Although a majority of HRM and IT students concurred that the requirement for educational use of WhatsApp propelled their habitual use of it, there were statistical variations between them. Comparatively more (21 of them) IT students professed this view: a result which resonates with the disciplinary differences in terms of access and productive use of educational technologies. Since IT students tend deal with technological applications, technological problems and issues more often than their counterparts in the social sciences, their higher affirmation of habitual use of WhatsApp, was ideally expected and logical. This finding resonates well with Czerniewicz and Brown’s (2007) study on disciplinary differences in the use of ICTs for teaching and learning in five South African higher education institutions. Their study affirms that, essentially, ICTs for learning appears to conform to existing disciplinary approaches, although the natural sciences (particularly Health Sciences) reported the most frequent and varied use of ICTs across all teaching and learning events. Other studies also questioned the connection whether differential differences in the uptake of educational technologies could be tied to differences of the academic communication system. Matzat’s (2009) research affirms that differential communication needs across differences explained variations in ICT usage across disciplines. For instance, scholars in fields where research projects had a low visibility (i.e., in fields with a high dispersion of journals), had a higher likelihood of starting to use particular communicative technologies like Internet Discussion Groups to orient themselves through them.

By the same token, there were less IT students compared to HRM who contested the influence of compulsory requirements on habitual appropriation of WhatsApp. For IT discipline, students were naturally expected to experiment with different technologies and dealing with technological issues was a broader imperative of the discipline by design. As such, the natural embrace of new educational technologies was an expected given. The reverse applies for HRM, where the appropriation of technologies could have been restricted to replicative functions of electronic submissions, database searches or typing of assignments. This finding buttressed findings from established literature. Kemp and Jones (2007) confirm that discipline and subject area are significant factors affecting the use of technologies like digital resources in teaching and learning in higher education. Their study maintains that the way academics organize their subject and task differentiation appears to carry over into the use of digital resources for teaching and learning. Since academic success is a function of the particular ways in which students intellectually engage with their academics, educator-directed tasks and activities, students in particular disciplines will naturally strive to function according to their academics’ expectations.

Mandatory use

Our identification with Venkatesh et al's (2003) UTAUT, we discerned that mandatory use approximates the theory's "social influence" variable. Social influence emphasises, the extent to which a technology users would feel that some influential others could expect them to use a particular technology. In the case study, educators expected their students to use WhatsApp for educator-student consultation, peer-based engagement and knowledge sharing. We tested whether such requirement of WhatsApp academic use could trigger perceptions of its mandatory use by students. Despite the concurrence of HRM and IT students on the requirements for WhatsApp use, positive influence on student perceptions of its mandatory use, comparatively fewer IT students affirmed this view. This is logical because for IT students, experimenting with different technologies is a legitimate imperative and natural constant for IT professionals and novices. As such, what could have been conceived as "compulsion" by HRM students might have been conceived as the obvious, logical practice by IT students –hence their dissociation with notions of compulsive use of WhatsApp.

The JISC Disciplinary Differences Report (2005) alludes to the distinct information-seeking behaviours and scholarly technology-mediated communication across the various disciplines (Sparks, 2005). For instance, the importance of [online] journal articles for the medical and biological sciences; e-prints (pre and post) in the physical sciences and engineering; a broader mix in social sciences and the particular importance of books in languages and area studies. The Report highlights a slightly higher awareness of subject-based repositories in natural sciences and such awareness was lowest in arts and humanities. Overall, we infer a higher level of technological dependence and awareness in the natural sciences compared to the social sciences, a view confirmed by their aforementioned results.

Although there was a balance between HRM students (29%) and IT students (28%) who disagreed with the positive effects of mandatory use, the rationale for their disagreement to this hypothesis could have varied considerably. For IT students, the basis for the location of MIM under the category of technologies of academic value could have been different from HRM's position. Since the South African young adults are already a text-centric generation using MIM for social purposes, the transition from social to academic use of WhatsApp could have been a steep learning curve for some HRM and IT students-hence their disagreement with the hypothesis. For instance, in South Africa, there was an estimated 13 million users on Mxit, a Java-based GPRS "Internet-lite" chat application (Bremen, 2011). Since the texting culture is a teenage social practice, we envisaged a sizable number of students to have socialised via the platform, reinforcing social production of artifacts than intellectual engagement. For instance, some respondents to Mxit usage associated it with "rude" chatrooms, "nude pictures," "gangster names," and swearing, rather than serious applications or the maintenance of existing friendships (Walton & Donner, 2012).

The hard to substantiate response was the "neutral" option for IT students. This profound uncertainty suggests that the consequences of compulsory adoption could be circumstantial (based on content involved, nature of course, work load involved), and contingent upon student individual identities, situations and social spaces. Walton & Donner, 2012 allude to the complex articulations of digital practices and identities by South African teenagers from townships, which can neither be equated to mobile habitus or middle-class norms, goals, or uses of mobile technologies. However, their enactment of technological identities, does not always display change, agency, and subversive or transgressive cultural appropriations. Extending Walton and Donner's view, the reverse could also be true- that their identities could also transcend or refuse to embrace the Internet digital identity.

Addictive use

Our prediction of a positive relationship between compulsory use of WhatsApp and its addictive usage by students was confirmed to various proportions across the two courses. There was a marginally higher confirmation in IT compared to HRM (IT=52; HRM=48) as much as there was a respectable balance among those who disagreed in both modules (IT=31; HRM=32). While the marginal confirmation could be attributed to student with strong technology-mediated academic identities immersed in WhatsApp, the disconfirmation could as well be indicative of "digital strangers" struggling to access or resisting the academic use of perceivably social technologies. With regard to access, although South Africa boasts of over 50 million mobile subscribers (ITU, 2011) and a data-intensive country, Walton and Donner (2012) allude to the paucity of reliable estimate of statistics on data-ready and data-using mobile subscribers. In connection with digital strangers, however Czerniewicz's (2009) suggests that her 2007 survey on 10 000 South African students' use of ICTs demonstrates the prevalence of digital strangers. She reports that 22% of these students still lack both experience and

opportunities of ICT usage judging from their limited exposure to computers and limited off campus access to computer technologies.

The middle ground, “neutral” responses for both HRM and IT has multiple meanings. Perhaps after having been exposed to WhatsApp and other local MIM applications like MXit for over half a decade, addiction could have been a psycho-social condition they might have fully recovered from. Alternatively, the neutral responses are illustrative of student skepticism about “academic addiction.” Alternatively, this evokes an uncertainty arising from unclear/ unknown consequences of a novel technology students have not explored about enough. The use of social networking sites [and instant messaging] remains a new emerging phenomenon among young adults at college (Kirschner & Karpinski, 2010). Perhaps, the middle ground might also be an expression of the metamorphosis of complex digital identities at work. As Walton and Donner (2012: p. 6) suggest, “Young people’s prior experiences and dispositions have shaped a digital “habitus,” and this results in distinct and divergent attitudes toward digital and mobile resources.”

Academic discipline

For all aforementioned three hypotheses, both student clusters confirmed all but one of them. The only hypothesis the IT students were ambivalent about was whether the requirement to use WhatsApp activated their compulsory use. For this hypothesis, the “neutral” (37%) response outweighed their “agree” response (35%) suggesting that perhaps, they were already using WhatsApp for academic-related activities long before their educator made its academic use compulsory. Overall a larger proportion of both HRM and IT groups were either ambivalent or disagreed with the view that the academic requirement to use this MIM triggered their mandatory use of it.

IMPLICATIONS FOR PEDAGOGY

The study has the following implications for pedagogy:

- There were some disciplinary variations in student habitual use of MIM (post compulsion) based on content taught and disciplinary communicative practices. IT students expressed higher positive affirmations of compulsory adoption on their habitual use of MIM than their counterparts. As such, educators may broaden the use of MIM for HRM students by developing strategies for its seamless integration with existing widely accessed technological platforms like the learning management systems.
- The marginal differences among the two student groups in *addictive* academic use of MIM suggests that a constellation of other factors (such student technological confidence, technological efficacy, perceived relevance and perceived convenience of the technology) influence student immersion and pre-occupation with technology. Therefore, educators need to explore student technological “habitus” (Bourdieu, 1972), the pedagogical imperatives and wider social influences on effective usage of MIM.
- Lastly, student ambivalence about the effects of compulsive adoption on their mandatory use of technology suggests that the compulsive adoption’s impacts on compulsory use remained untested and demands further academic scrutiny. A more productive strategy would be to compare voluntary MIM use with compulsory adoption to establish the possible implications on student mandatory use.

CONCLUSION

The current study examined the effects of compulsory adoption on student habitual, mandatory and addictive use of MIM. The findings confirmed a positive connection between compulsory adoption and student habitual use, compulsory adoption and student addictive use, but a negative relationship between compulsory adoption and student mandatory use of MIM. It seemed disciplinary variations in communicative practices, orientation towards task execution using educational technologies and information seeking behaviors explained the two student clusters’ varying perceptions about the impact of compulsory adoption on student use of MIM for educational purposes. Overall, however, the IT students expressed ambivalent views about the impact of educators’ requirement to adopt WhatsApp on their compulsory academic use of this technology. Academic programme, nonetheless, had some positive influence on all variables-habitual, mandatory and addictive use of MIM.

LAND USE MANAGEMENT POLICIES AND SMALL BUSINESSES WITHIN SOUTH AFRICA'S CITIES

Tlou Ramoroka
University of Limpopo, South Africa

ABSTRACT

This paper argues that the single land use strategy within cities has adverse effects on small businesses such as limited access; locational constraints; infrastructure and services constraints; time constraints; competition amongst small businesses; and inability to decrease unemployment and eradicate poverty. Therefore, the purpose of this paper is to describe how land use in cities is executed and its subsequent effects on small businesses. The paper uses the literature related to land use management and observations from Polokwane City to explain the effects of land use management on small businesses. Consequently, the paper concludes that land use management in South Africa's urban areas must be used as a strategy to provide advantageous economic conditions for the operation and survival of small businesses.

