategies that promote environmental, social and corporate governance (ESG) issues (Socially Responsible Investment Forum, 2006). Changes in investment strategies have contributed to the recent growth in demand for Socially Responsible Investment (SRI). Although, the definition of SRI has dominated academic debate for years there is still no consensus regarding its definition. SRI is generally defined as a practice of directing investment funds in ways that combine investors' financial objectives with their commitment to social concerns such as social sustainability, economic development and a healthy environment (Haigh & Hazelton, 2004). In broad sense, socially responsible investors integrate the ethical principles and ESG considerations into their investment decision making (Viviers, 2007).

The global SRI sector has grown considerably in recent years. At the end of 2012, the total worth of global SRI was estimated to be US\$13.6 trillion and it represented 21.8 percent of the total global assets managed professionally (Global Sustainable Investment Alliance (GSIA), 2013). SRI in Africa was estimated to be approximately US\$ 228.7 billion, at the end of 2012, with South Africa representing 95 percent of the SRI market in Sub-Saharan Africa (GSIA, 2013). This dominance of South Africa in the Sub-Saharan SRI sector was enhanced by the increased availability of SRI investment opportunities because of the introduction of the JSE SRI Index in 2004. This SRI Index was the first to be launched by a stock exchange in emerging markets, and has been a driver for increased attention to responsible investment in South Africa (JSE, 2012). JSE launched the SRI Index (JSE SRI Index) in May 2004 in order to respond to the growing interest in responsible investment around the world (JSE, 2011b). The development of a sustainable index, such as the JSE SRI Index, plays an important role in encouraging companies to disclose their ESG (Ethical Investment Research Service, 2009). The availability of the SRI Index highlights the role of the South African stock market in ensuring continuous sustainability of the SRI sector. In principle, a good development of the stock market is expected to encourage

economic growth by improving domestic savings and increasing the quantity and the quality of investment (Yartey, 2008).

Although the relationship between the South African stock market index and various macroeconomic variables has been investigated, there has been no specific study focusing on the growing area of SRI sector. Studies conducted on the SRI in South Africa focused mostly on the growth of the SRI sector, the challenges facing this sector and the performances of SRI sector relatively to their benchmark (Williams, 2007; Viviers, 2007; Viviers et al., 2008; Herringer et al., 2009; Viviers et al., 2009; Gladyssek & Chipeta, 2012;). It has been identified that South African macro-economic conditions have an impact on the demand for SRIs (Viviers, 2007; Viviers et al., 2008) but this impact has not been measured. The current study therefore measures the relationship between the SRI sector and the South African economy. The objective of this paper is to determine whether there are interactions between the JSE SRI Index and a set of macroeconomic variables the years 2004-2012. To achieve this objective, this paper uses the Engle-Grange cointegration test and Error Correction Model (ECM) and Granger causality test. The rest of the paper is organized as follows. Section 2 presents a brief review of the empirical literature. Section 3 provides the overview of the JSE SRI Index. Section 4 describes data and the methodology. Section 4 presents the results and discusses the findings. Section 5 provides conclusions and recommendations.

Overview of South Africa's SRI Sector

The JSE SRI Index was launched to serve four major objectives (JSE, 2011a). Firstly, the SRI Index seeks to identify listed companies that integrate the three pillars of sustainability into their business activities. These three pillars involve the sustainability of environment, society and economy. Secondly, the JSE SRI Index provides a tool for a comprehensive and complete assessment of company policies and practices against globally and locally related corporate responsibility standards. JSE SRI Index also serves as channel through which socially responsible companies, registered in the JSE, are identified. Finally, SRI index plays an important role of contributing to the development of responsible business practice in South Africa and beyond (JSE, 2011a).

To qualify for the JSE SRI Index, companies must demonstrate a high standard of reporting and performance in environmental, social and corporate governance areas (JSE, 2008). Companies are assessed by a UK-based research organization known as Ethical Investment Research Service (EIRIS). EIRIS uses profile and survey responses from companies taking part in the review as well as publicly available company information such as annual reports, sustainability reports and websites (JSE, 2008). In the evaluation, EIRIS considers global themes and other themes that are very specific to the South African context such as HIV/AIDS and BEE. However, companies with no operations in South Africa are exempt from assessments related to these specific criteria. Companies from the JSE All Share Index may take part in the selection of the SRI Index voluntarily through submitting data in terms of a questionnaire. The JSE SRI Index selection process does not exclude any specific sectors but companies that are in Top40 Index and Mid Cap are automatically assessed (JSE, 2011a).

The JSE SRI Index is reviewed annually, in November, based on information acquired during the period preceding the review. In addition to the annual review, the JSE SRI Index is reviewed quarterly to determine whether the constituent companies still conform to all the requirements (JSE, 2011b). If the quarterly report shows that a company no longer meets the criteria, such company is removed from the SRI Index. Additionally, a company is removed from the JSE SRI Index, if such company ceases to be a constituent of the JSE All Share Index. The process of adding and removing companies from the SRI Index maintains the stability in the selecting the constituents of the Index and ensures that the SRI Index continues to be representative of the stock market (JSE, 2011b).

Methodology

DATA

The aim of the study reported here was to determine the interaction between the SRI sector and selected macroeconomic variables. Since most of the variables are not available on monthly basis, quarterly observations from 2004 to 2012 are used. Average prices of the JSE SRI Index are obtained from McGregor BFA library

while other variables are accessed from the South African Reserve Bank (SARB) and Statistics South Africa (STATS SA). All variables are adjusted for inflation and transformed into logarithmic values.

MODEL SPECIFICATION

This study uses the Engle-Granger (EG) cointegration approach and Error Correction Model (ECM) to establish the long-run and short-run relationships between the SRI sector and a set of selected macroeconomic variables. Additionally, Granger-Causality test is used to determine the causality between these variables. Before conducting any cointegration test, it is important to test for unit root and the order of integration of the variables. The level of integration explains whether data are stationary or not and this level of integration is presented as follows:

$X_t \approx I(d)$, where d stands for the order of integration (Charemza & Deadman, 1997).

This order of integration refers to the number of unit roots in the series, or the number of differencing operations it takes to make a variable stationary. When $d = 0$, a series (X_t) is integrated of order zero ($I[0]$) and is stationary. However, when $d \geq 1$, a series is integrated of order 1 ($I[1]$), or higher, and is non-stationary. Following Brooks (2002), the following Augmented Dicky-Fuller (ADF) test is used to test for unit root:

$$\Delta x_t = \alpha + \beta T + \lambda x_{t-1} + \sum_{i=1}^n \alpha_i \Delta x_{t-i} + e_t \quad (1)$$

Where: x_t = the logarithm of the variable in period t ;
 Δ = the first difference operator: thus, $\Delta x_t = x_t - x_{t-1}$;
 α , β , λ , and α_i are the coefficients;
 T = time trend and e_t is a white noise error term.

The hypothesis tests for unit root (ADF) are:

The null hypothesis (H_0): $\lambda = 1$ then x_t has a unit root, $I(1)$;
 Alternative hypothesis (H_1): $\lambda < 1$ then x_t is stationary, $I(0)$.

Non-stationary variables that move together over time are said to be cointegrated if a linear combination of them can be stationary (Brook, 2002). This implies that non-stationary series may be bound by some relationship in the long-run. The cointegrating relationship is, therefore, considered as a long-run or equilibrium phenomenon of variables that might deviate from a short-run relationship but return their association in the long run (Brooks, 2008). The Engle-Granger cointegration test is used to identify whether there is a long-run relationship between the JSE SRI Index and macroeconomic variables. If our variables are $I(1)$, their relationship is given by:

$$LRSRI_t = \beta_1 + \beta_2 LRC_t + \beta_3 LRG_t + \beta_4 LRI_t + \beta_5 LRX_t + \beta_6 LRZ_t + \beta_7 LREM_t + u_t \quad (2)$$

Where: $LRSRI_t$ = the natural logarithm of the real value of the SRI Index,
 LRC_t = the natural logarithm of real private consumption expenditure,
 LRG_t = the natural logarithm of real government expenditures,
 LRI_t = the natural logarithm of real gross domestic investments,
 LRX_t = the natural logarithm of real export of goods and non-factor services,
 LRZ_t = the natural logarithm of the import of goods and non-factor services,
 $LREM_t$ = the natural logarithm of real rate of employment and u_t = the error term.

The ADF test is used to assess whether the error term, u_t , is stationary but the critical values tabulated by Engle and Granger (1987) are considered. If the error term is stationary then we will conclude that variables are cointegrated and we will proceed with the ECM as follows:

$$\Delta LRSI_t = \alpha_1 + \alpha_2 \Delta LRC_t + \alpha_3 \Delta LRG_t + \alpha_4 \Delta LRI_t + \alpha_5 \Delta LRX_t + \alpha_6 \Delta LRZ_t + \alpha_7 \Delta LREM_t + \alpha_8 u_{t-1} + e_t \quad (3)$$

Where: Δ is the first difference operator; e_t is a random error term, and u_{t-1} is the one-period lagged value of the error term from Equation (2).

Equation (3) suggests that changes in JSE SRI Index depend on changes in a set of macroeconomic variables and the equilibrium error term, α_7 . The absolute value of α_7 shows the speed of adjustment to the equilibrium. If α_7 is zero, it means that the SRI Index adjusts to changes in macroeconomic variables in the same time period. If α_7 is different from zero, the model is not at equilibrium and SRI Index will increase or decrease to correct the equilibrium error. If variables are cointegrated, such cointegrated variables are expected to have a causal link at least of one direction (Known & Shin, 1999). Thus, Granger causality test will be used to establish the causal relationship between the cointegrating variables.

Results and discussion

UNIT ROOT TESTS

ADF results are in Table 1 (number of lags were selected based on Schwarz criterion). The test statistics and their P-values at the level are columns 2 and 3, while columns 4 and 5 report the test statistics and their P-values at the first difference. P-values, in column 3, are greater than 5%; meaning that, at the level, all variables have a unit root at the 5% level of significance. However, the first differences of all variables are stationary at the 5% level of significance (P-values < 5%, in column 5). The LM-statistics for the KPSS test (not reported here) confirmed that variables are stationary at the first difference. This means that variables are I(1) and might be cointegrated. It is therefore important to continue with a cointegration test.

Table 1: ADF unit root test

Variables	Level		First difference	
	Test Statistics	p-values	Test Statistics	p-values
LSRI	-2.479112	0.3357	-3.848765	0.0059
LRC	-3.385673	0.0697	-3.539777	0.0009
LEM	-2.908066	0.1726	-6.566008	0.0000
LRG	-1.873746	0.6466	5.571602	0.0001

LRX	-2.283028	0.4313	-4.414915	0.0014
LRZ	-2.329739	0.4076	-5.241282	0.0001

COINTEGRATION AND ECM

Since it is established that all the variables are I(1), the next step is to test for the cointegrating relationship between the set of selected macroeconomic variables and the JSE SRI Index. Equation 2 was estimated to test whether its residuals (u_t) are stationary. The absolute value of the estimated test statistic u_t (4.85) is greater than the absolute value of the 5% EG critical value (4.76). This indicates that u_t is stationary at the 5 % level of significance. It is therefore concluded that the JSE SRI Index is cointegrated with independent variables. The next step is to use the ECM (Equation 3) to estimate the adjustment to the equilibrium. In order to avoid basic econometric problems, basic diagnostic tests were conducted on the ECM (Abdalla & Murinde, 1997). Breusch-Godfrey serial correlation LM test and Breusch-Pagan-Godfrey Heteroskedasticity test revealed that residuals from Equation 3 are homoscedasticity and have no serial autocorrelation.

The ECM results, in Table 2, show that the coefficient of error correction is negative and statistically significant at the 5% level of significance. This indicates that there is a long run relationship between SRI and macroeconomic variables considered in this study. The value of the EC coefficient implies that about 54% of disequilibrium is corrected in each quarter, meaning that the equilibrium is restored within 2 quarters. These results are similar to previous studies (Chung & Shin, 1999; Garcia & Liu, 1999; Liu & Hsu, 2006; Yang & Yi, 2008; Yartey, 2008; Kemboi & Tarus, 2012) which found a long run relationship between the stock market development macroeconomic variables such GDP per capita and income level. The variable LRC is positive and

statistically significant at the 1% level of significance, indicating that the short-run changes in private consumption expenditures have a significant positive effect on the SRI Index. Other variables are not statically significant, even at 10% level of significance. This indicates that short-run changes in employment rate, the government expenditures, gross domestic investments, the exports and imports have no short-run effect on the SRI Index. These results support the previous findings that the profit for social responsible investors is mostly realised in the long-run.

Table 2: ECM results

Dependent Variable: Δ LSRI				
Variable	Coefficient	Std. Error	t-Statistic	Prob.
Δ LEM	-3.955153	2.659978	-1.486912	0.1491
Δ LRZ	-0.288536	0.654576	-0.440799	0.6630
Δ LRX	1.046894	0.670169	1.562135	0.1303
Δ LRI	-0.142683	0.347556	-0.410533	0.6848
Δ LRG	0.120490	0.637327	0.189055	0.8515
Δ LRC	8.567217	2.403753	3.564100	0.0014
UT(-1)	-0.536650	0.196553	-2.730304	0.0112
C	-43.16574	11.13276	-3.877363	0.0006
R-squared	0.918240	F-statistic	36.50044	
Adjusted R-squared	0.893083	Prob(F-statistic)	0.000000	

Table 3 reports results from the pairwise Granger causality test, with 2 lags (Estimated by EViews 7). In overall, there appear to be a unidirectional causality from the SRI Index to the most of macroeconomic variables. A bi-directional causality between the SRI Index and two independent variables (gross domestic investment and government expenditure) and a one-way causality from the rate of unemployment to SRI Index are observed. They appear to be no causality between SRI Index and private consumption expenditures. In general, Granger causality test suggest that changes in SRI Index lags lead to changes in the lags of the selected macroeconomic variables. This is in line with the findings of Yang & Yi (2008) that the financial development *control-causes* economic growth.

Table 3: Pairwise Granger Causality Tests

Null Hypothesis:	Obs	F-Statistic	Prob.
LEM does not Granger Cause LSRI	34	3.01711	0.0645
LSRI does not Granger Cause LEM		1.34099	0.2773

LSRI does not Granger Cause LRX		10.9523	0.0003
LRZ does not Granger Cause LSRI	34	0.94149	0.4016
LSRI does not Granger Cause LRZ		7.11063	0.0031

CONCLUSION

The JSE SRI Index was introduced in order to encourage companies, registered in the JSE, to comply with issues of environmental, economic and social sustainability. Thus, the SRI Index is considered as a benchmark for the SRI sector in South Africa. This study used the Engle-Grange cointegration test, Error Correction Model (ECM) and Granger causality test to investigate the relationship between the SRI sector and a set of selected macroeconomic variables. Previous studies that linked the stock market development to economic growth produced mixed results, but in overall they favour a positive relationship between stock markets and economic variables. This study found a significant long run relationship between the SRI sector and a set of macroeconomic variables (private consumption, employment growth rate, government expenditure, gross domestic investment, exports and imports). With regards to the short run relationship, only one variable (private consumption expenditures) was found to have a significant effect on the SRI Index. Other macroeconomic variables (employment rate, the government expenditures, gross domestic investments, the export and import) had no significant short run effect on the SRI Index. Findings of this study suggest that the development of SRI sector may be linked to the long run economic growth. This is in line with the previous findings that SRIs generate long-term profits to investors while promoting social, economic and environmental needs of the society as whole (Herringer et al. 2009). In general, Granger causality test showed that there is a one-way causal link from the SRI Index to the majority of the selected macroeconomic variables. Additionally, a bi-directional Granger causality between the SRI Index and 2 variables (gross domestic investments and government expenditures), and a one way causal relationship from the rate of unemployment to the SRI Index were found. These results suggest that changes in SRI Index lags lead to changes in the lags of the selected macroeconomic variables.

As a concluding remark, it is important to note that this study faced a challenge of limited number of the observations, and is exposed to the limitations associated the Engle and Granger cointegration test. For future research, the VECM and super-exogeneity methodology can be used to examine the relationship between social responsible sector and variables of macroeconomic stability within a larger sample period.

THE POTENCY OF MANAGERIAL ACCOUNTING ON MUNICIPAL CAPITAL PROJECT DELIVERY IN SOUTH AFRICA: EX-ANTE DETAIL EXECUTION AS PREVENTION OF FUTURE DEFICIENCIES

Siphiwe Ndou
University of Limpopo, South Africa

ABSTRACT

The purpose of this paper is to assess the potency of managerial accounting practices and techniques in strategising municipal capital projects delivery. Managerial accounting is employed and appreciated by the private sector to provide timely financial information for managers in decision making processes in particular the production based businesses. In South Africa the ruling party is promoting a notion of a developmental state which requires state organs to be a driving force behind development processes. Central to a developmental state is the provision of capital infrastructure, which will complement socio-economic progress. This conceptual paper argues that, managerial accounting technics may boost efficiency in delivering capital projects in the South African municipalities. In addressing its purpose a literature review is undertaken to analyse the potency of managerial accounting in promoting sustainable capital project delivery strategies through organizational practices. The paper then concludes that paying detailed financial and managerial attention to each activity of a project may save the project objective from its possible deficiencies and failures.

INTRODUCTION

Accounting as a specialised information system, performs a service function, in providing relevant information about an institution to a wide range variety of interested parties. In the modern internationally oriented public sector management, managers increasingly require more accounting information to undertake calculated and enlightened decisions, in the management of public programmes (Nemand, Mayer, Botes and Vuuren, 2006, p. 4). Accounting has two significant forms; on the one hand it is financial accounting which provides information to interested parties external to the institution in a form of general purpose reporting, following the principle of the Generally Accepted Accounting Practices (GAAP). In the public sector context, communities and their formation serve as interested parties in this regard. While, on the other hand managerial accounting which at times is referred to as cost management accounting, focuses on the purpose of providing information to managers within an institution. This information assists in shaping institutional practices such as planning and direction setting, resource allocation and monitoring and controlling (Cuganesan, Dunford and Palmer, 2012, p. 246). In essence, managerial accounting seeks to meet institutional managers' decision making information needs. Therefore managerial accounting can thus be institutionalized (Burns and Scapens, 2000).

As indicated, this paper seeks to assess the potency of managerial accounting practices and techniques, an assessment is considered specifically in strategising the delivery of municipal capital infrastructural projects. In order to address the foregoing purpose, the paper match sentences in its argument based on literature, to evaluate the potential role of managerial accounting in the institutional practices through which strategy is developed (Cuganesan, Dunford and Palmer, 2012, p. 46), for establishing sustainable municipal capital project delivery strategies in South Africa. A provision of literature on managerial accounting and project (management) is undertaken. A further focus is on the role of managerial accounting in institutional practices for strategy development. Later a reflection on capital infrastructure project delivery in the South African municipalities is

provided. The potential role of managerial accounting concludes the overall discussion, with the notion that ex-ante execution detail execution is preventive of potential deficiencies.

CONTEXTUAL BACKGROUND ON MANAGERIAL ACCOUNTING, STRATEGIC MANAGEMENT AND PROJECT MANAGEMENT

Management accounting involves consideration of the ways in which accounting information may be accumulated, synthesised, analysed and presented in relation to specific problems, decisions and day to day tasks of institutions (Belkaoui, 2002, p. 1). It is worth noting that management accounting is a private sector based activity that place emphasis on economic outcomes; public institutions have adopted this approach as its relevance is more justifiable in the modern practices which have become more business-like (Economic Commission for Africa, 2003, p. 6). This part of the paper provides a contextual base analysis of managerial accounting, strategic management and project management, to provide background, on interrelation and supportive character of the concepts, (managerial accounting and project management) in delivery strategy development.

Management accounting

Practically managerial accounting practices is seen as a variety of methods especially considered for private institutions, to support the institution's infrastructure and strategic management processes. Management accounting practice include budgeting, performance evaluation, information for decision making, and strategic analyses, as methods used amongst others (Alleyne and Weekes-Marshall, 2011, p. 50; and Debarshi, 2011, p. 2). Belkaoui (2002, p. 1) Argues that management accounting deals with the provision of information that allows an efficient management for the delivery of products, services, projects or even processes. Belkaoui further provides that managerial accounting is a more elaborate version of cost accounting, undertaking a multidimensional focus in order to better serve the various and complex need faced by managers in institutions. Therefore managerial accounting is thus concentrating not only in accounting but also on organisational, behavioural, decisional, strategic and other foundations and dimensions (Benerjee, 2005, p. 2). The conception of formalising institutional practices that shapes strategic behaviours, in institutions is portrayed to legitimise good institutional governance. Managerial accounting however supports institutional practices, to assist in accomplishing substantive institutional change and action, in proactive sentiment (Modell, 2004, p. 40). Jones and Dugdale (2001) in Cooper and Hopper (2007, p. 209) offers a useful working definition of managerial accounting he argues that, managerial accounting is a system of governance that operates, at a macro level of national and international society, polity and economy, at the micro level of an institution, and permeates the managerial level where accounting constitutes both rules and resources for action. Managerial accounting is thus, encompasses an economic dimension, which focus on calculation of the production, distribution and consumption of value; apolitical dimension which deals with regulation and accountability and an ideological dimension focusing on forms of accounting reflexivity. Furthermore Cooper and Hopper (2007) argue that managerial accounting is associated with struggles for control rooted in organizational processes and their socio-economic context; the macro and micro are reciprocally related. Studying accounting in practice is motivated by the notion of examining, whether theories of accounting and control, notably structural functionalist approaches such as contingency theory and economic approaches such as agency and transaction cost theories, adequately explained budgeting and performance evaluation in large complex institutions in both public and private domain (Rahaman & Lawrence, 2001, p. 3).

Strategic Management

Strategic management is defined as the process whereby all the institutional functions and resources are integrated and coordinated to implement formulated strategies which are aligned with the environment, in order to achieve the long term goal of the institution and therefore gain a competitive advantage through adding value for the stakeholders (Ehlers & Lazenby, 2012, p. 2). Strategic management consists of the analysis, decisions, and actions, an institution performs in order to create and sustain competitive advantage (Prasad, 2009, p. 4 &

Drejer, 2002, p. 9). From this understanding a two-fold view arises, firstly is that strategic management of institutions entails three ongoing processes, namely analysis, decisions, and actions. Firstly strategic management is seen as concerned with the analysis of strategic goals particularly the vision, mission and strategic objectives along with the analysis of the internal and external environment of the institution. While on the other hand is the essence that strategic management is the study of why some institutions or governments perform better than others (Dess, Lumpkin and Taylor, 2005). Thus, managers need to determine how an institution is to perform optimally and compete to outperform problems and obtain advantages, which are sustainable over a lengthy period of time (Hill and Jones, 2002, p. 14).

Project Management

Project management does not only involve, crystallisation of a unique task into a number of small task, scheduled cross a specified time span, and allocated to groups or individuals, hoping for deliverability desired outcomes. Adopting this approach could be disastrous for projects that could otherwise have been successful, simply because project management was not properly understood (Oostuizen and Venter, 2011, p. 3). In order to provide a meaningful understanding of project management, a point of departure should be to define a project. There is a continual agreement that a project is a planned, temporary endeavour that is unique, which is to be completed within a defined and limited time schedule, using limited fiscal resources (Steyn, 2009, p. 3; Gray & Larnon, 2005, p. 4 & Project Management Institute, 2008, p. 6). While in this paper, projects are considered in the dimension of capital projects, which at a moderate definition, refers to the infrastructural projects which are include in municipal capital budgeting and consist of long-term benefit to the municipality. In this regard a project is a complex, non-routine, one time temporary endeavour undertaken to create a unique product or service. It includes the application of knowledge, skills, tools and techniques in order to meet or exceed stakeholder needs and expectations within a definite starting and ending period. It is limited by time, budget, resources and performance specifications designed to meet target beneficiary's needs (Oostuizen and Venter, 2011). Project management therefore is the application of knowledge, skills, tools and techniques to meet project activities to meet requirements of a unique endeavour. This include working processes that initiate, plan, execute, control and closure. In the process of project management, trade-offs such as where one factor is considered over another, must be made in respect of cope, quality, cost and schedule. When these trade-offs are successful, the project result meet the agreed requirements to meet the customer needs (Project Management Institute, 2008, p. 6).

THE ROLE OF MANAGEMENT ACCOUNTING IN INSTITUTIONAL PRACTICES

In the private sector environment companies compete on price, quality, speed of delivery, and customer service. However in the public sector set-up, institutions compete against the never ending desires of the societies they serve. Furthermore governments are run by political elites who require outperforming the raging challenges of governance, to sustain power. Managers need measures and performance indicators to perform institutional purposes (Yeshmin and Hossan, 2011, p. 148). Managerial accounting as a traditional information specialist, must provide such in information timely, otherwise management accounting may be considered comparatively irrelevant. However with the changes in public sector and business environment, managerial accounting has to be less concerned with a number crunching and generating the traditional, antiquated accounting measures and focus more at how they can add value and became more integrated into institutions. Thus managerial accounting should become a valued institutional practice, which acts as a greater strategic and managerial decision making influencer (Russell, Siegel and Kulesza, 1999). This section focuses on the role of management accounting on the institutional practices, within which emanates strategy, namely (i) planning and direction setting, (ii) resource allocation and (iii) evaluation and controlling.

Planning and direction setting

Financial information plays a greater role in strategy development, as expected to establish a competitive edge with scarce capital. Since, public sector and economic reforms, spread across the globe, the planning and fiscal resource management functions have had disproportionate increase in their involvement in strategy and direction

setting. Planning and direction setting functions seem a natural outcome of reforms aimed at giving institutions control of their destiny (Anderson and Lanen, 1999). Since strategy is to bring change in institutions, setting direction for that change is fundamental to decision makers. Direction setting is thus greatly associated with strategy development. Planning and direction setting is therefore a process of seeking, template analysis for moving the institution to a desired future destination. This means that planning and direction setting take a form, out of the vision, mission and objectives of the institution, to create valued acts towards destiny (Ehlers and Lazenby, 2012, p. 6). In an institution, without direction even short-term planning can become a management black hole, capable of absorbing an infinite amount of time, resource and energy (Kotter, 1990, p. 39). Direction setting is inductive, leaders gather a broad range of data and look for pattern, relationships and linkages that help explain issues that impacts institutional immediate and future prospects. The direction setting aspect of strategic leadership does not produce plans, it honour the vision and create strategies. Setting direction is never the same as planning or even long-term planning, although people often confuse the two. Planning is a management process, deductive in nature and designed to produce orderly results, not change (Mitzberg, Kotter, Zalezenik and Farkas, 1998, p. 42). The role of management accounting in planning and direction setting, is to analyse and interpret those modified data and extracts the necessary information for making them understandable and useable to the management in the process of its planning, direction setting and controlling. After analysis and interpretation of such financial data, it presents the results with necessary comments to the management, with certain directions for purposive and competitive edge, and with the most probable means to achieve institutional strategic destiny.

Resource distributions

Strategic plan documents the aspiration of the institutions strategists. Project implementation is meant for the creation of infrastructure required to put such a plan into action. In a procedural implementation, one need authority signal to initiate implementation, however nothing really happens until resources are procured and allocated to tasks for the accomplishment of institutional objects (Kazmi, 2008, p. 334). Resource allocation is the process of procurement, commitment and distribution of financial, human, informational and physical resources to strategic tasks for the achievement of institutional objectives. The importance resource allocation can be observed from the fact that strategic management is sometimes referred to as a resource allocation process. Resource allocation is both a one-time and continuous process (Alkhafaji, 2003, p. 201). When a new activity is implemented in an institution it requires resources being allocated prior implementation (David, 2007, p. 269). As an on-going concern there is a requirement of a continual infusion of resources. Strategy and implementation is required to take consideration of these components of resource allocation. Resource allocation especially for financial and physical resources could be done through budgeting (Kazmi, 2008, p. 334).

Evaluating and Controlling

Managerial accounting plays a pivotal role in the controlling process of institutions. Managerial accounting in the controlling process, involves framing of budgets, comparison of actual results with budgeted estimates, ascertainment of any deviation of actual results from budgeted estimates by computation of variances and adoption of necessary remedial measures against such deviation. Furthermore managerial accounting ensures control over the performance of different sections of an institution. It uses various techniques such as budgetary control, standard costing and responsibility accounting and to identify the weaker areas of performance activities and suggests appropriate remedial measures to overcome the prevailing problems (Debarshi, 2011, p. 6). It is worth noting that in all the above noted provision of management accounting, can be fitted into municipal capital project delivery, and thus can be effective when institutionalised.

THE NATURE OF CAPITAL PROJET DELIVERY IN SOUTH AFRICAN MUNICIPALITIES

Public sector reform has come into push after, scientific analyses of the infectiveness of government systems to deliver on their objectives. In order to improve management efficiency and effectiveness, most countries use the new management tools and informative accounting systems, which were mainly developed for business organisation (Economic Commission for Africa, 2003, p. 5). Thus these new managerial tools are seen to be

relatively new in the public sector, necessary because the public sector is specifically designed to deliver non-profit base objectives as opposed to business institutions which pursue a profit maximisation goal at a highly competitive environment (Therkildsen, 2001, p. 2). Government however, have objects including, accountability, working better and costing less, improving fiscal policies, delivering more with less, reducing and clearing debt, disclosing financial position of the whole government (Artley, 2001, p. 3). These functions of government are unlimited, and have a broader concern on strategic delivery of the general purpose of satisfactory service delivery to the people. It is for this reason that recent and scientifically proven, tools and informative system should be integral part of government institutional practices (Ouda, 2003, p. 3). South African municipalities are constitutionally mandated to provide socio-economic facilitation to its demarcation. As such the constitution, stress that the municipalities should provide capital infrastructure that includes, water systems, roads, rain water drainage, waste water management and provision of safe environment for its people.

The potential role of managerial accounting in municipal capital project in South Africa

Recently with the global reforms in both public and private sector, public sector methods are closely related to managerial methods and tools, especially performance measures and the focus on management control. The theory of new public management is founded on several theoretical microeconomic frameworks such as public choice theory, principal agent theory, transaction cost theory, technical rational theory and institutional theory (Gomes, Carnegie, Napier, Parker, & West, 2011). These profit maximization traits and rational choice are integrated with neoclassic economics and plays a pivotal role in the development of managerial accounting. However not only the origin of new public management and managerial accounting display similarities, management accounting techniques and innovation such as costing, budgeting and performance measurement tools are vital instrument in new public management reform making, especially within the public sector (Pettersen, 2004; Ryan, Scapens & Theobald, 2002; Lapsley & Wright 2004). Managerial accounting in the south African municipalities can be used, in line with the quest to attain the objective of creating value for money driven by being economic, efficient and effective (Hong, 1999).

CONCLUSION

Managerial accounting represents one form of institutionalized practice within institutions. managerial accounting practices can thus be institutionalised, because it embodies programmed actions, which generated common responses to situations and are drawn upon by managers of an institution regularly to help the institution gain support from society and hence legitimacy. Managerial accounting represents a ceremonial means for symbolically demonstrating institutional commitment to a rational cause of action. Experience beautifies that accounting practices, for management and reporting, fiscal use, can contribute to the realisation a public institutions which take stewardship in service delivery and national prosperity. Implementing management accounting techniques, based on an economic rational, in the social context of public sector institutions, where social results are generated based on the fiscal abilities of the institution. This paper draws conclusion that if South African municipalities, could institutionalise managerial accounting, could realise less inefficiencies, in particular those which are caused by lack of detail planning. The use of managerial accounting can thus promote accountability, in the progress of project implementation than on which is provided by financial accounting which is basically on post-ex factor reporting.

HR PRACTITIONERS' CONTRIBUTION TO BUSINESS EXCELLENCE: RESULTS SPANNING A QUARTER OF A CENTURY IN NEW ZEALAND

Pieter Nel and Leon de Wet Fourie
Unitec Institute of Technology, New Zealand

ABSTRACT

Competent managers and human resource (HR) practitioners play a pivotal role in the success of any business. This includes a variety of business functions that ought to be identified and managed to add value to the bottom-line and harness opportunities. Empirical research was conducted in New Zealand in 2010 to repeat two similar 2000 surveys and an earlier survey conducted in 1994. The longitudinal results up to 2020 identified important areas of the business environment as perceived by HR practitioners. These are awareness of the importance of the effect of change, international competition, and customer satisfaction. It is recommended that HR managers must become dedicated change agents to continue to support management optimally, as this perception was revealed by the survey results over the 25 year period.

INTRODUCTION

The global business environment provides a stage for actual business activities to be conducted nationally and internationally by organisations. Within this context, businesses are compelled to manage their affairs diligently if they wish to seize current and future opportunities to achieve their objectives. Concurrently a variety of factors impact on businesses success, such as the type of business being conducted and the quality and leadership the ability of management. Issues confronting managers are the ability to manage the effects of change, dealing with the demands of customers, the quality of the service/product being delivered, the ability to utilise technology and communicate effectively, and being, able to compete nationally and internationally due to global business competition, to name but a few. Some factors have a greater or lesser impact than others on businesses, depending on where and how business is conducted and the type of business, as well as the staff being employed, in particular the management staff. These issues form the focus of this paper, which aims to identify the state of affairs in New Zealand (NZ) with a particular lens on how human resources (HR) practitioners view these issues over the longitudinal period ranging from 1994 to 2020.

In this paper the various factors impacting on HR practitioners to execute their task in the context of the business environment within which businesses operate are multiple and varied, such as understanding governmental legislative requirements, the impact of international competition, the effect of total quality and customer satisfaction on the organisation and the influence of information and communication technology. These aspects are addressed in the literature review prior to the analysis of the findings of the survey. This is carried out to enable HR practitioners to meet the expectation that they will be able to interpret and manage the influence of the business environment on the organisations they work for.

The structure followed for the paper is to first review the applicable literature and then present the methodology being applied and the findings. Lastly an analysis of the results and conclusions is presented.

LITERATURE REVIEW

The world of today is increasingly subject to continuous change which varies from mild to catastrophic and occurs completely unexpectedly at times (Waddell et al., 2011) notwithstanding the fact that minor changes in all spheres of all aspects of life on earth takes place continuously. The business world also experiences these phenomena on a continuous basis. In this regard a change agent should have a variety of capabilities which include the expertise to understand required change interventions in an organisation to achieve existing or new objectives. As examples of issues that require massive adaptation is the Tsunami in 2012 in Japan, the two Christchurch earthquakes in 2010 and 2011 and the 2008 Global Financial Crisis (GFC), which affects organizations and countries alike (Reserve Bank of NZ, (2012). Global influences continue to impact on the workplaces, organisations, unions and productivity of workforces, which affect the quality of the products and, therefore, the satisfaction of the customers as well (Dessler 2011; Rudman 2010; Nel, du Plessis and San Diego, 2011).

The focus on quality and customer satisfaction in the competitive business environment also warrants particular attention. Innovation in quality and customer satisfaction is an important characteristic in the high performance work that has a significant impact on employee turnover, productivity, market value and profit per employee. The HR function is central within the organisation supply chain, and a range of service can be offered to the relevant users or beneficiaries to improve both the quality of their inputs and outputs in order to assure quality service internally and externally to customers (Losey et al. 2005; Nel et al., 2012).

Information and Communication Technologies (ICT) refers to technologies that provide access to information through telecommunications. It is similar to Information Technology (IT), but focuses primarily on communication technologies. This includes the Internet, wireless networks, cell phones, and other communication mediums. The (ICT) industry includes areas as diverse as wireless infrastructure, health IT, digital content, payments, geospatial, telecommunications and agricultural technology. (<http://www.nzte.govt.nz/access-international-networks/Explore-opportunities-in-growth-industries/growth-industries/Pages/Information-and-communication-technologies.aspx>). Human resource information systems (HRIS) and the use of technology are inescapable in conducting business effectively. This includes computer literacy in organisations and the ability to execute E-HRM practices.

Learning organizations and transforming HR into a strategic business partner is important. Rudman (2010) also states that it is critical for HR practitioners in New Zealand. By empowering employees with the knowledge to take independent action, the learning organization maintains a highly motivated, innovative workforce, capable of superseding organizational and individual expectations. According to Bratton and Gold (2012), the creation of knowledge and its management are now considered as a source of competitive advantage. It is estimated that, in the future, differences in organizations and nations will depend on the extent to which information can be obtained, turned into knowledge and applied to production. A key reason for this development is seen to be the advances made in information communication technology (ICT), which is used to store, retrieve, analyze and communicate information. Finally another important aspect which plays a role in the execution of effective business is international competition. Various aspects are of importance in organisations, depending once again on the type of business being focused on. It is also clear that line management, as well as HR practitioners should ensure that they are au fait with the impact of national and international competition on organisations if they wish the organisation they work for to be successful.

METHODOLOGY

The background to the methodology used in this paper is presented first and thereafter the approach used to gather information is then presented. Thereafter the findings are presented.

Background to the collection of the empirical data

A very comprehensive questionnaire covering 358 items to identify HRM and management trends was jointly compiled in New Zealand (NZ) and Australia in 1994. It was used in a survey to identify the future competencies and roles of HR in N Z in 1994 and forecasted for the year 2000 by the then Institute of Personnel Management, now known as the Human Resource Institute of New Zealand (IPMNZ 1994). That study included the views of 264 respondents formed the basis for subsequent research studies regarding HR practitioners.

The questionnaire was edited and slightly modified and used in 2000 by Burchell (2001) in association with the (HRINZ) to determine a future perspective on human resources issues in 2000 and forecasted for 2010 in NZ. The minor modifications involved updating and reducing the questionnaire and refining the questions for clarity.

Respondents were also asked to rank the five most important elements regarding goals, roles and activities in the various categories which were contained in the questionnaire. The final section of the said questionnaire sought to obtain demographic information from respondents. A total of 1,510 questionnaires were mailed, from which 150 usable responses were received, which represents 10% of the sample. After the responses were verified, the survey results were written up. At the time the research was executed in 2000, advanced statistical analysis was not applied, and the compilation of the questionnaire was limited to the use of a variety of statistical analysis methods. Therefore, in the follow-up survey in 2010 various improvements to the previous questionnaire were introduced to enable the application of different methods, as shown in the section outlining the repeat study.

Repeat study covering HR practice in New Zealand in 2010 forecasted for 2020

The NZ study of 2000 was again used with minor modifications in 2010. It was clear from the previous studies' responses that the questionnaire was too detailed as it covered 358 questions, which in retrospect, discouraged participation. The fact that it was paper-based also reduced the previous response rate. For the 2010 repeat study, the questionnaire was shortened, but some sections were again expanded to include contemporary aspects such as social media in the HRIS section. The reporting format was also changed to an e-survey using Survey Monkey. A 5-point Likert scale was also used which ranged from 1 = "unimportant" to 5 = "critical to success". The Likert scale was not applied in the 2000 survey.

Due to the growing importance of social media and e-HRM, the 2010 survey was expanded to include some new questions on aspects such as the use of Facebook, Twitter and Blogging. This was in response to the importance of HR communication and e-HR, which was identified in 2000 and forecasted for the 2010 survey. However, at the time the 2000 survey was executed, social media phenomena such as Facebook and Twitter were non-existent so comparisons of these aspects with the 2000 results would have been impossible. The target population was again limited to HRINZ members, and those who had registered to participate in HR research requests. The HRINZ provided links to the total number of HRINZ members in this category, being 635. A total of 119 members responded but only 98 questionnaires were fully completed and usable, resulting in a 15.4% response rate. Furthermore, due to the different reporting formats used in the different surveys (from being merely listing and identifying priorities to a Likert Scale and an e-format for respondents), not all results are precisely comparable. However, trends previously identified are indicative of the present importance and context of the 2010 survey and forecasts for 2020, which are reported in this paper. It must be noted that due to the magnitude of the research projects and their longitudinal nature, only the results focusing on HR in the business environment are reported on in this article, which represents a very small section of the overall survey.

The similarity in the 2000 and 2010 surveyed profile of the respondents adds value to the results and is discussed below.

In the current study in NZ (2010), the most frequent title was HR Manager (46.7%), and the next most common title was HR non-management (16.7%). Those two titles accounted for 60.2% of the reported titles compared to 72.5% in 2000.

It needs to be noted that a limitation regarding the two surveys of 2000 and 2010 could also be viewed as an advantage. As pointed out earlier in the methodology, the 2010 survey participants obtained from the HRINZ database only included members who were registered and who requested to participate in HR research from HRINZ. This perhaps explains the larger number of consultants in 2010 (up to 24.7% from 13.8%) and the lower number of CEOs (down from 10.1% to 1.4%). The overall positive implication is perhaps a higher quality and more focused response from participants in 2010, which also resulted in a higher overall response than that for the 2000 survey.

In NZ most organisations (83%) have fewer than 10 employees. In this study, the participants are from different sized organisations and are categorised as follows, namely 10 – 49 secondly, 50 – 99; thirdly, 100 – 499 and lastly 500 or more. For both the 2000 and 2010 surveys, the respondent profiles were comparable. Note that the following groupings were compiled for analysis: small organisations with fewer than 10 and the various categories that are also compatible. It should be noted that NZ is predominantly a country of small businesses, with 93.3% of enterprises employing 19 or fewer people ("SMEs in NZ: Structure and Dynamics" 2006).

It is shown in Table 1 that the results are comparable as far as the profile of respondents by industry sector is concerned and that the 2000 results and 2010 results could be used with confidence for trend identification.