INTRODUCTION

Globally, most land use management policies are popular for the promotion of single land use rather than mixed land uses (McMillen & McDonald, 1999; Gallent & Kim, 2001; Rossi-Hansberg, 2004; Qian, 2010; Butsic, Gaeta & Radeloff, 2012; Koroso, van der Molen, Tuladhar & Zevenbergen, 2013; Mincey, Schmitt-Harsh & Thureau, 2013). The common zones which define land uses within the majority of urban areas are residential, commercial popularly known as the central business district, industrial and green land zone known as public open spaces (Gallent & Kim, 2001, Butsic *et al.*, 2012; Mincey *et al.*, 2013). However, single land use is considered to be undemocratic as people are restricted in terms of what to do on their properties, uneconomical because it restrict land supply and increase adjacent land values and also environmentally unquestionable as in most cases it protects land with very limited preservation value (McDonald, 1995; Gallent & Kim, 2001; Mincey *et al.*, 2013). Additionally, access to urban land becomes difficult for the poor who are in most cases desperate to engage in economic activities (Koroso *et al.*, 2013). Practically, these land use management policies limit the ability of lands to diversify socially, culturally and economically (Gallent & Kim, 2001; Qian, 2010). However, only a few countries, mostly within developed nations, have adopted the mixed land use strategy in order to promote diversity and integration of social, cultural and economic activities, amongst other reasons.

Regardless of the important value that is attached to land use management, Houston which is one of the major cities in North America is without zoning (McDonald, 1995; McMillan & McDonald, 1999; Qian, 2010). According to Qian (2010) Houston City is known for adopting the traditional free market philosophy which views land zoning as violation of what is supposed to be private property and personal rights. The urban structure and land use of the city were informed by transportation infrastructure, enormous projects and private land use controls, amongst others, as a result of advantages for oil and gas (McDonald, 1995; Qian, 2010). However, there are a number of challenges related to the lack of zoning in the city. One of the challenges includes the encroaching of certain land uses on adjacent places which informs the continuous changes of land uses in the city (McDonald, 1995; McMillan & McDonald, 1999). For instance, heavy industrial and commercial activities are mixed with residences while some of the houses are adjacent to vacant unproductive land and toxic sites such as landfills (Qian, 2010). Seemingly, even though Houston is not zoned, the city is economically developed. The economic development might be due to the fact that areas of economic potential are at the disposal of every one including small businesses.

Houston's case provides evidence that land use management policies in urban areas have the ability to influence the success of small businesses. It is against this context that this paper describes how land use in cities is executed and its subsequent effects on small businesses. Furthermore, the paper argues that single land use strategy within cities has adverse effects such as limited accessibility of small businesses; locational constraints; infrastructure and services constraints; time constraints; competition amongst small businesses; and inability to decrease unemployment and eradicate poverty. The major areas of focus in this paper are legislative framework of land use management in South Africa; the nature of small businesses; land use management and small businesses specifically in Polokwane City; and, the effects of land use management on small businesses. The paper then concludes that land use management in South Africa's urban areas must be used as a strategy to provide advantageous economic conditions for the operation and survival of small businesses.

A LEGISLATIVE FRAMEWORK OF LAND USE MANAGEMENT IN SOUTH AFRICA

The apartheid spatial planning and land use management in South Africa's cities has been widely documented (Davies, 1981; Simon, 1986; Christopher, 1990, 1997, 2004; Donaldson & Kotze, 2006). With the aid of a number of policies such as the Group Areas Act (Act No. 41 of 1950), people living in urban areas were segregated according to their ethnic language origins and pigmentation (RSA, 2001). Therefore, the apartheid land use management policies shaped urban areas along racial lines, thereby excluding large sections of the population from the economic, social and the environmental benefits (RSA, 2001). Furthermore, this settlement policy resulted in structured social inequalities in the design and land use of urban areas (Christopher, 1997). The Group Areas Act ensured the control of the Black, indigenous and Coloured populations by prescribing places of residences, movements and economic activities among others, simultaneously, controlling the allocation of land for the White population which benefited them socially, economically and politically (Christopher, 1997).

Post-apartheid, the increase of rural-urban migration in search of economic opportunities has in recent years lead to the transfer of the rural poor into urban areas (Baycan Levent, Masurel, & Nijkamp, 2003; Rogers & Sukolratanamettee, 2009; Kotus & Hlawka, 2010; Geyer, Coetzee, Du Plessis, Donaldson and Nijkamp, 2011; Webb, Bruton, Tihanyi & Ireland, 2012; Sheehan & Rioemena, 2013). However, people who are migrating to urban areas in search of economic opportunities within the business sectors have to comply with the current land use management policies of those specific towns and cities. It is in this context that, an analysis of some of South Africa's current land use management policies which guide economic activities including small businesses, their growth and operations within urban areas is provided. There are three legislative frameworks which are the White Paper on Spatial Planning and Land Use Management; National Spatial Development Perspective; and, Spatial Planning and Land Use Management Bill, which the paper discusses respectively.

White Paper on Spatial Planning and Land Use Management of 2001

The White Paper on Spatial Planning and Land Use Management of 2001 provides principles and norms which collectively form a common vision of land use planning and management in South Africa. The principles and norms derived from the Development Facilitation Act (DFA) (Act No. 65 of 1995) strive to promote sustainability, equality, integration, efficiency and fair and good governance in order to stimulate economic development opportunities in rural and urban areas, amongst other objectives (RSA, 1995a; RSA, 2001). According to the White Paper on Spatial Planning and Land Use Management, the DFA features three general objectives which include the general principles for land development, land development objectives and development tribunals. The general principles for land development reject low-density, segregated, fragmented and mono-functional development and instead promote compact, integrated and mixed-use settlements. Whereas, land development objectives developed by all municipalities should take into consideration the need to plan land use in an integrated and strategic manner. Development tribunals which are established in all the provinces facilitate the speedy consideration of land use change and development applications (RSA, 2001).

However, in order to achieve the objective set in this White Paper, land must to be used wisely. Accordingly, wise land use entails planning and management of land uses in an integrated manner, linking social

and economic development with environmental protection and enhancement. Given this background, the spatial planning, land use management and land development system focussed on linking forward planning and development control executed through the municipal Integrated Development Plan and land Use Management, respectively. In addition, land use management prevents uncontrolled land developments and promotes various types of desirable land development supported by various sectors of the society. The White Paper however, outlines the land use management activities as the regulation of land use change and the regulation of green fields' land development, amongst others. In completing these activities, it was recommended that all the municipalities compile a spatial development framework which consists of four major components. The components include the policy for land use and development; guidelines for land use management; a capital expenditure framework indicating where the municipality intends spending its capital budget; and, a strategic environmental assessment (RSA, 2001). Additionally, municipalities must also develop land use scheme which illustrates the different land uses within their areas of jurisdiction including the areas of economic development and growth. If the principles of this White Paper are put into practice by municipalities through the land use management policies, the ability of small businesses to contribute to the economic development will be recognised. Therefore, municipalities' spatial development framework and land use scheme must support the development of small businesses specifically by locating them in areas where there is potential growth as prescribed by the White Paper.

National Spatial Development Perspective of 2006

One of the key priorities of South Africa's government is to increase economic growth and promote social inclusion especially within towns and cities (RSA, 2006). Therefore, the National Spatial Development Perspective (NSDP) provides a set of principles for guiding infrastructure investment and development decisions; a description of the spatial manifestations of the main social, economic and environmental trends that should form the basis for a shared understanding of the national space economy and interpretation of the spatial realities and the implications for government intervention (RSA, 2006).

There are five developed principles which in support of the broader growth and policy objective of the government address issues of economic development. The first principle states that rapid economic growth that is sustained and inclusive is a pre-requisite for the achievement of other policy objectives, among which poverty alleviation is key. The second principle indicates that government has a constitutional obligation to provide basic services to all citizens wherever they reside. The third principle aims that government spending on fixed investment should be focused on localities of economic growth and/or economic potential in order to gear up private sector investment, to stimulate sustainable economic activities and create long-term employment opportunities. The fourth principle advises that efforts to address past and current social inequalities should focus on people, not places. Lastly, in localities where there is economic potential, the government should concentrate mainly on human capital development by providing education and training; In order to overcome the spatial distortions of apartheid, future settlements and economic development opportunities should be channelled into activity corridors and nodes that are adjacent to or that link with the main growth centres (RSA, 2006).

In support of the development of small businesses in South Africa, the NSDP principles are based on a number of assumptions. The first assumption asserts that location is critical for the poor to exploit growth opportunities. The second assumption declares that poor people who are concentrated around economic centres have greater opportunity of gaining from economic growth. The third assumption affirms that areas with demonstrated economic potential provide greater livelihood and income protection because of a greater diversity of income sources and are most favourable for overcoming poverty. The fourth assumption indicates that the poor make rational choices about relocating to areas with greater economic opportunities. The last one declares that government must ensure that policies and programmes are in place to make certain that the poor are able to benefit fully from growth and development opportunities in such areas (RSA, 2006). Basically, the NSDP provides conditions that are suitable to support small businesses located in towns and cities. The NSDP recognises that land use development and management can be used as a tool to ensure that small businesses operating in urban areas contributes to poverty alleviation, job creation and ultimately economic development.

Spatial Planning and Land Use Management Bill of 2012

In response to the apartheid land use management which resulted in a system of unequal access to economic and social resources in almost all the urban areas (Christopher, 1990, 2004), the government had to develop a number of policies including the Spatial Planning and Land Use Management Bill to help deal with this challenge. The objectives of this Bill are to provide for a uniform, effective and comprehensive system of spatial planning and land use management in South Africa; ensure that the system of spatial planning and land use management promotes social and economic inclusion; and, provide for the sustainable and efficient use of land (RSA, 2012). Additionally, the Bill recommends that spatial planning, land development and land use management must promote spatial justice; spatial sustainability; spatial resilience; efficiency; and, good administration.

Chapter five of the Bill emphasises issues of land use management in South Africa. The chapter specifies that the land use schemes that municipalities develop in partnership with the public, must include suitable categories of land use zoning and regulations for the entire municipal area. Furthermore, municipalities must comply with the environmental legislation and take into consideration any environmental management tool adopted by the relevant authority. Simultaneously, land use schemes must give effect to and be consistent with the municipal spatial development framework in order to promote economic growth, social inclusion, efficient land development and the minimal impact on public health and the environment including natural resources. Furthermore, the scheme must include regulations indicating procedures and conditions related to land use and development in all the zones, a map consisting of different zones of the municipality and a register of all amendments to such a land use scheme. However, the scheme can be amended by the municipality based on public consultations if it is in the public interest in order to advance a disadvantaged community and to promote the vision and development goals of the municipality through land use change.

The Spatial Planning and Land Use Management Bill fully supports the notion that land use development and management must be practiced in a manner that will promote efficient land use which will then support economic growth and social inclusion. The bill further confirms that it is through land use development and management that small businesses can be given enabling circumstances to operate and grow as desired. The next section of this paper discusses the nature of small businesses, specifically in South Africa.

THE NATURE OF SMALL BUSINESSES IN SOUTH AFRICA

It has been documented that in practice small businesses are mostly synonymous with the informal economy (Baycan Levent *et al*, 2003; Geyer, Coetzee, Du Plessis *et al*, 2011; Webb *et al*, 2012; Sheehan & Rioemena, 2013). According to the National Small Business Act (Act No. 102 of 1996), a small business is defined as “separate and distinct business entity, including co-operatives enterprises and non-governmental organizations, managed by one owner or more which, including its branches or subsidiaries, if any, is predominately carried on in any sector of the economy” (RSA, 1996, p. 2). The National Small Business Act and the White Paper on National Strategy for the Development and Promotion of Small Business in South Africa of 1995 further categorised the small businesses into four categories, namely, survivalist enterprises; micro-enterprises; small enterprises; and, medium enterprises.

Survivalist enterprises are joined by people who are unable to find paid jobs of their choices. The businesses do not require much of capital investment and skills training in order to be developed. Although the activities of this category should assist in eradicating poverty, usually the generated income still falls under the poverty line given the large number of people, especially women who engage in survivalist activities. Furthermore, survivalist economy operates within the informal economy as they are mainly unregulated (RSA, 1995b, 1996; Geyer *et al*, 2011). Micro-enterprises are also small businesses which are made up of the owner, a few family members and a maximum of one or two paid employees with the basic business skills and training. Similarly, the survivalist enterprises, micro-enterprises also lack business licences; value-added tax registrations; formal business premises; operating permits and accounting procedures. However, contradictory to the survivalist enterprises, micro-enterprises have the ability to advance into viable small formal businesses depending on the particular sector and access to the needed support (RSA, 1995b, 1996).

The other category is known as small enterprises which consists of established businesses which can provide employment opportunities for five to fifty people. Customarily, the small enterprises are owner-managed with a more complex management structure; likely to operate from formal business premises; are tax registered; and, they comply with other formal requirements. These enterprises usually are involved in retailing, manufacturing, professional services and consultation, amongst others (RSA, 1995b, 1996). The last category is the medium enterprises which provides an average of 200 employment opportunities and capital assets of about R5 million, excluding property. Medium enterprises are sometimes owner or manager controlled through the shareholding or community control base with a complex management structure (RSA, 1995b, 1996). The activities of this category of businesses are the main contributors of the economic development as compared to other categories. For the purpose of this paper small businesses refer to all those which consists of the characteristics of the survivalist enterprises category. The characteristics of small businesses within the survivalist category include being owner-managed by unskilled and untrained people; operated by family members who in most cases are undocumented, unregistered and/or tax-avoiding business and not operating from formal business premises, amongst others (RSA, 1995b, 1996; Baycan Levent *et al*, 2003; Geyer *et al*, 2011).

These small businesses usually operate within the informal economy where they are concerned with legitimate activities that are mostly outside the formal institutional boundaries set by the government but not necessarily illegal (Geyer *et al*, 2011; Webb *et al*, 2012; Sheehan & Rioemena, 2013;). However, small businesses through the informal economy produce goods and services that in most cases are wholly legal (Webb *et al*, 2012). The goods and services include, amongst others; hairdressing, carpentry, sewing, arts and crafts, pottery, selling of fruits and vegetables and other goods which are usually practiced through the popular street hawking. However, the unpaid tax revenue by these small businesses has adverse effects on the development of the national infrastructure and its economy (Sheehan & Rioemena, 2013). Simultaneously, the small businesses are indirectly benefiting from the tax generated by registered businesses (Baycan Levent *et al*, 2003; Geyer *et al*, 2011). Webb *et al* (2012) asserted that the majority of small businesses delay their registration to be recognised within the formal economy on the basis that they have to ensure that the market opportunity is viable and sustainable as well.

According to Sheehan & Rioemena (2013) the motivation behind the establishment of small businesses is mostly the desire of economic well-being and benefits attached to these types of businesses. Furthermore, small businesses are a response to limited and unstable employment opportunities especially for the poor and uneducated people (RSA 1995b, 1996; Cunningham, 2001; Sheehan & Rioemena, 2013). However, some of the disadvantages of small businesses are that they are not guaranteed easy access to credit; their operations are usually smaller in scale; and they are more labour-intense as compared to many businesses within the formal sector (Geyer *et al*, 2011; Webb *et al*, 2012; Sheehan & Rioemena, 2013). The implications of these disadvantages are that small businesses are rarely financed by financial institutions such as banks and as a result they cannot afford the technology and infrastructure needed to successfully run their businesses. In many countries including South Africa, small businesses also tend to be gender oriented (Baycan Levent *et al*, 2003; Geyer *et al*, 2011). For example, the majority of people who engage in small businesses within the survivalist enterprises especially related to food production and distribution are women (Geyer *et al*, 2011), which in most cases low-incomes are experienced as a result of the perishable nature of the food. In contrast, the majority of men's small businesses are associated with more technical activities which are not associated with food production and circulation. These activities include carpentry, arts and crafts and car mechanics, amongst others. These types of small businesses are clearly observable within South Africa's urban spaces as they mostly operate in front of shops and alongside the roads. Furthermore, most of these businesses do not have formal infrastructure except for the limited few in selected areas within urban areas. In some cases, some businesses operate in restricted areas due to lack of spaces in areas demarcated for their activities. The succeeding section explains the relationship between land use management and small businesses in Polokwane City.

POLOKWANE CITY'S LAND USE MANAGEMENT AND SMALL BUSINESSES

In response to the national policies guiding land use management in South Africa, Polokwane Municipality has developed and adopted a number of guiding documents which include the Spatial Development Framework

(SDF), Town Planning Scheme, Integrated Development Plan (IDP) and the Local Economic Development (LED) Strategy, amongst others. However, this paper's focus is on the Town Planning Scheme which explains different land uses within the municipality, specifically in Polokwane City. The paper's attention will be more on areas zoned for businesses in order to determine the place of small businesses. In addition, the LED Strategy which emphasizes the types of small businesses and how they are supported by the municipality will be analysed. By use of the two documents, the relationship between land use management and small businesses in Polokwane City is explained.

Polokwane Town Planning Scheme of 2007 restrict any person the right to use any land or to erect or use buildings thereon in a manner or for any purpose which is prohibited by the provisions of any condition registered against the title deed under which such land is held, or imposed by legislation in respect of such land. This implies that land use is prescribed by the scheme in all the zones. The scheme is guided by principles which include discouraging illegal occupation of land and promoting efficient and integrated land development in order to promote integration of social, economic, institutional and physical aspects of the area of concern (Polokwane Local Municipality, 2007). Additionally, the scheme encourages active involvement of community members and promotes sustainable land development at the required scale, amongst other principles. Therefore, the scheme defines the use zones of Polokwane City further indicating the extent of uses in each use zone. Polokwane City is traditionally zoned, with the zones such as residential, commercial, industrial and green land zones. In the commercial zone, a number of businesses are accommodated and catered for by the scheme. The scheme divided businesses in four categories as Business 1 to 4, 1 for less-intense or small businesses and 4 for heavy businesses. The land uses identified in Business 1 use zone are single family residence, offices, medical consulting rooms, shops, public garage and restaurant, amongst other uses (Polokwane Local Municipality, 2007). However, these specified types of businesses require a formal structure in which they render their services and should also be registered. Apparently, if small businesses had a place in the town scheme, they would need to be considered in a category that best suits their characteristics. Therefore, the categorization of businesses in Polokwane Town Planning Scheme confirms that land use management policies have adverse effects on small businesses.

Regardless that the scheme does little to accommodate small businesses which are dominant within the informal sector; the LED Strategy of Polokwane Local Municipality of 2008 does recognise small businesses and their contribution towards economic growth. The strategy tend to focus more on survivalists enterprises operating within the informal economy as they are considered as transition phases in becoming part of the formal economy (Polokwane Local Municipality, 2008). Therefore, the municipality offers support to small businesses because the informal economy makes a significant component of Polokwane City's economy. However, in the city, the majority of small businesses rely on income from social grants and informal loans secured within the family structure as capital (Polokwane Local Municipality, 2008).

In support of small businesses in Polokwane City, the municipality formalised two of the so called satellite markets which specialise in convenience items in the city. The first market is based in the Pick 'n Pay Taxi Rank located in corner Church and Devinish Streets whereas the second market's location will still be determined based on pedestrian movements (Polokwane Local Municipality, 2008). Furthermore, the municipality identified a site for a tourists market in the city which is located between Market and General Joubert Streets and the second site will be around the western side of the city centre (Polokwane Local Municipality, 2008). Alongside Landros Mare and Market Streets which are known as pedestrian corridors, small businesses are given permission to render their services on the pavements provided that pedestrian movements, access to businesses premises and vehicular movements are not interrupted. The municipality either provided coloured spaces on the pavements, paved spaces with permanent steel display benches or permanent hawker stalls with roofs for small business operations (Polokwane Local Municipality, 2008). These initiatives are meant to support and provide favourable conditions for small businesses in an attempt to eradicate poverty and reduce unemployment. As already noted, the businesses contribute to the economic well-being of the city. The next section discusses the effects of land use management policies on small businesses, using inferences drawn from Polokwane City.

EFFECTS OF URBAN LAND USE MANAGEMENT ON SMALL BUSINESSES

Seemingly, land use management policies have the ability to affect the operations of, and the benefits associated with small businesses. To a large extent, South Africa's land use management policies encourage measures that will assist in providing favourable conditions for small businesses operating within towns and cities. Economic development and growth is one of the core values of the White Paper on Spatial Planning and Land Use Management; National Spatial Development Perspective; and, Spatial Planning and Land Use Management Bill. These policies inform land use management in the country which through towns and cities should then provide favourable conditions for the survival of small businesses especially located in urban areas. However, land use management in urban areas simultaneously provides adverse effects on small businesses which are presented as follows:

- Limited access to small businesses

Spatial planning and land use management policies in cities promote single land uses. These single land uses imply that small businesses cannot be situated in any parts of the city of their own choice. In most cases, small businesses locate themselves in the commercial zone within formal businesses. As a result, these small businesses can only be easily accessible to people who are within the commercial zone.