Table 1: Profile of the respondents by industry sector for 2000 and 2010

Sector	NZ profile 2000	NZ profile 2010
Agriculture, hunting, forestry and fishing	4.2%	4.3%
Mining and quarrying	1.4%	1.5%
Manufacturing	5.5%	6.9%
Electricity, gas and water	9.6%	8.3%
Wholesale and retail trade, restaurants and hotels	5.0%	6.2%
Transport, storage and communication	3.3%	4.1%
Business, insurance and financial services	13.7%	12.5%
Community, social and personal service	11.0%	11.1%
Education	20.7%	20.8%
Other	25.6%	24.3%
TOTAL	100%	100%

Results of the survey

The results of the e-survey were subject to verification for SPSS analysis purposes. The Likert Scale application (ranging from 1-Unimportant to 5- Critical to success) for the 2010 survey enabled the researchers to apply statistical analyses which were not possible for the 2000 survey. Parametric and non-parametric tests were applied using the Wilcoxon Signed Ranks Test as well. Significance levels at the $p < 0.01$ were recorded. This level of statistical analysis was not possible in 2000 due to the design of the then questionnaire. The current approach was, however, vital for the 2010 comparisons with the 2020 forecasts in order to identify significant differences. It must be noted that relevant results from the 2000 study and forecasts for the 2010 study are primarily compared with the current results (that is, 2010 and forecasted for 2020). Reference is also made to the 1994 survey results for longitudinal purposes.

FINDINGS

Only aspects relating to the business environment for HR are focused upon. There is a discussion and comparison of aspects of each survey for the respective time periods after the results have been presented. The results for all the surveys are presented separately prior to discussing the combined results in order to make deductions and then draw conclusions.

Results of the historical 1994 survey with forecasts for 2000

The 1994 survey was executed by the Institute of Personnel Management (IPM) in 1994 as outlined in the methodology section of this paper. The IPM was the fore-runner to the current HRINZ. The topics which were contained in that questionnaire were as follows:

Increased national/international competition; increased governmental regulation of the employment relationship, growth through joint ventures, acquisitions and alliances; awareness of the increased reliance on

automation technology to produce goods and services; more sophisticated information/communication technology; changing attitude of society towards business; heightened concern about pollution and natural resources; heightened focus on total quality/customer satisfaction; changing employee values, goals and expectations, e.g. less loyalty to current employer; fewer entrants into the workforce; inadequate skills of entrants into the workforce; changing composition of the workforce with respect to gender, age and/or ethnicity; greater concerns about the confidentiality of personal information.

For the subsequent surveys in 2000 and 2010, minor modifications to the questions were introduced to reflect a more modern day business environment. Questions such as reliance on automation and non-traditional business structures and so on were deleted and replaced with questions such as “organisation learning and knowledge management”.

The top 5 responses from the results of the 1994 survey were: First, heightened focus on total quality/customer satisfaction; second, increased national/International competition; third, changing employee values, goals and expectations; fourth, increased governmental regulation of the employment relationship, fifth new information technology.

The top 5 responses from the results of the forecast for 2000 were: First, increased national/International competition (was 2nd in 1994); second, heightened focus on total quality/customer satisfaction (was 1st in 1994); third, changing employee values, goals and expectations (same as in 1994); fourth, globalisation of the economy (not in top 5 in 1994); and fifth, globalisation of business structures (not in top 5 in 1994).

The 2000 survey results with forecasts for 2010

Note that the questions contained in the 2000 survey are shown in the 1994 survey, although further refinements of the questions took place, such as globalisation of corporate business structure; breakdown of trade barriers; increased energy costs; and cross border application of employee rights. In the 2000 survey respondents were once again asked to select only the 5 changes which were current for 2000 and forecasted for 2010 that would impact most, and they are presented below.

The top 5 responses from the results of the actual 2000 survey were: First, cross border application of employee rights; second, increased national/international competition; third, increased governmental regulation of the employment relationship; fourth, increased energy costs; and fifth, globalisation of the economy.

The top 5 responses from the results of the forecast for 2010 were: First, increased national/international competition (was 2nd in 2000); second, greater concerns about the confidentiality of personal information (nowhere in 2000); third, cross border application of employee rights (was 1st in 2000); fourth, organisational learning and knowledge management (nowhere in 2000); and fifth, globalisation of corporate structures (was 5th in 2000).

These results will be compared and discussed with those for the survey in 2010 and forecasts for 2020.

The 2010 actual survey results with forecasts for 2020

This part of the paper presents the results of the 2010 survey together with the respondents' forecasts for 2020. As previously outlined, the findings and discussions are only focused on the HR business environment issues that add value to the bottom line, which represents data from section 5 of the 2010 survey only. Section 5 of the HR survey again comprised 16 questions, but it included more refinement of the previous surveys. One of the questions which, was eliminated was increased energy costs, which attracted a low response in the forecast for 2010.

It must be noted that new questions were introduced in the 2010 survey which were not part of the 2000 survey. This was done because of the changed circumstances of the global business environment and to reflect the modern trends which HR ought to be familiar with. New questions were, for example, growth of electronic

business, organisational learning and knowledge management, and managing the effect of change in the organisation. The full set of questions for the 2010 survey still closely mirror the original set of questionnaires.

In the 2010 survey respondents were required to apply the 5-point Likert Scale ranging from 1 being “unimportant” to 5 being “critical to success” for both 2010 and 2020 when providing their responses. This approach would enable a measurable refinement of the approach to and analysis of the results which were obtained in previous surveys. The position of the responses would also be indicative of the importance of the results for comparative purposes. For the 2010 survey, the application of statistical methods to reveal the significance of the results and the position thereof would, therefore be possible.

The 2010 results analysis, however, only focused on the last 2 combined responses of respondents, namely “Very Important” and “Critical to Success”. Furthermore, only the results of the questions which attracted a combined response of two-thirds and above are discussed. The generally accepted convention of a majority clearly indicates a direction decision which is more important than a standard majority, which is then two-thirds instead of 50%. This is applied as a sharpened focus for the analysis of the 2010 survey results and the forecasted ones for 2020. Lastly, as a further refinement, parametric and non-parametric tests were applied, in particular the Wilcoxon Signed Ranks Test to obtain a much more focused picture of the results. The results which attracted a response of more than two-thirds are shown in Table 2 and are listed from the highest response to the lowest. Results below two-thirds are not analysed, but merely taken note of when possibly applicable to the functions of HR. Only one response satisfied the criteria and is listed below.

The top 5 responses from the results of the actual 2010 survey were: First, managing the effect of change in the organisation; second, heightened focus on total quality/customer satisfaction; third, organisational learning and knowledge management; fourth, more sophisticated information/communication technology.; and fifth, increased national/international competition.

The top 5 responses from the results for the 2020 forecast were: First, managing the effect of change in the organisation (also 1st in 2010); second, heightened focus on total quality/customer satisfaction (also 2st in 2010); third, more sophisticated information/communication technology (was 4th in 2010); fourth, organisational learning and knowledge management (was 3rd in 2010); and fifth, increased national/International competition (was 2st in 2010).

Because more sophisticated statistical methods could be applied in the 2010 survey, which were not possible with the previous survey, a more in depth analysis could be undertaken. See Table 2 below.

Table 2: Responses by question for 2010 and 2020 at 66.66% and above

Q No.	Question detail	Position of response	Response by year
16	Managing the effect of change in the organisation	1 1	2010 – 66.7% 2020 – 83.4%

In Table 3, responses are ranked for 2020 which were not part of the two-thirds and above threshold for both the 2010 and 2020 questions in order to reflect a further refinement of the results. Results are again listed from Highest to Lowest.

Table 3: Single results by question for 2020 only which attracted a 66.66% and above response

Q No.	Question detail	Response by year
8	Heightened focus on total quality/customer satisfaction	2020 – 76.6%
5	More sophisticated information/communication technology	2020 – 75.0%
15	Organisational learning and knowledge management	2020 – 68.4%
1	Increased national/International competition	2020 – 66.7 %

From the responses it is clear that the perception of the respondents regarding 2020 has shifted measurably as to what was regarded as “Very Important” and “Critical to Success” in 2010. These results are noteworthy and need to be explored in more detail as well as being compared with the results of previous surveys. It must be noted that all responses which have not attracted a response of 66.7% and above for either 2010 or 2020 are not addressed for the rest of the analysis in this paper. No further discussion is undertaken as they are apparently either unimportant or of no concern. They may be in place but not on the radar screen in organisations as far as the HR respondents are concerned. The questions which were not meaningful re the results are not further discussed.

A further refinement of the results is presented in Table 4 where the questions for either 2010 or/and 2020 which attracted 66.66% and above responses are listed after further statistical analysis was applied. It is indicated in the table under the section “Question and year” in terms of the applicable categories.

In the next section the results are analysed while bearing in mind the significance of each as shown in Table 4 as well as in the literature survey to determine the context of the results. The analysis is initiated for both the 2010 and 2020 results of the same question above the threshold of 66.66% and proceeds from highest to lowest. The discussion of the 2020 only results, which were above the threshold and which were significant as well, as shown in Table 4, are analysed and discussed in the next section.

ANALYSIS OF RESULTS

It must once again be noted that only responses which attracted 66.66 % and above are focused on in this section.

Table 4: Paired comparisons and significance of results

Paired Q number	Question and year	Mean 2010	Mean 2020	Significance
16	Managing the effect of change in the organisation (2010 and 2020 above threshold)	3.95	4.4	.000* /.000**
8	Heightened focus on total quality/customer satisfaction (only 2020 above threshold)	3.62	4.20	.000* /.000**
5	More sophisticated information/communication Technology(only 2020 above threshold)	3.20	4.15	.000* /.000**
15	Organisational learning and knowledge management(only 2020 above threshold)	3.28	3.97	.000* /.000**
1	Increased national/international competition (only 2020 above 60% threshold)	3.02	3.72	.000* /.000**

*p<0.01 (Note: Scale used was: 1-Unimportant, 5- Critical to success) ** Wilcoxon Signed Ranks Test

Managing the effect change in organisations

Managing the effect of change ranked first in 2010 and 2020, at 66.7% and 83.4 % respectively, which reflects the increasing awareness of the need for managing the effect of change for the next decade as well. In recent years in New Zealand, there have been numerous cases where sudden cuts in government spending or zealous cost cutting by senior managers have led to major reorganizations and downsizings that have resulted in loss of staff goodwill. This could perhaps explain the importance accorded to manage the effect of change by HR practitioners for the year 2020 (Macky, 2008; Nel et al., 2012).

This result is also significant after the various tests showed p<0.01 being .000, and applying the Wilcoxon Signed Ranks Test as well of the paired comparisons for 2010 and 2020. It is thus concluded that managing the effect of change in organisations is significantly important for the future as well. This was a new question for 2010 and not contained in the previous survey, yet it is clear that it is a factor which plays an important part in the Business environment in NZ as identified by HR practitioners thinking of the future as well.

Heightened focus on total quality/customer satisfaction

For the HR practitioners surveyed in 2010 the heightened focus on total quality/customer satisfaction was the second most important attribute in the New Zealand business environment with a response of 76.6% for 2020, but it was below the threshold for 2010. Customers bring pressure on a business to match competitors' prices, and these pressures filter down to line managers who in turn seek better and more efficient services from functional managers such as those in HR. This could perhaps provide the motivation for the 2020 result, with a 76.6% ranking. This attribute is the second most important in the business environment after change management. This result is also significant after the various tests were applied showing $p < 0.01$ being .000 and applying the Wilcoxon Signed Ranks Test as well of the paired comparisons for 2010 and 2020. It is thus deduced that total quality/ customer satisfaction is significantly important for the future as well. This also confirms the trend identified as far back as 1994 when it was the top priority then and second for the 2000 forecast, albeit low on the 2000 survey results. It is thus an important factor, which plays a critical role in the business environment in NZ, as identified by HR practitioners.

More sophisticated information communication technology

Respondents ranked more sophisticated information communication technologies at 75.7% for the next decade. It did not reach the threshold in 2010 although it was regarded as important. In the literature it was suggested that modern information and communication technologies have created a "global village," in which people can communicate with others across the world as if they were living next door. (<http://www.techterms.com/definition/ict>). According to New Zealand's Trade & Enterprise Department, the ICT industry contributes around \$19.3 billion to the economy each year. (www.nzte.govt.nz). It is perhaps that more sophisticated information communication technologies are critical in the business environment in future.

This result is also significant after the various tests have been applied showing $p < 0.01$ being .000 and applying the Wilcoxon Signed Ranks Test as well for the paired comparisons for 2010 and 2020. It is deduced that information communication and technology is very important for the future as well. This also confirms the trend identified as far back as 1994 when information technology was the fifth priority. It is important in the business environment in NZ as identified by HR practitioners, particularly for the future in NZ.

Organisational learning and knowledge management

Respondents attributed a weight of 68.4% for 2020, but it did not reach the threshold for 2010. The result is in line with various researchers (Rudman, 2010; Bratton and Gold, 2012) who pointed out that it appears that organizations develop opportunities to actively learn new information on an ongoing basis. These developments could perhaps explain why organisational learning and knowledge management is important New Zealand HR practitioners for the year 2010 and 2020. This result is, however, also significant after the various tests have been applied showing $p < 0.01$ being .000 and applying the Wilcoxon Signed Ranks Test as well of the paired comparisons for 2010 and 2020. It is deduced that organizational learning and knowledge management is significantly important for the future although it was not highlighted in the previous surveys except in the 2000 survey as the fourth priority forecasted for 2010. It is a more recent high level phenomenon in an organization's quest to be more competitive in future as shown in the 2010 survey with forecasts for 2020.

Increased national/international competition

Increased national and international competition achieved a response of 66.7% for the 2020 forecast. It did not reach the threshold in 2010 although it was regarded as important by respondents.

Like other countries New Zealand faces intense competition in most areas of economic activity. Distance from markets and the cost advantages enjoyed by low-wage countries in Asia and elsewhere, for example make it increasingly difficult for secondary industries (e.g. manufacturers) to operate profitably in New Zealand. The initiatives the government has taken to create a more productive and competitive economy fall into six areas: access for New Zealand businesses to capital markets, innovation and ideas, skilled and safe workplaces, natural resources, infrastructure (including electricity, broadband, transport) and export markets.

(<http://www.national.org.nz/economy.aspx>). This could explain the importance accorded by HR practitioners to increased national and international competition in the business environment in the years 2010 and 2020.

It is also significant after the various tests were applied showing $p < 0.01$ being .000 and applying the Wilcoxon Signed Ranks Test as well for the paired comparisons for 2010 and 2020, so is deduced that increased national and international competition is significantly important for the future as well. This also confirms the previous surveys' results in that it is the most consistent result from 1994 through to 2010. It was second in 1994 and first forecasted for 2000. In the 2000 survey it was second and first forecasted for 2010. It is thus a continuing factor which plays a very important part in the business environment in NZ for the future as well as far as HR practitioners are concerned.

CONCLUSIONS AND RECOMMENDATIONS

The 2010 results of the survey and the forecast for 2020 revealed that the following indicators are important in the business environment as identified by HR practitioners in New Zealand: manage the effect of change in organisations, focus on quality/customer satisfaction, information communication technology, organizational learning and knowledge management and national/international competition. Some of these results overlap with those of the surveys from 1994 and 2000 which is indicative of the view of HR practitioners regarding the business environment. The significance of the results of the 2010 survey should also provide confidence regarding the future foci in the business environment according to HR practitioners.

It is concluded that the ability to manage the effect of change is currently in sharp focus for HR managers in the organisations they work for. However, HR managers also need to be change agents and leaders as they have to go beyond the traditional roles of HR managers. HR managers must continue to support line management in various areas in the business environment to add to the bottom line and to harness opportunities for the future. There should also be a sharp focus on the identified aspects of quality and customer satisfaction and the impact of domestic and international competition on business, since this has been a focus for HR practitioners over the 25 years of the longitudinal surveys. Priority proactive New Zealand management actions to address the implications of the research findings as perceived by HR respondents over a 25 year period, could perhaps be the following:

- Managers should be more aware of the accelerated impact of change on their organisations and initiate proactive measures to meet this challenge in future. They could perhaps consider utilising expert change agents specialising in the application of information communication technology to keep their businesses competitive because New Zealand is geographically isolated in the global context.
- They could utilise means to enhance New Zealand's competitive business endeavours in the international business environment. For example utilise high level HR practitioners to effectively capture knowledge management expertise to enhance customer satisfaction across the economy.

A LONGITUDINAL COMPARISON OF ASPECTS OF DIVERSITY IN TWO COMMON WEALTH COUNTRIES

Pieter Nel, Leon de Wet Fourie and Andries du Plessis
Unitec Institute of Technology, New Zealand

ABSTRACT

Commonwealth countries have a common colonial background with accompanying problems and opportunities. Recognising and addressing diversity and equal employment opportunity are common issues in these countries. The focus is on four empirical research projects over 10 years in New Zealand and South Africa between 2000 and 2010 with forecasts up to 2020 enabling comparative analyses in a longitudinal manner. The overall results show a heightened awareness of particularly diversity and equal employment opportunity which highlights an increased role for HR practitioners in both countries. Opportunities are created for business leaders to take note of the commonality between New Zealand and South Africa which could lead to enhanced inter-country business activities and improved returns.

INTRODUCTION

Commonwealth countries in particular are experiencing a great increase in population and population mobility, which measurably increases the necessity to manage diversity, amongst others. In these countries organisation are generally under greater pressures than developed countries be able to attract a sufficient number of job candidates who have the abilities and aptitudes needed to harness future business opportunities. It is also common knowledge that the workforce is the lifeblood of organisations and they represent one of its most potent and valuable resources (Rudman, 2010; Dowling, Festing and Engle, 2013). The effect of being able to attract and manage diverse staff presents organisations with enormous challenges to be successful, in multicultural countries, for example, South Africa and New Zealand. The emergence of globalisation, development in technology and telecommunications; the shift towards a knowledge-based workforce, labour legislation and intensifying competition for skilled labour also create new competitive realities for organisations.

Organisations are keen for the human resources (HR) function to go beyond the delivery of cost effective administrative services and progress to providing expertise on how to leverage human capital. Simultaneously, the role of HR practitioners as strategic business partners and leaders of change has also received considerable attention (Haggerty and Wright 2009). The previous decade also saw the HR profession faced with criticism and questions regarding its validity, which subsequently resulted in a significant body of research that linked HR practices to organisational performance (Ulrich et al., 2012). Ultimately, the competitive forces that organisations face today create a new mandate for HR, and this necessitates changes to the structure and role of the HR function (Bryson and Ryan, 2012). The general roles expected of HR managers and functional line managers are not dissimilar in most economies and cultural environments around the world (Compton, 2009; Dessler, 2011; Galang, 2008; Nel et al., 2012; Pretorius, 2010; Rudman, 2010; Wright, 2008). The role of HR managers in particular is also interdependent with line management's activities because attempts to either be practising HR or only line management would result in organisations being in danger of becoming dysfunctional or even perishing. Ignoring the particular relationships between these functions can result in serious negative consequences for an organisation or even a country.

According to Paine (2009), HR manager interaction should occur constantly with all line managers in organisations and should cover various facets of a business's activities. It should focus on the aspects of change, diversity and intercultural management in organisations which affect all areas of its functioning. A business focus and approach is required of all categories of management in organisations. This includes HR staff, who should be au fait with management in general, as it is influenced by HR. The competencies of HR staff, which should be at a high level to meet the challenges of businesses in terms of their core functions, are also important. These aspects as they relate to the role of HR management in organisations are discussed in the next sections. In today's global economy HR practitioners must, therefore, be prepared to meet the considerable challenges and expectations posed by the continuing evolution of their role and show how their function is creating and adding value to the organisation. As recognised by Ulrich and Brockbank (2005), HR should not be defined by 'what it does' but by 'its contribution to achieve organisational excellence' (p.134).

The research propositions is to identify components of diversity and related aspects in two relatively similar commonwealth countries, yet being distinctive in its population composition.(Nel et al 2011) Identifying components applicable to the role of the HR functionaries in organisations are explored in order to guide and support management to do business more effectively and thereby creating and enhancing business opportunity is undertaken. The research entails identifying particular elements of diversity, equal opportunity and worklife balance which is of importance in both countries to perhaps enable improved inter-country business activities as well.

LITERATURE SURVEY

Researchers have taken different stances when referring to HR practices, but it appears that there is a consistent focus on the contribution of HR practices to enhancing human capital (Du Plessis et al. 2007). The shared assumptions of a number of authors has resulted in the definition that 'HR practices are a set of activities that actively contribute to achieving organisational objectives' (Macky, 2008), which have the ability to gain a competitive advantage over other organisations. It is the HR function's effectiveness in an organisation within the ambit of a country's applicable legislation that will determine the quality as well as the extent of observing all elements of diversity management. A range of change "triggers" to which organisations must respond in order to survive often happen unexpectedly. These factors are, amongst other things, laws and regulations (for example, legislation on age discrimination), the globalisation of markets, and the internationalisation of businesses reacting to major political and social events (Galang, 2008; Mthembu, 2010).

Diversity

Globally diversity has been a key focus in most countries around the world as a result of the Universal Declaration of Human Rights in 1945. The United Nations and its various bodies have also been instrumental in the acceptance of various conventions which provide guidelines on a global scale, such as Convention 111, which outlines anti-discrimination principles. Having people from different cultures and backgrounds is also the norm in NZ and SA organisations due to the fact that these countries are changing continuously and becoming increasingly multi-cultural and diverse (Du Plessis, 2009; Bryson and Ryan, 2012). According to Ulrich, Younger, Brockbank and Ulrich (2012), worldwide immigration patterns have sharply internationalised the labour force and there is a need for organisations to move beyond intellectual diversity and formally ingrain diversity into their culture. HR as a profession, therefore, has to recognise and espouse the value of diversity because diversity management has been identified as an emerging strategic necessity for survival in a globally diverse environment.

In this regard, diversity is defined as follows by Nel, Werner, Poisat, Sono, du Plessis and Ngalo (2011): "it encompasses all forms of difference among individuals, including culture, gender, age, ability, religious affiliation, personality, economic class, social status and sexual orientation" (p. 113). Diversity is the opposite concept to universality because certain activities occur across cultures, that is, they are common to all cultures, but their manifestation may be unique in a particular society.. Cultural diversity should, therefore, be addressed by observing Hofstede's (1991) approach to understanding cultural diversity.It also needs to be noted that NZ has both an indigenous and a western culture, which suggests that both Maori and European culture are meant to have an influence on society and in workplaces (Jones, Pringle and Shepherd, 2000). In addition, there

is also a growing number of Pacific Island people, Asians, Indians and many other ethnic groups, which can have implications on workplace diversity. This makes NZ quite similar to SA in a number of contexts. Different interests, backgrounds, competencies, skills and talents, if harnessed properly, can be beneficial to productivity and successful teamwork.. Diversity management also involves conscious efforts to actively recruit members from ethnic minorities. Demographic trends in NZ and SA clearly indicate that diversity is a distinguishing characteristic of both countries. HR practitioners need to recognise the uniqueness of each individual and the varied perspective and approach to work that they bring to the organisation (Rijamampianina and Carmichael, 2005).

It is also well documented that organisations that effectively manage change by continuously adapting their bureaucracies, strategies, systems, products and cultures in response to the impact of the complex, dynamic, uncertain and turbulent environment of the twenty-first century are identified as masters of renewal (Nel et al. 2011; Truss, Mankin and Kelliher 2012; Ulrich et al. 2012). This also applies to the way in which the composition of the workforce with respect to gender, age and ethnicity is managed as its profile changes in different countries.. The HR function has become more multifaceted over the years as the pace of change quickens, requiring a transition towards more value-added roles, such as the role of a change agent (Ulrich et al. 2012). HR practitioners as champions have to have the competencies, capabilities and discipline to make change happen and need to be skilled in the management of employee resistance to change. Managed change is proactive, intentional and goal-oriented behaviour). Overall, there is a clear indication that change is inevitable, and it is part of managing ever increasing diversity in organisations' workforces.

Equal opportunity

Although diversity is acknowledged globally as an inherent part of any modern society, it is also critical that equal opportunity is actively supported and preferably legislated for to provide maximum freedom to a work force so that they may work without fear and in conditions which promote a level playing field. Usually the constitution of a country, and its labour legislation in particular, would provide this protection to the work force. In SA the Constitution of 1996, the Employment equity Act of 1998, and Labour Relations Act of 1995 in particular, guarantee this protection to its citizens and the work force. In New Zealand the Human Rights Act of 1993 and Employment Relations Act of 2000 would broadly fulfil these roles. Other labour legislation is, of course, relevant in both countries apart from the major statutes outlined above.

Work-Life Balance

Finding the 'balance' between work and non-work, with neither of them intruding into the other in terms of time, resources, and emotional energy, could be an elusive goal for individuals and organisations (Nel et al. 2012). An organisation's response to their employees' needs may be family responsive programmes, which may include components such as leave programmes, dependent care and health/wellness programmes (Macky, 2008; Bryson and Ryan, 2012). Offering flexible work arrangements, which are the cornerstone of almost all work-life balance initiatives, can have significant beneficial results (Strack et al., 2008). Many younger employees tend to have new and non-traditional expectations about work. A particular demographic challenge comes from Generation Y (people born after 1980). As observed by Guthridge et al. (2008), these individuals demand, among other things, a better work-life balance. It becomes evident that these employees, who operate from a position based on their perception of the organisation's commitment to work-life balance, need to be managed differently. Ultimately, employees are interested in having both a good job and a life beyond work, and there is a need for HR practitioners to implement policies and practices that will increase employee commitment and also show commitment to diversity in the workplace.

BACKGROUND TO THE COLLECTION OF THE EMPIRICAL DATA

A very comprehensive HRM questionnaire covering 358 items to identify HRM and management trends was jointly compiled in New Zealand and Australia in 1994. It was used for a survey to identify the future competencies and roles of HR in those countries for the year 2000 for use by the Human Resource Institute of New Zealand (IPMNZ, 1994). This study formed the basis of four subsequent research studies which could be used as pointers regarding diversity, equal employment and work-life balance. The 4 studies are briefly outlined below. Note, however that, due to the magnitude of the various studies, only issues focusing on the components outlined above are analysed and compared, for the various studies and reported in this paper.

Study no. 1 covering HR practice in New Zealand for 2000 and forecasted for 2010

The questionnaire of the New Zealand and Australia study in 1994 was edited and slightly modified and used in 2001 by Burchell (2001) in association with the Human Resource Institute of New Zealand (HRINZ) to determine a future perspective on human resources issues in 2001 and forecasted for 2010 in New Zealand. The minor modifications involved updating and reducing the questionnaire, as it was too long, as well as refining questions for clarity. The questionnaire covered human resource goals, roles and activities, as well as the implications of changes in the business environment and identifying practices for gaining competitive advantage. The respondents were asked to rank the five most important goals, roles, and activities in the categories, which were contained in the questionnaire for 2001 and 2010. Respondents were also asked to prioritise the future activities of HR. However, the reporting of the results and comparisons only focus on diversity-related issues in this paper.

The final section of the above questionnaire sought to obtain demographic information from the respondents. The questionnaire was distributed to all members of the Human Resources Institute of New Zealand. A total of 1510 questionnaires were mailed, of which 150 usable responses were received, which represents 10% of the sample. After the responses were verified, the survey results were written up.

Study no. 2 covering HR practice in South Africa in 2002 and forecasted for 2010

The same questionnaire used in NZ in 2001 was used with permission, after minor editorial modifications, for an identical survey in South Africa in the last quarter of 2002. The questionnaire was distributed by mail to all registered members of the Institute of People Management (IPM) in South Africa, regardless of the position they occupied in the organisation. The address list of the IPM was used to mail the questionnaire. It resulted in 1640 questionnaires being mailed. The survey results are based on a total of 207 useable questionnaires, and represent a 12.6% response rate.

The responses obtained from respondents in both countries' surveys were compared regarding the following: the profile of the respondents by profession, the organisation size, and the type of industry. From the response in both countries, it was clear that it was broadly similar for comparative purposes. There was, however, a difference between the largest employee size groupings between the two countries due to their demographic differences.

Study no. 3 covering HR practice in New Zealand in 2008 only

This study by Payne (2008) and an invitation to participate in this study went to 364 members of HRINZ that had 'opted in' to participate in any forthcoming HR research requests. A total of 179 participants responded to a reduced survey questionnaire, but only 151 completed questionnaires were usable, giving a response rate of 41%. This was representative of the 'opted in' members of HRINZ. The data was collected via an e-survey, which was specifically designed for this study.

The questionnaire consisted of six sections with 40 questions (this number was made up of main questions and sub-questions). Several sub-questions were formed to explore, amongst other aspects, diversity related themes. These were: change agent, strategic partner, recruitment and retention, work life balance,

diversity management, and demographic aspects. All the questions in the questionnaire were closed questions. It must be noted that aspects covered in this paper, due to length limitation only focus on the aforementioned topics. Some of the themes in the study were diversity related aspects and form a small part of the actual study, but they are used for comparative purposes in this paper, and they could be useful to obtain a picture of the views of HR professionals with regard to diversity.

Study no 4 - repeat study covering HR practice in New Zealand in 2010 forecasted for 2020

The NZ study of 2001 was again used with minor modifications in 2010. It was clear from the previous studies that the questionnaire was too detailed, which, combined with the fact that it was paper based, discouraged participation. For the 2010 study, a section on information management was eliminated by using a sample of eligible respondents. The reporting format was changed to an e-survey using Survey Monkey as well. A 5-point Likert scale was used, which ranged from “unimportant” to “critical to success”.

The 2010 study again focused on the HR practitioners in NZ organisations who are registered as members of the Human Resources Institute of New Zealand (HRINZ). At that time, the HRINZ had 3,620 individual members who were involved in the management and development of HR in private and public sector organisations throughout NZ. The target population was limited to HRINZ members who had registered to participate in HR research requests that the HRINZ provided links to, and the total number of HRINZ members in this category was 635. A total of 119 members responded but only 98 questionnaires were fully completed and usable, resulting in a 15.4% response rate.

ANALYSIS OF RESULTS

The results of the various studies are compared in this section and conclusions drawn from it.

Diversity Management

According to the research results recorded by Payne (2008) the increasingly diverse workforce in NZ is interesting in terms of diversity management. The results reveal that the capacity to effectively implement a diversity management programmes is 28.4% (category 4 and 5 combined). Almost half of the respondents (43%) indicated a ‘neutral’ view regarding this capability.

Table 1: Self-identified capabilities in the area of diversity management

DIVERSITY MANAGEMENT					
1 for 'significant need for improvement' – 3 neutral - 5 for 'major strength'	1	2	3	4	5
Capacity to effectively implement diversity management programmes	5.3%	23.2%	43.0%	23.8%	4.6%
Competent to deal with the application of legislative issues of diversity management	4.6%	12.6%	28.5%	38.4%	15.9%

Competency in the ability to deal with the application of legislative issues of diversity management and the ability to effectively use the talents of people from various backgrounds were identified at 54.3% and 54.2% of respondents as ‘strength’/‘major strength’.

HR practitioners need to have the capabilities to articulate the changes required, make them explicit, and lead the process which was previously identified by other researchers reporting on the SA survey (Du Plessis, Beaver and Nel, 2006). It can be deduced that even though HR practitioners in NZ organisations in particular have a moderate level of capabilities in diversity management, they must invest time and effort to formally ingrain diversity into the culture if they want to maximise the potential of all available talent.

Equal Opportunity

This aspect refers to Equal Opportunity for females, minorities, and persons with disabilities.

Table 2: Comparison of equal opportunity activities for females, minorities, and persons with disabilities in South Africa (SA) and New Zealand (NZ)

2000 Actual	2010 forecast	% Increase	2002 Actual	2010 forecast	% Increase	2010 Actual	2020 forecast	% Increase
SA %	SA%	SA%	NZ%	NZ%	NZ%	NZ%	NZ%	NZ%
70.79	82.45	11.66	16.43	27.45	11.02	75.2	82.4	7.2

The 2010 forecasted results for South African respondents are (82.45%) and this represents an 11.66% increase over the 2002 figure. This emphasises the continued requirement for maintaining an equitable workplace, and the strong focus on redressing perceived past imbalances. In 1998 the Employment Equity Act set out inter alia to eliminate unfair discrimination in employment practices and promote a diverse workforce broadly representative of South Africa's people.

In New Zealand, however, equal employment opportunities (EEO) were low, with only 16.43% expressing high satisfaction with present activities, and 27.45% indicating that it was very important. This relatively low concern with EEO may be accounted for by New Zealand's long history of anti-discriminatory legislation (Bryson and Ryan, 2012; Rudman, 2010), and well-established HR practices.

The 2010 and 2020 result for New Zealand shows a significant increase which clearly indicates a heightened awareness of equal opportunity as the demographics of NZ is changing. The increase was significant over the previous forecast for 2010 versus the actual result for 2010 as well as the forecast for 2020. However, there are still many aspects, such as gender pay disparity, which will need the attention of HR professionals in both countries and probably elsewhere to enhance and consolidate aspects relating to diversity.

Work-life Balance

The research results recorded by Payne (2008) are discussed in this section regarding work life balance.

Table 3: Work-Life Balance

WORK/LIFE BALANCE					
1 for 'significant need for improvement' – 3 neutral - 5 for 'major strength'	1	2	3	4	5
Proactive in the approach to overcoming barriers to implement work-life initiatives	5.9%	11.2%	29.1%	39.7%	13.9%
Successful in benchmarking & measuring the effectiveness of work-life initiatives	7.2%	26.4%	42.4%	17.9%	5.9%

According to the research results recorded by Payne (2008), the capability to be proactive in the approach to overcoming barriers to implement work-life initiatives showed that 53.6% (4 and 5 combined) of the respondents regarded it as a 'strength'/major strength'. An unexpectedly high 29.1% (3 being neutral) was also recorded. Success in benchmarking and measuring the effectiveness of work-life initiatives was perceived as being strength / major strength by only 23.8% of respondents.

Organisations' responses to employees' needs may range from providing flexible work arrangements to addressing employees' growing desire to have more family-friendly working environments. These aspects would certainly contribute to the promotion of diversity awareness in organisations as well as in a country as a whole. More flexible time-off arrangements can also encourage more education and training, which ultimately addresses the issue of skill shortages. If organisations accept that HR practices are potentially going to produce beneficial

outcomes for the organisation and the employee, then the areas of practice that are more likely to contribute positively should be identified. HR practitioners need to be significantly more proactive in their approach towards improving work-life policies.

CONCLUSIONS

A comparison of the results from the surveys executed in 2001 in NZ, 2002 in SA, Payne (2008), and again in NZ in 2010 with forecasts for 2020 reveals significant changes in some areas. It provides some interesting pointers for both NZ and SA regarding diversity and its applications in particular countries, provided the commonwealth context of these countries is observed.

There has however, not been much difference in the forecast for South Africa, nor in the actual result for New Zealand for 2010. Diversity certainly appears to have become even more important in New Zealand, particularly for 2020. This trend is probably also applicable to South Africa, as demographic changes are speeding up worldwide, although there will be differences between developed and developing countries.

The following capabilities stemming from the results and comparisons of the different surveys are necessary for human resource practitioners in particular and businesses in general in the area of diversity management:

- Effectively implementing diversity management programmes
- Dealing with the application of legislative issues of diversity management
- Using the talents of people from various backgrounds, experiences and cultures

To manage equal opportunity includes the following:

- More awareness of the plight of females, minorities and persons with disabilities
- More focused attention paid to increasing support from governments in the form of financial rewards, for example, for mentally challenged persons being cared for by parents and caregivers.

To manage work-life balance human resource practitioners in particular need to:

- Develop and implement policies in response to changing demographic trends
- Implement a proactive approach to overcoming barriers regarding work-life initiatives.

To manage change effectively businesses need to:

- Successfully frame business strategies and be able to making key business decisions
- Develop and implement coherent HR strategies which are aligned to the business strategy
- Develop an achievable vision for the future and envisage its probable consequences

The various issues which were identified provided avenues for the refinement of HR practitioners' jobs to promote and observe diversity in particular. The most significant one is the expectations and challenges for the HR practitioner in aligning HR strategies with business strategies. Previous studies show an increase in the strategic role from 2000 and 2002 respectively (25% to 2010), which is in line with the global survey results of Ulrich et al. (2012) in particular. These trends are also supported by the results of the study by Strack et al. (2008) referring to the global context and Wilson (2010) referring to the Australian context.. A new kind of HR practitioner, business manager, and employee can be expected in successful organisations in the future who will add sustainable value by harnessing the opportunities which have been created.

Proposed strategic business recommendations are as follows:

- Business managers must be made aware of the crucial effect of effective diversity management on the bottom line of organisations.
- Change itself necessitates that business managers take cognisance of the changed business environment by highlighting the awareness and refinement of employee rights and equal employment opportunity in both New Zealand and South Africa.
- To execute business activities successfully would entail that businesses pay more attention to the work-life balance of employees in both New Zealand and South Africa due to the negative impact the global financial crisis had on these commonwealth countries.

- The approach to diversity and EEO in the two researched commonwealth countries could serve as an example to other commonwealth countries and the world in general.
- Business managers could perhaps lobby for legislative updates in both countries, as it is the domain of responsible and progressive business managers in both countries to enable and enhance business opportunities for the next century regarding the refinement of EEO and dealing with minorities and disabled employees in particular

THE COMPETITIVENESS MANAGEMENT OF STRATEGIC ALLIANCES IN THE VAGUENESS CONDITIONS

Liudmila Nikolova, Katherine Plotnikova and Sergey Nikolov
St.Petersburg State Polytechnical University, Russia

ABSTRACT

Nowadays the competitiveness management of strategic alliances in the vagueness conditions is one of the actual economic problems. The vague conditions of operating the strategic alliances are connected not only with intricate management and organization system but with clashes, resulting dissatisfaction with activity and high uncertainty of the possible terminal results. The clashes are cause of alliance disintegration at any stage of its development. They can be minimized due to preference of stable alliance interaction.

INTRODUCTION

Most researches of alliances explore limited, unrelated causes of their disintegration (I.R. MacNeil, N. Venkatraman, J.B. Heidi, B. Gray, H. Delerue). Other studies have more descriptive nature and also the have lack of theoretical justification for the results of empirical observation (B.Kogut, A. Parkh, R. Gulati, J.M. Gerindzher).

In this work we would like to offer you the model of competitiveness management of alliances in the vagueness conditions, which is allowed to eliminate the indicated lack in an explanation of strategic alliances disintegration. The model is based on the analysis of interconnected conflict sources in the view of decision-making theory in multistage processes and empirical justification of offered model.

The competitiveness of strategic alliances is based on them activity efficiency. The chief of alliance takes overall responsibility for managerial processes in the enterprise. So the chief and the main staff determine the alliance's activity efficiency. The criteria elaboration of alliances' activity efficiency is founded on the mutual and voluntary integration and the interests of alliance participants. In this case we research the integration, which is capable to realize the advantages within each enterprise. It is more expedient to apply the criteria of alliances' efficiency assessment, considering the social and economic conditions in the each part of the integrated structure.

According this situation, it's necessary to apply the factor analysis of the multi-stage processes for determining the main criteria of alliances' efficiency assessment. The criteria of alliances' activity efficiency are estimated on the main factors (criteria, which depend on the targets and conditions of the alliance's forming). They are divided on two classes: formal and substantial.

In the formal class it's analyzed the criteria, which estimates the accordance of alliance to formal requirements of process organization and to registration of created alliance. The criteria characterizes subsidiarity and loyalty to alliance, but doesn't consider the qualitative and substantial factors reflecting the alliance's productivity. The substantial class contains four criteria, which are elements of the complex of alliances' efficiency assessment. They are:

- "The process assessment" is an alliances' efficiency assessment, being constructed on the base of estimated actions. In this assessment the comparison of today's achievements and former is carried out. Then the

development of alliance and dynamics of its changes is analyzed. The criteria are estimated by employees or the chief, who is initiators of creation of alliance.

- "The purpose assessment" is an assessment, which is under construction on the base of the comparison of expected purposes achievement. For example, the assessment of knowledge acquisition, its practical applicability can be carried out on the base of expectations of the trained employee or expectations of alliance's chief.

- "The satisfaction assessment" is an assessment, which is carried out from the point of view of satisfaction by participation in process of strategic alliance.

- "The result assessment" is an assessment, which includes estimated actions of comparison economic, etc. indicators. The assessment of the reached result is carried out by the next social and economic conditions : labor productivity, expenses reduction, decrease in uncertainty and rise of development stability, decrease in risks, increase arrived, etc. [1]

These four criteria reflect options of complex of alliances' efficiency assessment:

- the satisfaction with process of strategic alliance' functioning;
- the individual importance of results for each company - participants;
- the achievement of the expected (planned) target of strategic alliance creation;
- the social and economic importance of results of strategic alliance' activity.