- Locational constraints

In most cases, small businesses are clustered around commercial areas where there are high volumes of pedestrians. However, locations that these businesses operate on are not zoned for small businesses. This is due to the fact that the majority of town planning schemes do not recognise the roles that these businesses play in the economic realm; therefore, they are not allocated formal spaces in cities. For example, the majority of small businesses are mainly found around taxi-ranks.

- Infrastructure and services constraints

As a result of lack of operating spaces in cities, the other constraints experienced by small businesses is lack of and/or limited infrastructure and services such as water and electricity. For example, in Polokwane City most businesses which specialize in fast foods use fire or gas as their source of energy for cooking. Moreover, the water they use for cooking is in most cases asked or bought from the nearby shops and restaurants and this is due to lack of recognition of small businesses by the town planning schemes.

- Time constraints

Small businesses are in most cases forced to operate during time slots which align with those of formal businesses. Usually small businesses are operational between morning around 06h00 and late afternoon hours around 19h00. Time limitations are also a result of the single land use adopted in most cities because people have to vacate the spaces into residential areas. Therefore, time limitations affect the ability of the businesses to generate more income and offer their needy customers services after hours as it becomes unsafe to do so in the presence of few people.

- High competition amongst small businesses

The congestion of small businesses around a few points in cities means there is high competition amongst the businesses. As most of these businesses offer similar services and products, profit making is not always guaranteed. Therefore, owners of small businesses have to always do their best to attract and keep their customers. For example, in the satellite market located in the Pick 'n Pay Taxi Rank, most of the small businesses mainly specialise in selling fast foods and fruits and vegetables.

- Inability to decrease unemployment and eradicate poverty

Despite the huge number of small businesses in cities, most of small businesses provided limited and unsustainable job opportunities. Most of the owners and their households still live in poverty because the income generated by the businesses is usually still below poverty line.

CONCLUSIONS

The paper confirmed that most land use management policies in cities adopted the single land use rather than mixed land uses which are classified as residential, commercial, industrial or green land zones. Furthermore, the paper indicated that single land uses limit the integration of social, economic, cultural and environmental diversity which to some extent affect the productivity of small businesses. Additionally, the paper provided the legislative framework of land use management in South Africa which looked at the White Paper on Spatial Planning and Land Use Management; National Spatial Development Perspective; and, Spatial Planning and Land Use Management Bill, respectively. Seemingly, these policies fully support small businesses in urban areas as they are considered as one of the economic drivers.

The paper has also showed that theoretically, small businesses are synonymous with the informal economy and further specified the nature of these businesses. Apparently, most small businesses are regarded as survivalist enterprises which offer goods and services such as hairdressing, carpentry, sewing, arts and crafts, pottery, selling of fruits and vegetables and other goods which are usually practiced through the popular street hawking. This paper further discussed the relationship of land use management policies and small businesses in Polokwane City. Then the adverse effects of the relationship were identified as limited access to small businesses; locational constraints; infrastructure and services constraints; time constraints; competition amongst small businesses; and inability to decrease unemployment and eradicate poverty. This paper then recommends that land use management policies including the town planning schemes, should recognise and accommodate small businesses in their development planning and management. The paper concludes that land use management in South Africa's urban areas have the ability to be used as a strategy to provide advantageous economic conditions for the operation and survival of small businesses.

INTRODUCTION TO A NEW SCIENTIFIC DISCIPLINE: MANAGEMENT OF ALLSELVE'S ENLIGHTENMENT AND EMPOWERMENT

Jaeyoon Rhee
Chung-Ang University, Korea

ABSTRACT

Corporations in modern capitalism society define the human beings as a means of producing performances, while utilizing them as resources and tools in the process of management in order to maximize profits from the stockholders' and top-level management's viewpoint for the sake of efficiency and effectiveness of the management only. In the situation, humanity is overlooked and the extreme diversions in the income structures are deepened, while one percent of people govern the rest 99% of people. Hence, people suffer from relative poverties, while feeling unhappy, even though they have been much better in materially-abundant and convenient living environment. The theories based on modern knowledge management and practices have the clear limitations, if not impossible, in solving the critical issue of humanity deprivation in the modern society. I would like now to create and show clearly an alternative academic field and ways and means to recover the genuine humanity and thus to solve problems people encounter in routine lives. The new academic field and concepts I would like to introduce is the Management of AllSelve's Enlightenment and Empowerment (here after MOSEE).

INTRODUCTION

Concepts of a New Academic Area: the Management of AllSelve's Enlightenment and Empowerment

The concept of the Management of AllSelve's Enlightenment and Empowerment (MOSEE) refers to enlightenment and empowerment of human spirits or consciousness. That is, it transforms people who are the major entities of corporation management, while the transformation change people to have the really built-in freedoms, and therefore inspired human relationships in joyful ways with family members, other people, jobs, money, capitalism systems involved. While individuals are transformed, the MOSEE also transforms the organizations and communities, such as families, corporations, societal organizations, one's own and other countries, world societies, globe natures and the universe. The MOSEE has developing powerfully workable ways and means that are applicable to people and organizations, by which everybody and every organization enlighten and empower with each other and transform all collectively. MOSEE is an consolidated and integrated concept of Korean traditional philosophies and oriental enlightenment by utilizing western management science analytical methodologies.

THEORETICAL REVIEWS

Definition of Enlightenment

The enlightenment in MOSEE means that people realize that human beings are the origin being so that the being is a part of the whole and all, and at the same time, the whole and all selves are not separated from the whole at all. We can understand easily the hologram concept. People create their own Being and are able to manage the reality with concentration of the management of the Being in the freedom and the value involved. Otherwise, people tend to just do lots without their own Being attached to the survival business games in order to take the ownership and gain the profits included, which I call the management for Possession, not the management for concentration of Being.

Comparison of two laws

Diminishing law of resources due to the management for Possession based on attachment to the survival business games, and enlarging law of resources due to the management for concentration of own Being. Management for possession may lose the future of people, since past experiences affect present's decision-making which controls future. Only if commitment to future creates being for present, future comes here around present

Table 1: Comparison of Law for Management for Possession and Law for Management for Being

Diminishing law due to Management for Possession	Enlarging law due to Management for Life path to enlightenment
Being Surviving life.	Life for enlightenment
Management for possession	Management for Being
CHRONOS(Man-made time)	KAIROS(Universe time)
No Being(Identity) Unreality	Real Being reality
Religion: God for myself only	Religion: God for All people
Survival Adaptation living no freedom	Open minded Give in most valuable things
Reactive Self Reaction to circumstances Ego(various conditions required)	Restoring process for integrity Authenticity Source of influence to get job done Creating new Being make new environment and circumstances
Reactive Human is Bio Robot equipped with basic software	Real Being Freedom Space Create new boundless realm of possibilities
I am separate unit on my own	I am a part of whole and all and whole and all itself
Continuous changes something from something	Create something new from nothing that is everything
Past→ Present→ Future	Past Present ← Future

Comparison of two curves

Diminishing curve of performance due to the management for Possession and enlarging curve of performance due to the management for Concentration of Being.

CONCLUSION

Individuals and corporations may create highly qualified human consciousness through the aid of MOEE, which may produce a new world or relationships among people. Knowledge management and informative education, along with lands, capitals, human resources, and technology and development skills, as the determinants for the management performance, define outer generated capacity in the four dimensions (??). MOEE adds human conciseness in the five dimensions as inside generated capacity, which results in integrated capacity which combines outside and inside generated capacity. The integrated capacity renders integrity and completeness of authentic creation.

A MULTI-DISCIPLINARY ARGUMENT FOR THE ALIGNMENT OF TWO DISCIPLINES – MARKETING AND DESIGN

M. Roberts-Lombard, University of Johannesburg, South Africa
H. Gaworek, Nottingham-Trend University, United Kindom

ABSTRACT

Managing design is an aspect of marketing's activities, but relatively little is known about the connections between marketing and design. This paper examines the interconnected and uneasy relationship between design and marketing. Managing this tension is important for marketers, whose viewpoint of differentiation is a combination of design excellence and market execution. A comparative study, integration of arguments and the case study approach are followed. The convergence of cultures represents an opportunity for marketing and design to build collaborative models for the development of products, services and brands. A contextual evaluation of this research, using a grounded theory approach, reveals that there is a convergence of design and marketing thinking reflecting a growing understanding of cultural factors and is driven by economic imperatives such as increased competition, growing virtual worlds and greater consumer demands.

INTRODUCTION

Marketing and design are interconnected. Innovative designs open up new markets and clever design rekindles in a mature market. Well-designed products communicate quality and value to the consumer. Logotypes, leaflets, packaging and signage provide visual cues to reinforce the values of the organisation to the customer. Advertising and promotional activity make consumers aware of new products and give a message to the consumer about the product and/or service available (Bruce & Daly 2007). Aldersley-Williams (1994) stated in Balmer and Gray (2003:974) that “designers talk strategy, but like pretty shapes and colours.” He failed to acknowledge that there is a growing body of design management educators, researchers and strategists who are contributing valuable new thinking about using design as a strategic resource. Yet, six years previously Aldersley-Williams (1994) argued that it is imperative for designers, marketing and other managers to work together when creating corporate identity schemes. However, Powell (2007) argues that the problems remain current in identifying concerns by business owners and managers about “creative mavericks”.

DEFINING THE CONCEPTS OF MARKETING AND DESIGN

Kotler & Armstrong (2010) defines Marketing as “A social and managerial process by which individuals and businesses obtain what they need and want through creating exchanging value with others. In a narrower business context, marketing involves building profitable, value-laden exchange relationships with customers. Hence marketing encompasses the process by which a business create value for customers and build strong customer relationships in order to capture value from customers in return. Kristensen & Gronhaug (2007) refers to marketing as “The management process which identifies, anticipates, and supplies customer management requirements efficiently and profitably”. They argue that this interpretation refer to the cognitive aspects of marketing such as identification and anticipation as well as execution and efficacy. Beverland (2005) state that the broad view of design covers a wide range of activity encompassing aesthetics, ergonomics, ease of manufacture, efficient use of materials, and product performance and a variety of functions relating to marketing, such as promotional materials, image and logo, brands, interiors, architecture, and the consumer-firm interface. Design is therefore defined as “An activity that translates an idea into a blueprint for something useful whether it

is a car, a building, a graphic, a service or a process". Managing design is an aspect of the activities of marketing. For example, at one level marketing requires design expertise to meet user needs and communicate brand values through a myriad of elements, namely products, packs, corporate identity, advertising and environments such as a retail outlet or a restaurant. Kristensen & Gronhaug (2007) also state that design incorporate "creating and developing concepts and specifications that optimize the function, value and appearance of products and systems for the mutual benefit of both users and the manufacturer". Marketing and design are both concerned with the understanding of something that does not yet exist. Both are concerned with the delivery of an imaginary state.