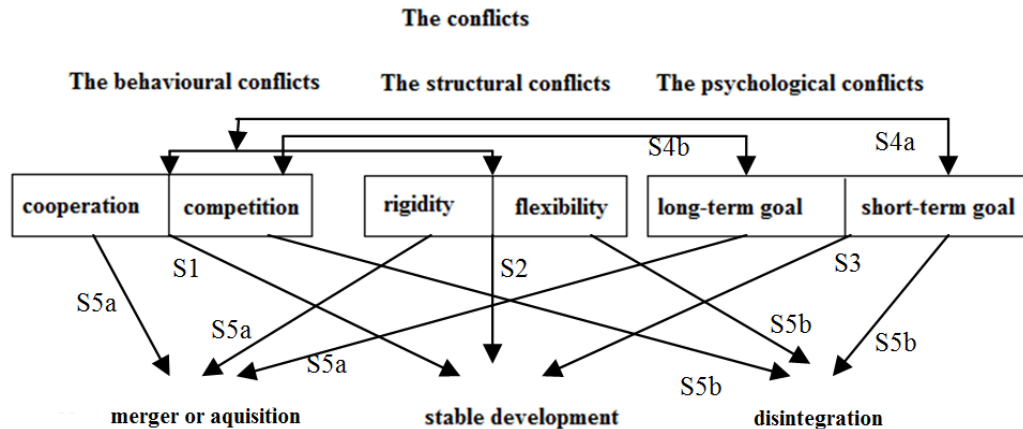

The different interpretation of results of strategic alliances' efficiency appears because of criteria's change during the assessment. Some chiefs of alliances carry out an assessment of efficiency, using the criteria "the social and economic importance of results of strategic alliance' activity". Others make an assessment by the criteria "the individual importance of results for each company - participants". As a result of this situation there are conflicts and decrease of the competitiveness or alliance disintegration. The criteria defined in research have important theoretical and practical value for understanding the principles, on which the assessment organizers and alliance's participants is based.

THE MODEL OF ALLIANCE STABILITY

In this work we, solving the revealed problem, identify the strategic alliance as a system of conflicts between cooperation and competition; rigidity and flexibility; short-term and long-term goals. The offered model of alliance stability recognizes that alliance as the system will develop and modify if the conflicts don't balance, but are operate (scheme 1).

Next suppositions are used to create the model of alliance stability:

- S1: The stability of strategic alliance is inversely proportional to difference between the extent of cooperation and competition in the economic process.
- S2: The stability of strategic alliance is inversely proportional to difference between the extent of rigidity and flexibility of enterprises' structures.
- S3: The stability of strategic alliance is inversely proportional to difference between the extent of short-term and long-term participants' orientation of economic activity.
- S4a: The extent of rigidity and cooperation as well as the extent of flexibility and competition are in positive independence in the situation when the participants have the short-term orientation in the strategic alliance.
- S4b: The extent of cooperation and rigidity as well as the extent of flexibility and competition are in negative independence in the situation when the participants have the long-term orientation in the strategic alliance.
- S5a: The alliance will move more in the direction of merger or acquisition, than in the direction of disintegration when dominate cooperation, rigidity and long-term orientation.
- S5b: The alliance will move more in the direction of disintegration than in the direction of merger or acquisition, when dominating the competition, flexibility and short-term orientation.

Scheme 1. The model of alliance stability.

The model allows choosing such interaction, which will be stable under certain conditions (character, temporary orientation and interaction structure). For example, to proceed from scheme 1, if participants focus on long-term, flexible and competitive interaction, licensing and coproduction will be the most stable forms of alliance [2].

Further we would like to indicate the forms of enterprises' interaction and the criteria of their choice. The judgments are based on results generalization of researches, which are executed for the last 15 years in the different countries (J. F. Hennart, J. Blik, D. Kent, S.H. Park, M.V. Russo, J.M.Pennings, X. Yamavaka and others).

The forms of enterprises' interaction. The short-term competition interactions are:

- the flexible interactions (short contacts);
- the rigidity interactions (joint researches and development, joint marketing).

The long-term competition interactions are:

- the flexible interactions (licensing, coproduction);
- the rigidity interactions (joint ventures, alliances with purchase of a participant's share).

The short-term cooperation interactions are:

- the flexible interactions (subsidized researches, joint distribution, assembly production);
- the rigidity interactions (joint assembly production, joint researches and development, joint marketing).

The long-term cooperation interactions are:

- the flexible interactions (local representation, franchising, licensing, coproduction, granting resources on a long-term basis);
- the rigidity interactions (joint ventures, alliances with purchase of a participant's share, subsidiaries).

The researchers are traditionally interested in the justification of a choice and result when they use these forms alliances. To a great extent the choice of form interaction are defined by its goal which limits options of relevant structures for a choice. For example, if the participants' goal is acquisition of the patented technology, the relevant types of structures will be licensing, coproduction and joint venture. If the main target is the reduction of risks and expenses at a stage of researches and development, the types will be joint researches and development, including with purchase of a participant's share. The communication between the alliance purposes and the conflicts systems is reflected in their interaction as the interaction structure is defined by its purposes.

The long-term competition and cooperation interactions are the key of sustainable strategic alliances' development. The conflicts, appearing in the course of strategic alliance's activity, are often connected with insufficient elaboration of alliance's efficiency planning. Authors offer the following sequence of decision-

making model creation in conditions of forming long-term competitive strategic alliance in the vagueness conditions.

1. It is necessary to arrange the description of mathematical model in the ambiguous situation.
2. There is need to analyze of vagueness, to understand of alliance purpose, to determine the criteria and the target function.

3. After all, it's possible to solve optimizing and other mathematical tasks.

The indicated sequence is rather conditional as each of actions closely intertwines in the course of the solution. Although the main moments of research are correspond to sequence.

It is known that any research begins with creation of mathematical model in the ambiguous situation. For this purpose it is necessary to understand specifics of process. To formulate a problem at decision-making we use language of the binary relations and criteria language of the choice description. The language of the binary relations is the general in comparison with criteria language, as it doesn't demand a numerical assessment of quality of each separately taken alternative. Criteria language is applied in that case when comparison of alternatives is reduced to comparison of numbers corresponding to them. In this situation it's possible a multiple criteria. So we can estimate the alternative, using several factors [4].

The purposes of the enterprises entering strategic alliance aren't always completely defined. Therefore at the initial stage it is necessary to use more general language to formulate the model (the language of the binary relations). To suppose, that U is the fixed target set of alliance creation for the enterprise "A". So U is the set of nonempty subsets of an alternatives set of A . The choice function (on U) is the targets of strategic alliance creation with the enterprise "C". So it's the reflection C , comparing to any set of $B \in U$ a subset of $C(B) \in B$ (i.e. a chosen subset, "the most preferable" alternatives of the purposes). In that specific case, if the ratio of target preference R is given, the choice function will be determined by equality of $C(B) = \text{Max}RB$. In this case the set of the targets $C(B)$ coincides with the total alliance's targets (a set of the maximum elements from B to ratio of R). The specified model of the strategic alliance targets is formed on the basis of the decision-making theory.

CONCLUSION

The offered approach of forming of the competitiveness management model of strategic alliances in the vagueness conditions is rather general. The criteria and the criteria functions characterize the targets only indirectly, sometimes better, sometimes worse, but it is always approximate. In this regard it is necessary to mention criteria deputies. It's criteria of target statement which indirectly characterize the degree of related target achievement. In effect, all criteria are "deputies" as nothing gives in to absolutely exact measurement.

The strategic targets of alliance creation have to correspond to economic essence of alliance dynamic developments and provide preservation of competitive advantages as the alliances as their production during their existence [3]. Irrespective of alliance development and the external market environment, the main criteria of an assessment of the alliance economic development is the increase of social and economic production efficiency and labor productivity growth. Accordance to these criteria is the base source of the formation of strategic alliance competitive advantages.

The experience of successful management of strategic alliances testifies that, first of all, successful functioning of this organization form of business demands the thorough preparation process for forming alliances, understanding of participants' strategic targets, and also definition of participants' interaction limits.

THE APPARENT DISJOINT BETWEEN MANAGEMENT RESEARCH AND MANAGEMENT PRACTICE

Angela Obwaka and Geoff A Goldman
University of Johannesburg, South Africa

ABSTRACT

This paper explores the apparent lack of cohesion between management practice and the scholarly, academic endeavor of management research. This gap is seemingly caused by suspicion on both sides toward the motives of the other party, which has hindered progress in both management training as well as management practice. By means of an exploratory, qualitative survey amongst management practitioners and management scholars, the study confirms that the disjoint between practice and research in management is indeed present and attributable to both parties. This situation does not bode well for management as an academic discipline, as it highlights epistemological anomalies within the discipline.

INTRODUCTION

Management as an academic discipline and further as a field of practice is relatively new (Koslowski, 2007; Stewart, 2009) with authors such as Micklethwait and Wooldridge (1996a) citing it as still being an “immature” discipline. Having evolved out of a necessity to control systems in growing corporations, management origins were based extensively on ideologies driven by few and lone voices, many of whom are either widely praised or critiqued for their supposed bias by recent researchers (Stewart, 2009).

Within other disciplines – primarily in the natural sciences – research and science influence and dictate a code of acceptable practice, to a lesser or greater degree. The same cannot be said for the relationship between management practice and management research (Grimes, 2003; Grossman, 2009, *The Economist*, 2007; Mays, 2009; Vermeulen, 2005; Wooldridge, 2011). Stewart (2009) states that management gurus – who have been identified as closely influencing management practice – write with complete indifference to or even against the outcome of scientific endeavours.

An article titled “Practically irrelevant: What is the point of research carried out in business schools?” in *The Economist* (2007), poses a thought-provoking question on whether academic research in management actually produces anything that is “useful” to the practice of business. Grossman (2009) and Vermeulen (2005:978) note that the majority of management research tends to be “strong on rigor and weak in relevance”. It is against this backdrop that this study is set, with an aim of assessing the exact nature of the gap that seemingly exists between management research and management practice.

LITERATURE REVIEW

The review of literature below will provide thematic guidance prior to the carrying out of physical research. The main themes that the literature focuses on are the current relation between management research and management practice, the factors that contribute to the disjoint between research and practice in management and finally possible avenues that can be used to bridge this gap.

The relationship between management research and management practice

Pfeffer and Fong (2002) state that there is minimal evidence to show that management research influences practice. Grossman (2009) attests to an incontestable gap between scholarly research and what is on-going in the world of management practice, a gap that Mays (2009) terms unhealthy. This notion of a 'gap' is further driven by researchers whose findings consistently indicate a lack of alignment in management education programs with what the industry or mainstream management practice requires (David & David, 2011; Jackson, 2009; Navarro, 2008; Pfeffer & Fong, 2002). Marrington and Rowe (2004) suggest that it is perhaps because management cannot in fact be taught save for the intellectual component as it needs to be experienced in a social context for it to be useful. Further studies conducted showed a different emphasis in what the organisations expected of their managers (practical management) compared to the focus on specialist knowledge and theories by management researchers (Blood, 2006, cited in Goldman, 2008; Phillips & Zuber-Skerrit, 1993). Goldman (2008) argues that although the use of case studies and hypothetical situations is prevalent, this is not sufficient to get students of management prepared for actual management practice and thus a potential 'set up for failure' occurs – further adding to the distaste that organisations have toward management research and its preparation of managers. Providing an example of this, Jackson (2009), notes that Australian business graduates are being deemed 'unready' by the industry based on their supposed lack of skills to apply the management knowledge they have acquired in a way that would add value to the workplace.

Despite this, a large number of professors cited in *The Economist* (2007) argue that management research should remain written with other academics in mind – a view that most certainly emphasises the presence of a disjoint – and in further argument propose that it is the role of management consultants, MBA and other “non-executive” programs to translate this research for management practitioners (Bailey & Ford, 1996:8, cited in Pfeffer & Fong, 2002; Fitzgerald, 2003:16). Efforts to streamline management practices in the EU, however, have seen an attempt to unify management research, management consultancies, media and research from academic institutions. A review of historical ideologies that gave rise to the predominant management practices was seen to have stemmed from management research, although more recently, a rise in the number of management consultancies has provoked a need to streamline populist ideologies that have been criticized for their seemingly irrational approach to management practices (European Commission report, 2001). This development in the EU suggests hope for the relation between management practice and management research.

The disjoint between management practice and management research

Pfeffer and Fong (2002) attest that this gap is attributable to the structure of business schools, focused primarily on analytics, with insufficient emphasis on problem finding as contrasted with problem solving and implementation. The pre-set agenda in business schools, in a quest to streamline management with other social-science departments as well as maintain commercial success, has led to an imbalance in the relevance of their educational products and questionable impact on management practice as whole, that requires a more integrative, pro-active and human-based approach (Huff & Huff, 2001; Li, 2009; Pfeffer & Fong, 2002). Phillips and Zuber-Skerrit (1993) as well as Grossman (2009) purport that most management practitioners deem management research as irrelevant, too theoretical and rarely falling under their 'need-to-know' priority. Thomas (2006) suggests that the management profession needs to be linked to knowledge-generation, whether internally or via strategic links and alliances to those who generate knowledge thus, suggesting that the onus is on the organisation to find the relevant research for their benefit. A key contributing factor to this gap and perception of irrelevant management research could in fact be the nature of management research itself (*The Economist*, 2007). Gaddis (2000) According to the Dean of a New York Graduate Business School, management research is largely fuzzy, irrelevant, and pretentious (Gaddis, 2000). Grossman (2009) contests that management research carried out by academics, in addition to expanding the knowledge boundaries, is primarily conducted to cement the careers of academics, as promotions, salaries and additional funding are based on their publications. This system seemingly encourages highly quantitative, hypothesis-driven, and esoteric research that is largely unread by management practitioners (Garman, 2011, *The Economist*, 2007). In addition, the perceived irrelevance of management research seems also to stem from the difficulty in gaining access to organisations as businesses are overly concerned with losing credible information or preserving their knowledge in their people. Researchers often get little or no cooperation from organisations, which discourages organisation-based research which could have practical value (Starkey & Madan, 2001). The problem does not necessarily stem from the content of the research, but the positioning of the research in the broader landscape of practitioners, consultants and other

actors who translate new knowledge into organisational and management-specific practice. Research is too often kept within the spheres of other researchers and thus has little opportunity to impact management practice (Mohrman & Lawler, 2010).

The motives, tasks and direction taken by practitioners and researchers with respect to business and management differ greatly, as well as what constitutes success in each of these realms (Mohrman & Lawler, 2010; Grossman, 2009, Starkey & Madan, 2001). Few managers have a background in management research or scientific inquiry, and even when they do advances in research are rarely rewarded in the organisation as opposed to outcomes and provision of solutions to current problems. Rousseau (2006) suggests that this in turn discourages management practitioners to take an active interest in conducting or being involved in management research. The lack of concrete solutions offered by management research in turn present no clear cut solution that management practitioners can appreciate and therefore they choose to stay away from it (Mohrman & Lawler, 2010). Stewart (2009) cites management guru supporters who argue that the writings of the management gurus are not necessarily scientifically rigorous, but they provide practical techniques and guidelines for practitioners to follow. The extensive amount of research on gurus supports their inclusion among the factors contributing to the disjoint between practitioners and researcher in management. This is justified by research proposing that the place set for management gurus is based on their ability to communicate in an understandable language to management practitioners (Bos, 2000) and persuasively sell their seemingly new ideologies and images (Anderson, 1998, cited in Wilkerson, 1999; Bolino, 1999, cited in Bos & Heusinkveld, 2007; Greatbatch & Clark, 2005). At the end of the day, three key areas need to be addressed in order to bridge the gap between research and practice (Garman, 2011; Starkey & Madan, 2001; Hodgkinson, Herriot & Anderson, 2001):

- The framing of research questions to ensure their usefulness to practitioners,
- translation of findings into practical guidelines and recommendations, and
- Turn these recommendations into actual changes in the workplace.

These aspects can help in demonstrating the contribution of scholarly research toward the organisations knowledge base and knowledge capacity

Following from the aim of the research, outlined earlier in this paper, and with cognisance of the points of view deliberated upon in this literature review, the following research question can be posed:

What is the relationship between current management practices and management research (primarily academia)?

METHODOLOGY EMPLOYED

This study adopted an exploratory qualitative research approach. As the primary aim of qualitative research is in-depth descriptions and understanding of actions and events (Mouton, 2011) it was deemed the approach best suited to the aim of this research, which is to understand the apparent disjoint between management research and management practice. Additionally, the use of qualitative methods allows for the consideration of people's experiences and opinions (Eisenhardt & Graebner, 2007; Graebner, Martin & Roundy, 2012), aspects crucial to the study.

As with most qualitative studies, a non-probability sampling frame utilising purposive sampling was employed in order to solicit feedback specifically from management scholars and management practitioners on the gap between research and practice. Purposive sampling assists in transferability of the research, which in turn boosts the trustworthiness of the research findings (Guba & Lincoln, 1984, cited in Mouton, 2011). The research population constituted academics and people occupying a managerial position. The sample consisted of 6 research participants, three academics and three managers, selected according to the following criteria:

- Academics: Must have a track record of management research; must have been practical management practice experience, and must to be lecturing management subjects at present.
- Managers: Must currently occupy a clear managerial position, and must have a track record in a managerial role of at least three years.

As data gathering mechanism, semi-structured individual interviews were conducted with the research participants. This collection method was selected because the information sought is based on individual experiences and required the research participants' insight, thoughts and experiences. This would allow for

patterns to be identified across the sample with no influence from other research participants, which might not be the case with focus groups. The interviews were guided by the key themes identified in the literature review. In this instance, the interviewer established a general direction for the conversation and without a specific set of worded and ordered questions; the research participant was able to speak for most of the time (Mouton, 2011). Interviews were recorded digitally. Additionally, hand-written notes were taken during the interview and reflections carried out post-interview.

The data were analysed using a process of content analysis. According to Hancock (2007), content analysis is a procedure for the categorisation of verbal data for the purposes of classification, summarization and tabulation. This process involves coding and classifying data and for this research, the latent level of analysis was used. This analysis process is used at the interpretative level that goes beyond the responses themselves to identify what was implied and inferred by the respondents in addition to basic descriptive analysis within the various themes. Following the analysis and presentation of findings, the researcher consulted with the respondents to ensure true meaning and content was captured as intended by the respondents.

PRESENTATION AND DISCUSSION OF FINDINGS

The findings presented and discussed below are divided into two main sections: findings from the management researchers and those from management practitioners. This is done as a way to distinguish the contributing factors generated as aimed for in the secondary research questions.

Findings pertaining to management research

i – Reluctance of organisations to implement management research: According to the management researchers, a major contributor to this gap from their experiences is the reluctance of organisations to implement new or modified management practices that emanated from research conducted in organisations. This was perplexing as, in these instances; the organisations took the initiative and sought aid from management researchers to investigate particular issues. The research subjects further reported that if the problem was seen as ‘not too drastic’, the research would be shelved. The following extracts from the interviews attest to this:

One research subject remarked that when it came to organisational change practices approximately 98% of the organisations he conducted research at have implemented suggestions research brought to light, as the following comment bears witness to:

Also, one research subject commented that when it came to HR issues, the companies she conducted research at often implemented her suggestions, as can be seen from the the following comment:

ii – Not enough incentive to streamline research to management practice: According to the management researchers interviewed, there are few, if any incentives given to them by research institutions and companies alike in terms of linking their research to actual management practice. A research subject commented as follows on the issue:

Two of the researchers admitted that they conducted “contract” research (research solicited by a company to find solutions to a particular problem) in an effort to boost income in addition to the research they had to conduct for the purposes of getting published in recognised, academic journals as part of their jobs.

iii – Management education not adequately preparing future practitioners: All the research subjects who are management researchers (and also business management lecturers) felt that the syllabus that had to be presented to the students was not always practical and hence did not reflect a true sense of what they would expect in today’s organisations, as the following interview extracts suggest:

Following further probing from the interviewer however, the research subjects added that they did not feel that the use of case studies always demonstrated the bridging of the gap for the students since the assessment criteria usually reflected how well students were able to systematically apply theory to the case study scenarios as opposed to holistic and critical thinking [that is necessary for management practice] that they noted is only usually taught in postgraduate studies.

iv – Gurus’ works are accessible: Research subjects exhibited mixed feelings regarding gurus, as keen be seen from the following interview extracts:

However, all of these research subjects agreed with the fact that a likely factor that contributes to their [gurus] popularity is the simple and accessible way their work is presented, an edge that management research does not seem to be seeking as can be seen from the following excerpts:

Findings pertaining to management practice

i – Perceived irrelevance of management research: This finding was broken down into two subsections:

- **Evaluations and job specifications not related to knowledge of management research:** Research subjects who are management practitioners seemed averse to the idea of keeping up with management research or working together with universities, as the following comments suggest:
- **No perceived difference between the work of academics and management gurus:** Interestingly the practitioner research subjects could not distinguish between the work of academics and the work of management gurus. All these research subjects commented that they were under the impression that gurus' work was academically sound and hence it meant that it was good enough for them to be up-to-date with those books, as the following comments suggest:

Some research subjects expanded on what they enjoyed most about the 'guru' books: These responses indicate a definite relationship between the management practitioners and the gurus' writings with justification from their readers whose responses read more like those of religious followers.

CONCLUSIONS

The findings presented in the preceding section confirmed the notion of a gap in regard to management practice and management research as outlined in the problem statement. Furthermore in the quest to address the research objective and answer the research question, various contributing factors were brought to light from the respondents' feedback.

The lack of incentives came out as a common contributor to both researchers and practitioners in management. Both sides cited the absence of extrinsic motivators as being a reason for their indifference in seeking partnerships with the other and actively moving to close this gap. This was further compounded by the fact that following some management researchers' partnerships with organisations, a resultant lack of implementation of the findings of the research (for various reasons) acted to de-motivate them from participating in similar future projects save for the monetary benefits.

Contrastingly however, the findings also indicated an interesting relationship between the 'subject specific' nature of the management research as well as the level of to which it was perceived to be critical to the organisation and the corresponding likelihood of its acceptance by management practitioners and organisations. Thus areas like 'change management' and 'human resource management' research in this instance were more likely to be assimilated by the organisation than general improvement of management practice research.

With regard to the gurus, the interviewed management researchers were a lot more understanding about the gurus' positioning than the researcher initially anticipated. This was reflected in a unanimous agreement by the respondents that the reason the gurus were more endearing to the management practitioners was largely due to the accessibility of the gurus' writings in comparison to the research published by the researchers. Management practitioners on the other hand, somewhat oblivious to this accessibility debate, firstly did not see a reason to doubt gurus' works based on credibility and secondly favoured these writings due to their self-help focus as well as clear and simple writing, a compliment rarely provided to management research (Grossman, 2009).

Lastly, a critical point that was raised by some of the management researchers was that management education was not adequately preparing management students with regards to practical managerial tools. Thus resulting in a the feeling that although the gap currently exists, more fuel is being added to the fire by not properly using this opportunity to demonstrate the usefulness of management education by creating more rounded and capable management practitioners through training in management education.

RECOMMENDATIONS AND MANAGERIAL IMPLICATIONS

Stemming from the research findings as well as in response to the 3rd secondary research objective outlined for this study, various recommendations can be made in moving forward toward a streamlining and bridging of this management practice-research gap:

- Based on the finding that management practitioners in many instances took the cue regarding what was important in their jobs from their evaluation criteria and explicit job requirements, and of which knowledge of management theory was not necessarily a part, organisations need to actively work toward facilitating the bridging of this gap through work descriptive dimensions. Such dimensions and actions can include the provision of job performance and reward evaluations, or stressing of recruitment criteria related to having some component of understanding, linking and knowledge of recent management research. Furthermore organisations can incorporate research elements or departments into the organisation which would imply less direct pressure on the individual manager to do this research and rather enhance accessibility of the research to the manager who can now be able to incorporate it into his/her work.
- Secondly the approach to management publications and writing technique needs to be re-evaluated in pursuit of a more accessible platform for management practitioners thus easing the tensions and finger-pointing between gurus, practitioners and researchers in management. Furthermore, a diversification in the publication spheres of management researchers into more contemporary avenues such as physical and electronic bookstores could see great strides made in terms of management practitioners being able to evaluate credible sources and keep up with management research as well as providing the researchers with much needed feedback from mainstream management on the perceived relevance of their work.
- Lastly, management educationists should consider incorporating a more practical, hands-on approach to management education and thus giving their students a more realistic feel for the corporate environment. A large contributor to this practical side could also be the use of management practitioners in management education as they are able to bring their experiences to the students using practical, relevant examples. This would work in preparing well-rounded practitioners who would be able to add tangible value to organisations thus re-enforcing the notion that management education and research could in actual fact be a source of competitive advantage to an organisation.

LIMITATIONS AND AVENUES FOR FURTHER RESEARCH

A key future research area that stems from this research is particularly in the direction of incentivizing the bridging of the gap between management research and management practice. A strategic approach needs to be taken on this research as well as the proposed incentives to avoid cyclical appearances of the gap which would be the case if a long-term orientation on sustainable incentives is lacking.

The biggest limitation of this research is the small sample size, as only six research subjects were used for this study. However, as a point of departure, the research already presents some commonalities in both academics and practitioners conception of the theory-praxis gap. Although this is extremely insightful in itself, it should be expounded upon in future studies of this nature

HEALTH RISKS ASSOCIATED WITH POLLUTANTS FROM COAL MINING AND COMBUSTION IN THE VICINITY OF SCHOOLS

Adejoke C. Olufemi, Andile Mji and Murembiwa S. Mukhola
Tshwane University of Technology, South Africa

ABSTRACT

Coal mining activities have been reported as one of the causes of environmental pollution in many nations of the world and have also resulted in various adverse health effects. This study aimed at assessing the levels of pollutants in air and drinking water and how they may affect the health of school learners in the vicinity of coal mines in the town of eMalahleni, Mpumalanga province of South Africa. For air pollutants, samples were collected from both inside and outside the classrooms in five different schools. This was done by using Radiello® samplers to determine the presence of Sulphur dioxide (SO₂), Nitrogen dioxide (NO₂) and Ozone (O₃) and filter pumps to determine the presence of Lead (Pb). Water samples were taken from drinking tap of two of the five selected secondary schools in this town to determine the presence of Lead (Pb), Nickel (Ni), Arsenic (As) and Mercury (Hg). All these parameters for both air and water were analyzed using different analytical methods. The results were compared with the recommended guidelines by South African National Standard (SANS). The result of air analysis revealed that the pollutants SO₂, NO₂, O₃ and Pb were present in vicinity of schools at various levels. The result for water indicated that most of the tested parameters in the tap water from the schools were at acceptable levels with the exception of lead (Pb) which was found to be at the threshold limit of SANS recommendation for drinking water. The presence of some of these pollutants at significant levels should be a cause for concern. It is therefore recommended that appropriate measures should be taken by the school management to safeguard their health.

INTRODUCTION

Our world environment is threatened by all sorts of environmental problems. This is as a result of industrialization which has ultimately led to urbanization. Urbanization has meant that there has been great movement from rural areas especially in Africa to areas where industries and thereby employment is. Unfortunately this unprecedented movement of people has led to a serious strain on the environment. The strain is due to human activities and needs which play a contributory role in environmental pollution. Environmental pollution is persistently and adversely affecting the quality of air and water supplies. The problems caused by pollution have resulted in global warming and climate change throughout the world. People living around industries are vulnerable to the effects of whatever pollutants are released. For example, in the gold mining industry surface water is affected by the chemicals used and problems of acid mine water are experienced. In this regard, it is argued in fact that when "... mine waters are discharged into streams, lakes, and the oceans, serious degradation of water quality and injury to aquatic life can ensue ..." (Nordstrom, 2011, p. 393). Another example may be seen from the Chernobyl nuclear power plant where a disaster still affects humans and the environment (Dubrova *et al.*, 1997). Environmental pollution is reported to be worse in developing countries due to lack of investment in modern technology, poverty, lack of basic sanitation and weak environmental legislation (Briggs, 2003).

The main cause of global warming and climate change is the processing of fossil fuels such as crude oil, natural gas and coal. Coal is the world's most abundant and an important energy source particularly in power generation. In fact it is estimated that there is about 1000 billion tonnes of coal reserves in countries such as the USA, Russia, South Africa, China and India (World Coal Association, 2012).

LITERATURE REVIEW

While coal is a source of energy it is also one of the largest sources of pollution to the environment. These effects result from the different stages of coal processing such as mining, transportation and combustion. In essence, the exploitation of coal results in pollution that affects the air, water and soil (Kearting, 2001). The demand for coal has grown rapidly over the last decade, outgrowing that for gas, oil, and other energy sources. An example of the dependence on coal for electricity generation may be illustrated by: South Africa (93%), Poland (92%), China (79%), India (69%) and the United States (49%) [Burnard & Bhattacharya, 2011]. Over the years, research studies have indicated that increased mining and combustion of fossil fuel such as coal for electricity generation in most countries is majorly responsible for environmental pollution (Kampa & Carstanas, 2008). Among all the fossil fuels, coal accounts for 40% of global electricity generated from coal-fired power plants (Burnard & Bhattacharya, 2011). Coal and its combustion contribute the largest percentage to global anthropomorphic emissions of greenhouse gases such as carbon dioxide (CO₂) (Burnard & Bhattacharya, 2011; Moore, Stanitski, & Jurs, 2008).

South Africa is the world's third largest coal exporting country, exporting 25% of its production internationally while it uses 53% of the balance on electricity generation, 33% for petrochemical industries (Sasol), 12% for metallurgical industries (ArcelorMittal) and 2% for domestic heating and cooking (Coal mining in South Africa, 2012). However, this results in emission of 170 million tons of carbon dioxide, about 0.7 million tons of nitrogen oxides and about 1.5 million tons of sulphur oxides into the environment annually (Lloyd, 2002). In fact a major problem with coal mining and processing is that it releases pollutants which affect the people, the environment as well as farming in particular. For example, Mpumalanga farmers have lamented water pollution from mining and they have pointed out that this may result in a national food crisis (Craven, 2012).

Pollutants and their Health Implications.

Apart from carbon monoxide (CO) and carbon dioxide CO₂, coal contains pollutants that are released into the environment thereby causing air and water pollution which invariably affect human health and the general ecosystem (Sabbioni, Goetz & Bignoli, 1984). Examples of these pollutants are: Ozone (O₃), Sulphur dioxide (SO₂), Nitrogen dioxide (NO₂), cadmium (Cd), arsenic (As) and lead (Pb). It has long been shown that children all over the world are one segment of society that is confronted with environmental problems (Bakshi & Naveh, 1980). To this day it is still argued that children are confronted with environmental hazards and are especially vulnerable to toxic effects than adults (Abbas & Alghobashy, 2012). An implication of health problems due to pollutants is identified as the major reason for absenteeism among American school children (Meng, Babey, & Wolstein, 2012; Taylor & Newachek, 1992; Weitzman, 1982). In England too the aggravation of chronic respiratory symptoms has been linked to exposure to pollutants (Chauhan, & Johnston, 2003). Similarly, in South Africa, it is reported that children are victims of pollution and this invariably happens within their homes and schools (Mathee, 2003).

Several studies have indicated that exposure to these pollutants may be associated with serious diseases such as increased respiratory symptoms, reduced lung function, nervous system damage in children, cardiovascular diseases, cancers of various forms and increased number of deaths (Brunekreef & Holgate, 2002; Dockery & Pope III, 2002; Stieb, Judek & Burnett, 2002; Okonkwo, Salia, Lwenje, Mtetwa & Shilongonyane, 2001). Agency for Toxic Substances and Diseases Registry (2002) reports that people who are near combustion sources such as coal fired plants may be exposed to higher levels of these pollutants. A study conducted in Taiwan on exposure to Arsenic (As) among children in schools located around coal fired plants revealed that exposure to this carcinogenic metal may contribute to DNA damage, asthma and allergic rhinitis in children (Malcoe, Lynch, Keger & Skaggs). Also, prolonged exposure to As in drinking water is reported to affect academic performance of school children (Wasserman et al. 2004). About O₃, It is reported that exposure to this element is a major cause of absenteeism among school children in Southern California communities where about 83 percent experience upper respiratory illnesses (Gilliland *et al.*, 2001). Studies conducted in various places have also reported that exposure to Pb affect children's IQ levels (Heinze, Gross, Stehle & Dillon, 1998; Schutz *et al.*, 1997; Schwartz, 1994; Malcoe, Lynch, Keger, & Skaggs, 2002). Similarly in Japan, school children exposed to NO₂ were also found to have suffered from respiratory illnesses (Shima & Adachi, 2000). Studies on

school going children have also reported an association between exposure to SO₂ and illnesses resulting in absenteeism in Korea (Park, Lee, Ha, Lee, Kim & Hong, 2002) and in Europe (Sunyer *et al.*, 2003).

METHOD

Research Site

This study was conducted in a town called Emalahleni situated on the Highveld of Mpumalanga Province of South Africa. Emalahleni formerly known as Witbank means a place of coal. Emalahleni is a coal mining town that also supplies the coal to adjacent power stations for electricity generation. Also there are a number of smelting companies around the mines that use the coal in the foundries. The effect of the mining and combustion in the area is the release of coal related gasses into this environment. This study was motivated by conversations held with schools' principals and residents in this vicinity. A conversation with one of the selected schools' principals revealed that there were approximately 15 mines in the general vicinity of her school (Personal communication, March, 2011). In fact, conversations with a number of the town's residents revealed that almost every evening one would notice smog emanating from the mines and combustion industries (Personal communication, September 15, 2010).

In a conversation with another school principal in eMalahleni, she intimated "... children and everybody sometimes bath and drink water that is contaminated ... many as a result of constant health problems are being hospitalized from time to time apparently without realising that their health issues may be linked to the pollution in this area" (Personal communication, September 15, 2010). Another conversation with a different principal revealed that pollutants from the mines, foundries and the power generating plants were affecting the schools (Personal communication, January 11, 2011). When asked in what way, he indicated that learners who fall under the harsh effects of pollution usually perform poorly. This, he felt may be as a result of prolonged exposure to pollutants that resulted in illnesses and "undue absence from school." He further pointed out that these problems are not limited to learners but affect teachers too. One important issue the principal suggested was to investigate what pollutants could be affecting all those in the vicinity of the school.

Sampling of Schools

There are about twenty five schools in this local municipality. In selecting the sample, the researcher contacted the local department of education who indicated that schools that were within the coal mining precinct would be the most appropriate to choose. In selecting the schools each school's name was given a unique number written in a piece of paper. The papers were put in a hat and five schools were drawn. When the schools were selected, the researcher approached the principal in each school to explain what she wanted to do. In order to maintain the anonymity of the schools, these were identified as School A, School B, School C, School D and School E.

Collection of Samples

There are three major forms of environmental pollution identified in literature. The main is air pollution which is followed by water pollution (Gambhir, Kapoor, Nirola, Sohi, & Bansal, 2012). The third is about land or soil pollution, which may be as a result of radioactive material, plastics thrown away or oil spillage (Nathanson, 2012). For the purposes of this study only air and water pollution are considered.

Firstly, air samples from both inside and outside the classrooms in all the five schools (A,B,C,D,E) were collected. Secondly water samples were collected from taps in only two schools (B and D) in the study area. Air samples were collected using Radiello ® samplers. The aim of collecting air samples was twofold. Firstly, we sought to determine whether known pollutants resulting from coal related activities would be found in the air in and around the schools. The pollutants produced from coal mining processes are compounds such as NO₂, SO₂, O₃, and Pb. The determination for pollutants was based on the fact that the schools were in the proximity of the coal mines and the allied industries such as electricity generating plants. Also, this determination was influenced by the 2005 WHO Air Quality Guidelines (AQGs) designed to offer global guidance on reducing the health impact of air pollution (WHO, 2005; 2011). This was because major sources of

(a) anthropogenic emissions of NO₂ among others are identified as combustion processes; (b) SO₂ involve the burning of fossil fuels such as coal and (c) O₃ are photochemical smog that is formed by the reaction of sunlight (photochemical reaction) with pollutants such as nitrogen oxides (ibid.).

Specifically, Radiello cartridges measuring the presence of NO₂, SO₂, O₃, and a filter measuring the presence of Pb was used. Secondly we wanted to establish the levels or densities of each of the identified compounds in the air within the vicinity of the participating schools. For the collection of the air samples all the five selected schools participated. Four samplers were put in each school. Two samplers were put inside the classrooms and two were put outside the classrooms (in the school premises). One sampler was used to collect both NO₂, and SO₂. The other sampler was used to collect only O₃.

The first setting up of equipment and sample collection for NO₂, SO₂, and O₃ commenced on June 5, 2012. The O₃ samples were taken away after 7 days (on June 12) for analysis. Two weeks was allocated for the sampling of NO₂ and SO₂. So for these two compounds the collection period was June 05 – June 19, 2012. To collect Pb sampling pumps with filters were used to collect this air pollutant over a period of 7 days (June 12 - June 19 2012). In this instance, two sampling pumps were put in two schools, School C and School E. The pumps were connected to an electricity power source and the filters were fixed in the mouth of each pump. The filters were then used to collect air particulates from the school environment. On collection of the equipment at School E on the 7th day, it was noticeable that the pump had been touched or tempered with. The equipment at School C however was intact. Drinking water samples were collected from taps of two schools, School B and School D. To collect the water samples, bottles ranging in volume from 250 ml to 1L were used

Analysis of Samples

In all, ten Radiello cartridges were collected for the determination of NO₂ and SO₂. Also, ten cartridges were collected for the determination of O₃. Meanwhile, one filter was collected for the analysis of Pb. In analysing for the presence of NO₂ and SO₂, initially extraction of the cartridges was performed with diluted hydrogen peroxide (H₂O₂). The main analysis after the extraction involved the use of ion chromatography. O₃ was determined by spectrophotometric analysis according to the method published by Radiello ®. Finally, to test for the presence of Pb the exposed filter was initially subjected to acid digestion. Following this, Pb was determined by graphite furnace atomic absorption spectroscopy. In analysing the water samples, bottles containing samples were collected for determination of chemical elements which involved Lead, Nickel Arsenic, and Mercury. For the analysis, different methods were used. Examples included inductively coupled plasma atomic (ICP) and Cold vapour generation. The analysis of the air and water samples was commissioned to the Centre for Scientific and Industrial Research (CSIR), Pretoria, South Africa.

RESULTS

Results of Air Analysis

Before presenting the result of the air analysis, it is perhaps prudent to highlight South Africa's acceptable levels of the pollutants reported in this study. Table 1 shows the national ambient air quality standards for NO₂, SO₂, O₃ and Pb proposed by the Department of Environmental Affairs (2004).

Table 1: National ambient air quality standards for NO₂, SO₂, O₃ and Pb[§]

	Averaging period	Density
NO ₂	1 hour	200 µg/m ³
	1 year	40 µg/m ³
SO ₂	10 Minutes	500 µg/m ³
	1 hour	350 µg/m ³
	24 hours	125 µg/m ³

O₃	1 year	50 µg/m ³
	8 hours	120 µg/m ³
Pb	1 year	0.5 µg/m ³

§ adapted from Department of Environmental Affairs, RSA (2004)

For all intents and purposes it should be explained that it is difficult to argue for the actual benchmarking with the national ambient air quality standards (Department of Environmental Affairs, 2004) and the (WHO, 2011) values as the averaging periods differed. All one can do is to extrapolate however a disadvantage of doing that would be speculative in nature. The compounds found in the air were NO₂, SO₂, and O₃. In presenting the results, all the calculations in respect of the determination of NO₂, SO₂, and O₃ were based on an average ambient temperature that was obtained from the South African Weather Service. Table 2 shows the densities depicting the presence of NO₂, SO₂, and O₃ in the air in the vicinity of the schools. The values were provided here to give a better picture of how the pollutants may affect teaching and learning in schools.

Table 2: Densities of NO₂, SO₂, and O₃ measured inside and outside the classrooms in each school

School	Location	Sample ID	NO ₂ (µg/m ³)	SO ₂	O ₃
School A	Inside	O-12-1680	19	4.8	40
School B		O-12-1691	20	3.0	10
School C		O-12-1693	20	6.0	30
School D		O-12-1695	26	38	26
School E		O-12-1697	28	8.8	018
School A	Outside	O-12-1690	9.9	17	110
School B		O-12-1692	24	20	82
School C		O-12-1694	19	17	110
School D		O-12-1696	24	84	66
School E		O-12-1698	27	31	75

It is observable from the table that the density of NO₂ inside the classrooms ranged between 19 (µg/m³) and 28 (µg/m³) while outside the classroom the range was 9.9 (µg/m³) – 27 (µg/m³). In fact, the results show that the NO₂ density inside and outside the classrooms was relatively constant. The (WHO, 2011) recommended exposure values to NO₂ at a rate of 40 µg/m³ on an annual mean and 200 µg/m³ on a 10-minute mean. As a clarification, an x-hour mean is calculated every hour, and averages the values for x hours. So a 10-minute mean entails exposure to the indicated amount of 200 µg/m³ in 10 minutes. These result shows that learners in this study were exposed to relatively low levels of NO₂ both inside and outside the classrooms (see Table 2).

In terms of SO₂ the density inside the classroom ranged between 3.0 (µg/m³) and 38 (µg/m³) while outside the classrooms the range was from 17 (µg/m³) to 84 (µg/m³). These results indicate that the amounts of SO₂ were extremely high inside School D's classrooms. The recommended exposure values to SO₂ at a rate of 20 µg/m³ on a 24-hour mean and 500 µg/m³ on a 10-minute mean (WHO, 2011). It is evident that SO₂ levels inside the classrooms of the other schools were well below the recommended levels. Outside the classrooms however the levels were at the threshold limit for School B while they were high for School E and School D respectively. For O₃ the density ranged between 10 (µg/m³) and 40 (µg/m³) inside the classroom while it was between 75 (µg/m³) and 110 (µg/m³) outside the classroom. The (WHO, 2011) recommends acceptable levels of exposure to O₃ at 100 µg/m³, on an 8-hour mean. The results presented in Table 2 show that in all the schools the exposure levels to O₃ were acceptable within the classrooms. However they were beyond the acceptable limit outside the classrooms in School A and School C.