CONFLICTING VIEWS ON DESIGN AND MARKETING

Kristensen & Gronhaug (2007) argue that marketing managers and designers are educated in very different schools and traditions. The consequence of that is a lack of communication. Designers are less capable of arguing their case than marketers, who are challenged in their ability to perceive graphically. Therefore, marketing managers use their "left", designers their "right brains". The key focus of marketing related to product innovation is market demand, access to markets and profitability. In design the criteria are related to the user needs and the quality and beauty. I.e., marketing concerns the masses and design the individual. However, there are cases where marketing also considers the individual, although on a small scale. Raz, Piper, Haller, Nicoda, Dusart & Giboreau (2008) are of the opinion that the major stakeholder differs too. Marketing is primarily concerned with the paying customers, and they may also be co-creating value. The work organisation of marketing is based on formal schemes and promotion may follow a fixed pattern. In particular, this seems institutionalised in fast moving consumer goods companies and in the consulting profession. In design a similar structure may be found in the large multinational agencies, but in most smaller design consultancies the studio culture is informal. Designers who work "in-house" in companies follow the measure of the organisation. This can cause problems because the designers are usually few, and they do not fit into the formal pattern in a large organisation. Some companies have large design organisations and have therefore found ways to integrate the design organisation with the rest of the firm, for instance Philips.

Designers are innovators and trendsetters who attempt to initiate change, to make a leap of imagination, and produce an idea. Those who design products are also people, ordinary people who apply their skills to develop new ideas and products (Vogel, Cagan & Boatwright, 2005). Design departs from the realm of pure aesthetics to create objects that serve human needs. Design reflects human needs and wants, as well as the dominant ideas and artistic perceptions of the time. The designer must accommodate economic, aesthetic, technological, and commercial constraints and arrive at a synthesis. He is a "creator of form" who understand creation in the context of predefined imperatives established by other professionals, and places human values over technological ones (De Mozota 2003). The common perception of designers is that their approach to their subject matter differs from the rational analysis and scientific rigor of the business disciplines. Designers are perceived by other functions with intrigue and frustration. Designers view design perfection as "a spiritual quest – a goal to be achieved in stages" that lies in contrast with the output performance orientation of other functions (Beverland 2005). For the majority of designers, the concept of "rational analysis" is too deterministic. The reason being that they are strongly individualistic in their expressionism and vitality towards design (Heskett 2002).

Molotch (2003) reports that designers are suspicious of market research because "market research isolates a product from the context of its purchase or use and cannot predict how it might catch on with time and exposure. Despite the functional role of design within the realm of marketing, Von Stamm (2003) writes of the continuing gap between marketers and designers when she writes "the lack of understanding of the differences leads many managers to view design and creativity as something close to black art, something which cannot be managed and is therefore better left alone". Marketers simply do not trust designers with a brand. They perceive the design function to be a subsection of marketing focusing more on product development, whilst the latter is responsible for decision making and management (Holland et al 2009). A major problem facing organisations today is that a few designers and marketers have the skills to manage a range of product design services, in the broadest sense, that are required to develop a comprehensive approach to innovative organic product and service development (Vogel, Cagan & Boatwright, 2005). Marketing is perceived as both a way of thinking that focuses on satisfying customer needs, as well as a set of activities in which organisations apply this way of thinking in

the world. Marketers think about ideas, goods and services that satisfy the organisation's goals as well as the needs of customers (Klopper, Berndt, Chipp, Ismail, Roberts-Lombard, Subramani, Wakeham, Petzer, Hern, Saunders & Myers-Smith 2006). Marketing is furthermore perceived as a philosophy and a management orientation that emphasises customer satisfaction. It is a set of activities used to implement this philosophy. Marketing is therefore a process that anticipates and satisfies consumer needs by means of mutually beneficial exchange processes. Marketing wants to achieve this in a profitable manner through efficient managerial processes (Lamb, Hair, McDaniel, Boshoff & Terblanche 2008). Marketing is by its very nature concerned with the interaction between the organisation and the marketplace, while design is an activity that translates an idea into a blueprint for something useful whether it is a car, a building, a graphic, a service or a process.

A focus group was conducted amongst 20 individuals (10 designers and 10 marketing practitioners) to determine how designers and marketers interpret key words used in their contemporary professional communications. A list of twenty (20) keywords was drawn up by a group of experienced design and marketing professionals. These 'experts' were selected on the basis of their long experience of the design-marketing interface. Keywords were printed on a survey form and the multi-disciplinary design participants and marketing practitioners were invited to write one word, the first word which comes to mind, against each keyword listed. This was done spontaneously and the participants did not spend time thinking about it. Four groups of five (5) were compiled, consisting of two groups of multi-disciplinary designers and two groups of marketing practitioners. The two groups of multi-disciplinary participants compared their results and the marketing practitioner groups followed a similar approach. Each group leader briefly presented his/her results, and the main areas of difference were identified according to each key word. The participants were then requested to summarise their findings into five broad categories according to their discipline. These categories were identified by the participants (i.e. multi-disciplinary designers and marketing practitioners) as characteristic of both designers and marketers as professionals in the market place). This is illustrated by Table 1 below.

Table 1: Key conflicts between design and marketing

CATEGORY	DESIGN	MARKETING
<i>Approach</i>	Innovative through design	Systematic
	Non-profit	Profit orientated
<i>Attitude</i>	Creative and original through design according to personal preference	Creativity and originality in marketing is driven by the needs and wants of the target market
	Not process driven (I.e. not structured or systematic)	Not process driven (I.e. not structured or systematic)
<i>Focus</i>	Trendsetters	Trend supporters
	Inter-connected with design idea	Communicate design idea through advertising
<i>Goal</i>	Satisfy own design needs	Satisfy consumer needs
<i>Inclination</i>	Non-rational thinking, emotional sculptures	Rational thinking to inform the market
	Non-strategic thinkers	Strategic planners
	Not market research focused	Strong focus on market research

Source: Researcher's own construct

From Table 1 it can be deduced that marketing requires design expertise to meet user needs and communicates brand values through a myriad of elements, namely products, packs, corporate identity, advertising and environments such as a retail outlet or a restaurant. Design, on the other hand, is a visual realisation of marketing and conveys, in particular, brand values to the consumer.

CONVERGENCE OF EDUCATION ON DESIGN AND MARKETING

Marketing requires design expertise to meet customer needs and communicate brand values through a myriad of elements, namely products, packages, corporate identity, advertising and environments, such as a retail outlet or a restaurant (Bruce & Daly 2007). Riezebos (2003) argues that in a brand strategy, several instruments are used to achieve set goals. For several of these instruments, design plays a large role. Design can differentiate products (goods and services), create a unique selling position and arouse feelings of desire and interest. Whether it be technical performance, style, reliability, safety or ease of use, design can make qualities visible. Consumers can be influenced in their decisions by design; it is therefore advisable to handle this instrument with care. Bell, Ledolter and Swersey (2006) argue that design management and marketing have many common intersections. In the marketing that was developed in the 1960s, design became ever more important. In the beginning design was understood as a marketing instrument, it further developed itself and today it can be seen on the same level as management. Today's management theories speak of an equal partnership between marketing management, product management and design management. Marketing and design connect in many different ways to produce a given result, ranging for example from working with graphic specialists to produce a new letterhead, or the development of a new brand of chocolate, to a different kind of motor vehicle. Marketing practitioners – whether they are based in a service, retail or manufacturing environment, spend a significant proportion of their time working with design. Scientists can invent technologies, manufacturers can make products, engineers can make them function and marketers can sell them, but only designers can combine insight into all these things and turn a concept into something that is desirable, viable, commercially successful and adds value to other people's lives. For the marketing professional, design management entails managing those corporate activities that generate products and corporate communications, which aim to optimise customer satisfaction and business success (Bruce & Daly 2007). Considering this, there is a definite need for designers and marketers to become more respectful towards the role played by each within the organisation. Respect that can be achieved through increased education about the function performed by both designers and marketers in their support for organisational goals.

CONVERGENCE OF BEHAVIOUR BETWEEN DESIGN AND MARKETING

It can be argued that both designers and marketers need to converge their aim of focus to obtain answers to the following questions. Answers to these questions can not only enhance the ability of the designer to develop products that will deliver increased consumer value and satisfaction, but will also empower marketers to communicate customer value more successfully to their target market. The questions are What is our business?, Who is the customer?, What is the value to the customer?, What will our business be?, and What should it be? (Webster 2009). Both designers and businessmen will therefore have to learn to practice marketing as an innovative force in itself. They have to learn that the truly “new” does not, as a rule, satisfy demands that already exist. It creates new expectations, sets new standards, markets possible new satisfactions. Innovative design and marketing therefore create markets. New product designs always need new markets which were not even conceivable until the new technology created new designs which stimulated new consumer demands (Maciariello 2009). Trueman and Jobber (1998) argue that design is more than a functional activity and is connected to marketing in three different ways, namely:

- At the product level, good design leads to the production of quality goods and services that can improve image and increase the consumer's perceived value of new products, so that they command a higher retail price in the marketplace.
- At the process level, designers can interpret, integrate and communicate new ideas... (so) likely to speed up and increase efficiency..... and reduce time to market.
- At strategic level in terms of brand building..... and the development of a corporate design culture.

Bruce and Daly (2007) also state that designers are not trained to be strategic thinkers, but are a creative resource that can make a strategic contribution in terms of developing new market opportunities and revitalising new markets. In addition, the Design Council of Britain (2006) understands the role of design in business as follows: “Scientists can invent technologies, manufacturers can make products, engineers can make them function and marketers can sell them, but only designers can combine insight into all these things and turn a concept into something that is desirable, viable, commercially successful and adds value to other people's lives”.

It is against the background provided above, that Table 2 illustrates the potential areas for marketing and design to connect to produce a given result.

Table 2: Potential area for the convergence of designer and marketing aims

DESIGN	MARKETING
Innovative design developments	Innovative marketing of designs
Setting of trends	Marketing of such trends to stimulate demand
Profit generation through innovative designs	Profit maximization through the marketing of new, fresh and innovative designs that meet target market needs
Design creativity should be aligned with target market preferences	The marketing of creative designs to stimulate target market preferences
Interact with marketing professionals on target market preferences for new design ideas (e.g. via consumer research)	Communicate new design ideas through advertising to the target market
Align own design needs with target market preferences to enhance consumer value and satisfaction	Satisfy consumer needs through continued provision of consumer value. This can be achieved through a stronger collaboration with designers to inform them of target market preferences, whilst respecting the individuality of designer designs
Increase rational thinking aligned with the inputs of marketing professionals enhance consumer value in a competitive market environment to ensure continued business growth and survival	Rational thinking to inform the market about new designs to stimulate demand and enhance market share
A market research focus could enhance business through the delivery of increases consumer satisfaction and value. This can be achieved through a stronger alignment with marketing professionals	Strong focus on market research. Such research should be communicated back to designers to ensure the accommodation of consumer preferences and enhancing consumer value

POTENTIAL SYNERGIES

Kotler and Rath (1984) argue that “design is a strategic tool” enabling marketers to match customer requirements to a product’s performance, “fitness for purpose”, quality, durability, appearance and price. Thus, Archer and D’Ambrosio (1976) has described designing as the “trick of discovering which set of attributes prospective purchasers would value and of discovering a product configuration embodying them at the right price”. For each market segment the mix of attributes and the price the customer is prepared to pay will differ. The argument of Kotler and Rath (1984) is that consumers’ perceptions of the product are shaped by its configuration and ability to convey “value for money” in comparison with alternatives. Putting effort into design is one way in which organisations can add value to their products and hence command higher prices. However, in mature industries in which many products are competing for the same market, value for money alone is not enough. Where many products represent value for money, design is also regarded by marketers as an ingredient needed to make their organisations products distinctive, or to “differentiate” them from the competition (Walsh, Roy, Bruce & Potter 1992). An evolutionary market environment, growth in competition as well as globalisation necessitate organisations to become more customer focused in their product and brand image designs. A stronger interaction between designers and marketers would require designers to interact with marketing professionals on a regular basis to establish the preferences of the target market for which they design, or to whom they want to communicate the organisational brand. Marketers, on the other hand, will have the responsibility to communicate new designs or the organisational brand image to the target market to stimulate awareness, increase demand and enhance market share. The ultimate goal, being increased profitability and design preference amongst consumers, can then be achieved.

OPPORTUNITY FOR A NEW PARADIGM BASED ON CONVERGENCE OF DESIGN AND MARKETING THINKING

Both marketers and designers are converging in their agreement on the value of systems and holistic thinking, and investing much intellectual effort into defining problems and generating creative alternatives. Strategic designers are no longer strange lonely artists detached from the world around them, but 'people' confident in their roles in multi-disciplinary teams. An example of research demonstrating such benefits may be found in Ivins and Holland (1999). Three views of the current relations between marketing and design are offered by Figure 1.

Figure 1: Evolution of Design and Marketing Relationship

Source: Adapted from Ivins and Holland (1999)

Possibility of integration

The convergence between marketing and design is revealed as a natural phenomenon by Figure 1, but important questions arise about how to proceed. Questions about issues such as cultures and semantics need attention, and in building the models further questions arise about added value to corporate brands, storytelling, narrative and leadership. The complex challenges of designing a corporate identity and building a corporate brand through designing a great customer experience need high quality multi-faceted thinking.

CONCLUSIONS

The paper makes a case for the integration and successful development of marketing and design, and identifies challenging issues to achieve a greater understanding and ultimate convergence of the marketing and design disciplines. It is important to begin with a thorough investigation of practices and educational provision. This is essential in relation to education, since a relatively small number of progressive design schools are ready to engage in developing a new paradigm. An agenda of issues to be addressed to further explore the potential benefits of cooperation needs to be drawn up and the authors offer the following framework for future study, namely an investigation into the characteristics and cultures of design and marketing environments, an evaluation of the processes and models used by marketing and design for strategic branding, a study of the semantics of the two disciplines: key terminology used by both disciplines; an evaluation of cross-disciplinary teamwork to develop new models to support creative teams; and the development of more multi-disciplinary courses – particularly at postgraduate level- which integrate design and marketing [and other functional areas] thinking.

PROTECTING DOMINANT TECHNOLOGY IN CONTEXT OF TECHNOLOGICAL DISCONTINUITY

**Leonel Cezar Rodrigues, Luiz Henrique Mourão Machado, Marco Antonio
Sampaio de Jesus, Carlos Mamori Kono
University Nove de Julho, Brazil**

ABSTRACT

The alignment between technological dominance and market leadership strategies has guaranteed to TOTVS, one of the main global developers of ERP solutions, to keep its dominant design, in spite of using a programming language, considered by many experts as outdated. The company combines the acquisition of small companies and strategic alliances with rivals in the sector, to incorporate to its middleware the challenging innovation that could risk the leadership of its dominant technology. Technical leadership of TOTVS integrates the premises of open innovation to keep up to new technology and, at the same time, it uses business acquisition to protect its dominant technology.

INTRODUCTION

Schumpeter (1982) first identified innovation in technology as a production factor, but it only became a strategic tool for business modeling by the end of last century. Some 40 years ago, however, studies on the function and the utility of innovation in production area polarized the attention of many researchers and experts, interested on knowing more deeply the cycle of market dominant models and the leading factors that make technological innovation a competitive advantage for industries. Studies on nature, type and process of innovation draw on a fundamental characteristic of the innovation cycle, the technological discontinuity (Anderson; Tushman, 1990). Technological innovation works under a cycle that could be shortened to the following phases: dominant technology; maturing/improvement period; challenging/ selection period (fermentation period); and replacement (discontinuity) period.

The maturing process of a dominant technology is normally associated to a fermentation period (Campbel, 1969), where many challenging technologies gladiate to become the dominant. And the period where a traditional technology is replaced by a new one is characterized by the descontinuity period.

This paper considers the case of the protection of a dominant technology in periods of technological fermentation (fight of challanging technologies to become the dominant one) by one of the most important Brazilian IT application developer, operating globally among 25 countries in the world. The company has being able to systematically manage the risks of technological discontinuities to its dominance leadership.

A technology/innovation ruling the market, normally distinguishes itself through three basic features: (a) greater operational efficiency; (b) smaller production cost; and (c) alternative radicality. The two first features are intrinsically associated to each other. That is, if a technology works more efficiently, it would necessarily result into less production cost. These features, bolstering the rulling position of a technology, could be associated to its degree of radicality unrivaled by the challanging technologies, but it could also be simply associated to a greater degree of incremental sophistication.

As noticed before, competition for market dominance of a technology is typical of fierce competitive environment (Campbel, 1969; Jenkins, 1975; e Landes, 1983), where technologies of low production cost and

higher productivity are critical. Because of reachness of alternative ideas during such periods, Basalla (1988) calls it technological diversity period. Serendipities and technical breakthrough either in product design, quality features or process simplicity, are common.

In the information technology industry, technological dominance concentrates mainly on possible work solutions allowed by programming languages. For instance, if an IT system, designed through an object-oriented language would be blind to network, it would need to be rewritten if a next generation programming language becomes the dominant one. This is the context of TOTVS Company, object of this study. TOTVS is an international company as an IT services provider. The company owns an Enterprise Resources Planning (ERP) system, market globally, oriented to small, medium and big users. TOTVS responds for about 35% of South American and for 11% of the global market (Totvs, 2012b). The company is in the market for more than 20 years, however, using a senescent programming language, but has been able to deal with the ever challenging IT systems and new programming languages, eventually more capable to deliver efficient solutions. How then a company, whose system bolstering a technology that is at risk, would be able to protect its dominant technological model? In other words, how a company is to face technological discontinuity by keeping the basic product technology?

This paper, therefore, aims at identifying and characterizing TOTVS' protection strategy to its dominant technology model, in a context of permanent challenges from new technologies and system designs.

THEORETICAL PRECEDENTS

The competitiveness of a company is directly dependent on the differentiation elements it distinguishes itself from rivals, especially through its technological dominion. The innovation base, bolstering the company's market position, however, is frequently threatened by technological discontinuity, because of challenging technologies with superior comparative advantages that end up being adopted by a sector companies. The technological discontinuity phenomenon and congruent elements are here revised as a theoretical foundation of this work's objectives.

The Nature of Innovation

Innovation has been recognized as an essential element to economic development (Schumpeter, 1982) because of the possibility to create either new product, to use new production method, to open new market or to organize industry in a new way. In any case, it is essential to economic development, as it bolsters a dynamic process of traditional technologies by new ones, called creative destruction. It is fundamental to understand that enterprises innovate to improve performance – expanding market and increasing profit – through product differentiation, increasing demand, cutting costs, and augmenting process effectiveness.

The nature of the innovation relates to the objectives of the modification and the respective process. Thus, we can identify modification in product that is recognized as a product innovation or modification in a process that is seen as process innovation. On the other hand, if a modification, be it in product or in process, is executed in small steps, it is an innovation incremental in nature (Freeman; Soete, 2008; Tigre, 2006). In this case, innovation base modification in existing knowledge, emphasizing competences and keeping product/process still competitive (Tushman, Anderson, 1986).

If the modification represents a structural rupture with established technological patterns, then we say that this is a radical innovation. In this case, resulting product or process are superior to the traditional, then it changes relationship among consumers and with suppliers as well as the relationship of the market economic elements (Leifer; O'Connor; Rice, 2002). Radical innovation rely on very distinct knowledge from the existing one, destruct competences, and make competitive the new products. Radical innovation also reverberates among traditional competitors, opening opportunities for new ones and for discontinuous innovation (Tushman, Anderson, 1986).

In terms of technological discontinuity, radical innovation generate deeper ruptures in the technology trajectory. Incremental innovation, on the contrary, maintain continuity in the changing process (Schumpeter, 1982). Practical observation indicates that long-range success enterprises use to interchange incremental with radical innovation (Benner; Tushman, 2001).