As indicated previously, the filter for Pb placed at School E was found to be tempered with. In fact the filter did not take any particulate material, so no results could be reported from it. The filter placed at School C was actually the one which a Pb reading could be assessed from. With respect to the presence of Pb, atomic absorption spectroscopy was used after acid digestion of the exposed filter. The results indicated that Pb density

was $< 0.007 \text{ (}\mu\text{g/m}^3\text{)}$. It appears that this value would still be low over a period of a year from a South African perspective

Results of Water Analysis

To contextualise the results of the water analysis, it is worth pointing out first that the South African Department of Water Affairs and Forestry, (2011) has recommended the acceptable levels of parameters that could be in drinking water (see Table 3). The parameters appear in the South African National Standard (SANS 241-1: 2011, edition 1) for drinking water quality (ibid.). This is indicated in the tabulated results of the analysis. Here, the standards were used as a basis for comparison with our results. In fact, in the standards, the expectation is that drinking water shall comply with the numerical limits for the physical, chemical, and microbiological determinants on the Table. With respect to drinking water the Department of Water Affairs also expects that 99% must meet the standards' determined quality (Luyt, Muller & Tandlich, 2011)

Table 3: Results of water analysis including the analytical methods used and South African National Standard for drinking water quality

Sample ID	Units	Tap Water		Method	South African National Std ^a
		School B	School D		
Lead (CMP 1)	mg/l Pb	<0.01	<0.01	ICP	≤ 0.01
Nickel (CMP 1)	mg/l Ni	<0.02	<0.02	ICP	≤ 0.07
Arsenic	mg/l As	0.00111	0.0015	ICP	≤ 0.01
Mercury(tot)(CMP 3)	mg/l Hg	<0.001	0.001	CVG/ICP	≤ 0.006

CMP = Chemistry Method; CVG = Cold Vapour Generation; ICP = Inductively Coupled Plasma atomic emission spectrometry, tot= total

^a = South African Department of Water Affairs and Forestry (2011).

The results indicated that most of the tested parameters in the drinking water from the schools were at acceptable levels (see Table 3). For instance, the values for *Nickel* were $<0.02 \text{ mg/l Ni}$ for (School B) and $<0.02 \text{ mg/l Ni}$ for (School D), which were at lower levels when compared to $\leq 0.07 \text{ mg/l Ni}$ recommended by the South African National Standard. Similarly for *Arsenic*, the values were 0.00111 mg/l As for (School B) and 0.0015 mg/l As for (School D) which were also at lower levels compared to $\leq 0.01 \text{ mg/l As}$ (South African National Standard). This suggests that the collected water samples complied with the recommended standards. With respect to Pb the determined concentrations ($<0.01 \text{ mg/L}$) in the water samples for both schools were right at the threshold of the recommended standards ($\leq 0.01 \text{ mg/L}$)

DISCUSSION AND CONCLUSION

This study aimed at determining the levels of pollutants in air and drinking water and how they may affect health in schools in the vicinity of coal mines in the town of eMalahleni, Mpumalanga province of South Africa. The result of the study revealed that pollutants SO_2 , NO_2 , O_3 , Ni, AS, Hg and Pb were indeed present in both air and water in the vicinity of the schools at various levels. The reality about these pollutants is that they may result in harmful health effects. About SO_2 it is reported that it can affect the respiratory system and the functioning of the lungs. Problems from these are associated with coughing, mucus secretion, aggravation of asthma, and chronic bronchitis that makes people more prone to infections of the respiratory tract (WHO, 2011). SO_2 is also reported to be the main cause of irritations of the eyes (WHO, 2011). The fact that SO_2 levels at School C were high is a cause for concern. In fact two issues need to be addressed in this school. Firstly, learners' and educators' health should be constantly monitored. Secondly, the levels of the SO_2 should be monitored too and appropriate action be taken to reduce these.

In this study it was reported that NO_2 inside and outside the classrooms could be at levels between $19 \text{ (}\mu\text{g/m}^3\text{)}$ and $28 \text{ (}\mu\text{g/m}^3\text{)}$. This may look innocuous when compared to the (WHO, 2011) guidelines of $40 \text{ }\mu\text{g/m}^3$ on an

annual mean. The main issue though is prolonged exposure to the NO₂. It is reported in fact that epidemiological studies have indicated that symptoms of bronchitis in asthmatic children increase proportionately with long-term exposure to NO₂ (WHO, 2011)

On the other hand, O₃ is reportedly responsible for breathing problems for instance. It is said that it may trigger asthma, reduce lung function and cause lung diseases (WHO, 2011). In this study, the amount of Pb measured in air at School C was found to be < 0.007 (µg/m³). This amount of Pb is reasonably low because in the US for example, the recommended air quality level for this pollutant is 1.5 µg/m³ for a maximum quarterly calendar average (United States Environmental Protection Agency, 2011). In fact the WHO (2004) recommended level is 0.5 µg/m³ to 1.0 µg/m³ on an annual mean. A good aspect about the Pb content with respect to air in this study is that it was low. This is in contrast to a study conducted in inner city schools in the Western Cape Province of South Africa. In that study it was reported that children were at risk of excessive exposure to environmental Pb because over 90% of their blood had levels of 10 µg/m³ (Mathee, Röllin, von Schirnding, Levin & Naik, 2006). The Western Cape study was comparable with a South Western Nigerian result that reported high levels of Pb in the air in the school environment. Further, this Nigerian study reported high levels of Pb that was above the recommended WHO air quality guidelines, in the urine of children in both urban and rural schools (Esimai & Awotoye, 2009).

With respect to water samples, most of the analyzed parameters were found to comply with the SANS guidelines for drinking water quality with the exception of Lead (Pb) which was found to be at the threshold limit of the guidelines. Our result is in contrast with a study conducted in Philadelphia on lead contamination in drinking water of some public schools. This study reported that Lead (Pb) levels exceeded the United States Environmental Protection Agencies Standards for drinking water quality. It was further stated by this author that lead-contaminated drinking water in schools is a cause of concern (Bryant 2004). Similarly, in Kansas a study conducted on lead in drinking water of some schools revealed that about one third of drinking water consumed by school children had some lead contamination which exceeded the USEPA guidelines thereby exposing them to both short term and long term health risks (Massey and Steele 2012). Although it was reported that most of the parameters in this study were within the recommended levels. It should be cautioned though that these parameters were however present. For example, heavy metals like Arsenic (As) and Mercury (Hg) were detected in the water. The problem with heavy metal accumulation is that it affects the quality of crops and thereby humans, animals and drinking water (Kawada and Suzuki, 1998). The presence of heavy metals has its inherent dangers because it is reported that long term exposure to these pollutants in drinking water leads to human health problems (Duda-Chodak and Blaszczyk 2008, Kaspizak et al. 2003). Here, the fact that Arsenic was at acceptable levels for example, does not indicate what the cumulative effect is from drinking water. This is because it is reported that prolonged intake of Arsenic in drinking water may result in cancer of various types and respiratory infections (Shi, Shi, & Liu, 2004). This issue is more critical considering that children in Taiwan that were in schools around coal power plants were reportedly susceptible to DNA damage, asthma and allergic rhinitis (Wong et al. 2005). Also, prolonged exposure to Arsenic in drinking water is reported to affect academic performance of school children (Wasserman et al. 2004).

The fact that the levels of Pb in water was found to be at the threshold limit of SANS should be a cause of concern to the educational community and government. This is because Pb is a fairly dangerous heavy metal with devastating effects. In fact in the United States high concentrations of this metal in the blood were reported to be responsible for 89% increase in deaths from cardiac diseases (Menke et al. 2006). Regarding children, it is reported that exposure to Pb affects the nervous system (Schütz et al. 1996, Heinze et al. 1998, Okonkwo et al. 2001, Malcoe et al. 2002.). While it may appear that the level of Pb found in the water in this study was at the threshold limit of the recommended guidelines, this could still cause major health problems with children. The Pb content may be a problem with children because it is reported that "... even small exposures are associated with reduced IQ, increased ADHD and other health problems in children... No safe blood-lead level for children has been identified" (Young 2012 p. 3A).

It may be argued however that the air pollutants reported in this study were not as high. The problem here though is the risk of prolonged exposure. For instance, learners starting in Grade 8 in these schools are likely to be exposed to these pollutants for the next five years if they are to study there until Grade 12. What the compounded effect of this exposure results in, should be a source for concern. It is critical therefore that better environmental pollution management systems should be implemented by the mines and the allied industry. This

could be achieved by these entities assisting in ensuring that there is a marked decrease in the amounts of the pollutants they churn out. Major reductions will certainly assist learners and educators breathing and drinking pollution free air and water. Not only that, we recommend that learners and their educators should be medically checked from time to time by school management authorities. This is because while it may be argued that the levels as reported in this study were not at 'dangerous' levels the participants nonetheless spend most part of everyday of their lives in the schools. The fact that a majority of these participants are children makes this issue even more urgent. This calls for collective action because if these children are exposed to these chemicals from childhood until adulthood then their health may be compromised. Another way of managing this situation in order to avoid crises is to bring it to the attention of the learners parents through the Students Governing Bodies (SGB). Considering the fact that some of the parents may be health workers, they may be able to look at various ways of effectively mitigating the effects of these pollutants on the learners' health. It is also suggested that government can make policies that schools should not be cited close to coal mines and foundries and existing schools may be relocated far away from these industries

LIMITATIONS

This study was about assessing the levels of pollutants in air and drinking water and how they may affect health in schools in the vicinity of coal mines. The town eMalahleni in Mpumalanga Province was selected for the purposes of this study although this is not the only province where coal is mined in the country. This suggests that whatever is reported in this study may not be generalizable to all the coal mining belts of the country. Another limitation stems from the fact that some principals were not willing to allow us in the collection of data because they indicated that the schools were busy at this time of the year. In addition, an ideal situation would have been to measure the air quality following the periods depicted in this Table 1 as recommended in the ambient air quality standards in South Africa. Also, replicate analyses of the samples were not done and as such this study should be seen as a preliminary study until further investigations are concluded.

INFORMATION AS A STRATEGIC BUSINESS ASSET

Sevim Oztimurlenk
Long Island University, USA

ABSTRACT

The importance of information to individuals and organizations, and therefore the need to manage it well, is growing rapidly. Now more than ever, we need to understand the critical role information plays in so many aspects of business and life. It drives our communication, our decision making, and our reactions to the entire environment. My main objective in this paper is to identify the characteristics of information as an asset, the purposes of information management and information systems such as Management Information Systems (MIS), Supply Chain Management Information Systems (SCMIS) and Decision Support Systems (DSS) which play a vital role in the process of decision making in organizations and to discuss that organizations should or not focus on information rather than technology.

INTRODUCTION

Information is a critical asset in the operation of any business. The data you capture, record and share every day is the very definition of your relationships with vendors and customers, as well as the foundation for your internal operations and business processes. Organizations are increasingly aware of the potential of information in providing competitive advantage and sustaining their success (Porter, 1985) as evidenced in a number of published case studies (Owens, *et al.*, 1996; Grimshaw, 1995) and commentaries (Broadbent, 1977). The descriptions of information as an asset and a resource (Burk & Horton, 1988; Best, 1996) are no longer unusual. However, the origin of these descriptions in classical economics ignores the place of information in the fabric of a political system or culture of an organization. If information is to provide competitive advantage then its full potential needs to be considered. My main objective in this paper is to identify the characteristics of information as an asset, the purposes of information management and some types of information systems such as Management Information Systems (MIS), Supply Chain Management (SCM) and Decision Support Systems (DSS) which play a vital role in the process of decision making in organizations and to discuss that organizations should or not focus on information rather than technology.

Some definitions of information

Within information science, it is desirable to develop an understanding of information that is applicable for the various senses in which researchers and practitioners need to talk about information. Buckland (1991) has said that most definitions in the field represent approaches toward information that take information 1) as knowledge, 2) as process, or 3) as thing. Derr (1985), Dretske (1981) and Fox (1983) have followed the knowledge approach, by taking information to be various types of propositional statements. Boulding (1961), Brookes (1980) and Dervin (1977) have taken a different tack within the knowledge approach, by writing of information as constituting additions or changes in a mental map. Finally, after the original submission of this essay, but before the final version was sent in, a paper by A.D. Madden appeared, titled 'Evolution and information', where information is defined as "a stimulus which expands or amends the World View of the informed" (Madden 2004). This approach constitutes another of the definitions of the additions-or-changes-in-the-mental-map variety. Madden's paper is a reflection on why and how animals need to perceive and communicate information to each other. Continuing with Buckland's categories of information definitions, Pratt (1977) has taken the purest process approach by defining information as the moment of being informed, of 'in-formation' in the mind. Buckland himself (1991) has emphasized information's *thing-ness*, always of importance in a world with many information objects lying around. Claude Shannon, the progenitor of the original burst of interest in the concept just after World War II, took the amount of information to be a function of one's freedom of choice in selecting a

message (Shannon & Weaver 1975). Cornelius (2002), Day (2001), Hayles (1999) and Rayward (1992), on the other hand, view information as a social construct and endeavor to extract out the social meanings and history surrounding the term.

Is Information an Asset? Information is commonly referred to in the academic and popular literature as an “asset”. But is it really? The essential characteristics of an asset are (Godfrey et al, 1997; Henderson and Peirson, 1998):

1. Having service potential or future economic benefits: something is only an asset from an accounting viewpoint if it is expected to provide future services or economic benefits. The benefits may arise from either the use or sale of the assets. Information satisfies this requirement, because it provides the capability to deliver services and to make effective decisions.
2. Being controlled by the organization: “control” in this sense means the capacity of the organization to benefit from the asset and to deny or regulate the access of others to that benefit. Information also satisfies this requirement. If an organization has information, it alone has access to it unless it sells or gives access to another party.
3. Being the result of past transactions: this means that control over the asset has already been obtained as a result of past transactions such as purchases, internal development or discovery. Information also satisfies this requirement. Information is usually collected as the by-product of transactions which have occurred (internal development), or may be the result of a purchase (e.g. a proprietary mailing database) or discovery (e.g. through analysis of data).

The Seven “Laws” of Information

Like other organizational assets, information has a cost (how much it costs to acquire, store and maintain it) and a value (how much it is worth to the organization). However this is where the similarity ends. Information does not obey the same laws of economics that other assets do. It has some unique properties which must be understood in order to be able to measure its value (Glazer, 1993). We have attempted to define the nature of information as an asset by identifying

First Law: Information Is (Infinitely) Shareable

Perhaps the most unique characteristic of information as an asset is that it can be shared between any number of people, business areas and organizations without consequent loss of value to each party. The World Wide Web perhaps provides the ultimate example of how the same information can be shared by a virtually unlimited number of people. Most assets are appropriable. Either you have it or I have it. In the case of information, we can both have it (Glazer, 1993)

Shareability of Information

In general, sharing of information tends to multiply its value. The more people who use it, the more economic benefits can be extracted from it. A major problem in practice is that there are barriers, both institutional and personal, to sharing of information. “Knowledge is power”, and as a result, people do not share information easily (Davenport, 1994). Information hoarding where people deny others access to information represents a loss of business opportunity, because it prevents the potential value of information being realized (Moody and Walsh, 1999).

Second Law: The Value of Information Increases with Use

Most resources exhibit decreasing returns to use, they decrease in value the more they are used. For example, vehicles depreciate based on kilometers travelled, aircraft based on flight hours, plant and equipment based on hours in operation. However information actually increases in value the more it is used. The major cost of information is in its capture, storage and maintenance. The marginal costs of using it are almost negligible (Moody and Walsh, 1999). Information has no real value on its own. It only becomes valuable when people use it. From an accounting point of view, something can only be an asset if it provides future services or economic

benefits. If information is not used, it cannot possibly result in economic benefits and is therefore not an asset. Unused information is really a liability, because no value is extracted from it, and the organization incurs future costs of storage and measuring the value of information. In many organizations, there is a large amount of information that is collected and stored but never used (Moody and Walsh, 1999).

The prerequisites for using information effectively are:

- knowing it exists
- knowing where it is located
- having access to it
- knowing how to use it

Information is at its highest “potential” when everyone in the organization knows where it is, has access to it and knows how to use it. Information is at its lowest “potential” when people don’t even know it is there. In most organizations there is a huge amount of computer based information that could be used for business advantage. However the opportunities for using information are often not realized because people don’t know it exists. As obvious as it seems, few organizations have a catalogue of their information assets and where they are located. Clearly, such a situation would be intolerable for physical or financial assets. However information is not subject to the same audit requirements as other assets (Moody and Walsh, 1999). Another important issue is that of information literacy. It is often assumed that if information is provided to people that decision-making will automatically improve (Ackoff, 1964). However the quality of decision making depends on both the quality of information provided and the ability of decision-makers to interpret the information and use it to take appropriate action (information literacy). There is little point in improving the accuracy and timeliness of data if people don’t know how to use it effectively. Equal emphasis therefore needs to be placed on improving people’s information literacy skills as improving the quality of information itself.

Third Law: Information is Perishable

Like most other assets, the value of information tends to depreciate over time. The speed at which it loses value depends on the type of information. For example, once a customer has changed their address, the old address may be of little or no importance. On the other hand, product sales figures may be relevant for years into the future. As shown in Figure 3, information effectively has three “lives”: an operational shelf life, a decision support shelf life and a statutory shelf life (Moody and Walsh, 1999). Information has a relatively short useful lifetime at the operational level. Usually, the only information of relevance is very recent information such as a customer’s current address or their last bill. It has a much longer lifetime for decision support purposes. In practice, operational systems often discard information once it has exceeded its operational shelf life, making it unavailable for subsequent decision-making purposes. Data warehousing provides a mechanism for storing historical information which has exceeded its operational life, and making it available for decision support and analysis (Inmon, 1992).

Fourth Law: The Value of Information Increases with Accuracy

In general, the more accurate information is the more useful and therefore valuable it is. Inaccurate information can be very costly to an organization in terms of both operational errors and incorrect decision making (Wang and Strong, 1996). The level of accuracy required is highly dependent on the type of information and how it is used. For some information, 100% accuracy may be required (e.g. aircraft maintenance data or banking records), while for other information 80% may be good enough for practical purposes (e.g. employee home phone numbers).

For decision making purposes, often just knowing the accuracy of information is as important as having accurate information. If decision-makers know how accurate (or inaccurate) the information they are working with is, they can incorporate a margin for error into their decisions (Haebich, 1996). However in practice, the accuracy of data is rarely measured. People rely instead on subjective opinions and anecdotal evidence.

Fifth Law: The Value of Information Increases When Combined with Other Information

Information generally becomes more valuable when it can be compared and combined with other information. For example, customer information and sales information are each valuable information sources in their own right. However being able to relate the two sets of information together is infinitely more valuable from a business viewpoint. Being able to relate customer characteristics with buying patterns can help to target marketing efforts so that the right products are promoted to the right people at the right time. Producing decision support information generally requires consolidating information from a wide range of different operational systems. In most organizations, the lack of integration of information in operational systems is a major impediment to producing decision support information.

Sixth Law: More Is Not Necessarily Better

In most cases, the more of a certain resource you have (e.g. finances), the better off you are. A common management problem is deciding how to allocate limited resources (e.g. people or finances) among a number of competing causes. However with the increasing use of information technology, information is anything but scarce. In fact, the biggest problem in most organizations today is not the lack of information but the overabundance of information. Psychological evidence shows that humans have a strictly limited capacity for processing information (Miller, 1956; Newell and Simon, 1972). When the amount of information exceeds these limits, information overload ensues and comprehension degrades rapidly (Lipowski, 1975). It has been found in practice that decision making performance decreases once the amount of information exceeds a certain optimal point (O'Reilly, 1980; Driver and Mock, 1975; Jacoby et al, 1974).

Seventh Law: Information is not Depletable

Most resources are depletable. The more you use, the less you have. However information is self-generating. The more you use it, the more you have (Glazer, 1993). This is because new or derived information is often created as a result of summarizing, analyzing or combining different information sources together. The original information remains and the derived information is added to the existing asset base. Fundamentally, this is why information is not a scarce resource. Techniques like data mining are used specifically to generate new information from existing holdings of data (Moody and Walsh, 1999).

Purpose of information management

Information management contributes to the achievement of organizational goals. There is little doubt that information does contribute to the success of organizations. Whether information is regarded as a resource or a force for change and development it is clear that information can contribute to the achievement of organizational goals. The assumptions are made that the goals of an organization are explicit, thus are known throughout the organization and there is some way determining the extent to which the goals have been met (Kirk, 1999). A process approach to information management supports the integration of business strategy and information. The calls for integration come from at least three different communities: information management, information systems and management. Successful companies are those that adapt to and shape their environments and do so by using and creating information in a process of continuous improvement and innovation. Information management has been described in one particular model as a continuous cycle of related activities which encompass the information value chain. The activities in the cycle (Choo, 1995) are:

1. identification of information needs defined by subject matter requirements and situation
2. information acquisition involving evaluation of current sources, assessment of new sources and matching of sources to needs
3. information organization and storage of the organization's memory or its knowledge and expertise
4. information products and services aimed at enhancing the quality of information
5. information distribution through sharing information informally or formally
6. information use in the creation and application of information in interpretation and decision making.

Management Information Systems (MIS)

Management information system (MIS) is one of the major computer based information systems. Its purpose is to meet the general information need of all the managers in the firm or in some organizational subunit of the firm. Subunit can be based on functional areas on management levels. There are many definitions for MIS, but one of the most appropriate definitions describes management information system (MIS) as "an organizational method of providing past, present and projected information related to internal operations and external intelligence. It supports the planning, control and operation functions of an organization by furnishing uniform information in the proper time frame to assist the decision makers" (Waston, 1987). The information in MIS describes the firm or one of its major systems in terms of what has happened in the past, what is happening now and what is likely to happen in the future.

The role of MIS in decision making process

The MIS and its organizational subsystems contribute to decision making process in many basic ways. Nowadays, some of the organizations use MIS to assist managers for decision making. For example, to assist decision-makers in extracting synthesized information from a massive database such as the Current Public Transport Record (CPTR) of Durban (CPTR), the Durban Unicity Council decided to make use of a Public Transport Management Information System (PTMIS) developed by Stewart Scott. This system is for use by transport planners and managers (Louw et al, 2001). Power (2002) has stated that making decisions is an important part of working in business environment.

Supply Chain Management (SCM) and SCMIS

A supply chain is a network of facilities and distribution options that performs the functions of procurement of materials, transformation of these materials into intermediate and finished products, and the distribution of these finished products to customers (Kaihara 2003). Supply chain management (SCM) is mostly about effectively integrating the information and material flows within the demand and supply process (Soroor and Tarokh 2006a). The potential for improved productivity, cost reduction and customer service are enormous. Of course, the benefits are based on effectively employing the right processes and supporting information technology. This is a higher priority than ever before (Simchi-Levi et al. 1999). An SCMIS is user-interfaced and designed to provide information and information processing capability to support the strategy, operations, management analysis, and decision-making functions in an organization's supply network. The system uses IT, manual procedures, models, and knowledge bases and databases (Shemshadi et al. 2008). Applications may improve operational efficiency, improve and innovate functions, or restructure business processes. An information system stores, processes, and delivers information relevant to an organization's supply chain, in such a way that the information is useful to those who wish to use it, including managers, staff, customers, and suppliers (Soroor et al., 2009).

Decision Support Systems (DSS)

A decision support system or DSS is a computer based system intended for use by a particular manager or usually a group of managers at any organizational level in making a decision in the process of solving a semi structured decision. The DSS produces output in the form of periodic or special report or the results of mathematical simulations (Raymond, 1990). It is difficult to pinpoint that are completely structured or unstructured. The vast majorities are semi structured. This means that the DSS is aimed at the area where most semi structured decision is needed to be made (Soroor et al., 2009).

CONCLUSIONS

Information is a critical strategic asset for organizations and must be treated and accounted for accordingly. Like water in the home, the approach to managing information must ensure not only that it is leak proof but also that it is free flowing and on tap where and when it is needed. But, as with water, information can be taken for granted and often its value is only fully understood when one is deprived of it. Therefore, it should also be 'metered' and accounted for, so that its cleanliness and usage can be monitored and managed and it will be more appreciated for the precious resource that it is. Moreover, apart from variety of information system in business

world, MIS, DSS and SCMS were mentioned in this paper. According to studies (Asemi et al., 2011; Kirk, 1999; Soroor et al., 2009), it was found that MIS is best suited to identify problems and help management to understand them to make suitable decisions. At the same time, MIS is not aimed to help particular and specific need of the individual and group decision making while DSS are tailored to the specific need of individual and group managers. Therefore, it could be concluded, that DSS can extend its support to the same steps of decision making process and has more roles in decision-making and problem solving than MIS. On the other hand, SCMS provides high quality, relevant and timely information flow that effectively supports decision-making for inventory replenishment, capacity activation, and for synchronizing material flows at all tiers within the supply chain. It grants regularity and speed to the current SCM processes and prevents supply channel activities from getting too complicated and hard to perform. The ultimate goal of developing and implementing SCMS, in spite of the high related costs, is to increase SCM performance up to an acceptable level and facilitate all the processes necessary to perfectly accomplish supply network tasks.. In future works can study on the role of other information systems for managers' decision making and comparative it to DSS, MIS and SCMS in order to achieve competitive advantage

INHIBITING FACTORS FOR KNOWLEDGE TRANSFER IN INFORMATION TECHNOLOGY PROJECTS

Ramesh Babu Paramkusham, KM Collaboration, USA
Robert DeYoung, Walden University, USA
Jean Gordon, Florida International University, USA

ABSTRACT

Information technology (IT) projects have been known for the high failure rates caused due to multitude of factors ranging from project dynamics, project environment to flexibility and fluid building blocks of these projects (Keith & Demirkon, 2009; Pretorius & Steyn, 2005; Shwalbe, 2010). The work in this paper following a qualitative methodology, based on six IT projects implemented in the last five years in the USA, identified inhibiting factors that influence them negatively. The results indicate that the knowledge transfer initiatives could help the IT projects to improve the overall performance. The research also helps in synthesizing convergence solutions to IT projects in creating innovative methods to minimize project risks.

INTRODUCTION

Information technology (IT) projects are impaired with intricate and complex issues which range from organizational culture, project environment, to project team skills, project body of knowledge, available skill level, temporary or permanent membership of the projects, team cohesion, predominantly virtual environment, project goals and their dissemination to the project teams, political and organizational capabilities, and complexity (Aladwani, 2002; Daniels & LaMarsh, 2007; Drake & Byrd, 2006; Hartman & Ashrafi, 2002; Keith & Demirkon, 2009; Shwalbe, 2010). The risks associated with IT projects are discussed in contemporary literature, for example 50 IT investments (challenging projects and associated budget) were analyzed to apply risk management (Benaroch., Lichtenstein, & Robinson, 2006). Environmental factors (that relate to customer demand), lack of staff skills, and competing business drivers are key factors that can lead to project failures (Chen., Zhang., & Lai, 2009; Benaroch, 2002). These factors have their component influencing the projects negatively, which cause to fail and/or lead to dismissal in the middle. Failure rates close to 70% have become common in IT projects (Daniels & LaMarsh, 2007). Knowledge transfer (KT) in IT projects depends on the extent of the knowledge culture and KT is related to the overall success of the project (Karlsen & Gotschalk, 2004). Project performance depends on the level of effort of KT (Landaeta, 2008). This work, following a qualitative case study methodology, derived patterns that impede the progress of the projects. This paper analyzed and identified the role of knowledge inhibitors with respect to IT project performance. These inhibiting factors, identified in this paper, enable IT project managers and future research in paying attention and in devising methods to mitigate project risks.

Software engineering testing analogy can be drawn for the research methodology used for this research. In software testing, functional testing assumes no internal logic of the system under test, while white box testing involves structural aspects of the software and requires the knowledge of internal (Singh & Rakesh, 2010; BCS-SIGIST, 2001). Following the black box method, defined as functional verification of a software system, however, is not possible to discover internal mechanism on how these projects were planned and executed (BCS-SIGIST, 2001). Adapting black box method for the research provides results

without knowing the internal dynamics; where as following white box method the project's internals are probed, analyzed and researched to gain better understanding. It allows to addressing associated problems that challenge these projects.

The paper is organized into introduction, which is this section, literature review, research goals, methodology, results, summary and recommendations, and conclusions and potential for future research. Literature review prepares the ground for this research, while projecting the gaps in the existing research. Methodology section provides research method selected and its rationale. Research goals include details of what the research tried to achieve and how it was done. Results section explains what the findings were and their interpretations and how to use them. Summary and recommendations part of this paper incorporates brief details of findings along with the recommendations derived from the data, collected. Conclusions and future research potential, the last section of the paper, projects the research conclusions and the possibilities for further research on this topic.

LITERATURE REVIEW

IT projects are found to poorly manage the associated risks. These risks include lack of skilled professionals, ambiguous business cases, poorly done requirements, and inadequate risk mitigation plans (Debbie, Timothy & Mark, 2007). IT projects suffer from multitude of problems due to measurable factors such as scope, time, quality, staff and money. These projects over the years have been found to fail and are still failing with lower success rates of only 29%, according to Standish Group CHAOS report published in 2004, along with other refereed references in IT project management literature (Debbie, Timothy & Mark, 2007; Hartmann, 2006). The trend of the failure rates is continuing despite the fact that there have been tremendous amount of advances in technology over the last decade. One observable phenomenon is that the IT projects are dealing with changing environment with dynamic business goals that are ever changing with increasingly difficult and competitive markets. Projects are going through challenges in the areas of overload, political motivations, and ambiguity (Haas, 2006). There are two major concerns in IT project environments, first, the building blocks are fluid, and the second there are multiple IT solutions for the same business need (Pretorius & Steyn, 2005). This flexible and fluid nature of IT projects lead to increased ambiguity, which is accentuated by organizational environmental factors, which influence the project performance negatively (Aladwani, 2002).

In knowledge management, the primary forms of knowledge transfer include two types of knowledge - tacit and explicit knowledge. While tacit knowledge resides internally in a person, explicit knowledge can be modeled and can be perceived through possible representations using modeling, expressions, and/or by other means (Cortada & Woods, 2000; Nickols, 2000). There are mechanisms, found in the literature, where tacit knowledge takes the forms of explicit and explicit knowledge taking the form of tacit, through knowledge flow (Nonaka, 1994). Project based knowledge, comprising of technical design knowledge, organizational knowledge, and business value knowledge enables the projects to compete with desired business outcomes and the key factor is alignment of these three areas (Reich., Gemino & Sauer, 2012).

Knowledge management literature, to this point, have included topics on frameworks that are general and includes project sense making, process coordination, knowledge transfer between projects for project management knowledge, and some other papers on capability models (Burgess, 2005; Ermine & Boughzala & Toukara, 2006; Iyer & Shankarnarayan & Wyner, 2006; Jewels & Ford, 2006; Haas, 2006; Kalpic & Bernus, 2006; Kane & Pretorius & Steyn, 2005; Landaeta, 2008; Whelton & Ballard & Tommelein, 2002). This paper provides results based on project dynamics in projects that were planned and executed in commercial settings. Impeding factors for knowledge transfer, within IT projects, are specific to the industry related to IT projects and vary from country to country (Argote & Ingram, 2000). IT project performance has been discussed in the literature with perspectives from culture, diversity, technologies and approaches followed by the teams (Aladwani, 2002; Daniels & LaMarsh, 2007; Drake & Byrd, 2006; Hartman & Ashrafi, 2002; Keith & Demirkon, 2009; Shwalbe, 2010). There is a gap in the literature in this area, which this research tries to address through exploring inhibiting factors for KT in IT projects from a project dynamics perspective. The research in this paper takes another approach, from qualitative stand point, working through data captured from project managers and project leads on project specific conditions, environment, and causes for failure from KM

perspective. Project performance relates to knowledge transfer (KT) via the level of KT effort, and body of knowledge in the project (Landaeta, 2008). In this paper inhibiting factors, causing the projects to fail, were identified. These factors were recognized with a reference to knowledge transfer and analyzed. The analysis leads to devising the methods and practices for knowledge management.

RESEARCH GOAL

The research aimed at looking at the problem of identifying the inhibiting factors, directly, from the collected data on projects that were implemented in the last five years. These projects have the latest history of what went during the project planning, execution and delivery stages, dynamics of the project teams, availability of resources, project environment, organizational elements, and project specific knowledge. By drilling through the data, it was possible to gain an understanding of the project specifics including the environment. This has led to discovering methods to mitigate and improve the project performance. Finally the research calls for marinating a continuum in knowledge transfer and project performance, which would be observed over a period of time.

METHODOLOGY

The research methodology adopted for this research was qualitative method with a case study approach. The intent of the research was to analyze the data derived from the projects that were conducted in the five years and to consider these projects as objects that had to be looked at from the perspective of understanding, exploring, and discovering and not necessarily for deducing inferences. While quantitative methods adopt reductionist approach, which tends to churn the data and operate on data from deduction techniques, qualitative methods adopt inductive and integrative approach and tries to find “what”, “how” and “why” of the story. The research in a qualitative study focuses on aggregation of the data rather than reducing the data, to provide greater understanding within the context specific knowledge (Verschuren, 2003). The projects were implemented, which cannot be manipulated for their outcome. These have to be viewed as such, and understood. Since this research focuses on understanding of the project specifics, as they existed, during the project execution, the research topic dictates the methodology to be qualitative. Case study method within qualitative branch was selected to study the object in question (which were the projects in this research), which requires considering the study of an object as a whole and a holistic manner (Yin, 2003).

The patterns of inhibiting factors in IT projects were gathered through the case study using multiple case-method. Since single case method may not yield valuable information, albeit, used in the contemporary research, and may impact negatively, in that it lacks generalization (Baxter & Jack, 2008). This also ensures the qualitative research characteristics such as conformability, transferability, generalizability and dependability and provides the research credibility (Creswell, 2007). This research took the approach of multiple case studies, with six cases, to make sure that the data were consistent. The data provided rich qualitative information to derive meaningful and powerful conclusions to allow continuing this research further in the future. Six cases in this research constitute six IT projects that were conducted within USA and which were performed in the last five years. Thus, it was possible to work on qualitatively rich data that was current and as well as potent to yield such findings that these can formulate into best practices.

The research adapted purposeful sampling method, designed by the researcher, to select the projects. The selection criteria, in addition, included those projects, which were initially challenged for scope, time, quality, staff or money, although succeeded after provisioning additional resources, and these projects are defined as challenged projects. These projects were also selected based on the environment in which they were initiated, planned and executed. The environment specifics included items such as project’s organizational level, project methodologies followed, standards adopted, and a clear absence of knowledge management infrastructure. The projects data was collected from five different organizations and the organizations selected followed and shared similar organizational maturity and project management levels which were implemented in the USA within the last five years. The selection provided the research with a plain field for comparing themes derived from multiple IT projects. Case study method in qualitative research methodology provided a platform to gather data from project managers and project leads via face-to-face interview sessions. The challenging factors,

relative to KM, were analyzed to explore inhibiting factors for knowledge transfer and prescribed KM practices that should be followed to alleviate the concerning issues.

The qualitative data from six IT project interviews were recorded, transcribed, and coded into themes and identified as KM practices. These patterns were listed in Table 1. The transcribing process included de-natural, instead of natural. Natural transcription requires that the speech is translated exactly as spoken, while de-natural transcription allows to transcribe the essence of the speech and not necessarily the verbatim (Cameron, 2001; Schegloff, 1997). IT project data contained technical information and was specific to the projects. The essence of what was said is important, relative to capturing exactly what was spoken.

Table 1. Causes of inhibiting factors in Knowledge Transfer (KT)

S.No	Project 1	Project 2	Project 3	Project 4	Project 5	Project 6
1	Multiple project assignment. The project members were assigned to 1 – 3 projects in parallel. The project team spent, at certain stage, 98% of the time on this project.	No one in the project was assigned to multiple projects. 40% people who were temporary members of the project.	The project team was assigned to 50% of their time for this project.	Team members assigned to multiple projects. One person who worked on temporary basis and was assigned to this project for 50% of the time.	Project team members were assigned for 2 – 3 projects at the same items There were people worked on temporary basis.	Project team members were assigned for four different projects at the same time including this project. There were temporary members who were the clients of the projects deliverables.
2	Technology Skills – average 3- 5 on (1-10 scale with 10 being most significant). Business and Systems Analysis skills were to be acquired and/or polished.	Technology Skills – average 9 (1-10 scale with 10 being most significant). Project had dependencies from other projects that were not necessarily captured due to lack of control on other projects.	Technology Skills – average 5 (1-10 scale with 10 being most significant). There was poor analysis done for the project and was essentially based their analysis empirically.	Technology Skills – average 6 (1-10 scale with 10 being most significant). There were issues on scope related concerns on ‘how’ of the tasks on the deliverables.	Technology Skills – average 9 (1-10 scale with 10 being most significant). Scope was changed to deliver, given the fixed time resulting in reduced deliverables.	Technology Skills – average 9 (1-10 scale with 10 being most significant). Detailed scope was not perceived and projected due to lack of analysis, although the team had technical expertise.
3	Virtual and time shifted environment. Lag time affected the project negatively on the project.	The team had heavy use of email communications followed by phone conversations. There were 10% offshore team members involved in this project.	There were two external team members who have dealt with the code involved for extending their help to the project.	The team interacted using predominantly virtual communications.	Teams interacted half and half for face-to-face and virtually, although virtual interactions dominated to the extent of 80%.	Team interactions were both face-to-face and virtual.
4	Interaction levels to the tune of 70% by the team	The interaction levels were found to be at 30%. There was some interaction among the project team, which resulted in informal knowledge sharing although informal in nature.	There was 20 – 25% (business group 70%) interaction level within the project teams.	There were interactions to the tune of 40%.	The team had to interact to about 30% of the time.	There were 60% of the interactions took place in the project teams.
5	Fluid deliverables. Scope changed 15 – 20 times.	Scope was reduced due to time constraints.	Scope was changed with additional work	Scope changed by 30% and changed five times.	There were no scope changes.	Deliverables had to be changed due to fluid and poorly

		Team spent several additional hours and beyond the normal working schedule.	added to the existing scope with no time extension. Scope of the project, initially, was too big.			understood requirements.
6	Vendor team performed majority of deliverables and this was a vendor product based development project.		The project was a vendor product based development and was an upgrade of the system.			Vendor product based development and upgrades for this project.
7	Training and learning happened at insignificant levels and occurred informally.	On-shore team trained offshore folks in the technology area. New team members joined the team. This led to time constraints, which impacted the scope of the project.	The project suffered from lack of knowledge. There was some gap in the skills and some new skills had to be acquired and could have been better. There were technical knowledge required and the vendor manuals were utilized as privileged by the team leads.	30% of the skills were to be learned for this project and happened informally.	Informal help received from the team members. The team was big and the project manager involved interacted with the team and found that there was drag on the resources within the project. New people joined the team and existing people left the project at different stages of the project affecting the project deliverables.	Some training took place on the vendor product.

Knowledge Inhibitor 1: Multiple Project Assignments

Project teams worked on multiple projects simultaneously with temporary members who were contracting. Teams were working beyond the regular hours and it was difficult for the teams to transfer knowledge on the tasks on which they performing. Teams focused on their deliverables with no other activity. Quality of the project output suffered resulting in an inferior product/service. No buffer time allocation identified and/or the teams could not use the buffer time for any knowledge activities. Temporary members focused on specific tasks and could not do beyond that. Multiple project assignment is common in IT project environment and requires team members to organize their tasks and schedules. Team members require time and bandwidth for knowledge activities such as sharing, representing, structuring, and transferring knowledge. The projects have had some buffer time allocated, as part of the project planning, and this time was used in resolving ambiguities, conflicts, unidentified risks, and changes in the scope. These factors lead to chaos in the project dynamics, which impacts KT.

Knowledge Inhibitor 2: Distributed and Insufficient Expertise

The project teams suffered from lack of analysis skills, which linked to both systems and business related expertise. Projects worked in a virtual environment working with teams from multiple countries. Expertise in project specific areas were all distributed over teams and individuals, with time and space dispersion, based on the function. While the scope at a high level was fine, detailed scope was challenging resulting in fluid and ambiguous deliverables. Inter project dependencies troubled the milestones while extending the timelines along with scope reduction and modifications. Teams required to be on a constant vigil and used their time to fixing scope problems. These scenarios inhibit the teams, due to lack of time and bandwidth, and make it harder to exchange knowledge. KT in these projects occurred at low levels with individuals learning bare essentials

informally with no recourse to the knowledge activities. Different approaches and mental models of multiple global teams also add to inferior knowledge transfer and act as inhibiting factors (Karlsen & Gotschalk, 2004).

Knowledge Inhibitor 3: Virtual Environment

Virtual environment dominated the project teams with the project teams interacting virtually for the majority of their time. Virtual settings required the teams to communicate asynchronously, for the most part, and the teams experienced delays and suffered from lack of understanding and clear goals. Teams relied on electronic communication and troubled by lack of ground rules, best practices, expectations, and clear understanding of project goals. These factors inhibit the project knowledge flow regardless of whether it is formal or informal.