Innovation Strategy and Business Leadership

Any market insertion of new product requires a strong correlation of the product with market performance, or else, innovation would not accomplish its basic function. In doing this, innovation strategy must target increasing competitiveness through three main ways: new products; invecible products in quality and in delivering; and services cheaper, faster and of better quality (Tidd; Bessant; Pavitt, 2008). Innovation is a powerful inducer of competitiveness, however, developing innovating and technology inside the enterprise became too expensive and results do not always give the desired return. The basic reason remains the diminishing time of technology life cycle that influences the level of profitability and the time frame to return. It is advisable then that companies find ideas and innovation outside their own walls (Chesbrough, 2007). To bring external technologies inside requires, on the other hand, the development of internal capabilities to capacitate enterprises either to buy well or to develop adequately the needed technology. The research of Rothaermel and Hess (2010), among multinational of pharmaceutical industry, has detected four strategically important options: (1) hiring human capital of superior ability; (2) investing in internal Research and Development; (3) formalizing strategical alliances; and (4) acquiring external innovation. Critical aspects involved in these options refer to: technological maturity of the company, familiarity with patent (use and incorporation), deal with technology risk (mitigation and sharing), technical rivalry and organizational culture. It is combining two or more of these elements that companies look for ways to improve technical attributes and economic goals object of modification or innovation (Durham, 2006).

While thriving for developing novelties on products, process or tools, companies strengthen technological capabilities associated with their ability to innovate and improve competitiveness (Kim, 2001). The ability to innovate as a tool to compete is also emphasized by Prahalad and Hamel (1990) for whom companies must increase the portfolio of competences as a way to create competitive advantage. Still incorporated in the notion of innovation strategy for business leadership are the identification and exploration of technological trajectory of industries to drive and consolidate technological dominion of their own in order to perfect competitive strategies (Tidd; Bessant; Pavitt, 2008).

Considering competitive strategy under technological dominion context, Freeman and Soete (2008) classified business leadership of companies into six distinct strategies: (1) Offensive – thrives for leadership based on technological dominion, mainly on chosen market segments. (2) Defensive – rapidly reacts to innovation launched by rivals, but do not run the risk of being the first in innovation. (3) Imitative – product cheap imitation of product and trademarks leaders in their segment. (4) Dependent – exert a subordinate role regarding other companies technologically stronger. (5) Traditional – do not change technical base and advance in small incremental steps. And (6) Opportunist – jump on temporary favorable situations. This classification, however, is not definitive and companies may evolve to distinct categories or use combination of strategies.

More recently, Tigre (2006) reasoning inserts the technological strategy of a company in two distinct approaches of the competitive strategy. The first one uses the concept of new theories of the industrial organization and the games theory, where competitors try to influence rivals and market agent behaviors. The second one feeds on the dynamic capacities principle (Teece, 2010), that emphasizes not only the exploration of internal resources but also the generation of knowledge derived from the experience originated in the combination of new capabilities needed to align innovation with market requisites. These are complementary, rather than exclusive and self-contained concepts targeting at articulating proper business strategies to optimize economic returns from innovation.

Innovation is not only associated to cost reduction, but also to the strategic positioning of a business to explore market opportunities, to adequate technologies, to agglutinate competences and to balance competition with cooperation. This new context involves economic considerations toward technological issues aiming at value generation for business based on innovation contents.

Technology Cycle and Technological Discontinuity

To prosper in an increasingly innovative context, companies depend on better dealing with challenges coming from innovation discontinuity, breaking barriers to entrance and create differentiation (Hamel and Breen, 2000). Since no structured pattern governs competition management based on innovation standards, each company tries to find the best way to combine continuous, incremental, disruptive or radical innovation. To deal with these elements, it is necessary to understand the life cycle period of technologies, where new product or process technologies with superior performance surrogate the existing ones. It is important to notice that the life cycle phases of a technology influences directly competences, capabilities and strategic actions of a company in a technological discontinuity context.

Anderson and Tushman (1990), after studying the phenomenon, propose an evolutionary model to explain technological discontinuity. The changing cycle starts with challenging technologies gladiate to be adopted by industry. This is the era of technological fermentation. When incremental innovation on dominant technology gives low significant return and technology shows signs of saturate value. Industry start then to try alternative technology (challenging technological paradigms) to replace the dominant one. Once a new technology proves to be advantageous over the dominant, it is adopted, becoming the dominant model. Another dominance period begins, where dominant technology undergoes incremental innovation. This period opens up again a new fermentation period when incremental innovation proves not to be as effective as expected. The discontinuity of a dominant technology, however, may happen when a radical technology comes up replacing advantageously the dominant one. The process of adoption and substitution of a dominant technology by a new one characterizes the technology cycle/technological discontinuity process.

There will always be implications from technological discontinuity on industrial performance, market share and profitability. A discontinuity will happen when it improves costs, productivity or product/process quality for a company inducing to a new technological trajectory (Tushman and Anderson, 1986). In the context of technological discontinuity versus competitive performance, some enterprises are able to maintain superior performance even during the event, since dynamic capabilities are at the same time supporting capabilities that guarantee the needed time for the companies to adapt to technological changes and keep being competitive during the discontinuity times (Jenkins, 2010).

Rothaermel and Hill (2005) consider that not every technological discontinuity lead companies to decrease performance, as new technology becomes market dominant. Some enterprises can manage better certain types of technological discontinuity than others, if they are able to develop a set of abilities (Jenkins, Floyd, 2001). On one hand, they need to have an array of technical capacities of greater comprehensiveness (knowledge, development and integration of systems, etc) that reduces the impact of the new technological trajectory. On the other hand, they are able to recognize the implications of radical innovation faster than rivals and construct or reconstruct dynamic capabilities during discontinuity periods. More recently Birkinshaw and Gibson (2004) alert industry to develop organizational ambidexterity – external forces adaption and internal resources alignment – as a strategy to prompt companies to the discontinuity derangements. In the same route, Reinmoeller and Baardwijk (2005) propose constructing organizational resilience, through technological diversity, as a way for business to become less vulnerable to market technological changes. In any case, “disturbance” of technology variances – incremental, radical, and disruptive – must be dealt with through dynamic capabilities to appropriate companies to better cope with dominant technical models and architectural innovations.

METHODOLOGY

This research, of qualitative and descriptive nature. We designed this research using the method of case study, carefully considering the premises in the specialized literature (Yin, 2009). Case study as a research method is especially useful to understand individual, organizational, social and political phenomena in organizations or individualized groups and as so, it applies to studies in management. It can also be used to test and create theories by deepening analysis of specific phenomena, or expand theoretical concepts of accepted or emergent theories (Eisenhardt, 1989). Specialized literature, however, unanimously recommends adequate circumscription of the problem under study, systematic and trustful information gathering and rational analysis of data.

To guarantee rationality of analysis and trust of results, we select the social subject of this research by picking the ones directly involved in the case. We also complement data through reports and official documents of the company and individual studies from other authors. The social subjects interviewed are the company's executives, such as the Director President; the co-founder of the company and member of the Technological Development Council; the Vice-President for Technology, the Director of Technology and the Vice-President for Business Strategy.

The chosen enterprise for this research is TOTVS, a software system developer, specialized in Enterprise Resources Planning – ERP, for small and medium size enterprises. The choice for TOTVS is based on the fact that the enterprise is the six in the international ranking of ERP developers in the world, according to Gartner Institute (Totvs, 2012a). TOTVS is the leader company in market share in Latin America (34.5%) and Brazilian market (48.6%), the biggest market in South America. In 2010, TOTVS revenues comprised about US \$ 800 million, the single highest revenue in integrated solutions developers in Brazil (Totvs, 2012a).

Research Results

The rank of companies in corporate software, published by Gartner Institute in *All Software Markets, 2010*, TOTVS was classified number six in the world, as an ERP solution provider (development, commercialization, and consulting). TOTVS competed with multinational companies such as SAP, Oracle and JD Edward's (Totvs, 2012a). Ernesto Haberkorn, today a TOTVS' shareholder and member of Technology Development Council, established TOTVS in 1969 as software services provider. The company gained significant market share, however, after the market launching of an enterprise management system to automate administrative tasks, but it was only in the beginning of the 1980's that the company concentrate in the micro-information field.

By 1983, current CEO and President of TOTVS Administrative Council Laercio Cosentino, proposed a detail business plan to drive the company to focus on software systems for microcomputers market. Once accepted the plan, Cosentino assumed 50% of the company's shares to start a newly reshaped company, called Microsiga Software S/A. Microsiga concentrated on software for small and medium sizes companies. To leverage the company's growth, Microsiga received capital injections from private funds sources during the 1990's, but went public by 2006 (Namour, 2009). After the acquisition of DataSul, its major rival, Microsiga formulated its business model, reshaped and expanded the franchising system and became TOTVS (all or everything in Latin). The new corporate trademark refers to the repositioning of TOTVS, now offering solution to any industrial and economic sector (health, agroindustry, law, financial services, distribution, logistics, retail, education, construction/projects, manufacturing, media and services). It also relates to the idea of integrating all acquired trademarks by TOTVS. Today TOTVS operates in 23 countries in five continents, employs above 9 thousand people (2.7K in R&D activities), holds a portfolio of 26K clients and more than 220 distribution channels (own offices and franchises) (Totvs, 2012a, 2012c, 2012d).

Cosentino business strategy for Latin America focuses on market share expansion while keeping leadership, according to the V-P for Business strategy. There is a huge effort to increase market participation among big corporate users, based on improvements of complementary ERP modules and incremental innovation of current products. It is part of this strategy the acquisition of enterprises and growth in the segment of small and medium size companies (Totvs, 2012d), supported by a macro model of franchising, similar to the fast-food industry, to cover all economically effective regions in Brazilian market (Nakagawa, 2008). According to Cosentino, now, TOTVS growth passed the phases of "foundation", "positioning", "definition of DNA and mission", and "market consolidation". The company is now entering a phase to becoming a "global icon." (Santana and Julibone, 2006).

Since the restructuring of Microsiga, that is, the inception of TOTVS, the company determined an aggressive acquisition or association strategy to rivals, such as DataSul, RM Sistemas, Logocenter, and TotalBanco, to accelerate internal capabilities on data bank, management for consulting services, data hosting, portals, internet provider services (cloud computing), outsourcing. The association or acquisition would be either as a shareholder, as associate or as a buyer of the companies (Totvs, 2012d). The priority of the association (acquisition down to shareholding) would be determined by the degree of threaten to TOTVS' ERP.