Knowledge Inhibitor 4: Interaction Levels

Team interactions were found to be in excess of 20% and some cases to the tune of 70%. These increased and extended interactions caused project environments to use the resources inappropriately with less accountability to both quality and output of the project deliverables. The resource drag had led to unproductive atmosphere. Interaction levels that were informal in nature experienced some knowledge transfer locally with few people benefiting and on a temporary basis. This has a devastating effect on project performance as well as on knowledge transfer.

Knowledge Inhibitor 5: Fluid Deliverables

These project were teams troubled with fluid deliverables due to lack of detailed scope analysis with poor skill level. Multiple scope changes in excess of 5 were experienced along with reduced scope. The team members did not understand the deliverables and compromised the scope due to time constraints and the analysis was not given necessary importance. This is a knowledge inhibitor with people spending time on something that they are not good at. This means that there would be increased dependencies on the resources. For knowledge transfer to occur people should have time, however little it might be, and bandwidth. In one of the projects, it was found that information flow was privileged, which is also fairly common, as the projects may have to go through Sarbanes-Oxley (SA, 2007) or similar compliance guidelines for security and privacy reasons.

Knowledge Inhibitor 6: Vendor Product Development

Three of the six projects were delivering projects that were directly developing applications on vendor products. Vendor based development warrants specific knowledge on the products and requires integration skills for applications to be developed. Vendor development within these projects was found to challenge the teams due to teams' inadequate skills that relied heavily on vendor experts. The teams did not have time to interact enough for knowledge transfer. This is inhibiting factor for knowledge transfer, as there was not enough time or bandwidth for the project teams to share knowledge, which was accentuated by multiple time zones.

Knowledge Inhibitor 7: Informal Training and Learning

There were people leaving and joining the project in the middle of the projects and learning curve of the people affected the projects dearly. People from the teams had to train the new professionals, which were a drag on the resources. This inhibits the knowledge transfer in ways where people may suffer from lack of motivation and become hard-pressed for time and other resources. There were also experts in technology within the teams, although no apparent knowledge transfer could be found.

Training and learning activities were found to be minimal or poor and informal, although there were requirements from the teams for new skills for the projects. This is inhibiting in the sense that the project teams had no formal training or learning provision, although the teams were interested in the learning the required skills.

All of these projects were performed in predominantly virtual environments with the projects interacting teams were in different countries with time dispersed and space dispersed conditions. This commonly found team

structuring generates a consensus that the teams require common ground rules, which were lacking in all these projects. Communication, interactions, and relationships, developing trust, and setting expectations, were found to be in jeopardy. There were teams within these projects, which could not interact adequately for transferring knowledge due to lag time, asynchronous communication methods, and delayed or shifted project deliverables. This causes hindrance to knowledge transfer.

SUMMARY AND RECOMMENDATIONS

It was found that from the rich qualitative data that the projects were challenged for time, scope, quality and money. The research provided appropriate data that supported the significant presence of knowledge inhibitors. These have to be addressed through knowledge transfer mechanisms while minimizing or eliminating these hindering effects. Projects were found to have either low-level knowledge transfer and/or inadequate knowledge flow, although the projects required these and demanded optimized environment. The following are the recommendations.

- Allocate buffer time for KT within projects teams and account for it.
- Formalize KT through structuring knowledge and storing in knowledge base (KB).
- Measure knowledge transfer using structured knowledge references.
- Adapt to fast search mechanisms and provision organization techniques and tools.
- Reward knowledge-contributors.
- Maintain a continuum of knowledge flow.
-

CONCLUSIONS AND FURTHER RESEARCH

The main contribution of this paper is the exploration of the inhibiting factors for KT within IT project environment. The research concludes that IT projects, despite the tremendous strides in technologies, processes and methods adopted in organizations can benefit from KT initiatives. These factors challenge the quality of the product/services that the projects deliver. Structuring and formalizing knowledge to enable it for exchange is the key, although not all knowledge can become a candidate for interchange. This significantly drives the project performance towards quality deliverables with improved project environment. Formalizing KT provides knowledge assets to organizations and helps in value creation. The increased complexity of IT projects with predominantly virtualized and global environments require to identify, recognize and implement creative methods to provision solutions for IT projects via managing vendor product knowledge management and learning management (Paramkusham, 2011).

The knowledge transfer should be viewed as a process and should be treated as such and made accountable, similar to any other process in the project development (Paramkusham2, 2011). The probability of improving the state of affairs in IT project management increases with the implementation of KM processes within risk management (Alhawari., Karadsheh., Nehari & Mansour, 2012). There is a large potential for further research on this topic. Environment specific to the industry and organization provides unique inhibiting factors, which can then be addressed through competent management methodologies. The research can be repeated with projects from a different population, such as India, to see if similar inhibiting factors could be found and how this compares. Further, the research can be extended to discovering KT motives within IT projects.

LET THE GOVERNMENTS SERVE THE NEEDS OF THE PEOPLE: SHAPING PUBLIC POLICY AND PARTICIPATION IN THE SUB-SAHARAN AFRICA

Kedibone Phago
University of Limpopo, South Africa

ABSTRACT

The question of public policy making and the manner in which public participation takes place in most African countries are controversial. This is because, since liberation of the 1960s, Africans have not fully benefitted from the fruits of their independence and democratic gains their countries have obtained. This paper is an attempt to argue for the need to broaden democratic participation to the publics in order that they could influence public policy and decision making processes. A literature is undertaken to understand how research has been conducted over the years as well as useful statistics regarding some of the indicators of the democratic participation (such as the literacy rates of the Sub-Saharan Africa) to understand these participation influences on public policy. The paper then concludes by highlighting some key considerations in the broadening the participation of Africans in the government affairs

INTRODUCTION

The notion of public participation in developing countries, especially in the African context is crucial. This is because institutional decision making has not appropriately benefitted the citizens in a manner that it is expected. Actually, the understanding of how governments' participation models are made to function is that citizens are left at peripheral positions which continue to marginalise their input in the public policy and decision making processes. In fact, those in the elite positions within communities have taken over decisions and created or supported parallel systems using public resources. For example, the effective and efficient provisions of public health care and education systems are generally seen to be cases in point where parallel systems (one for the rich and the other for the poor) exist. Largely the elites (politicians, senior civil servants and the business people) have supported the private education and health systems which actually compete with the public systems. As a matter of principle, it wouldn't be a problem to have elites supporting private systems except for the basic reason where those who financially supporting the private system are the ones entrusted to manage the public sector systems. Thus, the fact that elites have not been utilising such public services generate doubts on the effectiveness and efficiency of these systems and their intentions regarding their (systems) quality. This state of affairs raises fundamental questions that relate to the manner in which public policies are shaped through public participation. This is because the existing public participation trends are not sustainable as they serve to enrich the few (materially) while the majority of the citizens languish in poverty and at times rife unemployment on the African Continent. The question is: whether sub-Saharan countries can broaden democratic participation to their publics to influence public policy and decision making processes?

In order to address this question, two main issues should be borne in mind. Firstly, a broader civil society participation in government policy initiatives is necessary. The understanding of this aspect means that a place of government in the public sphere is underpinned by a need to ensure that African governments' policies represent the aspirations of their citizens. This is because both policy development and implementation are intended to address the societal challenges and therefore require that public policy should not be elitist but instead be broadened to the most vulnerable in the society. However, in Sub-Saharan countries, 38% of the adult population (or 153 million people) is unable to read and count in everyday life (UNESCO, 2010). In fact, it is projected that not a single country in Sub-Saharan Africa will be able to achieve the basic quantifiable goals by 2015, which are:

- Universal primary education - This goal is measured by the primary adjusted net enrolment ratio.
 - Adult literacy - This goal is measured by the literacy rate for those aged 15 and above.
 - Gender parity and equality - This goal is measured by the gender-specific education for all (EFA) index and gender specific index (GEI), an average of the gender parity indexes of the primary and secondary gross enrolment ratios and adult literacy rate.
 - Quality of education - This goal is measured by the survival rate to grade five.
- (UNESCO, 2010)

The issue of universal access to education is a second MDG goal in facilitating access to primary and secondary school education. The most vulnerable region lagging behind in this access to education is Sub-Saharan Africa (United Nations, 2010). The relevance of access to basic education is that governance and public administration issues are getting complex and participation of the civil society and the public continues to require high or tertiary education levels. Without access to education, it could mean that democratic participation and shaping of government policy would continue to be elitist and marginalise those who should be served (UNRISD, 2011). Further, the challenge of most of these civil society organisations to participate fully in the issues of public policy is that very few carry the agenda of the locals or represent legitimate local constituencies.

Secondly, the issue of media freedom requires an understanding on the approach and manner in which governments in most African countries have supported the role of the media. Tlakula (2012) as a commissioner of the African Commission on Human and People's Rights notes that there are many cases of government crackdown on media personalities and in some cases journalists are jailed. Usually, such actions by governments are propelled by discomfort regarding media stories about government corruption, graft and the diversion of public resources into benefiting private individuals. This is also due to a lack of the right to information policies which governments need to undertake through their parliamentary systems. A theoretical investigation is necessary to generate debates regarding possible interventions governments can put in place to facilitate and regulate government information access and media freedom. In responding to the questions and these matters of shaping public policy in Sub-Saharan region, several issues are considered and further discussed in the paper:

- An analysis of policy making and the role of government and its publics (in policy making processes).
- What are the generic participation modalities and who participates in those governments established policy making processes?

POLICY MAKING PROCESS AND THE DIFFERENT ROLES OF GOVERNMENT AND ITS PUBLICS

The question of policy making in different countries has always been a complex one. Part of the complexity is that policy making itself is a complicated process. What this paper attempts to do, however, is to consider whether policy making systems in place are taking into consideration the abilities of their people to participate (or rather to make relevant the process as well as the government role) in the engagement of people's views and aspirations.

According to Yahie (2000)

African governments adopted deliberate economic policies aiming at taking over the ownership of economic enterprises controlled by colonial regimes and creating a good number of parastatal agencies in production, finance and trade sectors. Nationalisation ideology promoted the introduction of these policies, which aimed at indiginisation and rapid development. These moves coincided with the economic boom of the 1960s and early 1970s. The gains of the post-independence decade were, however, doomed as prices of primary commodities that the continent depended on for export and to support its balance of payment fell. (p.5)

Yahie's (2000) views above are compelling in that the essence of policy making process and the different roles of government in the promotion of the general welfare of community are meant to ensure political and socio-economic benefits reaches the community which the government has undertaken to serve. There is some relevance of this discussion in this paper. Part of the relevance of this discussion is twofold. First, is the

nature of a governmental system in place in a democratic dispensation. That is, whether the role of the executive authority influences policy process in a manner which could advantage societies. The executive authority is embedded in the context of *trias politica* model which encapsulate a notion of separation of powers in any constitutional democratic dispensation. The other two key arms of government in a constitutional democracy include the judiciary and legislative authorities which are also complementary to one another. This is in regard to the fact that the rule of law is upheld above all individuals irrespective of their standing and positions in the society. The context for the executive authority in this regard is that its formation (executive authority) is done as a government of the day. This is because there is an expectation that policy implementation could only take place when specialists and practitioners are able to facilitate the provision of public services. The role of the executive/cabinet/government therefore remains to oversee and ensure that those employed in government departments possess the relevant managerial and administrative skills and competencies for improving public service delivery in line with the aspirations of the people. So, implementing public policy requires an understanding of how to transform the government plans into public services.

However, as this paper alludes, a question of the role of legislature needs attention because part of their responsibilities is to ensure that the executive authority undertakes their responsibility in line with the community's expectation. The question of accountability in any democratic society is central to this discussion of policy making and public participation since it eventually determines the pace of services. In regard to the electoral proportional representative system, a reinforcement of an elite theory is usually entertained. This is essentially because decisions are facilitated through an elitist system which denies the community opportunities to directly influence policy making. A proportional representative system considers a limited participation of the individuals in decision or policy making but entrenches a political party representation system which is understood to be intending to represent the needs of its communities. There are checks and balances as well as key political dynamics necessary for this model to be considered:

- Firstly, the question of the seniority of the politicians who are both in the legislature against those in the executive. This means that those in the legislature are often junior in their political careers of those in the executive. For example, the Speaker in Parliament often reports to the President of the ruling political party who is often the president of a country. In a case of this example, the President should be able to directly account to the legislature which he/she normally views as a junior structure. The question of a balancing act arises then in ensuring that the legislature and executive roles are enhanced.
- A ruling political party usually requires accountability from both the legislature members and executive authority and therefore creates parallel accountability systems which could render useless the legislature and other bodies created to hold government to account.
- The level of education to debate and understand issues is often compromised. This is because most of the Sub-Saharan countries do not consider educational qualifications level. To consider individuals as members of parliaments and cabinet positions education criteria could minimise challenges of poor performance of the legislatures and cabinets.
- An unbalanced majority in most African countries' public representatives (legislatures) often render other opposition relegated to the periphery since they are always outvoted.

This discussion may not always be correct because it is based on the assumption that governments in African countries are democratic and therefore adheres to this basic democratic tenet. That is, in a country where a different system of governance which is not democratic in nature is in place, a different approach to remodel such a system to give its public space to engage in public policy making process is crucial. In fact, Adejumbi (2000) provides a further complex picture regarding the state of democracy in African countries where a democratic project could be regarded to as a 'façade' where elections are arranged and the perpetual civil political autocracy which is often 'window-dressed' as a democratic rule (p. 8). Country experiences show that active and efficient government participation and a well-conceived strategy are necessary for providing, regulating and supervising the delivery of social services, for promoting improved welfare for all, and for protecting the progress achieved. These experiences also give some indication of the main characteristics of successful social interventions as well as their limitations (United Nations, 2012, p. 33).

Second, concerns whether the publics have what it takes to participate and influences decisions. These include the following: education, political affiliation, political connectedness, NGOs, etc. While this concern is critical

and has been partly addressed in the earlier discussions, it is necessary to highlight that they require targeted efforts to address their adverse effects on public participation and policy making. What remains necessary for further considerations is to understand participation modalities and those who uses these means of participation as discussed below.

PARTICIPATION MODALITIES AND WHO PARTICIPATES

Adejumobi (2000) argues that in order to successfully engender public participation and democracy in Africa, there are four dimensions which need to be taken into consideration. Namely, 1) the strengthening of civil society and unleashing and actualising its democratic potentials; 2) demilitarisation and demobilisation; 3) the re-orientation of economic policy; and 4) reconstructing the international context of democracy in Africa, by reforming the global economic and political order.

Since this paper considers the issues of policy making and public participation, its focus is not broader than what Adejumobi (2000) is proposing as indicated above. However, these issues (of public policy and public participation) are viewed in the context of the manner in which the governments in Sub-Saharan Africa consider the questions of public service delivery for their people. The question of public participation in African countries is essential if the myriad poverty and underdevelopment problems are to be addressed accordingly. This is because participation's intention should be premised on the notions of both problem identification and the necessary interventions to resolve such societal problems. The question of public participation is usually a highly politicised matter partly because it deals with decision making for the communal resources which are at the disposal of the public. In this regard, it means that influencing decisions remains an important individual and collective status of most groupings including African countries.

In asking a question of who really participates in the decision making process, particularly those that consider the usage of public resources, part of the answer could be found in the fact that a dominant elitist model has taken over decision making in many respect. While this matter may have been debated in the extensively in the public policy literature, what has not been clearly quantified is these elitist's interest. That is, whether the interest is for individuals and private gains over the societal benefits.

Public participation has been enacted in most of the countries south of the Sahara Desert and therefore raises expectations that major policy decisions such as education, housing, taxes, among others, should be influenced by those that are affected by such decisions, either directly or indirectly. For example, in a scenario whereby a public education fee is considered for an increase, different stakeholders require an opportunity to input their opinion on how the proposed policy amendments are likely to affect their constituencies going forward. A general understanding on this is that these stakeholders usually represent sections of the society which need such a voice in policy processes such as during such proposed amendments.

While such provisions are put in place to ensure a representation of those who need such a support, it is not always undertaken in the manner expected. In fact, in most cases, those who are expected to represent communities often have their priorities conflicted for one reason or the other. One key example of this assertion relates to the model of an election system which is a proportional representation whereby the elections of leaders are to the political parties who then have the power to nominate their members according to their own internal party processes. In regard to this, the issue of interest and loyalty of these elites often shifts away to favour individuals and political parties and not the community. This is despite the fact that these nominated individuals are expected to properly articulate societal needs. This kind of a system has positive advantages in cases where the minority's rights and representation are protected. However, in cases where the democratic processes are maturing, the challenge remains whether such a system is relevant since it is difficult to keep those representatives to account directly to those they are serving. If direct accountability to the society is enforced, then there would be dubious reporting which may not assist.

BROADENING THE PARTICIPATION OF AFRICANS IN THE GOVERNMENT AFFAIRS

This paper makes an attempt that when proper public participation channels are used in the Sub-Saharan African countries, the nature and shape of public policy would unavoidably favour citizens. This is because, the governments' undertakings have always meant to address the needs of the society, although in many cases in the African continent, an aberration to this thinking has been observed, especially since the 1960s after most countries were decolonised. Therefore, as captured in the discussions and literature above, some of the following aspects should be borne in mind in the ensuring of proper public policy and participation models which favour citizens:

- Governments that are in power through credible and legitimate election processes. While this is difficult to institute, the creation of democratic institutions and systems which are supportive of the rule of law needs urgent attention.
- A clarification of establishing civil societies which are able to maintain their mandate of addressing African issues. This is because, the role of a civil society is crucial in the development of policies that are relevant to African conditions. However, civil societies in most Sub-Saharan countries have been accused of conniving with and representing the views of the former colonial masters at the expense of the communities they claim to serve.
- Consolidating democratic systems is the essence of every government in Sub-Saharan Africa. The question of *trias politica* requires that each arm of government maintains its independence from the others. Usually, because politics (and ruling political parties) tend to conflate their responsibilities in dealing with this matter. This model could serve as a pillar that holds accountability for the success of any democratic dispensation if well implemented. Otherwise, an alternate model which considers African contexts should be investigated and promoted.
- Consolidating the role of African democratic systems at regional and continental levels to ensure that issues of political and socio-economic development are improved for the integration of the African systems.

CONCLUSION

In serving the needs of the people, governments' public policy is fundamental. Usually, the shape of public policy is influenced by the public participation of its citizens. This paper undertook to understand whether sub-Saharan countries can broaden democratic participation to their publics to influence public policy and decision making processes. In order to address this, several observations and discussions have been advanced, namely, the issue of policy making process and the different roles of government and its publics, participation modalities and who participates in the government affairs, as well as the broadening of participation of Africans in the government affairs. In the final analysis, it is argued that several considerations should be made, especially in the broadening of participation which sets out to allow citizens to input their views in shaping public policy to their favour.

UBUNTU-CENTERED ASSESSMENT IN RURAL-BASED HIGHER EDUCATION UNDERGRADUATE PROFESSIONAL PROGRAM OFFERINGS

C.M. Phiri and R.T. Lebeso
University of Venda, South Africa

ABSTRACT

Ubuntu is significant for everyone who wishes to understand the dynamics of rural settings and the heart of African people and their age-old values and belief systems. Mainly, the ancient concept of Ubuntu denotes a combination of the following elements; acknowledgement of the interdependence of people, respect for one another as a virtue and the need for inter and intra-personal relationships founded on cultural sensitivity for all parties involved. Invariably, in rural settings, how much people trust each other ranks highly in comparison to urban environments, even within the same country. Ubuntu provides exactly the kind of attitude needed to resolve a myriad of complex issues the rural-based Higher Education Institutions are currently confronted with; for example, curriculum relevance and the credibility of the attendant assessment processes. Consequently, this paper seeks to address an intriguing question, 'What does assessment measure and evaluate in rural-based Higher Education undergraduate professional program offerings?'

INTRODUCTION

teaching and learning practices, including the Field Instruction (FI) program assessment processes of some Higher Education undergraduate professional program offerings in South Africa are not doing justice to the cultural dynamics at play in rural-based settings. Besides, when rural-based learners who have no exposure to alternative settings by virtue of the dynamics of their upbringing encounter professional offerings – with the eminent reflections and the attendant workplace integrated learning or FI assessment processes they experience academic and cultural shock. Students can become anonymous failures, unrecognized, unseen and deeply troubled. All this implies that much more must be done by the Basic Education System (schools) and the Higher Education Institutions (universities) to address these gaps. On observation in South Africa, employers complain about the language competence of our graduates, and refer to a poor work ethic and to the absence of analytical skills.

This paper seeks to answer an intriguing question: *'What does assessment measure and evaluate in rural-based Higher Education undergraduate professional program offerings?'* Furthermore, the purpose of this paper is to contribute to a cumulative process of understanding how Higher Education undergraduate professional qualification assessment processes may borrow lessons from a tapestry of context-based meanings offered by cultural dynamics at play in different rural-based settings, without compromising the quality and program-specific standards. In the ensuing discussion, specific reference is made to social work and nursing science professions, respectively. The ancient concept of Ubuntu is engaged in informing the ensuing discussion, concluding with a resounding appeal to teachers, practitioners, researchers and other stakeholders' practice perspectives to heed a *'Return-to-Ubuntu'* call – which advocates a context-based preference of Afro-centric Ubuntu-Centered perspectives.

Furthermore, given the realities of linguistic and colonial biased-past, juxtaposed to the imperatives of The 1997 White Paper on Transformation of Higher Education, the significance of a paying attention to socio-cultural needs of indigenous or local community members when engaging teaching and learning practices, FI programs assessment, including the attendant profession-specific moderation processes cannot be overemphasised. This discussion is premised on the notion that mainly, assessment processes and related

perspectives are hugely influenced by issues of the local context, respective epistemologies, what and how students learn. It is noted that assessment has much to do with the formation and development of the professional self as impacted by profession-specific ethics, standards and quality assurance processes as determined by respective regulatory and accreditation associations, for example, the professional Standard Generating Bodies. Also, when embedded effectively within the larger culture of respective institutions, context-based assessment can help the teachers, practitioners, researchers and other stakeholders to collectively examine their assumptions, epistemologies, including perspectives that inform their own teaching and learning practices - with a view to consequently embrace a shared profession-specific and interdisciplinary academic culture dedicated to building and improving the capacity of the Higher Education sector in South Africa and internationally.

CULTURE, CONTEXT AND RELEVANCE

Culture consists of socially established structures of meaning that are passed down to members of cultural groups through behavior, narratives and stories. Narratives and stories are important because they structure the meanings by which a cultural group lives (Freeman and Couchonmal, 2006, p. 119). Additionally, culture is a set of interrelated behaviors, beliefs, values, attitudes and practices that are transmitted or communicated from generation to generation.

In the professional practice of Social Work and the Nursing Science, stories provide themes and issues that can help service providers to understand patients or cultural groups' connection to their past, and may ultimately help teachers, practitioners and student-practitioners to understand their current situations as enhanced by the culture-based narratives. Besides, FI can be an effective pedagogy when learning goals of specific courses include having students understand how a specific discipline plays out in a socio-cultural context. For example, having student understand how the two disciplines of Social Work and Nursing science collaborate in addressing the Health Promotion and Public Health issues facing society today, engaging multi-disciplinary perspectives and best practice models that reflect a sense of respect for the culture of local community members.

It is noted that culture strongly influences how people meet their basic needs, cope with the ordinary problems of life, make sense out of their experiences (their sickness, illness and diseases included), and negotiate power relationships, both within and outside their families and local communities alike. Thus, for the teacher, including student-practitioner working with patients and their families and/ or local community members it is important that they develop acceptable levels of cultural competence. As a result, reference will be made to the latter in the ensuing discussion. Mainly, cultural competence entails using sensitivity to the client/ patient's cultural background. Addressing the social work teacher and practitioner (Horejsi, 2006, p. 172-173) maintains that the social worker must be sensitive to his or her own culture and how that affects the manner in which he or she perceives clients and provide services. The same could be said about the professional nurse in the course of discharging their day-to-day duties, given that the latter professions are about improving the quality of life and health for all people irrespective of their race, creed or socio-cultural background.

ASSESSMENT CONTEXT DEFINED

According to Linn and Miller (2005), assessment is a systemic process that drives learning and begins with identification of learning goals and end with judgment concerning the extent to which these goals are achieved. Assessment includes a wide range of procedures that can be used to assess the student progress toward attainment of goals. These wide ranges of procedures are used to supplement the teacher's informal observations of students and are a more systemic measure of aptitude, achievement and personal development. These procedures may include observations, ratings of performance, projects, well extended responses or essays, students self-report including paper and pencil tests.

Furthermore, assessment that stimulates learning should have adequate sampling of the performances of complex competencies that cannot be broken down to form a holistic assessment (van Vleuten and Lambert, 2005, p. 309). Also (van Vleuten and Lambert, 2005, p. 315) hold that good assessments programme should incorporate several competency elements and multiple sources of information to evaluate those competencies on multiple occasions using credible standards. Making specific reference to the training and assessment of physicians (Epstein, 2007, p.2) postulates that the goals of assessment includes optimizing the capabilities of

learners by providing motivation and direction for future learning, protect public by identifying incompetent physicians and to provide a basis for choosing applicants for advanced training.

ASSESSMENT PROGRAM OBJECTIVES

It is noted that the generic objectives of an assessment programme include:

- To determine pass or fail of a learner. Meaning, the mark obtained will determine the promotion decision (Epstein, 2007, p. 3).
- To provide feedback during formative evaluation for improvement. Progressive feedback is very important in assessment as it ensures that any final decision does not come as a surprise to the learner. In case where feed-back is indicative of failure, a mechanism along the way should be implemented to remedy the situation (van Vleuten, 2005, p. 309). Furthermore (Epstein, 2007, p. 3) also emphasizes the value of feedback as it is said to optimize the capabilities of learners and teachers and by providing motivation and direction for future learning.
- To assess the cognitive aspect of the students (knowledge and intellectual skills), which includes the ability of the student to recall data, understand, use, analyze, synthesize and evaluate. Finally, the ultimate purpose in cognitive assessment is to evaluate if the learner has the ability to judge based on the specific criteria which can be internal (organization) or external criteria (relevance to purpose) (Linn and Miller, 2005, p. 526).
- To evaluate the effectiveness of the program and implement quality assurance processes to ensure that specific programme is of acceptable quality within the socio-cultural context in which it is offered. Here, the aim is to define the criteria that can be used to judge quality.

ELEMENTARY KNOWLEDGE STRUCTURES TO BE ASSESSED IN UNDERGRADUATE PROFESSIONAL OFFERINGS

The need to explain to students the ‘what’ and ‘why’ of Field Instruction in the early phases of their course of study cannot be overemphasized. Overall, this means making clear to students what their individual commitment to the FI projects will be. To this end Kelly (2012) notes that “By participating in service, students take on a responsibility beyond their performance in class. For, example, if a student does not complete a term paper, his or her grades suffer but it does not affect others. If a student does not show up for a service activity, community members can be adversely affected” (p.1). Alongside this, it is also important to explain to students the ‘planning-reflection-action’ principle of the life-cycle of every project. Students need to comprehend what critical reflection means and why it forms an essential part of their Field Instruction program.

Furthermore, based on the System’s framework, the approach to helping people for the two professional disciplines grows out of the basic premise that human beings can be understood and helped only in the context of their intimate and broader social systems of which they are a part, Sheafor and Horejsi (2006). As indicated earlier, culture seems like an all-encompassing word for the application of the latter. On the other hand, at the center of postmodern thought, social construction seeks to understand the processes, by which people describe, explain (for example, the origins of their sickness, illness and diseases) and ultimately view the world and themselves.

Also, social constructivism holds that the individual’s past experiences, backgrounds, historical contexts and social exchanges influence their knowledge and understanding of the world around them. Again, the concept of culture seems to be the most appropriate word in terms of summarizing the latter. And ultimately, this very concept of culture enable the intriguing question raised by the authors to be addressed, namely, *‘What does assessment measure and evaluate in rural-based Higher Education undergraduate professional program offerings?’*.

Notably, this notion and use of the concept of culture provides a means of bringing analysis of the field of assessment; including the attendant knowledge, the intellectual production and the reproduction thereof within

the framework of rural-based Higher Education undergraduate professional offerings. Furthermore, three socio-cultural and context-related issues of interest that stand to render the envisaged professional interventions both meaningful and sustainable beyond the termination of the student-practitioner's FI are identified and discussed, namely: (a) the attitude of both the teacher and the student-practitioner, (b) cultural competence and (c) the embedded knowledge and the skill to be appropriated by both the teacher and the student-practitioner during the administration of the FI at different levels of their course of study. That said, a brief illustration on their application follows, proposing what the student-practitioner needs to be taught as part of their learning goals in their individual elementary knowledge structures within the context of their respective programs. It is envisaged that these learning goals would inform the formative and the summative assessment processes, with a view to enhance motivation and direction for future learning - given the notion of life-long learning for both the teacher and the student.

(a) The attitude of both the educator and the student-practitioner

This refers to the attitude of students towards the cultural heritage of the indigenous or local people where they are required to conduct their Field Instruction (FI), otherwise referred to as Work Integrated Learning (WIL) program. Students need to be taught that they need to 'sit down' ask questions and listen to the belief systems and issues of the local people or patients as a critical determinant for the success of their FI because they are the ones who know their traditions, culture and values best, and as such they are experts in their own rights. This calls for the 'critical reflection' principle to be incorporated in all phases of student-teacher FI experiential learning. It is noted that 'critical reflection' enhances learning in that it presents countless opportunities for the teacher and students to examine the meaning and socio-cultural significance of experiences, data or different FI-related encounters. Because this has a direct bearing on the assessment of the FI program, Hvenegaard (2012) holds that "both the teacher and the student might want to create a list of recommendations that might improve an activity for future students" (p. 3). The latter may take the form of required process notes, a group debriefing and sharing circles in the form of special FI tutorial sessions.

(b) Cultural competence

This is the critical cultural consciousness or the functional knowledge of the culture, belief systems, the norms, traditions and rituals, including the local traditional leadership tribunal systems. In this case, students need to be taught that expression of trust, respect and belief in local people and acknowledging their traditional leadership as credible in that context – when expressed through cultural competence in their client/ patient relationship, enhances the value of teaching and learning practices, including the attendant assessment process. The principle being expressed in the latter is that the means (the process of communication information or knowledge) justifies the end, namely, the envisaged professional intervention the student-practitioner is expected to propose and administer to the community members, clients or individual patients, respectively.

However, it is noted that the major challenge facing designing and administering a FI program in a rural-based setting is finding Community-Based Organizations (CBO's), understanding their needs and all the attendant logistical issues. And given the notion that CBO's deeply understand local issues and their contextual manifestations Kelly (2012) maintains that "sharing a draft of the FI syllabus with them as partners to solicit their input on the learning outcomes, including the students' learning goals is crucial for the effectiveness and quality assurance processes, measuring and evaluating the effectiveness of assessment procedures" (p.1).

(c) The skill to be appropriated during FI program

This refers to the ability of both the teacher and student to appropriate the abovementioned sections (a) and (b) confidently within the generic and specific learning outcomes of respective professional degree program offerings at different levels during their course of study. Also, given the notion that in South Africa the learning outcomes of the Social Work and the Nursing Science professions are predetermined by their respective Standard Generating Bodies, the teacher's role is to present a wide variety of pedagogies that can be used to help students achieve those learning outcomes. Besides, for the two disciplines, the FI program becomes an ideal pedagogy to achieve those learning outcomes.

Additionally, students need to be taught that they would do well to use the local peoples' 'frame of reference' as a point of departure in their FI program as it renders the process of learning and the attendant assessment

processes meaningful and credible for the local people especially. Besides, this is one way to communicate respect for the local people, clients and/ or the patients, respectively.

CONCLUSION AND RECOMMENDATIONS

The preceding discussion sought to address an intriguing question, ‘what does assessment measure and evaluate in rural-based Higher Education undergraduate professional offerings’? Socio-cultural and context-related issues that need to enjoy prime currency during assessment processes of rural-based Higher Education professional offerings were identified and discussed. An illustration of their respective FI application was presented; given the notion that the thrust of the professions of Social Work and Nursing Science is to improve the quality of life and health for all people irrespective of their race, creed or socio-cultural background. It is noted that the overarching objective of the assessment process in rural-based Higher Education undergraduate professional offerings is to evaluate their effectiveness and to implement quality assurance procedures to ensure that the program is of acceptable quality in the socio-cultural context within which they are offered.

Furthermore, when embedded effectively within larger culture of respective institutions, rural-based and context-based assessment processes can help teachers, practitioners, researchers and other stakeholders to collectively examine their assumptions, epistemologies, including perspectives that inform their own teaching and learning practices; with a view to consequently embrace a shared profession-specific and multi-disciplinary academic culture dedicated to building and improving the capacity of the Higher Education sector in South Africa and internationally. This paper is an advocacy tool appealing to teachers, practitioners, researchers and other stakeholders’ practice perspective to heed a ‘Return-to-Ubuntu’ call – which promotes a context-based preference of Afro-centric Ubuntu-Centered perspectives.

ORPHANS AND VULNERABLE CHILDREN (OVC) PROGRAM MANAGEMENT: THE CASE OF HOPE WORLDWIDE SOUTH AFRICA

C.M. Phiri
University of Venda, South Africa

ABSTRACT

HIV is an epidemic affecting all people in the world regardless of race, gender or class. The epidemic has also left children alone due to death of their parents, often during their prime years of life, devastating families and communities. Stigma-related issues may cause orphans to be denied access to schooling, health care, housing and other social security services. Worst still, Orphans may also be stripped of their inheritances and property, and thus further jeopardize their livelihoods as orphans. It is aptly noted that in countries that have high levels of HIV infection, an apparent trend is that the increase in Orphans and Children made Vulnerable because of HIV and AIDS (OVC) has been so sporadic that it has overwhelmed the extended family system. The aim of the study was to investigate the role and challenges faced by the OVC Program Manager in improving the health and quality of life of affected children in Johannesburg, South Africa.

INTRODUCTION

UNAIDS (1999) asserts that a child is orphaned when he/ she loses both or either one of the parents. It is noted that in countries that have high levels of HIV infection, an apparent trend is that the increase in Orphans and Children made Vulnerable because of HIV and AIDS (OVC) has been so sporadic that it has overwhelmed the extended family system. Orphans themselves are in a difficult position, having to contend with conditions that are financially, socially and emotionally dislocating. Besides the financial constraints, orphans are more prone to have their schooling disrupted as they move around between caregivers and thus are likely to perform poorly in school. Adato et al., (2006) hold that orphans encounter many difficulties in staying at school which infringes on their right to education. Also, stigma may cause orphans to be denied access to schooling, health care, housing and other services. The incidence of dropping out of school and falling behind in school is greater for children orphaned as a result of HIV and AIDS in comparison to other causes of orphan hood.

Studies show that orphans were also more likely to have dropped out of school compared to non-orphans, citing financial difficulties as the main reason. Literature also indicates that non-orphans have superior rates of school attendance compared to children orphaned by HIV and AIDS. While there is no conclusive evidence to suggest that orphaning per se increases the risk of children missing school, research from Uganda suggests that double-orphans are most likely to miss out on an education, UNICEF (2006). For example, in Africa in 2005, 70 per cent of non-orphans attended school compared to 62 per of orphaned children, UNICEF (2006). Furthermore, a study conducted during 1991-1994 in Tanzania found that the death of a mother or both parents negatively impacted on school enrolment, Ainsworth et al. (2005). Again, access to education tends to be skewed in favour of male children and the education of girls is often compromised. Evidence from Kenya showed that young girls were most likely to fall behind in school on death of a parent as girls' education was deemed unimportant, Ainsworth et al. (2005). Worst still, Orphans may also be stripped of their inheritances and property, and thus further jeopardize their livelihoods as orphans. On the other hand, in 2006 the South African Department of Health estimated that by the year 2010 South Africa will have 2.3 million orphans, or approximately 15, 8% of the total child population.

Hope Worldwide South Africa is a Nonprofit Organization established in 1991. It is a Faith based Organization affiliated to the International Churches of Christ involved in community-based HIV and AIDS care, support and prevention efforts. These programs began in South Africa, Soweto in 1994 and quickly expanded to offer services at over 30 sites. The NGO works in partnership with the government, decision-makers and professionals with trained staff at all levels of management, supervision and operation, www.africa.hopewww.org. Furthermore, Hope Worldwide South Africa OVC Program Manager is a professional social worker; and professional social workers play multiple roles in promoting the health and wellbeing of their communities, individuals and society. Social Work is an applied science and mainly, it is concerned with how people and their environments interact and the factors that affect their ability to accomplish the life tasks, distress and realize their aspirations and values. In South Africa, The 1997 White Paper on Developmental Social Welfare provides regulatory framework for social welfare services to be rendered along the continuum of Prevention-Development-Care-Support. This paper is based on research conducted in 2006 at Johannesburg, Gauteng Province.

METHODOLOGY

The aim of the study was to investigate the role and challenges faced by the OVC Program Manager in improving the health and quality of life of affected children in Johannesburg, South Africa. The study adopted qualitative research methodology and purposive sampling was used. A semi-structured interview guide was designed with open-ended questions developed to avoid ambiguity and bias, and 10 key respondents in the employ of Hope Worldwide South Africa underwent interviews. The method used in the present study provide direction to the interviews, ensuring that the content focuses on the crucial issues of the study, without imposing too much structure in obtaining responses and allowing for exploration of unexpected and potentially significant responses to be framed from the perspective of the participants themselves. Prior to this process, procedures for anonymity, confidentiality and participants' withdrawal were designed to ensure ethical integrity and minimize any risks of participation in the study. Data analysis was conducted on interview transcripts based upon Ross-Jones and Longhurst (2010) six-phased thematic analysis approach cited in Phiri and Perron (2012, p. 163). A summary of this data analysis approach as undertaken in this study is provided in Table 1. The researcher depended primarily on respondents descriptive narrative accounts of their day-to-day lived experiences as OVC Service Providers, and themes identified using this approach form the evidence base from which this research draws its conclusions.

Table 1: Summary of the six-phase thematic analysis process undertaken.

Phase	Description of the process
1. Familiarize with data	Raw data transcribed, transcripts read and re-read
2. Generate initial codes	Segments were coded for as many features as necessary. Once all data was coded, data were collated by code. Final transcripts read and all segments of data were systematically coded for features
3. Search for themes	A list of codes was produced and related codes were gathered into potential themes. All data relevant to each theme was then collated
4. Review themes	Data relating to each potential theme was considered in relation to other themes. The validity of themes was considered in relation to entire data set.
5. Define and name themes	A detailed analysis was conducted on each theme by organising data into a coherent account, with narrative. Constructs were given to each theme for the written account.

6. Produce the report	The final analysis of themes was conducted and presented in the report

Results and discussion

The 1997 White Paper on Developmental Social Welfare categorically states that the Government is committed to giving the highest priority to the promotion of family life and to the survival, protection and development of all South African children. Furthermore, this White Paper indicates that family support programs should address the fundamental causes of family disintegration. In this case, the latter presents itself as HIV/ AIDS, leaving children as orphans, vulnerable and disenfranchised. Through the narrative analysis, the following three themes that relate to the aim of the study were identified:

Theme 1: *OVC funding sources for Hope Worldwide South Africa*

Results reveal that a significant amount of the NGO program funding is provided for by the International Churches of Christ involved in community-based HIV and AIDS care, support and prevention efforts. Given that Hope Worldwide South Africa as an NGO is an initiative that has its roots in the United States of America, this assertion is understandable. In South Africa, the government has introduced various types of poverty alleviation measures, and social security assistance assumes a prominent role. Social grants like Foster Care Grant (FCG) fulfill a crucial role in the poverty alleviation process and are essential in helping poor households enjoy a life of dignity and it is envisaged that it will help in meeting minimum standards of living. It is noted that in South Africa the extent and scope of social assistance is well defined, however, a source of concern is that the impact of HIV/AIDS and the attendant OVC phenomenon trajectories are evidently causing a strain on related grants. It is for this reason that initiatives like Hope Worldwide South Africa are a most welcome and sought after intervention. At the time of the study, the value of FCG was R590.00.

Foster care is a crucial element of care for children whose parents have passed-on or who are simply unable to care for themselves. The original role of the foster care system, namely, protecting children in distress has been put under pressure by the HIV/AIDS pandemic which is overwhelming even the extended family and household systems. For example, the number of beneficiaries of the FCG grew from 245, 798 in March 2005 to 300, 119 in March 2006, an increase of 22%. Reasons attributed to the latter are varied, and include the changing emphasis on the scope of the grant. An audit in 2004 found that FCG was being utilized as a poverty alleviation strategy rather than a means to protect children. Moreover, in South Africa, there were already in 2004 533, 747 maternal orphans and 512, 684 double orphans. A total of 251 inter-country adoptions and 2, 256 domestic adoptions were registered during the period 2005/2006. Furthermore, the Department of Social Development Report (2006, p. vii) also found that children come to the foster care system when they are older than 7 years of age, 52% of foster children were 13 years or older and only 10% were younger than 7, and 8% older than 17.

Theme 2: *Employee Assistance Program (EAP)*

On this issue, respondents' responses varied in terms of depth of their understanding and articulation. However, all 10 agreed that that was an area that needed a lot of attention from the NGO Management side. On this note, The Department of Public Service and Administration (NDPSA), (1997) provides that the following eight *Batho Pele Principles* are a strategy to kick start the transformation of public service delivery, a part of enhancing participatory democracy and are applied to demonstrate a caring accessible and accountable service; namely, consultation, service standards, access, courtesy, information, openness, transparency and redress. Given the notion of *Batho Pele Principles* being a value statement of ethical and accountable or professional work that is committed to public service excellence, through the narrative analysis of the three themes all 10 participants could relate to the latter and all the Post-1994 South African gains. However, as Service Providers, the single most important and overarching burden as far as their situation is concerned is EAP. Since the provision of the latter has financial implications, it is noted that this is where the government of South Africa should take the lead, and lead by example. Furthermore, an encouraging observation is that internationally EAP is a management

function; also as a policy imperative it is locally in harmony with the intents of the 1996 Constitution of South Africa, namely, to improve the quality of health and life for all citizens

Theme 3: *Content of their OVC Program*

Mainly, the NGO OVC Program comprises psycho-social support for the children registered with them. This includes counseling services, aftercare (after school) and homework supervision for the children and a recreation club for school holidays and weekend activities. Through this club, children are also taken on different excursions. According to the OVC Program Manager, the bulk of the time is spent on training and supervising the care givers since all the programs are based in their respective local communities where all children originate from.

The United Nations Declaration of Commitment on HIV/AIDS implores countries to develop strategies to support OVCs as a means of alleviating the impact of the epidemic on children. Measures in this regard should include guaranteeing their equal access to education and other services, and shielding them from abuse and stigmatization, UNGASS (2006). OVC and the attendant management issues are most pressing in Sub-Saharan Africa. Almost 49 per cent of countries in sub-Saharan Africa rate their efforts of addressing the needs of OVCs as average or below-average. Among the 25 countries in Sub-Saharan Africa that have adopted national policies to deal with OVCs, only 21 had reduced or eliminated school fees for vulnerable children and set up community-based programmes to assist OVCs, UNGASS (2006). OVC statistics in selected Southern African Development Countries (SADC) reveal the following about orphaned children: 1 200 000 in South Africa, 1 200 000 in Zimbabwe, 710 000 in Zambia and 120 000 in Botswana, UNICEF (2006).

The latter, including the The 1997 White Paper on Social Welfare and related policy imperatives provide for a rationale for the study. Besides, given the ever-present need to monitor and evaluate the impact of our professional interventions, the overarching rationale for conducting and subsequently reporting on this study is to track how the OVC phenomenon trajectories have evolved over time in South Africa. These results are important because they represent an important contribution to the study of OVC Program Management in South Africa; being among the first qualitative studies to build on empirical foundation of knowledge using phenomenology for understanding issues associated with the phenomenon of OVC from the perspective of the Service Providers themselves.

CONCLUSION AND MANAGEMENT IMPLICATIONS

The study sought to investigate the role and challenges faced by the OVC Program Manager in improving the health and quality of life of affected children in Johannesburg, South Africa. Mainly, results reveal that in the light of the 2010 2.3 million children predictions alluded to earlier, this OVC program is a much needed service South Africans cannot have enough of. Its objectives are timely and noble, and the results on the ground speak for themselves. In the same vein, results point to a need for this NGO Management to consider the wellbeing of their respective employees as equally important in rendering this worthy cause sustainable.

Overall, harnessing wisdom on the future of this OVC Program, this NGO has opportunities to be among leaders in the field of OVC Program Management in South Africa and globally. Therefore, this paper concludes that failure on the part of the NGO Management to act swiftly on developing EAP might lead to institutional 'brain drain' whose repercussions the orphans and the entire country can ill afford. Furthermore, it is envisaged that when their envisaged EAP is embedded effectively within the corporate management systems, it may help pioneer a business culture dedicated to building the capacity of the NGO sector in South Africa and globally. It may well be that the implementation of the recommended EAP may serve as a model that could be adopted and adapted locally and internationally; given that the agenda of Hope Worldwide NGO is developmental and their strategic partners are international with an established office in South African. Besides, internationally EAP is a good management practice; and locally, it is a policy imperative that is in harmony with the intents of the 1996 Constitution of South Africa, namely, to improve the quality of health and life for all citizens, and in this case, this NGO's employees included. Thus, the challenge for Hope Worldwide South Africa management is finding a balance between investments in human resources and other investments in economic growth as a policy imperative critical in ensuring that trade-offs do not bias the human capital.

CHALLENGES OF ENTREPRENEURS OF SMALL- AND MEDIUM-SIZE COMPANIES IN THAILAND WITH FOCUS ON GENDER INEQUALITIES

Nimnual Piewthongngam

University of the Thai Chamber of Commerce, Thailand

ABSTRACT

An investigation among 156 owners of small- and medium-size companies in the Bangkok area has been performed to assess the difficulties in starting and operating a business. The conclusion of previous studies has suggested that there are differences in the challenges facing male and female entrepreneurs. The present survey, therefore, put special emphasis on gender inequalities. In contrast to previous studies, however, no such differences were found. Several common obstacles were nevertheless identified for which recommendations are provided.

INTRODUCTION

A study on women entrepreneurship of the Organisation for Economic Co-operation and Development (OECD) (2004) concluded that female entrepreneurs create new jobs for themselves and others but by working differently than men, also provide society with different solutions to management, organization and business problems as well as to the exploitation of entrepreneurial opportunities. However, for women there are many additional obstacles than for men. Women's opportunity to operate small and medium enterprises is found problematic not only in developing countries but also in developed countries.

U.N. Women and International Labour Organization (ILO) policy brief (2012) notes that, in the area of women's economic and human rights, their contributions and priorities have been largely overlooked. They are more likely to be unemployed than men, dominate the unprotected informal sector, are more likely than men to be in part-time formal employment in most high income regions, spend more time than men in unpaid care-work globally, have lower levels of productivity and earn less than men for work of equal value and are poorly represented in public and corporate economic decision-making (p.3).

Women from all around the world experience difficulties both in the beginning phase of starting a business as well as during business operation, especially from their family responsibilities as daughter, wife, or mother. The OECD report (2008) concludes that cultural beliefs about gender (so called gender beliefs) are the component of gender stereotypes that contain specific expectations for competence and knowledge acquisitions. Additionally, it is this component with its specific expectations of competence that presents special problems for gender equality. The OECD report illustrates that gender beliefs are also cultural scheme for interpreting or making sense of the social world. Thus they represent what we think "most people" believe or accept as true about the categories of "men" and "women". In most countries men are widely believed to be more competent than women, except when performing feminine tasks. As we will see below, substantial evidence indicates that entrepreneurship is stereotyped as a "masculine task" (OECD 2008).

This argument also fits the description about perspective of men and women in Southeast Asia regarding to the competence to do business where men have been dominating and playing important role in business society for decades. Women were expected to take care of families and children while men were

operating businesses. Even though women have historically participated in business role at modest levels compared to men, the number of women entrepreneurs has been increasing significantly compare to men (Piperopoulos 2012). Despite a generally admitted scarcity of theories, knowledge and statistical data both from academic research studies and from national and international research and policy bodies on female entrepreneurship, in the last two decades, women-owned businesses are increasingly becoming a significant part of local and national economies. (Adesua-Lincoln 2012). Many women have been forced into alternative avenues of generating an income, with a greater number of women setting up business.

The change of culture and behavior toward women plays an important role in this new development of women entrepreneurship. Currently, women obtain equal opportunity to access to higher education and to become business owners. Furthermore, business society accepts that women are competent just like men. However, women in some countries are still held back by conservative mores that consider women incompetent at business and should instead focus on traditional female roles such as familial responsibilities. In additional, women need to be fully engaged in efforts to shape responses to these interfacing crises, both in terms of influencing the design and assessing the impacts of recovery packages from a gender perspective, and have an equal voice with men at all levels of economic decision-making (UN Women-ILO 2012).

Even in many E.U. countries, women continue to face traditional views similar to the view of women in Southeast Asia (EU Commission 2008), which lead to great difficulties in balancing the family responsibilities with work in fast-moving and highly competitive sectors. Such types of work expect long and flexible working hours and demand to be up-to-date on technical developments and market opportunities.

The Ministry of Industry of Thailand issued Ministerial Regulation in 2002 that classified SME into 4 sectors; manufacturing industry, wholesale industry, retailing industry, and service industry. Furthermore, a definition of each chapter is also defined.

Industry	Small Enterprise (S)	Medium Enterprise (M)
Manufacturing Industry	Enterprise which corresponds to any of the following: with employees of up to 50 or with assets of up to 50 million baht	Enterprise which corresponds to any of the following with 51-200 employees or with assets of no less than 50 million baht and up to 200 million baht
Wholesale Industry	Enterprise which corresponds to any of the following: with employees of up to 25 or with assets of up to 30 million baht	Enterprise which corresponds to any of the following: with 26-200 employees or with assets of no less than 30 million baht and up to 50 million baht
Retailing Industry	Enterprise which corresponds to any of the following: with employees of up to 15 or with assets of up to 30 million baht.	Enterprise which corresponds to any of the following: with 16-150 employees or with assets of no less than 30 million baht and up to 60 million baht
Service Industry	Enterprise which corresponds to any of the following: with employees of up to 50 or with assets of up to 50 million baht	Enterprise which corresponds to any of the following: with 51-200 employees or with assets or no less than 50 million baht and up to 200 million baht

Source Asia Foundation (Thailand) 2012.

Thailand's economy has been driven by small and medium enterprises (SMEs). The estimated number of SMEs in 2012 was nearly 3 million, which is about 99% of all size enterprises in Thailand. However, there are no numbers available on the gender of the entrepreneurs. Therefore, the number of women entrepreneur is not identified. Unlike before, Thai society is now more open to accept women to do businesses. Under the assumption that women experience some difficulties to do business more than men in the same businesses, this paper focuses on the constraints on women entrepreneurship that contribute participation in Thai economy and aims to identify and understand constraints to women's full participation in economic the growth. The study is

concluded with recommendations on how to improve women's capacity to fully play their role as economic actors.

LITERATURE REVIEW

There are many studies that show that there are many obstacles that women have faced in doing businesses. The main difficulties can be found in many forms regardless the development of countries. Women in Thailand, or other developing country likes Laos, often share the common challenges with women in certain European Union countries for instance: difficulty to start a new business, less opportunity to access finance, lower personal finance asset, sex discrimination and entrepreneurship (Loscocco & Leicht 1993). Studies on women entrepreneurs show that women have to cope with stereotypic attitudes on a daily basis. Business relations as customers, suppliers, banks, etc. constantly remind the entrepreneur that she is different, sometimes in a positive way such as by praising her for being a successful entrepreneur even though being a woman. Employees tend to mix the perceptions of the manager with their images of female role models leading to mixed expectations on the woman manager to be a manager as well as a "mother". The workload associated with being a small business manager is also not easily combined with taking care of a family.

Bruni, Gherardi and Poggio (2004) view that Studies conducted in the majority of the Western countries identify three main types of barrier against female entrepreneurship. First, the socio-cultural status of women, which identifies the primary role of women with family and domestic responsibilities and reduces the credibility of women intent on setting up businesses in a variety of ways. Secondly, the access to networks of information and assistance, which are often the main source of information and contacts, but which equally often comprise more or less overt mechanisms of gender exclusion. Finally, access to capital; whether women entrepreneurs apply to an institutional financier (a bank, a finance agency), a friend, a relative or even her spouse, they are likely to come up against the assumption that "women can't handle money".

In the European Union (EU), a study of the EU Commission on women innovators and entrepreneurship in the EU in 2008 concludes that woman's obstacles to innovative entrepreneurship composed of 3 types:

1. **Contextual obstacles:** educational choices, including traditional views and stereotypes about women involving science and innovation;
2. **Economic obstacles:** innovation sector requiring substantial investment and women being seen less credible financially than men;
3. **Soft obstacles:** lack of access to technical, scientific, general business networks, business training, role models, and entrepreneurship skills.

Even though number of female entrepreneurs around the world has been rising, they are still facing many unique challenges and obstacles when they play in a male-dominated field.

METHODOLOGY

In order to get better understanding of women's role in Thai SMEs, the interview of 156 SMEs from both male and female who own SMEs in Bangkok and its surrounding provinces has been conducted. The survey covers basic information and the operation of the enterprises, financial constraints and access to capital / credit issues associated with exporting, ability to make a profit, and complete a business goal in the future. In addition, this survey explores relationship of the selected enterprises with other business organizations as well as government agencies. The overall challenges, business experience corruption, safety, security and personal data also included in the result of this paper. The results of this study as well as recommendations are presented herewith.

Fundamental Corporate and Business Information

For business profile and operations, of all 156-business owners, the number of male owners was 45.5% and number of female owner was 54.5%. In addition, Chart 1 shows that there were 33.3% male and 26.3%

female who own and run their businesses. Regarding to the business acquisition, it is found that 21% of male and 22.3 % of female were self-established with partner(s) (see Chart 2). And 19.5% of male and 26% of female in this sample group began their business operations between years 1998-2007.

Chart 1 Number and percentage of the interviewees by position.

Chart 2 Nature of business set up.

The first rank of the primary sector of the interviewees in both genders is wholesale and retail trade. Furthermore, the legal status of the business shows that 21.4 of male and 20.8% of females in the interviewee group registered as a limited company as shown in Table 1 below.

Table 1 Number and percentage of the interviewees by the legal status.

Business status	Male		Female		Total	
	Amount	%	Amount	%	Amount	%
No legal status	3	1.9	1	0.6	4	2.6
Sole proprietorship	6	3.9	13	8.4	19	12.3
Partnership	11	7.1	16	10.4	27	17.5
Corporation	33	21.4	32	20.8	65	42.2
Public listed corporation	18	11.7	21	13.6	39	25.3
Total	71	46.1	83	53.9	154	100.0

This survey also finds that females who owned or co-owned these companies accounted for the number of 84.5% of the samples (see Chart 3). Majority of the female interviewees do not want to invest more times into their businesses (see Table 2).

Chart 3 Number of women who own or co-own small or medium companies.

Table 2 Number and percentage of the interviewees who would like to invest more times to their business.

Intention	Male		Female		Total	
	Amount	%	Amount	%	Amount	%
YES	27	17.3	24	15.4	51	32.7
NO	44	28.2	61	39.1	105	67.3
Total	71	45.5	85	54.5	156	100.0

For labor inputs and location, the samples employ 30 labors on average and half of them being women. Regarding the possession and rental status of the business location, 55% of own and 40.6% rent their business location. It is found that the possession and rental status of the business location seem to be indifferent between both genders. They stated low risk of a business premises or being expropriated by the government. The majority of the interviewees share their opinions that they do not need for legal assistance or official aid and support in the rental or purchase of the business location.

The number of 42.4 % of female interviewees does not find any difficulty in finding a good location of business as shown in Table 3. This demonstrates that women do not find it is more difficult to conduct the business than men. Additionally, the average of working hour per day and week compares to men and women slightly less than men, which indicates the capacity to work closely to that of men.

Table 3 Number and percentage of the interviewees by the difficulty of female owner in looking for the appropriate place of business.

Comment	Male		Female		Total	
	Amount	%	Amount	%	Amount	%
More difficult	17	11.0	12	7.7	29	18.7
Not more difficult	53	34.2	73	47.1	126	81.3
Total	70	45.2	85	54.8	155	100.0

In regards to clients and suppliers, it was determined that a majority of their sales in 2011 were in Bangkok and surrounding provinces rather than remote areas. And the sales were to customers rather than wholesales. Most of them found their clients through contact with similar businesses. The languages that they use to do business with their clients are Thai and English. The main channel to obtain customers comes from referral from the same type of business. The average proportion of their foreigner clients is 29.13%, the average proportion of female clients is 43.75% and female supplier is 36.79%.

On the survey questions relate to technology, the result yields that 99.4% of the interviewees use computer and IT for accounting and business records as they view that computers and IT play important role to the improvement of their businesses. However, 0.6% of the samplings think the computer and IT are too expensive.

Pursuant to the questionnaire about sustainability and environmental friendly questions, the interviewees find that local customers are concerned about sustainable environment and friendliness. Therefore, most of them change their production and manufacturing as well as services to be more environmental friendly. However, they have yet obtained any type of certification of the environmental sustainability.

Financial and access to capital / credit

The majority of the interviewees have checking or saving account with major commercial banks. The source of start-up capital for most female uses personal or family savings, shown in Table 4, gifts or inheritance and female has fewer attempts than most males to borrow funds in and out of the financial system. Furthermore, the interview finds that female owners do not need financial help from others which shows that women are ready to invest from their saving more than men. Both male and female samplings agree that too long and difficult loan application process and the high interest rate are the challenge of borrowing funds.

Table 4 Number and percentage of the interviewees by the source of capital for starting business.

Source of Capital	Male		Female		Total	
	Amount	%	Amount	%	Amount	%
Individual or household savings, gift or inheritance	62	42.8	67	46.2	129	89.0
Savings from family, friends or community member	-	-	1	0.7	1	0.7
Remittances from migrants working abroad	3	2.1	9	6.2	12	8.3
Borrowed from family, friends or community member	5	3.4	6	4.1	11	7.6
Borrowed from moneylender	2	1.4	3	2.1	5	3.4

Export issues

Most of the interviewees do not export (see Table 5,6 and 7). However, some of them export their goods within Southeast Asia region. One of the reasons that they do not focus on exporting their goods to other countries is the difficulty to find qualified assistance in writing internal legal contracts/documents. It is found that men and women are alike in facing export difficulties. And the challenge in export is completing the administrative process while most of them stated that corruption do not create a difficulty for export.

Table 5 Number and percentage of the interviewees by convenience in exporting goods (exporter only).

Convenient to export	Male		Female		Total	
	Amount	%	Amount	%	Amount	%
Very difficult	5	7.7	5	7.7	10	15.4
Difficult	8	12.3	17	26.2	25	38.5

Issues related to currency conversions and fluctuations	6	9.2	5	7.7	11	16.9
Language barriers	8	12.3	2	3.1	10	15.4
Cultural differences	2	3.1	2	3.1	4	6.2
Others	-	-	1	1.5	1	1.5
Total	28	43.1	37	56.9	65	100.0

Profitability and Future plans/Aspiration

Two major challenges include finding new customers and increase sales. Table 8 illustrates that most of the businesses were profitable in the year prior to the survey. The business owners plan to increase size of their businesses and expand into other main provinces in Thailand.

Table 8 Number and percentage of the interviewees by the next three years business plan.

Business growth plan	Male		Female		Total	
	Amount	%	Amount	%	Amount	%
Plan to increase the size of operations	42	27.5	44	28.8	86	56.2
Will continue operating at present size	25	16.3	35	22.9	60	39.2
Plan to reduce the size of operations	3	2.0	4	2.6	7	4.6
Total	70	45.8	83	54.2	153	100.0

Relationships with business and government organizations

This survey finds that the female interviewees have one-to-one meetings with business people in the same industry more than men. This result suggests that women have stronger interpersonal skills. The male interviewees prefer to socialize with other business people in associations, organizations, informal group meeting or networking events. Additionally, men also enjoy socializing with people in the various social occasions such as parties and weddings more than females. There is small number of women who join business association or organization compared to men.

Table 9 Number and percentage of the interviewees who are the members of association or business organization.

Membership	Male		Female		Total	
	Amount	%	Amount	%	Amount	%
Membership in business association or professional organization						
Yes	38	25.2	43	28.5	81	53.6
No	30	19.9	40	26.5	70	46.4
Total	68	45.0	83	55.0	151	100.0

Both male and female owners have obtained useful information, seminars and trainings from the associations or business organizations to improve and develop their businesses and personal business skill (see Table 10). However, they want those business/entrepreneur organizations to improve access to information about customers via such organization's email or website.

Table 10 Number and percentage of the interviewees by the services that the interviewees expect an improvement from the association or the business organization.

Services needed to be improved	Male		Female		Total	
	Amount	%	Amount	%	Amount	%
Information/trainings for improving business operations	18	12.7	20	14.1	38	26.8
Information/trainings about the use of technology	11	7.7	16	11.3	27	19.0
Information/trainings about government regulations, policies or taxes	12	8.5	16	11.3	28	19.7
Improving access to/information about suppliers	11	7.7	13	9.2	24	16.9
Improving access to/information about clients	23	16.2	22	15.5	45	31.7
Collective bargaining with either suppliers or clients	13	9.2	18	12.7	31	21.8
Improving access to financing	16	11.3	5	3.5	21	14.8
Advocacy/lobbying to the public sector	9	6.3	4	2.8	13	9.2

The result show that to get the support of the business of government, the sampling group does not believe that the government is behind them. Not only do they believe the government agencies are unsupportive towards SMEs but the government officials also are not accessible for the SMEs in order to improve business development. This concludes that the involvement of the SMEs with government and its agencies is inadequate at this time. The seminars and trainings that they have received from the government agencies are related skill trainings (such as accounting, management, marketing, and advertising etc.), which the business owners to be quite useful for their businesses.

Table 11 Number and percentage of the interviewees by the degree of support from the Thai Government, in the viewpoint of the interviewees.

Supportive Level	Male		Female		Total	
	Amount	%	Amount	%	Amount	%
Very supportive	3	2.0	4	2.6	7	4.6
Somewhat supportive	25	16.6	32	21.2	57	37.7
Indifferent	33	21.9	41	27.2	74	49.0
Unsupportive/ hostile	8	5.3	5	3.3	13	8.6
Total	69	45.7	82	54.3	151	100.0

Corruption, safety and security

The survey provides that the majority of both female and male confirm that bribery is a serious problem to their business. The samplings do not agree that women trend to pay for bribery more than men. Women have more concerns about the safety of the business than men for instance hours of work (e.g., not working after dark), travel (e.g., traveling less or not traveling unaccompanied), and physical security investments (locks, window bars, alarms) more than men accept for human security investments (guards or protection payments). The samples stated that they are somewhat worried about the physical security of their business due to crime and/or theft but they hardly pay to gangs, organized crime organizations to ensure the safety and security of their business. Additionally, women seem not to be more worried than men. (See Table 13 and 14).

Overall challenges

As Table 15 indicates, the majority of both male and female view that the market access and relationship with customers are the most concerned the challenges of doing business followed by recruitment and training. The interviewees see that there is no different in difficulty of women to manage a successful business compare to men in the same type of business. This is because both men and women have skills in doing business as they have equal opportunity to obtain their knowledge and skill from training and seminar. Regarding to the difficulty of female business operators success in business in comparison to male business owners in the same industry, the result of this interview shows that the female interviewees do not think that they experience more difficulties than men.

CONCLUSION

The majority of entrepreneur has knowledge about laws and regulations as well as the Government's policy toward to doing business and trade for instance the corporate income tax rate reducing since the year 2011 and a limited company which incomes less that 1.2 million baht per year enjoys corporate income tax exemption. In additional, the registration of a new limited company has become easier since 2010 onwards.

The result of the survey finds no specific challenge that poses a difficulty for females conducting business in comparison to males. In fact, the conclusion from the survey indicates that both male and female entrepreneurs have equal opportunities in conducting business. However, major areas of challenges include the market access and the relationship with customers. Other challenges that create concerns to the SMEs are the access of information and trainings relate to doing business of the SMEs, corruption as well as participation in

government policy-making regarding SMEs. In relation to the above challenges, this report provides some recommendations as follow:

- Improving business skills for instance marketing, business communication, branding and networking events.
- Encouraging female entrepreneurs to participate in business organization such as chamber of commerce and to set up women business association to help each other to do business and create a good platform for women to have stronger voice in business world.
- Requesting that the Government and its agencies relate to SMEs to provide an opportunity to the SMEs to participate in policy making and access to activities arranged by the Government agencies.
- Involving government agencies to pay close attention to SMEs in order to overcome challenges and to develop ability of the SMEs to improve and expand their businesses.

THE CONCEPT OF A CULTIVATION PLAN IN SOLVING IRREGULAR FLOW OF CASSAVA SUPPLY

**Kullapapruk Piewthongngam, Potjanat Sitiwet and Supachai
Pathumnakul,
Khon Kaen University, Thailand**

ABSTRACT

The lack of coordination among small-scale cassava growers and cassava processing plants causes irregular flow of cassava supply. The variations within the flow disturb processing operations and ultimately lead to customer dissatisfaction. In this study, we proposed the concept of a cultivation plan, which is composed of a crop growth model and a mathematical program. The estimation of cassava growth was simulated using DSSAT-GUMCAS for different planting dates and cultivars. Then, a mathematical model is developed and applied to simulated growth in order to select cultivar, planting periods and corresponding harvest windows. To estimate the benefit of the model, the results of uncoordinated cultivation and collaborative cultivations are compared. It is found that the proposed cultivation plan results in higher cassava production by as much as 24 421.2 Mg. In addition to this, supply overage is also prevented. This formulation could also reduce the loss of cassava production due to rapid deterioration of cassava root.

INTRODUCTION

Recently, the agri-food supply has been gaining a good deal of public attention. Similar to other supply chains, the agri-food chain is a network of organizations working together using different processes and activities in order to satisfy customers' demands. One of the central differences between agri-food and other supply chains is that the agri-food supply chain often characterized by their limited shelf life, as well as high supply seasonality and uncertainties. In this sense, the agri-food supply chain is more complex and harder to manage than other chains (Ahumada and Villalobos 2009). Besides these factors, the number of suppliers in this industry is high especially in developing countries where raw materials are produced. One food mill may have more than thousands of farmers supply agricultural products to the mill. Hence, attempting to coordinate suppliers whose operations are reliant upon unpredictable factors in nature is all the more difficult. While processors are responsible for their capacity and inventory management, the quality and quantity uncertainty of raw material can affect their capacity utilization. A production and procurement plan of a food mill that does not take into account the nature of agricultural production is likely to cause supply overage in some periods of the year, while producing shortages in other periods. Both supply overage and shortage can harm quality and quantity of agricultural products. When the raw material flow exceeds the capacity of the processor, it usually reduces the freshness and yield of the products and increases operating waste. Likewise, under capacity operation causes high per-unit fixed costs for the processor. Therefore, manufacturing must have a well-thought-out procurement plan in order to minimize their waste or non-value-added activities.

To state the important of collaborative planning, in this study we investigate a case of a cassava starch factory that suffers from uncoordinated incoming main raw material, cassava root. Due to its drought tolerance and production cost, the crop widely attracts growers in the Northeast of Thailand. The average land area to plant cassava ranges from 1.0 to 5.75 ha (Ratanawaraha et al. 2000), which is categorized as small-scale farm. Hence, one starch factory might engage with more than thousands of growers in order to fill up their production capacity. And because the cultivation plan of each farmer does not take into account processing plan of the factory, the factory often faces cassava supply fluctuation. Although cassava can be planted all year in Thailand, generally, the crop is grown in the early rainy season (March-June) and the late rainy season (October-November). The majority of the famers (about 23-31%) plant the crop in May, followed by 10-20% and 11-17%

in April and June, respectively. Another 10-20% is planted during October or November, at the end of the rainy season (Ratanawaraha et al. 2000). As indicated in Figure 1, cassava production tends to rise from November – February and tends to be low in other periods. That is because farmers grow and harvest cassava approximately at the same time. As a result, during November-February, factory experiences are cluttered with cassava roots, while in the other periods, such factories face a dearth, the consequence of which is that commonly each factory seeks raw material supply further away.

Figure 1. Cassava production in the Northeast of Thailand during October 2002-September 2003

The cassava supply overage directly affects the quantity and quality of cassava starch. If the cassava supply cannot be promptly processed after harvested, cassava root will suffer due to its rapid perishability (Iisamah 2004) especially during the cluttered period. Physiological deterioration often becomes apparent 24 hrs after the harvest (Richard 1985), and subsequently followed by microbial deterioration within 5-7 days (Jekayinfa and Olajide 2007). The prompt processing of cassava should, therefore, begin, soon after harvest (Jekayinfa and Olajide 2007). This situation leads to substantial quantitative and qualitative post-harvest losses of the roots causing high production, and processing risks. The rapid post-harvest deterioration of cassava restricts the storage potential of the fresh root to a few days (Wenham 1995). In addition to direct the physical loss of the crop, postharvest deterioration causes a reduction in root quality, which leads to price discounts and contributes to economic losses –both those directly felt by the farmer and indirectly by the mill. Hence, the short shelf-life of cassava has played a major role in the evolution of cultural and post-harvest management practices. In the past, to avoid losses from root deterioration, cassava starch factories would often host decentralized, small-scale processing nearby the production areas to ensure a daily supply of raw material. Fresh roots were generally processed on the day they arrive at the facility and it is rare to find industries that have storage facilities (Wenham 1995). However, as the process capacity expands (as it has done), the processor needs a large production area and a well organized supply procurement plan to supply fresh roots to the factory.

To reduce the problem of deterioration due to overage cassava supply, such a factory could solve their capacity problem by asking cassava farmers to leave the crop unharvested until the processing time approaches. The plant will be without deterioration for a year until the processing time. However, this way of avoiding loss will cause the roots stay in the soil beyond the period of optimal root development. This practice comes at a high cost of land because land is occupied and unavailable for further agricultural production. Likewise, roots lose some of their starch content and palatability declines as roots become more fibrous (Wenham 1995). To get a maximum return, the crop should be harvested at the right time. If harvested early, the yield will be low and the root still be fibrous. The right time of harvest also depends on the cultivar (Evangelio 2000). Hence, to set the cultivation plan, the growers should also be advised to plant the cultivar along with planting of the root during harvest time such that entire cassava production of the chain is optimized.

The problem of inadequate supply of raw cassava for industrial cassava processing also happened in Nigeria (Ugwu and Okereke 1985). In that country, the cultivation of cassava root was from not coordinated among growers or with the factories. The cassava growers in Nigeria harvested a variety of roots and had no clearly formulated plan with the cassava processors. The wide quantity variation of the fresh root of cassava

supply caused instability and irregular flow of the cassava products. This impacted the overall competitiveness of Nigeria's growers on the market and took a toll on the profitability of the processing operations. Reliability and regularity of raw material supply is of vital importance to satisfy customer requirements. Erratic flow of raw material caused by a number of small-scale independent producers to agro-based industries is likely to draw serious implications for the next supply chain units. If the cassava processors have control over the planting and harvesting period, the quality and quantity of cassava supply is ensured. At that time, Ugwu and Okereke also proposed that cassava growers should be organized into co-operative units through administrative arrangements of both cassava processors and producers. Companies should provide technical advice and supply production inputs to the participating growers in return for arrangements of time of planning and harvesting. Both parties would benefit from the scheme. Although their suggestions are similar to ours, they did not outline in detail a harvesting plan.

The objective of this study is to set a collaborative cultivation plan for cassava growers and a mill such that cassava production is optimized under processing capacity constraints. The cultivation plan concept used here is adapted from Grunow et al. (2007) and Piewthongngam et al. (2009). Although, originally the concept was aimed to solve similar problems in the cane industry, it is highly applicable to cassava inadequate supply problems. Their cultivation planning is stated as a long-term coordination effort between growers and processors, which determines the cultivation time, the corresponding prospective harvesting time window for each field and the selection of cultivars such that overall production is optimized. The concept is aimed to prevent excessive supply of raw material in one period and shortage in others.

MODEL AND NUMERICAL CASE STUDY

In order for both parties to benefit from this concept, planners should be able to visualize cassava growth for each field and the effects of planting times, harvesting times, and other environmental factors (e.g., soil type, temperature, rainfall) on cassava growth. Cassava growth model is a good candidate tool to perform yield simulation task. The growth model divides growth of cassava into 3 phases: 1) planting to emergence; 2) emergence to first branching; 3) first branching to maturity or final harvest (Matthews and Hunt 1994). Each phase differs in terms of the interactions of plant physiology and its environmental factors (e.g., solar radiation, temperature, organic matters, rainfall). The growth simulation step is necessary because different cultivar responses to environmental factors operate differently (Connor et al. 1981). Likewise, growth stages of cassava planted in different dates will be in different environments. As a result, different planting dates also yield different growth rates of the plant (Keating et al. 1982). Hence, in order to determine a collaborative cultivation plan, a planner should be able to estimate growth of each cultivar in different environment. In this study, DSSAT-GUMCAS is used to simulate cassava growth. To set the cultivation plan, a mathematical model is constructed and applied to simulated cassava growth. The details of the proposed mathematical model are described next.

Mathematical Model

Notations

i, j, k, t	Index of planting date, growing region, cultivars, harvesting period,
I	Number of planting dates, $i = 1, 2, 3, \dots, I$,
J	Number of growing regions, $j = 1, 2, 3, \dots, J$,
K	Number of cultivars, $k = 1, 2, 3, \dots, K$,
T	Number of harvesting periods, $t = 1, 2, 3, \dots, T$,
P	Price received by cassava growers (THB kg ⁻¹),
C_k	Production cost of growing cultivar k (THB ha ⁻¹),
\tilde{Q}_{ijkt}	Estimated yield of the cassava planted at date i in region j with cultivar k and harvested in period t (kg),
L_{ijkt}	Land area allocated to plant cassava at date i in region j with cultivar k and to be harvested in period t (ha),
$Land_j$	Maximum land area available for region j (ha),
CAP	Maximum cassava processing capacity for a period (kg).
Objective function	

$$\text{Maximizing } \sum_{i=1}^I \sum_{j=1}^J \sum_{k=1}^K \sum_{t=1}^T (P\tilde{Q}_{ijkt} - C_k L_{ijkt}) \quad (1)$$

Subject to

$$\sum_{i=1}^I \sum_{k=1}^K \sum_{t=1}^T L_{ijkt} \leq Land_j \text{ for } \forall j \quad (2)$$

$$\sum_{i=1}^I \sum_{j=1}^J \sum_{k=1}^K \tilde{Q}_{ijkt} L_{ijkt} \geq 0.8 \times CAP \text{ for } \forall t \quad (3)$$

$$\sum_{i=1}^I \sum_{j=1}^J \sum_{k=1}^K \tilde{Q}_{ijkt} L_{ijkt} \leq CAP \text{ for } \forall t \quad (4)$$

$$L_{ijkt} \geq 0 \text{ for } \forall i, j, k, t \quad (5)$$

The objective of maximizing overall profit for the contracted suppliers is expressed in (1). Constraint (2) ensures that the amount of cassava grown land would not exceed the maximum area in each region. The constraint (3) guarantees that in each harvesting period, at least 80% of maximum capacity of the mill should be satisfied. Constraint (4) ensures that all harvested cassava will not exceed the maximum capacity of the mill. Constraints (5) guarantee nonnegative value of L_{ijkt} .

Numerical Case Study

To illustrate the advantages of this suggested framework, let us consider a case of a cassava processing plant located in Nakhon Ratchasima province, Northeastern Thailand. The plant has cassava supply area of 52,000 ha. These cassava supply area is composed of 4 soil series, Si Khiu, Chum Phuang, Kula Ronghai, and Khon Buri. Each soil series is assumed to have cassava land area of 12 000, 13 600, 12 800, and 13 600 ha respectively. Weather stations located in the province are used. The maximum capacity of the cassava processing plant in each period (bi-week) is assumed to be 28 000 Mg of fresh root of cassava ($2000 \text{ Mg day}^{-1} \times 14 \text{ days}$).

The decision-makers are assumed to choose from three planting dates; early rainy season (March), middle of the rainy season (May) and late rainy season (November); and the four most commonly grown cultivars (RY01, RY72, RY90, and KU50). The parameters for crop management such as fertilizer, herbicide applications, land preparation and tillage are added to reflect common practices in these studied areas. In total, there are 48 different yield trends ($4 \text{ regions} \times 3 \text{ planting dates} \times 4 \text{ cultivars}$) to be simulated. A physiological cane growth model, GUMCAS, which is embedded in DSSAT 4.0.2, was used to simulate those cassava yields. The daily rainfall and maximum and minimum temperature were obtained from 5 years (2003-2007) of Thai Meteorological Department and it is as shown in Table 1. The historical daily data was found to be reliable with few missing records.

Table 1: Descriptive statistics of daily rainfall and maximum and minimum temperature data from 2003-2007

Source: Thai Meteorological Department

In solving this numerical case, the parameters and index used in the mathematical model could be set as follows: 1) $i = 1, 2, 3$ represent the planting dates in the month of November, March and May, respectively, 2) $j = 1, 2, 3, 4$ represent growing regions which are Si Khiu, Chum Phuang, Kula Ronghai, and Khon Buri, respectively, 3) $k = 1, 2, 3, 4$ represent the cane cultivars which are RY01, RY72, RY90, and KU50, respectively, 4) $t = 1, 2, 3, \dots, 24$ represent the harvesting periods, respectively, where $t=1$ is the first (bi-week) harvesting period (e.g., 1-14 July). The price of cassava root is assumed to be 2.03 THB kg^{-1} . And the production cost is assumed to be variable cost and varied depending on cultivar selection. The production cost of RY01, RY72, RY90, and KU50 are 13,000, 10,000, 9,800, and 12,000 THB ha^{-1} , respectively. Note that, THB is the unit of Thai currency which is approximately 0.03 USD THB^{-1} .

RESULTS

The simulated cassava yields from DSSAT with different cultivars, regions, and planting dates are shown in Figure 2 – 4. RY01 seems to outperform other cultivars when planted in November on Kula Ronghai. From Figure 2, a planner is able to disguise the cultivar for early and late harvest. For example, this yield simulation suggests that KU50 is a good candidate for early harvest while RY90 suit for late harvest. Figure 3 and 4 show that planting dates and grow regions affect cassava yields and therefore, the overall harvesting plan.

Figure 2. Simulated cassava growth of different cultivar planted in November on Kula Ronghai

Figure 3. Simulated cassava growth of KU 50 planted in different region on November

Figure 4. Simulated cassava growth of KU 50 planted in Kula Ronghai on different planting dates

The cultivation plan resulting from applying this mathematical model is shown in Table 2. This plan results in an optimal solution of 672 000 Mg of fresh root of cassava for all 24 harvesting period.

Table 2 : Cultivation plan results from the proposed mathematical model

Harvesting period	Region	Planting date	Cultivar	Land area (ha)
1-6	Chum Phuang	November	RY01	11,624
7-11	Kula Ronghai	March	RY90	9,118
12	Kula Ronghai	March	RY90	605
	Si Khiu	March	RY90	1,106
13-19	Si Khiu	March	RY90	11,694
20	Kula Ronghai	May	RY72	479
	Khon Buri	May	KU50	2,450
21-22	Khon Buri	May	RY01	5,121
23-24	Khon Buri	May	RY72	6,030

Factors affecting the plan

In this present simulation, all cultivars are selected by the mathematical model with different planting dates. The mainly selected cultivars are RY01 and RY90. Their selection is based on the profit of each harvesting period. However, the crop growth model does not account for unforeseen events such as disease or insect outbreak and severe weather conditions (e.g., draught, flooding, etc.). If these unexpected but almost inevitable events occur, the plan will be affected. Contingency depends on the time information is perceived. If the effects of environmental change are realized prior to planning, one could consider the vulnerable or infected or drought tendency regions separated from other regions. For example, from the above numerical example, there are four regions which are distinguished by the soil series. Assume that 40% of Chum Phuang was a drought tendency area and other cultivars were assumed to be drought tolerant except for RY01. The simulated yield for RY01 in this drought tendency area is assumed to be 60% of its original simulation as shown in Figure 5. To take this information into account, Chum Phuang is divided into two areas, drought tendency and normal area of 4649.6 ha and 6974.4 ha (11 624 ha in total), respectively. The number of regions (J) should be 5 instead of 4 and one more yield trend should be added to reflect RY01 affected by drought. The other parts of cultivation planning should remain the same. If, on the other hand, the yield change was perceived after growers planted their crops, then the harvest schedule is subject to revision such that the harvest schedule takes the planted area into account. The above growth scenarios will be reduced from 48 different yield trends (4 regions \times 3 planting dates \times 4 cultivars) to the combination of planting dates, cultivar, and region of planted area (as suggested in Table 2) plus affected region that was separately treated and the yield trends of upcoming planting dates. If 40 % of the cassava was planted on November in Chum Phuang and affected by drought, then one more yield trend should be added. The concept of the proposed mathematical program is still valid for harvest scheduling. After yield trends are revised, the mathematical model can be reapplied to retrieve the harvest period (t) of the planted regions by applying the planting date (i), growing area (j) and cultivar (k) of the original plan while for the

remaining land area the cultivation plan can be reset. To be more thorough, the numerical example is explained. Firstly, the index represents the drought area is added to the model (e.g., $j = 5$). Then, the total number of areas to be planned is 5 (e.g., $J = 5$). Assume that the yield change was perceived at the end of December (i.e., before harvesting period 1). The cultivation plans after discovering the drought is subject to revision. The mathematical model should be modified to incorporate the drought problem. Since some areas had been planted, there exists the possibility that the cassava supply might not be adequate for some periods. If this is the case, the starch factory should plan to procure the remaining cassava supply somewhere else—an effort that will likely prove costly for the factory. The mathematical model should be modified accordingly. And the modified version of the mathematical model of the numerical example incorporating drought situation is written as follows:

Additional parameters:

Y_t Estimated deficit cassava supply of period t (kg).

R Unit cost of obtaining deficit supply of cassava from other area (THB kg^{-1})

Objective function

$$\text{Maximizing } \sum_{i=1}^3 \sum_{j=1}^5 \sum_{k=1}^4 \sum_{t=1}^{24} (P\tilde{Q}_{ijkt} - C_k L_{ijkt}) - R \sum_{t=1}^{24} Y_t \quad (6)$$

Subject to

$$\sum_{t=1}^{24} L_{121t} = 11,624 \times 0.6 \quad (7)$$

$$\sum_{t=1}^{24} L_{151t} = 11,624 \times 0.4 \quad (8)$$

$$Land_2 = (13,600 - 11,624) \quad (9)$$

$$\sum_{i=2}^3 \sum_{k=1}^4 \sum_{t=1}^{24} L_{ijkt} \leq Land_j \quad \text{for } j = 1, 2, 3, 4 \quad (10)$$

$$\sum_{i=1}^3 \sum_{j=1}^5 \sum_{k=1}^4 \sum_{t=1}^{24} (\tilde{Q}_{ijkt} L_{ijkt} + Y_t) \geq 0.8 \times CAP \quad \text{for } \forall t \quad (11)$$

$$\sum_{i=1}^3 \sum_{j=1}^5 \sum_{k=1}^4 \sum_{t=1}^{24} (\tilde{Q}_{ijkt} L_{ijkt} + Y_t) \leq CAP \quad \text{for } \forall t \quad (12)$$

$$L_{ijkt} \geq 0 \quad \text{for } \forall i, j, k, t \quad (13)$$

$$Y_t \geq 0 \quad \text{for } \forall t \quad (14)$$

The objective function, expressed in (6), is modified by subtracting total cost of obtaining deficit cassava supply RY_t from Eq. (1). Constraints (7-8) represent land areas that planted cassava in November according to the original cultivation plan (Table 2). Constraint (7) represents the normal area and Constraint (8) represents the drought area of Chum Phuang, respectively. Constraint (9) indicates remaining land area for Chum Phuang after November planted. Constraint (10) ensures that the land area available to be planted in March and May will not exceed the available area for each region. Constraint (11) guarantees that, in each harvesting period, at least 80% of the maximum capacity of the mill should be satisfied by both cassava supply from the contracted area and cassava supply from somewhere else. Constraint (12) ensures that all the overall cassava supply will not exceed the maximum capacity of the mill. Constraints (13-14) guarantee nonnegative value of Y_t and L_{ijkt} , respectively.

Figure 5. Simulated RY01 yield that planted on November in Chum Phuang affected by draught

Figure 6. Simulated cassava supply overage and shortage of uncoordinated plan

The new cultivation plan obtained from the modified mathematical model is as presented in Table 3. Notice that the harvesting plan of period 4 and period 6 differ from the original plan (Table 2). However, from period 7 onward the two plans are alike. The revised plan suggests harvesting the drought affected areas in period 1 and 2 and the normal area in period 1, 3, 4 and 5. The total production as well as the revenue of the two plans is identical, while more land area is needed to fill up capacity if the drought occurs. Hence, the production cost is higher and the profit is lower in the drought case. In this numerical case, there is no deficit cassava supply to be procured from some other area. That is because there are some land areas still available in the constraints.

Table 3: New cultivation plan results after drought perceived

Harvesting period	Region	Planting date	Cultivar	Land area (ha)
1	Chum Phuang	November	RY01	1,834
	Draughted Chum Phuang	November	RY01	1,111
2	Draughted Chum Phuang	November	RY01	3,538
3	Chum Phuang	November	RY01	1,911

23-24	Khon Buri	May	RY72	6,030

Table 4 : Comparison of objective function between original and revised plan

Component of objective function	Original plan	Revised plan
Total cassava production (kg)	672,000,000	672,000,000
Land area (ha)	48,226	50,824
Revenue for contracted area (THB)	1,364,160,000	1,364,160,000
Production cost of contracted area (THB)	532,887,570	559,294,282
Cost of procuring deficit supply(THB)	-	-
Objective function (THB)	831,272,430	804,865,718

Simulated benefit from being coordinated

To illustrate the benefit of the proposed cultivation, we simulate another scenario when cassava growers are free to set their own cultivation. We assume that 30% of the growers plant the crop in May, followed by 40 % in March and 30% in November, respectively. And growers are assumed to choose cultivar that gives the highest 12-month yield and to harvest their crop randomly from 8-12 months after planting. Most of the assumed growers are small-scale growers who dedicate 0.8-2.5 ha to produce cassava. The simulation was conducted for 10 iterations. The cassava supply overages and shortages are shown in Figure 6. The average total cassava production when cultivation plan is uncoordinated is 647 578.8 Mg. It is 24 421.2 Mg lower than the former without any drought effects. Moreover, the supply of cassava that exceeds the processing capacity is subject to rapid deterioration. Hence, the lack of a coordinated plan suppresses the cassava supply even further.

DISCUSSION

To implement this concept to the Thai cassava industry, efforts from each party are needed. From the processor side, Ugwu and Okereke (1985) suggest that the processor work on supplier development programs, which provide technical advice and supply production (e.g., fertilizers) to the growers. The authors also suggest that the processors should facilitate harvest operations and deploy a cultivation plan on a yearly basis. In order to strengthen the partnership among parties, price transmission should be transparent and fairly stated. From the grower's side, once committed to be business partner, agreement or contracts and guidelines of producing cassava should be honored. Both parties should lay out any difficulties or constraints during implementation. Next, the industry also needs information technology to coordinate the plan. An agronomy team needs to collate field data such as field location and size, and soil type. Auxiliary but not nonessential factors that will make cassava yield estimation more accurate include farming skills and the production of organic substances. The use of Geographic information System (GIS) and database management will facilitate such coordination and other field management as well as other customer rising trends (e.g., traceability, carbon footprint). Furthermore, the accuracy of the crop growth model also depends upon the quality of climate data (Lawless and Semenov 2005). Although, we used randomly drawn of the five-year data, which may introduce bias into the simulation (Hansen and Jones 2000), it is utilized here to demonstrate the concept of a cultivation plan. For more details of the practical applications of the crop growth model to forecast crop yield at the large area and bias correction, see Besuidenhout and Singels (2007); Everingham *et al.* (2002); Everingham *et al.* (2005); Hansen and Jones (2000); Hansen *et al.* (2004); Hansen and Ines (2005); Ines and Hansen (2006); Lawless and Semenov (2005); Mavromatis and Hansen (2001). Lastly, although the objective of this study is to maximize cassava production, maximization of starch can be and, in fact, should be used if starch production is affected by the harvest time of the year. In this light, either crop growth modeler might additionally include starch production into the output of the crop growth estimation software or the planner might start collecting data and convert the cassava production into starch production.

CONCLUSION

In this study, a combination of a crop growth model and a mathematical programming is used to solve the problem of inadequate cassava supply to the cassava starch factory. The cultivation plan results from the model and states planting times and the corresponding harvesting window as well as select cultivars that might profit the farmer so that the capacity of the starch factory is optimized. The concept of the proposed cultivation possesses high potential to solve similar problems in the other industry as well. However, to implement the plan, involvements among parties are needed. For the research community, through the crop growth model is developed mainly for field management and estimation of crop production, it is highly applicable to supply chain management problems. In order for the agricultural chain to be well managed, it is necessary for a planner to understand how the crop and its environment interacts with each other so as to manage the chain intimately related to the nature of the crop. If one incorporates and plans according to those foreseen constraints, the number of manageable uncertainties and fluctuations in the chain will be tremendously reduced. In this light, the research community should explore more of the application of crop growth model on supply chain management. Although the concept of supply chain management has been widely used in other industries for a while, agri-food chain seems to be far left behind in apply its concept to the industrial practice. On the path to develop the knowledge on agri-food supply chain management, interdisciplinary collaboration is needed. Contributions from experts in different fields such as engineering, management, and information technology are crucial because this interdisciplinary knowledge must be taken into consideration in order for the agri-food supply chain management to be successfully developed.

SCENARIO MODELING: MANAGEMENT TECHNOLOGY TO HARNESS FUTURE OPPORTUNITIES OF MULTILEVEL ORGANIZATION SYSTEMS

Olga M. Pisareva
State University of Management, Russia

ABSTRACT

The article presents some questions of changes in the construction forms and activity conditions of a modern business-company. The premises of scenario modeling in process-oriented methodology for predicting the formation of the future technology design for a multilevel organizational system are proposed. The basic problem set of forward-looking management for multilevel organizational systems and an approach to a formalization of their descriptions in regular management procedures are denoted. The example of practical implementation the proposed concept for the Russian Federation (RF) largest confectionery corporation is represented.

INTRODUCTION

In the post-crisis period of socio-economic development active transition processes in the economy and society as a whole, traditionally causing in the expert and scientific community the aggravation of discussions about the problem of predictive power of economic theory. On the background of changes of structural and behavioral characteristics of the economic objects of various types there is an increasing need of improvement of methodology and methods of analytical research in the area of socio-economic foresight at both the state and corporate levels of management. Along with the improvement of the institutional arrangements for sustainable development of the economy of particular importance is the study and improvement of adaptation properties of the modern economic systems. It is connected with the formation and implementation in practice of regular management technologies for the design of the company's future. The development of predictive capacity of economics comes in two interrelated areas: improving the methodology of future research and development the technologies and tools for analytical and predictive activity (APA) in the systems of organizational control.

RESEARCH METHODOLOGY

The issue of modeling and forecasting of the business organizations are well represented in many works in the modern sections of classical, institutional and evolutionary economic theory. The economic realities of theoretical and practically justify a structured review of economic objects as multi-level organizational systems (MLOS). The increasing organization of the activities related economic agents in the context of coordinated implementation their plans, suggests a natural weakening in theoretical studies of the hypothesis of weak influences. Should consider the potential and direction of self-organization of economic space and test the hypothesis about the active influence of the single economic entity in the formation of market trends. The most productive from the point of view of the author, can be integrated description of the current economic organization in the framework of the system concept of the enterprise based on integration of the rationalist and procedural paradigms of forecast research in interpretation of the uncertainty factor in developing economic

systems. The present study is based on the most pragmatic of the existing theoretical assumptions. It may be noted earlier results: the neoclassical theory in terms of determining and forecasting the impact of external market conditions to assess the effectiveness of management decisions in the activity of the company; neo-institutional theory in terms of determining and predicting changes in the formation of the efficient frontier (and preservation) the objectives of the enterprise and control the operation of a business organization; neo-evolutionary theory in the simulation of the mechanism of inter-farm interactions of economic agents and the formation of a focused economic development organization in a dynamic and volatile economic environment. The basis of tools of research is made by methods of the system analysis and mathematical modeling, probability theory and fuzzy computing.

Determining the composition of the basic predicative tasks within an integrated concept forecasting and analytical support to management in MLOS made in accordance with the methodology of the process-oriented forecasting (Pisareva, 2013). Study the evolution of objectives and content for the prediction function in economic management and business systems, as well as analysis of the composition, characteristics and practice of forecasting techniques allowed choosing one of the possible directions of theoretical apparatus forecasting research - scenario modeling (Pisareva, 2004, 2007, 2011; Popper, 2008; Porter, 2004; Van der Heijden, 1996). Expanding opportunities purely descriptive scenario approach by formalizing a scenario's method significantly increases the validity of the results in the formation of forward-looking options for the development of research and technology in the design of the future of the company. Applied aspects of research are connected with peculiarities of the development Russian's economy.

General global trends: globalization, information and innovations, unfolding in the Russian economy in low structuring of the economic environment with the excessive and hypertrophied role of national state-owned corporations. Today is characterized by the following features of the Russian economy: the heterogeneity of the development of industries and regions; the stratification of production technology platforms; the differentiation of the conditions for activity commercial and noncompetitive sectors of the economy; methodological gap in development of the national school of forecasting and planning upon transition from centralized administrative to the decentralized market mechanisms for regulation of activity of enterprises and organizations. In the RF the historical experience of mobilization of national resources to accelerate the development and qualitative transformation of the economic system of a society determines the unique and exceptional role of large strategic companies in the successful implementation of the national programme to modernize and re-industrialization of the Russian economy. The next example of the application of the proposed conceptual approach and developed theoretical device predictive modeling in MLOS shows estimate reserves for the growth efficiency of a major Russian integrated industrial company. It gives an evident illustration of special value, which purchases development of the methodology and design technology of the future in dealing with the challenges of economic growth. Source of information were the various scientific publications and open the analytical reviews in RF and world press, the official statistical data of the Federal Agency for Statistics of the RF (<http://www.gks.ru>), The Ministry of economic development of the RF (<http://www.economy.gov.>), the Central Bank of the RF (<http://www.cbr.ru>), the Federal Taxes Service of the RF (<http://www.taxes.ru>), the Federal Customs Service of the RF (<http://www.customs.ru>), The Russian Association of enterprises of confectionary industry (ASCOND) (<http://www.ascond.ru>), the Holding «United Confectioners» (<http://www.uniconf.ru>).

THE STRUCTURE OF THE ECONOMIC SPACE AND FORECASTING TECHNOLOGIES

Continuous transformation of the economy and strengthening of the influence on its development factors of instability and uncertainty requires improvement of methods and models of economic forecasting. The most important factor for a change in the role of prediction in management is to transform the general economic space and local economic environment, due to the evolution of the nature and structure of business organizations. This is manifested in the formation of the network structure of the economy and distributed control mechanism, characteristic for MLOS of economic type (Miles, Snow, 1986; Pisareva, 2013).

The global economic area is characterized by a qualitative change in the technological, functional and teleological structure. The layered construction of economic objects is typical and natural for the organization's form of economic activity and management in the society. During the consolidation of business organizations is

a clear relationship of universalization and specialization processes. This causes the strengthening of the role of inter-organizational interactions at various levels of the Russian economy. There is a process of active formation of flexible economic structures (not necessarily administratively subordinate) of the technological and functional cooperation. MLOS is intended to integrate the various institutions and economic activities through the development of related business processes and build the object, spatially and temporally approved control mechanism. Synergy potential growth of economic efficiency increases, including through the use of the generated depth business information. Building effective value chains provides the participants of the economic integration additional competitive advantages in predicting and satisfaction consumer demand for goods produced/services provided.

Following the conclusions of the fundamental works of Miles and Snow (1986), can refer to the main attribute symptoms of the network model of the economy the most important, in the opinion of the author, to determine the characteristics of analytical support forecasting in the management for MLOS: distribution, shared among several firms dispersed assets and competencies needed for the creation and development of a competitive product / service (integrated structure of business processes); combinable, i.e. use depending on the values, interests, goals and conditions of cooperation activities of the various types of building of networking business organizations (stable, internal, dynamic model of economic networks); modifiability, i.e. building is not a replication, and the evolutionary mechanism of reproduction of effective and rational elements and relationships in corporate structure (maintaining capacity development and the goals of economic activity); independence, i.e. forming approved decisions that take into account diverse predictive assessment control elements of the network structure of the results and consequences of the interactions in the corporate structure of the various economic interests (the activity of associated economic agents). *In conceptual terms* the formation and the dominance MLOS in the structure of the network economy can be considered as institutional condition of gradual transition from a forecasting system to the system of designing of the future. *In terms of information* forming MLOS associated with decrease in the entropy of the economic space. *In formal terms* the building MLOS described in terms of graph theory is different from the structure of the hierarchy to remove restrictions on the number of upstream organizational relationships (in the hierarchy - one) and cycles (in the hierarchy are not available) in the construction of a topological model of the system. *In economic terms*, the complexity of the system of management for the activities in the integrated economic organization leads to higher administrative and transaction costs, including the appreciation of the reproduction cycle of the predicative information. *In organizational terms* this means a shift from the periodic implementation of function prediction to build forecasting process in management system (stable set of related and standardized predictive tasks).

KEY PRINCIPLES OF BUILDING THE APA-SYSTEMS BASED SCENARIO MODELING FOR MULTI-LEVEL ORGANIZATIONAL SYSTEMS

To effectively solving problems and tasks of justification and approval forecasts for the formation of managerial decisions in the MLOS proposed to use the three basic principles of building the AFA-system based scenario modeling: the variability of the future, reverse causality and enhanced compensation (Pisareva, 2013).

The variability in the future due to the influence of a combination of many different factors, including the capabilities and vectors of development for interacting agents of economic evolution at all economy's levels. Solution of control multi-organizational system with the prognostic assessment with the prognostic assessment of possible qualitatively different images of desired future for different control centers greatly increases the feasibility of developed plans, the validity of implemented activities and the adaptability of chosen strategies. This improves the overall stability of the economic system by preparing for a possible transition to a new version of the trajectory of the development if an existing changes internal and external conditions of functioning within the range of scenario opportunities. *The reverse causality* is that, the future (as path and state satisfactory to the formulated goals of development) is the cause of action in the present. It combines the cumulative capacity of the system and generated opportunities. Thus, the future of design technology radically changes the nature inform management decisions and the formation of strategic and current plans of the business activity. Here there is a complex task for a formalized description of the generation or identification the goals in the MLOS. *The extended compensation* is linked to the implementation of the multiplicity of interest's related subjects in the

MLOS. This presupposes a mismatch of expectations, intentions and images of the advisable or acceptable future and leads to an uneven distribution of the expected results on the elements of the network structure of inter-economic cooperation. Consequently, it is impossible to follow a single optimality criterion when making decisions on the assessment of possible options for the development of the complex economic object. That is, the inclusion of an integrated value chain in the network structure involves the comparison of diverse advantages (benefits, effects), which are outside of the common metric.

The basis of a scenario-oriented technology forecasting is an approach to formalization of scenarios (Pisareva, 2011). Scenario model has a rather complex structure, which includes models of: the system under study; the system environment; the external background; the goal-setting; the system management; the system behavior; the state measurement system; the state measurement environment; the state measurement of the external background; the measurement of quality control; the system time and, in fact, the model scenario. Indicators to assess the characteristics of the simulated elements of the MLOS $p(x, y, u)$ represented composition exogenous x , endogenous y и control u , variables can be defined in a deterministic $\{D_\rho\}$, probabilistic $\{P_\rho\}$ or fuzzy $\{F_\rho\}$ state space. The key points of formalizing models of construction and operation of the MLOS and subsequent computer experiments is to determine the structure of a set of scenario parameters S^θ . This set contains the elements (\aleph^θ) and characteristics ($h(t)$) accounted unknown factors (interval, stochastic or uncertain), as well as the elements (\Im^θ) and specifications ($\xi(t)$) accounted events in the period under development, which are considered the subject of management in the MLOS. In general, to describe the logical and chronological sequence of events can be given a graph of connected events $G_\Im(t)$, defined exogenously or identified on the basis of the rules for evaluation the situation $R_\rho(t)$ in a clear or fuzzy formulation. As such, it is event-graph defines the logic of interaction of actors and factors of influence on the formation and transformation of the trends of the simulated trajectories of the economic system. Thus, the variability of the scenario described by a set of tuples with a pair of complex structure $S^\theta = \langle h, \xi \rangle$. The specifics of the description and construction of the scenario model to determine a wide range of possible directions for its use for analytical support in the management of forecasting in the MLOS.

KEY TASKS OF PREDICATIVE MODELING IN MANAGEMENT MULTI-LEVEL ORGANIZATIONAL SYSTEMS

In the framework of the concept of scenario modeling as part of the AFA» in the MLOS can implement the following main types of predictive tasks (Pisareva 2013, 2012, 2011).

The predictive control task (its modifications under additional assumptions are stated as the normative, descriptive, cooperative and situational predictive modeling): $\Pi^\Sigma : (I_D, G_{\Sigma EF}, \Theta_\pi, S^\theta) \rightarrow I_\Pi$. Here we use the notation: I_D, I_Π - sets the initial and forecast information; $G_{\Sigma EF}$ - graph of construction and interactions of elements of the system, the environment, and the background; Θ_π - set goals future studies. The predictive control task focused on proactive assessment of the conditions of the company's development and Prediction of the action plan refers to the class of the traditional problems of predicative analytics.

The next group of predictive tasks can be associated with the analysis of the dynamics of the implementation of planned solutions for the development strategy of the MLOS. Often in the publications and information materials devoted to future studies of socio-economic systems, the concept of "controlling", "monitoring" and "scanning" are mixed and used as synonyms. Entered in a formalized set-theoretic description of scenarios separation of elements of the environment under study MLOS on the system environment and the system background allows a clearer distinction in the use of these terms in economic forecasting. Based on the objectives and content problems predictive modeling and semantic differences in the design technology of the future can be formulated as a number of excellent performances productions predictive tasks: predictive controlling, which centers on the problem of forecasting the dynamics parameters of system elements (often

managed and controlled by the control parameter of the system), that is estimated the changes of current conditions and values of the implementation plan; predictive monitoring, focusing on the study of the relationship of parameters for the system elements and system environment (controlled and regulated in the institutional field parameters of the system) to assess the occurrence of critical conditions and the values of the indicators of the implementation of the plan; predictive scan-looking, focused on the prediction of the set of parameters for the system elements, the elements of the system environment and the elements of the system background (causing uncontrollable factors influence the functioning of the MLOS) with the purpose to estimate the change in the composition and role of the elements and the identification of new conditions of economic activities.

In this statement of the projected tasks should provide some key models of general scenario models: the behavior of the system - in the predictive control task, the state measurement system - in the predictive controlling task; the state measurement system and system environment - in the predictive monitoring task; the state measurement system, system environment and external background - in the predictive scan-looking task. Next, we give a description of the fragment of scenario modeling procedures for tactical production planning for the current activity industrial holding company.

APPLICATION OF SCENARIO MODELING CONCEPT IN MANAGEMENT TO HARNESS FUTURE OPPORTUNITIES OF MULTIPRODUCT COMPANY

As an example of a complex economic entity with multi-level organizational structure for the network type was considered an integrated business system located in different sectors of industrial, transport, commercial and other assets, which are involved in the formation process of value chains of various orientation. In this case, the model of the system, for example, for tactical planning in the MLOS will have the following content levels of formalization: 1) the evaluation of the economic potential, which determines the amount and structure of financing (depending on the forecast yield on the capital markets); 2) the evaluation of productive capacity, which determines volume and structure of product offer (depending on the forecast profitability of resources and products in the goods markets); 3) the evaluation of technological capacity, which determines the intensity and structure of production modes (depending on the prediction of productivity and efficiency technologies and the forecast profitability equipment and technologies markets). Basic integrated model coordinated tactical planning to forecast evaluation planning decisions in a multi-organizational system is described by the author (Pisareva, 2012). It is important to note that the proposed base model does not impose specific requirements on the structure of the original and derivative mathematical task (block-diagonal matrix of the system of linear constraints, the additivity of the global objective function, etc.). For its formalization in the static and dynamic performances adopted classic way of describing the production technology as multi-resource and multiproduct. This allows us to study the device in the input-output matrices, convenient, including, for the description of a multi-stage production, jobs typology of resources and products in the process, use post optimize analysis for prediction of changes in the parameters of the solution.

Computer experiment the forecasts agreed planning solutions in the current production planning was carried out on the example of industrial holding “United Confectioners” (<http://www.uniconf.ru>). “United Confectioners” is one of the largest confectionery holding companies (HC) in Europe includes 19 manufacturing facilities (production companies, PC), including branches, different legal form located throughout Russia, and specializing in the production of confectionery products. In economic network also includes more than 20 supporting organizations (service companies, SC), including distribution centers, chain stores, transport companies, investment and financial companies, repair and construction companies, logistics companies, etc.). Number of employees is more than 22 000 people. Control of the current operations provides management company (MC). Sales volumes holding in Russia can control according to various estimates by research companies from 15 to 20% of the market for confectionery products, confident in the lead on the priority product categories. In turn “United Confectioners” part of the financial-industrial group “Group Guta” (<http://www.gutagroup.ru>), having access to the resources and infrastructure of banking, investment, insurance, real estate development and social activities.

The product range is divided into local (original brand produced by a separate company and submitted to the local market) and global (universal brands produced by different companies of the holding by a single formula and presented at local, regional, domestic and international markets). A characteristic feature of the holding "United Confectioners" is output, covering a full assortment of confectionery market, classified into five categories: chocolate, chocolate candy (by weight and in boxes), candy, flour (waffles, cakes and gingerbread, biscuits, breakfast cereals, cakes and wafers etc.) and other sweeteners (marshmallows, candy, halva, toffee, nougat, etc.). Technical equipment of OC allows 196 technology of production for different products with varying degrees of interoperability equipment. The set of technologies for each company is different. The main subjects of the formation and adoption of the planning decisions were determined by the Board of Directors (HC), the General Directorate (MC), the Executive Directorate (OC), members of the Board of Directors (PC and SC) from outside the owners companies (OC) differentiated representing minority shareholders on various levels of holding.

Test measurements were performed in 2012, modeling the process of planning for 2009 based on historical baseline (at the time in the holding was 15 confectionery factories) for the period 2004-2008 using the proposed concept of scenario modeling to forecast evaluation planning decisions. It is possible to compare these results with those of traditional technology of formation of the current plan and the actual results of the holding in 2009, indirectly evaluating the adequacy and effectiveness of the applied method in the implementation of the AFA». Pre-processing and consolidation of project information during the formation of the overall structure of the system model has been issued for the one-step version of the problem of predictive assessment planning decisions (for annual planning). For a fixed set of values of the parameters and the fixed list of events the problem dimension to the models of integration of the activities of the components of the HC-MC-OC amounted 2125 equations (not including internal and external assessment criteria for elements of the MLOS from HC and OC) and 29,085 variables. For the specified a group of five parameters и three quality events for each of them the total number of alternative scenarios to be $5^3 = 225$ options, each of which may be a series of calculations using the Monte Carlo method for the integrated assessment of the influence of random factors. Statistical calculations were performed using the application of the E-Miner (company SAS Institute Inc.), the optimization calculations were performed in the original environment optimization Linear Program Solver (LiPS), developed at the chair of mathematical methods in the management (the State University of Management, Moscow). Simulation results for the base case scenario are illustrated in Table 1.

Table 1: Characteristics of the results of the holding in the products space (thousand tons)

Categories of products Design status	Chocolate	Chocolate candy	Candy	Flour	Other sweeteners
The current calculation scheme	54,15	145,15	53,95	44,25	26,35
The model's calculation scheme	56,69	147,44	51,13	43,06	27,35
Observed values	55,89	147,18	52,17	42,85	27,01

The comparison of the predictive assessment of the planned solutions obtained on the basis of the proposed approach with the adopted variant of the plan developed by the scheme operated tactical planning and the actual results of the holding is shown in Table 2.

Table 2: Comparison of the summary measures of the holding company

Indicators Design status	Sales, mln.rbl.	Operating income (EBIT), mln.rbl.	Output					
			Total		Global range		Local range	
			thousand tons	average capacity utilization, %	thousand tons	average capacity utilization, %	thousand tons	average capacity utilization, %
The current calculation scheme	47676,21	3694,91	323,85	64,00	275,27	54,40	48,58	9,60

The model's calculation scheme	48398,61	3932,39	325,67	64,36	277,30	54,80	48,38	9,56
Observed values	49435,00	4058,61	325,11	64,25	271,47	53,33	53,64	10,92

The results of predicative estimation for consensual planning decisions are shown in Table 3.

Table 3: The relative effects of the scenario modeling application in management

Decision status Indicators	The model calculation scheme	The current calculation scheme		Observation	
	Value	Value	Deviation, %	Value	Deviation, %
Output, thousand tons	325,67	323,85	0,56%	325,11	0,17%
Sales, mln.rbl.	48398,61	47676,21	1,52%	49435,00	-2,10%

Average capacity utilization rates	64,36	64,00	0,56%	64,25	0,17%

SUMMARY AND CONCLUSIONS

Proposed version of the formalization of scenario modeling can be the basis for developing of a model complex. Its application for realization tasks of coordinating and harmonization of predictive estimates and options business plans for a wide range of multi-level organizational systems real sectors of the economy. It can be horizontally or vertically integrated holdings, territorial-industrial complexes, integrated technology clusters, network of industrial and commercial companies, complex target program (intersectoral and interregional), large-scale investment projects (corporate and government), objects of public-private partnership, international economic associations, etc.

The volume and complexity of computational procedures requires rational restrictions scenario options to build the generation settlement alternative chains and determining how to combine key scenario parameters. The need to develop a theoretical apparatus of calculation scenarios (a set of rules and operations for static and dynamic predictive tasks) and the construction of useable and functional analytical system were identified for modeling and predictive assessment of the planned solutions to the most common conditions and problems of the future design in integrated business systems. Of key importance in the formation of relevant and complete array of data needed to create a panoramic picture of the future, including the tasks consistent tactical planning, is an effective organization of reproduction quality predicative information for all levels, shapes and control channels in the MLOS.

THE INFLUENCES OF PRODUCT INVOLVEMENT AND FEAR OF SELLER OPPORTUNISM ON PERCEIVED USEFULNESS OF MEAT TRACEABILITY SYSTEM: THE MEDIATING ROLE OF PERCEIVED INFORMATIVENESS

Kawpong Polyorat and Nathamon Buaprommee
Khonkaen University, Thailand

ABSTRACT

Due to the outbreak of mad cow disease and bird flu, there is more concern regarding meat product safety. Meat traceability, therefore, become more widely implemented in order to handle the food safety concern. Although traceability is more common among manufacturer-wholesaler-retailers cycle, it is rarely used as a marketing tool to persuade consumers who are meat endusers. Therefore, the present study attempts to understand consumer behaviors in the context of meat product with traceability system by conducting a study in Thailand where research in this area is scant. The study results reveal that fear of seller opportunism positively influences perceived informativeness and perceived usefulness of meat traceability system while involvement with meat product does not. Finally, perceived informativeness appears to mediate this impact of fear of seller opportunism on perceived usefulness.

INTRODUCTION

Food safety is an important issue in consumer's decision to buy food product (Gruner, 2005). The concern for food safety has been particularly pronounced for meat products after the emergence of mad cow disease in Europe (Sans, de Fontguyon, & Giraud, 2008) and H5N1 bird flu in poultry in Asia (Burgos & Burgos, 2007).

In Thailand, bird flu situations that have occurred since 2004 seriously stir consumer concern in food safety and resulted in the decrease in chicken and poultry consumption at that time (Burgos & Burgos, 2007). In response, the Thai government had attempted to initiate safety and standard measures in meat production. For example, the Department of Livestock Development launched campaigns under the safe meat program to promote consumers to buy meat and meat-processed products with a "Q" mark which denoted a quality assurance starting from meat production process at cattle farms through the consumers (Piengkhoontham & Ruenrom, 2010). In a private section, leading Thai companies which operate a comprehensive meat business have developed traceability systems to standardize quality and safety of their meat production.

Traceability system is an information technology that records and displays information for each particular piece of product in every step of manufacturing process (Hobbs, 2004). Therefore, information including source-of-origin, production method, ingredient, manufacturer, warehouse, distributor, selling place, and product movement from the beginning up to the point where that particular product reaches enduser can be retrieved with this technology. Traceability system, therefore, are tremendously useful for product tracking and checking (Hobbs et al., 2005).

In Thailand, although traceability has been used within manufacturer-wholesaler-retailers cycle, its role as a marketing tool intended for consumers who are endusers of meat products is relatively scant. One reason could be attributed to the lack of profound understanding of consumer behaviors in the meat traceability context.

As a consequence, the present study attempts to fill these gaps by conducting a study with consumers in Thailand to examine four constructs related to the consumption of meat product with traceability system: (1) product involvement, (2) fear of seller opportunism, (3) perceived informativeness of traceability system, and (4) perceived usefulness of traceability system. It is expected that what uncovered in the present study will contribute to marketing literature by empirically documenting how these four variables may be relevant for marketers and academics interested in using traceability as a marketing tool. Moreover, due to the scarcity of meat traceability marketing research in Thailand, the results from this study would also provide managerial implications for Thai meat producers. In this regard, the use of Thailand as a country in focus would respond to the need for more empirical evidence from other underrepresented countries (Sophonsiri & Polyorat, 2009).

CONCEPTUAL FRAMEWORK AND HYPOTHESES

Product Involvement

Product involvement refers to the level of consumer's general interest in or attention to a product or a product class (Hupfer & Gardner, 1997 as cited in Shu & Yi, 2006). Product involvement is different from product evaluation in that the latter is a process in which consumers respond positively or negatively to a particular product. Product involvement, on the other hand, influencing consumers to search for product information and spend more time selecting the right product before making purchase decision (Celsi & Olson, 1988 as cited in Shu & Yi, 2006).

Careful product information search usually occurs with high-involvement product as it is a riskier purchase decision because this kind of product is often high-value or more expensive than general products. Besides, the product may involve emotion, feeling, and values of consumers as in the case where consumers are intrinsically interested in that product. Product information gained through the extensive search may lead to consumer's higher level of product knowledge, and eventually purchase decision (Cho, 2010)

In contrast, low-involvement product is relatively unimportant, inexpensive, or lack of emotional attachment. Quite often, the purchase occurs on a regular basis. As a result, consumers tend to do relatively less product information search and spend less time making purchase decision (Rahtz & Moore, 1989)

Fears of Seller Opportunism

Fears of seller opportunism (Pavlou, Liang, & Xue, 2007) can easily occur when consumers do not have much ability or opportunity to completely check seller's behaviors. Therefore, consumers may worry that sellers may become opportunistic because there could be hidden information available for sellers but not for consumers. In addition, there could be some actions from the seller side that consumers are not aware of. Deception in product quality or product guarantee not delivered as promised (Mishra et al., 1998) are some examples of this fear.

When consumers are not certain about the outcome of a purchase decision, they are likely to conduct information search before buying in order to have more knowledge and understanding of the actual product attributes (Fazio & Zanna, 1987 as cited in Xingyuan, Li & Wei, 2010).

During the information search process, consumers are likely to have confidence in sellers who can sufficiently provide detailed product information. The confidence in seller will be even higher if the provided information can be used to trace back the product if problem occurs after the purchase. In this sense, this useful information will lessen consumer's fear for seller opportunism (Choe et al., 2009).

Perceived Informativeness

The informativeness of the traceability system is a perceptual construct (cf., Chakraborty et al., 2002) which can be different from the actual or objective number of type of informational cues provided by the sellers' effort. In the buying process, consumers may fear that sellers may deceive about product quality. As a consequence, consumers usually search for product information to help their decision making. Consumers may use information

from websites, labels, or any signs on product in order to evaluate the trustworthiness of the seller and the product. When sellers can provide and reveal complete product information in a straightforward manner, consumers may get information relevant for their purchase decision. This perceived informativeness from the seller's action, therefore, could signal the seller's professionalism coupled with high level of trustworthiness. Consumers, therefore, become relieved that sellers will not take advantage from consumers through deception in product quality or selling product with quality lower than that advertised (Pavlou, Liang & Xue, 2007).

This perceived informativeness is particularly critical for food product where consumers often cannot accurately evaluate the product safety with their eyes. As a result, the provision of detailed product information in various aspects, as well as the information regarding the manufacturer or seller, will ascertain consumers that they received information sufficient for each purchase decision making (Aboulnasr, 2006)

Perceived usefulness

Perceived usefulness reflects the extent to which consumers believe how useful a certain thing, in the context of the present study, the meat traceability system or the use of technology to receive product information, is. In other words, this construct deals with a consumer's belief that traceability will augment their decision performance in buying meat product (cf., Pavlou, Liang & Xue, 2007). Whether consumers will accept or reject the use of this technology depends on how much consumers believe that this technology will increase the effectiveness and efficiency of purchase decision in comparison with the status quo. In general, the higher level of perceived usefulness of such product or technology will encourage its acceptance.

In general, consumers are encouraged to perceive the usefulness of the technology that provides information on food product. Manufacturers and sellers of meat food product, for example, implement traceability system and thus demonstrate the transparency of manufacturing process in every step of the supply chain network (Choe, et al., 2009). Information provided from traceability system is regarded as valuable and useful for consumer's better decision making for the food purchase (Golan, Krissoff, & Kuchler, 2004).

Based on the discussions thus far, the current study proposes a set of hypothesized relationships among these four variables. First, consumers with higher level of involvement with meat product are expected, to search for more information about meat product. As the meat traceability system enables consumers to acquire more product information, it is expected that, consumers with higher level of meat product involvement will find the meat traceability system more informative and more usefulness. That is, the present study hypothesizes that meat product involvement will positively influence the perceived informativeness and perceived usefulness of meat traceability system.

H1: Meat product involvement positively influences perceived informativeness of meat traceability system.

H2: Meat product involvement positively influences perceived usefulness of meat traceability system.

Next, based on a similar line of reasoning, because fear for seller opportunism may encourage higher level of information search and meat product traceability can provide consumers with more information, it is expected that, consumers with higher level of fear for seller opportunism will find the meat traceability system more informative and more usefulness. That is, the present study hypothesizes that fear for seller opportunism will positively influence the perceived informativeness and perceived usefulness of meat traceability system.

H3: Fear of seller opportunism positively influences perceived informativeness of meat traceability system.

H4: Fear of seller opportunism positively influences perceived usefulness of meat traceability system.

Furthermore, perceived product informativeness which reflects the extent to which meat traceability offer information buyers perceived as relevant for their decision making is expected to positively influence perceived usefulness of meat traceability system. In addition, it is also expected that the perceived informativeness will mediate the influence of meat product involvement and fear for seller opportunism on

perceived usefulness of meat traceability system, reflecting the mechanism underlying consumers' decision in the context of meat traceability.

H5: Perceived informativeness of meat traceability system positively influences perceived usefulness of meat traceability system.

H6: Perceived informativeness of meat traceability system mediates the influence of meat product involvement and fear for seller opportunism on perceived usefulness of meat traceability system.

METHOD

Samples and Procedure

The survey was distributed to 121 consumers in the Northeastern region of Thailand via judgmental sampling. The profile of the research participants is: female (64%), between 21 to 30 years old (54%), bachelor's degree holders (55%), public sector workers (58%), and with an income of 10,001-20,000 baht/month (60%).

The research participants were first informed of the study description. Next, they were requested to complete the measures of meat product involvement, fear for seller opportunism, perceived informativeness of traceability system, and perceived usefulness of meat traceability system. Finally, the participants provided their personal data at the end.

Measures

The research participants were instructed to indicate the degree to which they agreed or disagreed with each of the scale items in the Likert type (1 = strongly disagree, 5 = strongly agree). Product involvement was measured with five items (e.g., "In general I have a strong interest in meat product") adapted from Beatty and Talpade (1994) and Kopalle and Lehmann (2001). Fear of seller opportunism was measured with three items (e.g., "The producers of meat product who sell through the traceability system will not cheat on consumers.") adapted from Pavlou, Liang and Xue (2007). Perceived informativeness of traceability system was measured with three items (e.g., "I would learn a lot from using a traceability system.") adapted from Luo (2002). Perceived usefulness of meat traceability system was measured with four items (e.g., "Traceability system would be useful in purchasing meat products.") adapted from Pavlou and Fygenson (2006).

RESULTS

Means, standard deviations, and reliabilities of the variables are displayed in Table 1. All scales exhibited Cronbach's alphas higher than .70, thus suggesting the adequate scale reliabilities (Nunnally 1970).

Table 1: Descriptive Statistics and Reliabilities

	Mean	SD	Cronbach's α
Product involvement	3.34	.85	.90
Fear of seller opportunism	3.48	.76	.86
Perceived informativeness	3.69	.63	.83
Perceived usefulness	3.87	.68	.89

Impact of product involvement on perceived informativeness (H1). To test this hypothesis, perceived informativeness was regressed on involvement. The regression results are shown in Table 2. The results reveal that involvement did not significantly influence perceived informativeness ($\beta = .10$, $t = 1.08$, $p > .1$). Therefore, H1 is not supported.

Impact of product involvement on perceived usefulness (H2). To test this hypothesis, perceived usefulness was regressed on involvement. The results reveal that involvement did not significantly influence perceived usefulness ($\beta = .13, t = 1.39, p > .1$). Therefore, H2 is not supported.

Impact of fear of seller opportunism on perceived informativeness (H3). To test this hypothesis, perceived informativeness was regressed on fear. The results reveal that fear of seller opportunism significantly influence perceived informativeness ($\beta = .43, t = 5.17, p > .001$). Therefore, H3 is supported.

Impact of fear of seller opportunism on perceived usefulness (H4). To test this hypothesis, perceived usefulness was regressed on fear. The results reveal that fear of seller opportunism significantly influence perceived usefulness ($\beta = .47, t = 5.79, p > .001$). Therefore, H4 is supported.

Impact perceived informativeness on perceived usefulness (H5). To test this hypothesis, perceived usefulness was regressed on perceived informativeness. The results reveal that perceived informativeness significantly influence perceived usefulness ($\beta = .70, t = 10.55, p > .001$). Therefore, H5 is supported.

The mediating role of perceived informativeness in the impact of product involvement and fear of seller opportunism on perceived usefulness (H6). Because product involvement was not found to significantly influence either perceived informativeness or perceived usefulness (H1 and H2), this predictor was not further included in the meditational analysis. Therefore, perceived usefulness was regressed only on fear for seller opportunism and perceived informativeness. To test the mediating role of perceived informativeness, a series of regression analyses were run according to Baron and Kenny (1986). First, H3 indicates that fear for seller opportunism had a significant impact on perceived informativeness: FEAR \rightarrow INFORM. Second, H4 indicates that fear for seller opportunism had a significant impact on perceived usefulness: FEAR \rightarrow USEFUL. Third, H5 indicates that perceived informativeness significantly influence perceived usefulness: INFORM \rightarrow USEFUL. Fourth, to test a mediating role of INFORM on FEAR - USEFUL relationship (H6), perceived usefulness was regressed on both fear for seller opportunism and perceived informativeness. The results indicate that beta coefficients of fear for seller opportunism decreases more than half, though still significant. The beta coefficient of perceived informativeness, however, remained quite the same and strongly significant, thus suggesting the partial mediating role of perceived informativeness ($\beta_{\text{FEAR}} = .21, t = 2.97, p < .01$; $\beta_{\text{INFORM}} = .61, t = 8.57, p < .001$). Therefore, H6 is supported.

Table 2: Regression Results

Hypothesis	Independent variable	Dependent variable	F, P, R ²	IV's β coefficient, T, P
H1	product involvement	perceived informativeness	F = 1.16; $p > .1$; R ² = .01	$\beta = .10, t = 1.08, p > .1$
H2	product involvement	perceived usefulness	F = 1.93; $p > .1$; R ² = .02	$\beta = .13, t = 1.39, p > .1$
H3	fear of seller opportunism	perceived informativeness	F = 26.68; $p < .001$; R ² = .18	$\beta = .43, t = 5.17, p < .001$
H4	fear of seller opportunism	perceived usefulness	F = 33.47; $p < .001$; R ² = .22	$\beta = .47, t = 5.79, p < .001$
H5	perceived informativeness	perceived usefulness	F = 111.31; $p < .001$; R ² = .48	$\beta = .70, t = 10.55, p < .001$
H6	(1) fear of seller opportunism (2) perceived	perceived usefulness	F = 63.69; $p < .001$; R ² = .52	($\beta_{\text{FEAR}} = .21, t = 2.97, p < .01$; $\beta_{\text{INFORM}} = .61, t =$

DISCUSSIONS

The results of our study which was conducted in Thailand reveal that, for Thai consumers, fear for seller opportunism positively influences perceived informativeness of meat traceability system which, in turns, positively influences perceived usefulness of meat traceability system. That is, perceived informativeness acts as a mediator in this set of relationship. Contrary to expectation, however, product involvement, does not significantly influences either perceived informativeness or perceived usefulness of meat traceability system.

A number of research implications can be drawn from this study. First, for marketers of meat product in Thailand, the main target for meat product with traceability is more likely to be consumers who have fear of seller opportunism, rather than those who are highly involved with meat product. In this light, marketers may consider using fear appeals (e.g., Hastings, Stead, & Webb, 2004) to persuade consumers to buy meat product with traceability system. Furthermore, as perceived informativeness of meat traceability system is found to be a significant mediator, marketers may need to make detailed information available for consumer so that their product with traceability system will be viewed more favorably. For policy makers, governments may consider encouraging the disclosure of meat product information through traceability to alleviate consumers' fear of seller opportunism as perceived informativeness is found to be critical.

In terms of study limitations and directions for future research, it is perplexing, however, to find that involvement with meat product is not a significant predictor in this set of relationships. It is possible that, in Thailand where the use of traceability in consumer marketing is still scant, consumers are not familiar with traceability. Therefore, traceability system may not develop the desired impact as what could be predicted based on the literature. In this regard, future studies may attempt to revalidate our results with consumers from other countries where traceability is more widely used. One limitation of the present study is the use of judgmental sampling. Future research, therefore, may seek to replicate our study with the use of random sampling. Furthermore, in addition to a survey method, other research methods including depth interview, experiment, and content analysis (cf., Polyorat, 2011) may shed further light on the use of meat traceability system as a strategic marketing tool.

ACKNOWLEDGEMENT

This work was supported by the Higher Education Research Promotion and National Research University Project of Thailand, Office of the Higher Education Commission, through the Food and Functional Food Research Cluster of Khon Kaen University.

THE IMPACT OF THE SOUTH AFRICAN LABOUR REGULATORY REGIME ON LEADERSHIP AND COMMAND IN THE SOUTH AFRICAN NATIONAL DEFENSE FORCE. (SANDF)

M A W Prinsloo
Tshwane University of Technology, South Africa

ABSTRACT

Organizational effectiveness is closely linked to the role of a leader, and the way in which such leadership impacts on the work engagement of the people in any organization. Leadership styles have evolved over time, with a prominent shift from the traditional autocratic and directive leadership of the past centuries to a more participative and democratic style of military leadership of the new age. The South African National Defense Force similarly has to contend with this reality. Strong and appropriate military leadership provides the decisive edge and is the most essential dynamic of operational effectiveness in the South African National Defense Force. As with any military organization, the choice of leaders and methods for educating, training and developing such leaders will have a major impact on the provision of a combat ready force for South Africa. The South African National Defense Force as a transforming entity should seek to explore appropriate leadership, command and manage practices that will satisfy the needs and requirements of South Africa's combat forces. There is however no simple formula for leadership development, especially in an African context. Leadership is about influence and action; to be truly comprehensive, African leadership theory must surpass the test of local applicability in diverse cultural, geographical, political, economic, and military settings. In view of the aforementioned, the labour-regulatory regime in South Africa may be seen as contributing to this problem. Since the new democratic Government came into power in 1994 a number of labour-related policy and legislation have been drafted. Examples include the Bill of Rights, the White Paper on Defense, the Labour Relations Act, and the Basic Conditions of Employment Act. Such documents pose significant implications for commanders and leaders in the South African National Defense Force as it may be seen to focus overwhelmingly on the rights of subordinates, and thus possibly rendering traditional leadership styles redundant. Concern exists that the status quo will have an impact on the leadership and command efficacy of commanders in the South African Defense Force. In this paper, different leadership models will be analyzed and the traits of a successful commander and leader will be identified. A further objective of this paper is to identify the most suitable leadership style for a commander to ensure that South Africa will have a combat-ready force when needed. A qualitative research methodology is applied to initiate the debate on this matter. In addition to a desktop study, empirical research is undertaken by means of interviews with selected military officers who have been strategically placed in key positions in the SANDF. It is envisaged that this paper should form the basis of further discourse on the matter.

INTRODUCTION

Organizational effectiveness is closely linked to the role of the leader and the way in which this leadership role impacts on the work engagement of the people in the organization. The levels of interaction and the relationship between employees and leaders can be linked to productivity, commitment and satisfaction in the work environment (Dibley 2009:1)

Leadership as a concept has been subjected to research and development for many years. The ultimate challenge for leadership is the ability to transform the behavior of leaders into organizational outputs of job satisfaction, commitment and collaboration. (Kouzes and Posner: 2007)

Leadership styles have evolved over time, with a prominent shift from the autocratic and directive leadership of the twentieth century to a more participative and democratic style of the new generation. There is no simple formula for leadership. Leadership is about influence and action, and in the military environment it can be argued that nations need leaders to be of admirable character. Leadership development should be an integral part of officer training and development.

Since the new democratic South African Government came into power in 1994 a number of legislation such as the Constitution of the RSA, 1996 , the Labour Relations Act 66 of 1995 , the Basic Conditions of Employment Act,1996,the Occupational Health and Safety Act,85 of 1993,the Employment Equity Act 55 of 1998 and the White Paper on Defence,1995 were passed in parliament. Each one of these Acts ensures the basic rights of employees. This empowerment of employees changed the role of the military leaders dramatically. Leadership is important for the South African National Defense Force and procedures are in place for leadership development, however a balance should be found between the type of leadership development and the rights and freedom of employees in the SANDF in terms of the new legislation.

CHANGES IN LABOUR LEGISLATION IN SOUTH AFRICA SINCE 1994

Since the first democratic government in South Africa, came into power in 1994, a number of legislation has changed and these changes has a significant impact on the leadership of commanders in the South African National Defense Force. Some of these changes include:

The Constitution of the Republic of South Africa, 1996

The basic human rights of South African citizens are found in the Bill of Rights detailed in Chapter 2 of the Constitution, and are based on the democratic tenants of human dignity, equality and freedom. According to Van Der Walt (1998:99) fundamental rights are the basic human rights of citizen's which are protected to ensure that they are not violated by Acts or omissions of any employee or representative of the state, or by actions of an organ of the state. Labour rights are articulated in Section 23 of the Constitution of the RSA,1996 and specific mention is made that everyone has the right to fair labour practices.

The White Paper on Defense, 1995

The acceptance of this White Paper in 1995 has resulted in dramatic changes in the SANDF. The SANDF was established through the integration of former statutory and non-statutory forces. The integration of these forces, many of which were once enemies – in – arms is part of South Africans commitment to national reconciliation and unity. The White Paper further alludes to the fact that external military aggression will be allowed as a last resort when political solutions have been exhausted. The SANDF will also commit to peace keeping operations in Africa. Before 1994 the South African Defense Force was deployed and was in full combat on the South African borders, the White Paper now clearly state that South Africa is no longer at war and because of the fact that South Africa is once again part of the International Community, Political means rather than force will be used to resolve possible threats and aggression from outside its borders. The SANDF therefore has change from an offensive force to a defensive force.

The Labour Relations Act,66 of 1995

The purpose of the Labour Relations Act is to enhance the economic development, social justice, labour peace and the democratisation of the work place. The Labour Relations Act,1996 seeks to strengthen workplace

democracy by promoting the rights of workers. The Act prohibits unfair discrimination and victimization of workers and favors conciliation and negotiation as a way of settling disputes.

Occupational Health and Safety Act 85 of 1993 (Supplemented by Government Notice R1179 of 1995)

The aim of the Occupational Health and Safety Act 85 of 1993 is to provide for the health and safety of persons at work, it also includes general duties of employers to employees (Section 5) , general duties of employees at work (Section 14) and the creation of Health and Safety Committees in the work environment (Section 19 and 20) .

The Employment Equity Act 55 of 1998

This Act seeks to eliminate unfair discrimination in employment and to provide for affirmative action to redress the imbalances of the past and to create equality in employment. The purpose of this Act is to promote equal opportunities and fair treatment in employment through the elimination of unfair discrimination and to ensure equitable representation in all occupational categories and levels in the work force.

LEADERSHIP

The first organized efforts by researchers to learn more about leadership involved the analysis and identification of personal qualities of leaders. The underlying idea was that strong leaders have certain basic traits that distinguish them from non-leaders and if these could be isolated and identified potential leaders could be recognized. (Smith and Cronje 1999:288). Jones identify these traits as, intelligence, knowledge and expertise, dominance, self-confidence, high energy, tolerance for stress, integrity and honesty and maturity.(Jones, George and Hill, 1998:408) A leadership style refers to a pattern of behavior and actions leaders use to achieve the desired out comes. It describes how they set up standards for the team, develop their teams short and long term goals, listen to employees and provide them with feedback, motivate them, reward them and punish them (<http://www.trubyachievements.com>). From a military perspective it can be argued that no nation would tolerate its military leaders to be dishonest cowards with no integrity and weak characters. It is rather a given that militaries, as representatives of their respective nations, desire their military leaders to be of admirable character. Leadership is important for the South African National Defense Force and the SANDF has procedure in place for leadership development (<http://scientiamilitaria.journals.ac.za>). It is however crucial that officers who has the potential to be a successful leader in the new role of the SANDF be identified to participate in leadership development programs. The South African Department of Defense however does not have an officially approved leadership philosophy or policy on which the SANDF can base their own leadership development policies and practices (<http://scientiamilitaria.journals.ca.za>) .

Defining leadership

Over time, the concept of leadership has been attributed with a variety of meanings. More than 50 years ago Hemphill and Coans (1957:7) described leadership as the behavior of an individual, directing the activities of a group towards a shared goal. Waddell, Devine, Jones and George (2007:193) define leadership as the process by which an individual exerts influence over other people and inspires, motivates and directs their activities to help achieve group or organizational goals. Leadership thus entails influencing the behavior of others in the direction of goal achievement (Swanepoel, Erasmus en Schenk 2012:339). Waters (1999:10) identify the following characteristics of leaders:

- Leaders have the ability to create a vision and excite people to achieve the impossible;
- Great leaders have an external energy and inner strength that see them through tough times;
- Leaders have a mental agility that enables them to make effective decisions much faster than other people;
- Leaders allow their team members to grow and carry out tasks without interruptions;
- Leaders have the ability to tap into peoples souls. They are emotionally intelligent and

enhance people's confidence by understanding and dealing appropriately with their emotions and concerns. This reflects to the ability to adapt one's style to the needs of the situation and people.

Smith (1999:11) argues that the primary function of a leader is to lead, and leading refers to directing the human resources of an organization and motivating them to achieve the goals of the organization. Leaders do not act in isolation and do not only give orders, they collaborate with their superiors equals and subordinates with individuals and groups to attain the goals of the organization. Leading also means making use of influence and power to motivate employees in achieving organizational goals.

Different leadership styles

Leadership styles are different. There are no good or bad, right or wrong, leadership styles. The most effective leaders know how to adjust their leadership styles, depending on the situation they are in. It can thus be argued that a military leader should be able to adopt his or her leadership style to the situation at hand. The following leadership styles have been identified, it should be noted however that any leader can use any style, and a good mix that is customized to the situation is generally the most effective approach. Successful leadership depends on the fit with regard to the leader, the subordinate and the situation. A leader's effectiveness is determined by how well his or her style fits the situation. (Smith and Cronje 1999:293)

The visionary leader

The visionary leader moves people towards a shared vision, telling them where to go but not how to get there, thus motivating them to struggle forwards. They openly share information hence giving power to others. They can fail when trying to motivate more experienced experts or peers. This style is best when a new direction is needed (<http://changingminds.org>) Visionary leaders can also be described as transformational leaders. Transformational leaders have the ability to make the necessary changes in the organization's mission and structure (Smith and Cronje 1999:296)

Coaching leader

This one-on-one style focuses on the development of individuals, showing them how to improve their performance and helping to connect their goals to the goals of the organization. They are good at delegating challenging assignments, demonstrating faith that demands justification and which, leads to high levels of loyalty. (<http://guides.wsj.com>)

The Affiliative leader

This style emphasizes the importance of team work, and create harmony in a group by connecting people to each other. It is a very collaborative style which focuses on emotional needs over work needs. This approach is particularly valuable when the leader tries to heighten team harmony increase morale, improve communication or repair broken trust in an organization (<http://guides.wsj.com>)

The Democratic leader

This style draws on people's knowledge and skills and creates a group commitment to the resulting goals. The democratic leader acts to value inputs and commitment by way of participation and listening to both the bad and the good news. It works best when the direction the organization should take is unclear, and the leader needs to tap into the collective wisdom of the group.

The Pace-setting leader

The pace-setting leader builds challenging and exciting goals for people, expecting excellence and often exemplifying it themselves. The leaders set extremely high standards for performance. They identify poor performers and demand more of them. They tend to be low on guidance, expecting people to know what to do. They get short term results but over the long term this style can lead to exhaustion and decline, because it can undercut morale and make people feel as if they are failing (<http://changingminds.org>).

The Commanding leader

The commanding leader soothes fears and gives clear directions by his powerful stance. This is a classic model of military style leadership. This leader needs emotional self-control for success and can seem cold and distant. It rarely involves praise and frequently employs criticism, it undercuts morale and job satisfaction (<http://guides.wsj.com>)

Each one of these leadership styles has strengths and weaknesses. As leaders are working with people whose styles might differ from theirs. Each one of these different styles starts with a different vision and that vision determines how they respond to specific circumstances, for example:

- Visionary and commanding leaders start with the vision of the future;
- Coaches start with a vision of the individual;
- Affiliative leaders start with a vision of the team; and
- The pace setting leader starts with a vision of the system .

LEADERSHIP DEVELOPMENT IN THE SOUTH AFRICAN DEFENCE FORCE

From the information in the Acts mentioned above, it is clear that the role and functions of a commander in the SANDF should change dramatically. A commander should have the necessary skills to be able to motivate and inspire a homogeneous group of people who has joined the SANDF from different cultures, backgrounds and groupings in South Africa. Whereas in the past a commander was regarded as a strong autocratic leader who will direct the actions of his subordinates, it can now be argued that the commander will have to focus on personal skills, negotiation skills and motivational skills, to ensure that subordinates will follow his / her command and that the objectives will be achieved without infringing in the rights of the subordinates.

SOUTH AFRICAN LEADERSHIP

Charlton in Swanepoel (2012:351) points out that studies conducted in South Africa have shown that leader's ability to manage themselves is very important. Khoza (2007:24) argues however that South African leadership should be situated squarely in the Africa context. According to him leadership is dominated by values. It is about Africans anchoring themselves in their own continent; it's history, tradition, cultures, mythology, creative motive ethos and value systems. The South African leadership challenge is thus multidimensional and very complex (Swanepoel, 2012:354) Strangle (in Swanepoel:355) lists eight leadership lessons from the former President of South Africa, Mr Nelson Mandela:

- Courage is not the absence of fear – it is inspiring others to move beyond it;
- Lead from the front – but don't leave your base behind;
- Lead from the back – and let others believe they are in front;
- Know your enemy – and learn about his favorite sport;
- Keep your friends close – and your rivals even closer;
- Appearance matters;
- Nothing is black or white; and
- Quitting is leading too.

CONCLUSION

The composition of the South African Defense Force has changed dramatically since 1994. This as well as the impact of the labour legislation in South Africa has serious challenges for future leaders in the South African

Defense0. Force. A combination of the leadership approaches should become part of the training of commanders in the SANDF. Commanders should be trained to be sensitive towards the needs and aspirations of subordinates, and at the same time successfully achieve the goals and objectives of the defense force. Although some of the acts clearly indicate that members of the SANDF are excluded from its provisions, the exclusions put even further pressure on the leadership as it creates an environment where workers(soldiers) who has a vital role to play in the protection of the people of South Africa gets frustrated. This frustration has recently led to classes between the South African Police Service and the South African National Defense Force.

CRISIS MANAGEMENT AND COMMUNICATION STRATEGY IN RESPONSE TO ETHICAL LAPSES AND CORPORATE SOCIAL RESPONSIBILITY FAILURES

George Priovolos and Vincent Maher
Iona College, USA

ABSTRACT

This paper critically reviews the specific approaches used by three “brand-name” entities (a global car company, a highly-ranked university, and a famed world champion cyclist) to defend their recently blemished record. The paper identifies a number of commonalities in their crisis management and communication efforts, which appear to have exacerbated the negative effects on their business reputation and brand. Based on the lessons drawn from these unsuccessful Public Relations campaigns, the authors make a number of recommendations on how to handle apparent discrepancies between desired and actual brand image in the areas of ethics and corporate social responsibility.

INTRODUCTION

In the past few years, a diverse group of organizations and individuals with high-profile brand names have committed public relations blunders in the course of dealing with the communications aspect of inappropriate actions and questionable conduct that they were accused of engaging in.

Corporate giants like Toyota, Carnival Cruises, News Corporation, Goldman Sacks, and British Petroleum—among many others—have all become embroiled in controversies involving allegations of wrongdoing; unfortunately, they seem to have worsened their position by using ineffectual public relations campaigns. The problem is not confined to the corporate world: not-for-profit organizations and recognized individuals with stellar reputations have also come under attack for failing to employ timely and effective communication strategies in the aftermath of operational and/or performance fiascos.

This paper first briefly reviews the specific approaches used by three “brand-name” entities (a global car company, a highly-ranked university, and a famed world champion cyclist) to defend their tarnished record. Next, the paper identifies elements of their crisis *communication* management, which appear to have exacerbated the negative effects of the crisis on their business reputation and brand. Finally, on the basis of this analysis, the authors make a number of recommendations on how “star” performers should handle apparent discrepancies between desired and actual brand image in the areas of ethics and corporate social responsibility.

THREE UNRELATED INCIDENTS OF WRONGDOING

In the period 2009-10, Toyota, a best selling automobile marque known worldwide for its reliable, durable, and well-engineered cars, had to initiate several vehicle recalls following well-publicized reports of sudden acceleration incidents, some of them fatal (Andrews et al., 2011).

At the beginning of 2011, Lance Armstrong, the celebrated professional road racing cyclist, cancer survivor, and founder of the Livestrong Foundation admitted during a TV interview to using performance-enhancing drugs for much of his career, including his record seven consecutive Tour de France wins (Salzman, 2013).

In 2012, Emory University, an elite institution of higher education based in Atlanta, Georgia, acknowledged purposefully misreporting admissions-related data to various reference sources and third parties ranking college/university services, like the US News and World Report, for over more than a decade (Pope, 2012).

In all three cases described above and many others involving similar misdeeds, the responsible parties had to defend themselves against accusations of violating principles that were central to their strong global brands and corporate identities; in most instances, their commitment to ethical values and corporate social responsibility was explicitly mentioned in their own mission statements. To that extent, many analysts and commentators have suggested that such improprieties would not only result in extensive monetary damages in the short-term but will likely linger in people's minds for much longer causing significant harm to brand reputation and equity.

WHAT WENT WRONG IN PR STRATEGY?

Although the nature of wrongdoing in each of the cases discussed in this paper varied, the communications strategies chosen to deal with the effects of the crises on public perception shared a number of common elements as described in various press reports: for instance, there were considerable delays by the accused parties in disclosing the facts of each case; when, belatedly, the latter—under pressure from the media and legal authorities—started revealing what transpired, reporting was fragmented and selective with an eye towards protecting those responsible from legal liability. Occasionally, the Public Relations (PR) methods devised included efforts to pin responsibility on individual employees, shift much of the blame to outside parties (e.g., subcontractors, suppliers, etc.) and/or attack supervisory agencies, the government, and the news media, for—allegedly—engaging in “witch-hunts” (www.thedailybeast.com).

Although a careful examination of the facts in each case may point to mistakes committed by specific staff members and/or third parties, wrongdoers appear to have worsened their problems by relying on belated and selective accounts of what transpired and—even worse—seeking to deflect their responsibility. In fact, such an approach by leading organizations and high-profile individual performers is likely to backfire—it makes them look arrogant, dishonest, and causes whatever “goodwill” they may have established over the years quickly dissipate.

SHORT-TERM DAMAGE CONTROL

Following a fiasco of the magnitude described in the three cases above and in light of the need for self-perpetuating negative publicity to be contained as a prerequisite for eventual reputation recovery, a carefully designed communications strategy should employ a balanced combination of the following elements:

- (a) Disclose fast and accurately all available evidence regarding issues pertinent to the mishap that can be of concern to the public. The advantages of such an approach should be obvious—it's certain that a vacuum of pertinent information about a problem will be promptly filled by rumors, leaks, and opinions outside the control of the accused party. By contrast, the timely dissemination of the facts, as part of a genuine conversation with one's stakeholders, offers the opportunity to tell one's own story and help—to a certain extent—restore the wrongdoer's credibility through what is known in the communication literature as “inoculation” (Jones et al., 2000).
- (b) Develop and publicize a short list of specific, doable, high-priority measures that the transgressor will swiftly enact to boost internal controls so that similar mistakes will not be easy to commit in the future. This step—if completed with a genuine concern towards righting what's wrong—could also help

improve one's credibility by reassuring the public, while at the same time addressing any existing "gaps" in operations.

- (c) Offer a sincere and humble apology to those, directly and indirectly, adversely affected by the misdeeds and—to the extent possible—provide material assistance and/or some form of compensation to victims in order to demonstrate empathy and understanding of their needs. These actions can help re-shape all-important public opinion by easing public anger and decreasing negative perceptions.

Clearly, one cannot overlook the fine line walked by those adopting the steps above; in particular, a public reckoning of error combined with some form of redress and atonement may be construed as admissions of guilt resulting in potentially expensive lawsuits and other legal implications. Therefore, all related communications by the accused parties and their representatives should be carefully crafted to protect their legitimate interests without though giving the impression that they represent marketing "spin."

The Role of Technology

In the past few years, technology has offered communication professionals new ways (e.g., digital and social media) to reach (and hear from) the public. However, the ensuing flood of real-time information is very difficult to attend to and digest—not to mention properly respond to. This manifests itself clearly in the aftermath of a crisis when, for instance, related facts as well as rumors and opinions spread worldwide fast-mutating along the way.

Thus, those accused of perpetrating a misdeed should have in place appropriate monitoring tools and processes to keep up with the volume and speed of relevant information; moreover, properly trained personnel should also be available to relay a response reflecting their own point of view.

LONG-TERM REPUTATION MANAGEMENT

A brand synthesizes the sum total of perceptions, images, and expectations a product or organization generates in people's minds to establish a desired, distinct position in the marketplace and ensure long-term, sustainable growth. Brands incite beliefs, evoke emotions, and prompt behaviors (Kotler & Gertner, 2002); moreover, they offer a reassurance of quality and "peace of mind" making purchasing decisions easier and less anxiety-ridden.

Therefore, virtually all studies of crisis communication management view the brand of the party at the center of a crisis as a potential casualty based on the—correct—assumption that a public relations catastrophe is bound to impact on the way the public perceives the organization or individual involved and their credibility.

However, a brand—one of the most valuable assets for organizations like Toyota or Emory University and even individual performers like Lance Armstrong—could also become a powerful tool in the long-term effort to restore the reputation of an embattled party.

For this to happen, those charged with managing the communications aspect of a blunder on behalf of the accused party need to focus their efforts on immediately isolating those—few and potentially remediable—elements of the transgressor's image affected by the crisis from the organization's or individual's "core" brand.

As discussed in the previous section of this paper, the former i.e., the wrongdoer's "reputational vulnerabilities" should be publicly identified and promptly acted upon. At the same time, implementing a public relations strategy that could be labeled "Back to Basics," the transgressor's essential *positive* brand qualities i.e., "reputational advantages" should be emphasized in a clear, consistent, and effective tone and manner through all appropriate communication platforms and activities. Successful application of this plan is likely to help bridge the distance between the accused party's desired and actual brand image created as a result of the crisis.

Such a methodology may be disputed as a high-risk approach to the extent that it could be considered hypocritical and/or ethically deficient by some members of the public. Furthermore, it is clearly a costly strategy requiring an extensive persuasion campaign to achieve its goals. Nevertheless, if executed properly, it may contribute to the successful evolution of the reputation of accused parties and eventual strengthening of their brand.

CONCLUSION

This paper, addressed the communications aspect of a crisis from the perspective of the transgressor. Based on the lessons drawn from the handling of three recent cases involving widely-publicized blunders committed by a global carmaker, an elite university, and a celebrity-athlete, the paper proposed both a short- and a longer-term public relations approach, which—if properly implemented—could help the accused party benefit from its past mistakes, while protecting its brand equity.

In particular, it was argued, mistakes by high-profile organizations and/or individuals should be disclosed in a timely and accurate manner; related communications should recognize the agony and suffering of the victims and describe concrete steps to be taken in order to avoid error repetition.

Perhaps more importantly, in the long run, successful crisis management will ultimately challenge the ability of communication experts representing the wrongdoer to leverage their client's brand power. In fact, the latter can be *augmented* by a carefully designed and administered campaign disconnecting the brand's "weak links" from its defining nucleus.

TOWARDS A NOVEL PERSPECTIVE ON THE ACADEMIC USE OF MOBILE LEARNING APPLICATIONS: A CASE OF UNIVERSITY STUDENT PERSPECTIVES

Patient Rambe
University of Free State, South Africa

Crispen Chipunza and Aaron Bere
Central University of Technology, South Africa

ABSTRACT

The voluminous research on mobile adoption often emerges from the premise that technological affordances (mainly ease of use and perceived usefulness) motivate the decision to adopt and ultimately trigger the actual adoption of mobile technologies. This framework, though cogent and plausible, fails to account for presage conditions such as compulsive decisions for adoption of mobile technologies. In scenarios where educators impose the decision for student adoption of mobile technologies, technological affordances cannot be assumed to motivate actual adoption of technologies as students adoption is a consequence of their reaction to the authoritative decisions rather than technological qualities. To address this unique condition of compulsory adoption, we reversed Venkatesh et al's (2003) Unified Theory of Acceptance and Use of Technology (UTAUT) to account for the "universal" adoption and to understand student perceptions of use at the post-compulsion phase. The study, therefore, investigates University of Technology Third Year Information Technology and Fourth Year B. Tech Human Resources Management students' perceptions towards mobile instant messaging (MIM) following their educators' imposition of MIM as the mainstay lecturer-student consultative strategy/mode in their respective courses. Findings suggest that requiring students to use MIM for academic consultations resulted in student habitual, addictive and compulsive use of MIM in their modules. Although academically productive knowledge sharing and collaborative practices were reported in both courses, there were some subtle variations in student receptions of compulsive use of MIM with implications for pedagogical delivery.

INTRODUCTION

The South African mobile communication architecture has witnessed a sporadic surge in the adoption and domestication of mobile devices. The mobile phone adoption experience though a fairly recent phenomenon on the South African communication scene, has been profoundly impressive. For instance, as at October 16, 2012, there was an estimated 29 million mobile phone users in South Africa compared to 6 million users of desktop computers (Inter-gate Immigration, 2012). Similarly, Gartner, a global technology research firm, predicted that smartphone penetration in South Africa will hit 80% by 2014 (Rao, 2011). The uptake of mobile internet data had been correspondingly commendable. In February 2011, SA is ranked 5th in the World for mobile data usage (Rawlinson, 2011).

At South African universities, a surging appropriation of mobile technologies was reported. For instance, the University of Cape Town's Centre for Educational Technology (2010) reports a 98% uptake of mobile phones among students and academics (Centre for Educational Technology, 2010). Since young adults are often enrolled at university, it is envisaged a majority of them is using cell phones for various purposes. The

Kaiser Family Foundation (2007) reports that young adults are among the early adopters of mobile technology in South Africa. Their 2007 national study demonstrates that 72% of the 15-24 age group surveyed had access to a cell phone. The commendable uptake of mobile phones in South Africa has been precipitated by a constellation of propitious communicative conditions / circumstances namely, the subsiding prices of low-end mobile phones, free SIM cards, reliable Internet connectivity, strong network infrastructure and generally cheaper tariffs on mobile data compared to stand alone desktop computers.

Consistent with the widely popularised tradition of the Technology Acceptance Model, many African studies on mobile adoption (Renaud and Van Biljon, 2008, Richards and Van Belle, 2007; Mtega, Bernard, Msungu and Sanare, 2012) and elsewhere (Wang and Liao, 2008; Jayasingh and Eze, 2010; Daud, Kassim, Said, Noor, 2011) often affirm the connection among technological affordances, mobile users' decisions to adopt mobile technologies / applications and the actual application. The central theme with the Technology Acceptance Model and its variants, however, is that roaming user's decision to adopt technology is often conscious and voluntary. Particularly the decisions to adopt and ultimate use mobile technologies are often tied to the technological affordances (*perceived usefulness, perceived ease of use*) and promoting context (*facilitating conditions*) and community (*social influence*) of adopting the mobile device/ application. This conception of voluntary use, thus, potentially downplays or fails to adequately account for conditions where educators adopt a unilateral or authoritative decision on student adoption of mobile communication to influence their educator-student academic interaction and information sharing. In such a scenario, student mobile use is mandatory, unconscious and often almost "universal" as students feel compelled to meet the requirements of the module.

Mindful of the unique presage conditions of academic compulsion and almost "universal" adoption, the extended TAM model had to be reversed to cater for this complexity. Our study thus employs a reversed version of Unified Theory of Acceptance and Use of Technology (UTAUT) to unravel Informational Technology (IT) and Human Resource Management (HRM) students at South African university's perceptions of a mobile application (WhatsApp) post "compulsive" adoption. The mobile application, WhatsApp, was adopted to enhance educator-student knowledge sharing and academic networking and students were required to use it as an official consultation space.

The rest of the paper is modelled as follows, a brief theoretical framework is provided, followed by a research methodology, data analysis processes, presentation of findings, discussions, study implications and a conclusion.

THEORATICAL FRAMEWORK

The Unified Theory of Acceptance and Use of Technology (UTAUT) provided a theoretical lens for this study. It was rooted from a merger of eight theories, models and conceptual frameworks popular in Information Technology for behavioral intention and decision to adopt new technology. Diffusion of Innovation, Theory of Reasoned Action (TRA), Technology Acceptance Model (TAM), Motivational Model, Theory of Planned Behavior (TPB), Combined TAM-TPB, Model of PC Utilization, and Social Cognitive Theory contributed in the development of the UTAUT (Venkatesh, Morris, Davis, & Davis, 2003).

UTAUT is defined by four latent variables namely Performance expectancy, Effort expectancy, Social influence, and Facilitating conditions. Furthermore, the theory incorporates four moderating effects to the latent variables namely gender, age, experience and voluntariness. These latent variables and moderating effects constructs influence behavioral intention to use technology and actual use of technology. Figure 1, represents the original UTAUT.

RESEARCH MODEL AND ASSUMPTIONS

Since educators' directive of student adoption of the mobile application required all students to download the WhatsApp application and engage on WhatsApp (a requirement all students fulfilled from the onset), the study's model proceeds from an unique assumption of almost "universal" adoption of the mobile application. This means progression from adoption (from the right in Figure 2) towards understanding student perceptions of the mobile learning experience in the post mandatory phase (shift towards variables on the left in Figure 2). Our

model, has four variables: *m-learning adoption*, *habitual behaviour* (or use), *mandatory influence* (mandatory assumed to be happening twice pre and post adoption?), and addictive behavior.

The research model for this study is illustrated on Figure 2.

Figure 1: Original Unified Theory of Acceptance and Use of Technology (UTAUT)

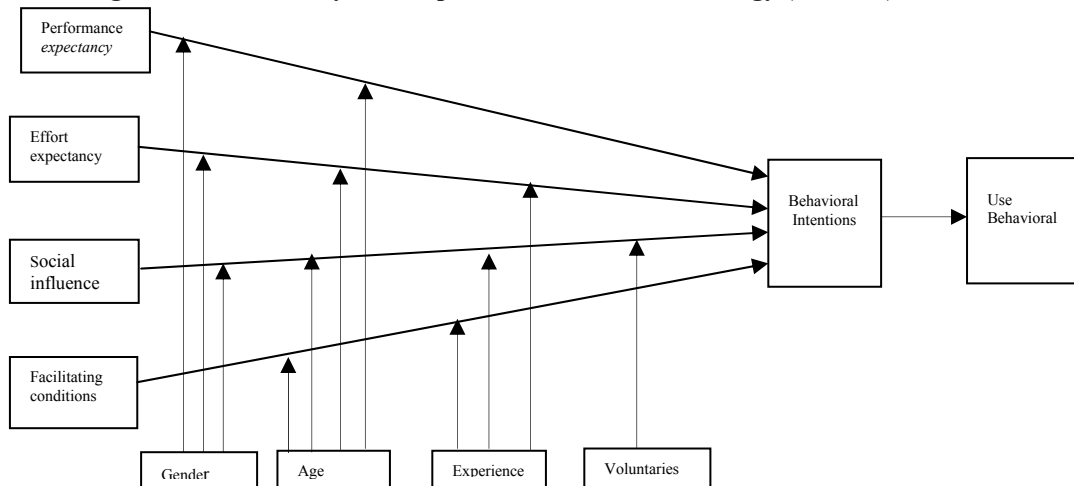

Figure 2: Research model

Habitual Behaviour (facilitating conditions)

In our model habitual behaviour towards MIM was conceived as synonymous with UTAUT's facilitating conditions. Facilitating conditions describe objective conditions in the environment that observers agree make an act easy to accomplish (Thompson et al 1991). Guthrie (1942) defined habit as a model of related movements, which are obtained by a collection of stimuli in many different situations. Reis, Sheldon, Gable, Roscoe, & Ryan (2000), argue that humans cannot survive without habits, since habits offer a ground for people's daily practices that define their livelihood. These researchers argue that the compulsive use of mobile applications if reinforced by persistent inducements (symbolic, real or imagined) can trigger student habitual usage of mobile applications. Our assumption, therefore, is:

Assumption 1: Educator's requirement for student use of WhatsApp will have a positive influence on its habitual use for academic purposes.

In this study, habitual use describes unconscious frequent usage of WhatsApp for educational purposes. Since societal desirability and perceived authenticity of a social practice in a certain context determines habits and daily routines (Gallimore and Lopez, 2002) we assumed that compulsive use in anticipation of academic benefits (social desirability) and productive educator-student interactions, would trigger the natural, inadvertent use of the mobile application.

MANDATORY INFLUENCE

The mandatory construct was adapted from *social influence* construct of UTAUT. Venkatesh, Morris, Davis, & Davis, (2003) define social influence as the extent to which a person perceives that important others believe he or she should use a new technology. Three constructs from the existing models capture the concept of social influence: subjective norm (TRA, TAM2, TPB and C-TAM-TPB), social factors (MPCU) and image (IDT) (Venkatesh, Morris, Davis, & Davis, 2003). Prior studies suggest that social influence is significant in shaping an individual's intention to use new technology (Wang & Wang, 2010; Venkatesh & Davis, 2000; Venkatesh, Thong, & Xu, 2012;). In this study mandatory influence refers to the lecturer's authoritative influence through making WhatsApp academic usage an academic requirement. Consistent with thus we assumed that:

Assumption 2: Educator's requirement for student use of WhatsApp will have a positive influence on its mandatory use for educational purposes

ADDICTIVE BEHAVIOUR

Addictive behaviour in this study describes a neurotic state of absolute absorption and pre-occupation in a particular technology-mediated social practice. Since psychological pre-occupation and immersion in particular activities like texting might distract the students from other activities like face-to-face engagement with peers at particular times, we assumed that:

Assumption 3: Educator's requirement of student use of WhatsApp have a positive influence on student addictive use of it.

ACADEMIC PROGRAMME

Academic programme will mediate the development of perceptions that use of WhatsApp is habitual, mandatory or addictive as an academic tool for learning purposes. This hypothesis is based on speculations that Information Technology students appreciate emerging technologies better than Human resource students hence, making Information Technology students early adopters of new technology than the later. Based on these assumptions the following assumption was tested:

Assumption 4: Habitual, mandatory and addictive use of WhatsApp will be more positive for Information Technology students than for Human resources management students.

METHODOLOGY

The research adopted a positivist paradigm. Positivist paradigm is a natural scientific methodology which holds that research must be limited to what can be observed and measured objectively (Welman, Kruger and Mitchell, 2005:6). The sample were fourth year human resource management (HR) students (n = 63) and fourth year Information students (n = 55). A semi-structured questionnaire measuring students' habitual, mandatory and addictive use of WhatsApp was developed. The open ended questions solicited students' experiences of using WhatsApp for learning. Descriptive statistics were used to analyse student's responses from the two groups, while inductive analysis was used to interpret the qualitative responses.

FINDINGS

The findings were interpreted from the main assumption that WhatsApp adoption has already happened when students were required to download WhatsApp software and were grouped into WhatsApp-based clusters of approximately 10 members per cluster to initiate intra-cluster interactions. The collected data was therefore to determine whether such an interaction resulted in mandatory, habitual and addictive behaviours in using it. The findings are presented in tandem with the hypotheses of the study as shown below.

HABITUAL USE

Assumption 1: Educator's requirement for student use of Use of WhatsApp will have a positive influence on its habitual use by students

We sought student perceptions of the assumption that compulsive WhatsApp use could have positively impacted their habitual use of this mobile application. Habitual use thus describes the internalization of WhatsApp use into the communicative repertoires of these students unconsciously and naturally. Such accommodation of technology use would mean its application in natural, fluent ways like students would do other familiar technologies they grew up with.

Table 1 below shows the results of students' responses from both HR and IT

Table 1: Habitual use of WhatsApp

Academic Programme	Sample size	Agree (%)	Neutral (%)	Disagree (%)
HRM	n = 63	57%	16%	24%
IT	n = 55	78%	12%	9%

Table 1 indicates that 78% of the IT students and 58% of the HRM students concurred that WhatsApp resulted in them adopting it for academic purposes in natural ways (habitually). To the contrary, 24% of the HR students and 9% of IT students disagreed that WhatsApp compulsive use activated their habitual use of it.

MANDATORY USE

Assumption 2: Educator's requirement for student use of WhatsApp will have a positive influence on its mandatory usage for educational purposes by students

In the context of our study, we conceptualised mandatory influence as synonymous with *social influence*. Social influence is embodied in subjective norm concept, defined as “the degree to which an individual perceives that important others believe he or she should use the new system” (Venkatesh et. al., 2003, p. 451).

Table 2: Mandatory use of WhatsApp

Academic Programme	Sample size	Agree (%)	Neutral (%)	Disagree (%)
HRM	n = 63	48%	23%	29%
IT	n = 55	35%	37%	28%

As shown in Table 2, 48% of the HR students and 35% of the IT students confirmed that the educators' requirement for academic use of WhatsApp activated its mandatory use among them. The percentage of HRM and IT students disagreeing to this hypothesis is almost identical.

ADDICTIVE USE

Hypothesis 3: Educator's requirement of student use of WhatsApp have a positive influence on student addictive use of it

Addictive behaviour describes students' neurological absorption and pre-occupation with the academic use of WhatsApp. Once this mobile application has been internalised and accommodated as part of student's communicative repertoires, the assumption was that students would be absorbed and “consumed” in its educational usage.

Table 3 illustrates the findings on the effects of compulsive adoption on student addictive use of WhatsApp.

Table 3: Addictive use of WhatsApp

Academic Programme	Sample size	Agree (%)	Neutral (%)	Disagree (%)
HRM	n = 63	48%	20%	32%
IT	n = 55	52%	17%	31%

As shown in Table 3, 52% of IT students and 48% of the HRM students indicated that the academic requirement to use WhatsApp for academic purposes resulted in them becoming addicted to it. . However, there was a balance between those in disagreement in both courses.

ACADEMIC PROGRAMME

The hypothesis *Habitual, mandatory and addictive use of WhatsApp will be more positive for Information Technology students than for Human resources management students*” was tested. This finding suggest this statement was confirmed habitual and addictive uses but not for mandatory usage. This was due to the fact that a semblance of compulsory use was already imputed into IT programmes and modules by virtue of their strong ICT mediated practical orientation. Consequently, students’ mandatory appropriation of WhatsApp was not necessarily attributable to educators’ compulsive requirements but rather to the demands of the programmes and modules which made the use of various ICTs constitutive of this course’s delivery.

DISCUSSION

Habitual use