For instance, the company acquired Logocenter in 2004, because of the Logocenter's Business Intelligence (Logix-BI) module, superior to the one of the TOTVS' ERP. Logix-BI was then incorporated in the T's ERP. TOTVS also acquired RM Sistemas in 2005, because of RM's system (a CRM) strong position among small, medium and large companies. DataSul was incorporated to TOTVS by 2008 because of its products (ERP, BI, CRM and B2B) would allow TOTVS to enter the market of large companies.

By integrating the answers of all interviewed people and specialized literature we identify eight premises orienting the acquisition process at TOTVS: (1) mapping of market opportunities by expert people; (2) compatibilization of TOTVS technological food print; (3) negotiation of financial values of the acquisition; (4) evaluation of the owner/entrepreneur to establish business empathy; (5) definition of the business incorporation process; (6) evaluation of products and distribution channels; (7) agreement on terms of the acquisition contract; (8) execution and market communication ((Namour, 2009).

Beside the acquisition of entire companies, TOTVS use to buy independent technology to endorse, improve or expand solutions embedded in its ERP. The company incorporates directly independently bought technologies in the middleware, a hard core of the ERP system that integrates the application of each module. This technology acquisition process is carried out within the concept of the open innovation premises, as noticed by Rodrigues and Lima (2009), through TOTVS' internal innovation program (INOVE), targeting at exploiting internal expertise and exploring external technologies/innovation available in the market. Today, TOTVS speeds technological dominion by internal development and supplementary by acquiring independent technology and systems.

TOTVS dominant technology is a compiler called Protheus. It was developed by the company *"to verticalize the development of the company's portfolio of products"* as observed Mr. Haberkorn, the company's co-founder. This compiler uses programming languages in xBase standard (Clipper, Visual Object and FiveWin). With the advent of a technological discontinuity (the discontinuation of Clipper, by Computer Associates) the company became before a technological dead end. Given the criticality of this language for TOTVS' compiler continuation. So the company decided to invest in the development of its own Advanced Programming Language – AdvPL. The Director of Technology does not see AdvPL as a risky choice, since Clipper is *"the bed language, but real solutions reside in advancing the language codification and the addition of external libraries"*. In short, this language uses the core code of Clipper programming language and incorporates the standard xBase (Namour, 2009), but became improved by the addition of external libraries and graphic interfaces, which allows users to easily customize as they wish.

The V-P for Technology bets on three main elements that guarantee TOTVS dominant technology in place. One is the AdvPL language that is very flexible to create solutions and does not require hardware sophistication. The second element is the compiler (Protheus) that integrates applications from distinct sources into one single middleware (TotvsTech). The use of TotvsTech is technically very productive, since it allows developers and users to operate with diverse and unified platforms. Third, TOTVS adopted the concept of service-oriented architecture (SOA) to manage the development of its systems and applications. SOA architecture brings two competitive advantages to TOTVS: it drives and controls the internal proliferation of application standards, because the company needs internal standards to maintain compatibility among applications. In addition, it decreases application/systems development costs, because the company can better manage internal resources and outsource what is advantageous to be externally developed.

Discussion and Final Remarks

Technological discontinuity of Clipper language in the beginning of the 1990's required a strategic business adaptation of TOTVS and a clear definition of a new technological trajectory. The innovation and the competitive strategies determined by the company ended up making TOTVS less vulnerable to the risks of technological discontinuity. On the business side, the company decided to speed the incorporation of needed technologies through acquisition of autonomous applications and systems or acquisition of entire companies and their client portfolio, and establishing strategic alliances with global developers to earn systems sophistication and international experience. On the technology side, TOTVS created the elements (AdvPL – Compiler – Middleware or Integrator) for its dominant technology, the set these three elements.

Operationally, the company focused on market niches initially disregarded by large multinational ERP providers. TOTVS offered a suite of solutions at a low implementation cost and integrated by an IT architecture that requires low level of processing requisites. This strategy, accepted by small users with no barriers, became even better accepted by medium size users because of the modularization of the system (ERP). These strategies and the modularization of the system, by Totvstech, transformed TOTVS in the main incumbent in these segments.

In the effort to protect its dominant technology, TOTVS established three main route, followed simultaneously. One refers to the verticalization of technical dominion, that is, the decision to create autonomy by developing a propriotor technology - programming language; compiler (Protheus) and integrator (TotvsTech). The avoidance of a technological dead end in the programming language allowed for maintenance of the compiler and growth in solutions, of the integrator.

A second route refers to the choice of the level of complexity of the embedded technology in the proprietary system, the dominant technology. Clipper is considered a less complex, however, higher flexible programming language. Using its standard code to subsidize AdvPL favored the socialization of the language, increasing absorptive capacities (Schmidt, 2005) of the company, appropriating internal technical structure for innovative solutions. Externally, the resulting ERP will run on hardware with less technical features, requiring less investment in IT than IT systems from rivals (SAP, JD Edward, similar).

A third route focuses on the way the company adopted to speed up the updating of its technological base. External acquisition, either of independent or incorporated technologies in the portfolio of acquired firms, would supplied the internal demand, would support alternative innovative solution and would help expand the technological dominion of the company. External acquisition has been an important strategy to slow down eventual pressure from challenging technologies.

Thinking on Freeman (2008) innovation strategies, TOTVS demonstrated to work under the criteria of an offensive technology strategy, when the company decided to develop its own proprietary technology and to use acquisition strategy to speed demand and updating. This decision made, on the one side, the company's ERP accessible to small and medium industrial segments, leveraging TOTVS to market leadership in this segment. And on the other, strengthen the protective strategy of dominant technology by developing internal resilience capacity (Reinmoeller and Baardwijk, 2005).

Considering Rothaermel and Hess (2010) concepts on innovation, the combination of acquisition strategies and international alliances guarantee the consolidation of TOTVS technological dominion base necessary to maintain its dominant technology. Internally, there is a great deal of contribution coming from the flexibility of TOTVS' ERP platforms (TotvsTech), improved by the expertise of fusions and international alliances. IT solutions from TOTVS multinational concurrent are difficult to be implemented by small and medium size companies, due to hardware requisites, training, and customization and implementation costs. Finally, the Service Oriented Architecture, added management flexibility to the company's IT sector.

The risk of the less complex technology as the core of the dominant technology at TOTVS may lend to the system a certain level of vulnerability to technological discontinuity. Considering that large multinational companies are prone to introduce innovation, some of radical nature, with superior performance, then we may have a challenging situation to the dominion of established technologies threatening TOTVS market leadership. To this point, however, TOTVS protective strategy has work well.

Finally, we recommend new studies, for instance, aiming at understanding the influence of growth strategies on technology management and strategies of the acquiring company, looking at the effect on its technological footprint. Or to study the effect of absorptive and/or dynamic capacities on the process of adaptation to a new dominant technology in the context of the cycle of technology discontinuity.

INNOVATION POTENTIAL OF REGION.

Irina Rudskaia and Alexandr Sedov
St.-Petersburg State Polytechnical University, Russia

ABSTRACT

There are lots of approaches which are used when giving a definition to the notion of competitiveness. In order to identify ways for better competitiveness of a region, it is important to assess, first of all, its innovation potential as a basis for competitiveness factors' development.

The shift towards provision of competitiveness on the basis of innovation development factors will result in increased competitiveness of Russian goods and attraction of better and cheaper resources. In order to achieve this, it is necessary to develop competitive advantages of regions which base on innovations. It becomes especially important for the regions which have no other competitive advantages, such as natural resources or availability of transport infrastructure. In order to increase innovation potential of a region there should be control mechanisms, which will boost evolution of effective regional innovation systems.

INTRODUCTION

Today the economy of Russia is mixed and unequally developed in different regions, which implies that some specific features should be taken into account when tackling this problem.

There are lots of approaches which are used when giving a definition to the notion of competitiveness. On the whole, one can speak about competitiveness of a certain object (product, service) or economic system (company, region, national economy) as of its capability to compete with other similar objects or systems in the market.

As competitiveness characterizes the ability of a region to compete effectively with other regions for resources, investments and target markets, the general approach to assess competitiveness is based on the system of individual potentials. Thus, according to the technique of the rating agency Expert – RA, the investment rating of a region (which, as we believe, is an important competitiveness characteristic – the higher the investment rating is the easier it is for a region to attract resources for development) comprises investment potential and investment risk related. The potential reflects the share which the region has in the all-Russian market, whereas the risk characterizes the size of problems investors may experience in a certain region. Each of these synthetic parameters, in its turn, is classified in the system of individual measurements in table 1. Every individual potential or risk has a specific group of indices.

Table 1: Components of Region's Investment Attractiveness

Parameter	Individual measurements	Effect on competitiveness
Investment potential	Labor potential	Makes positions in labor market stronger
	Financial potential	Helps to obtain competitive positions which lack
	Production potential	Improves positions in commodity market
	Consumption potential	Improves positions in domestic market
	Institutional potential	Tools which provide competitiveness can be created
	Infrastructure potential	Infrastructure which provides competitiveness can be built
	Natural resources potential	Strengthens positions in resource market
	Tourist potential	Creates specific advantages in domestic and external market
	Innovation potential	Creates stable competitive advantages
Investment	Financial risk	Financial security risk when creating competitive advantages

risk	Social risk	Risk of social unrest
	Management risk	Risk of inefficiency and management
	Economic risk	Risk of economic inefficiency
	Environmental risk	Risk of unfavorable environmental situation
	Criminal risk	Threat to creation of competitive advantages, risk of uncontrollability

As stable competitiveness may be achieved on the basis of a wide range of competitive advantages, different individual potentials are worth developing. However, innovation potential is that of priority, since that is exactly the one which becomes the platform for developing a set of competitive economic sectors. Due to dynamic growth of innovation industries it is possible to form competitive advantages of regions that do not have a significant raw material or labor potential. In such a case a region is considered to be a place where innovatively active companies are concentrated. Consequently, one has to improve interaction between companies, universities, research centers, small and big businesses in the region, which is meant to create long-term competitive advantages relying on regional intellectual resources.

The term *potential* is widely spread in many fields of economic and social life. Traditionally, potential implies a combination of ‘sources, facilities, funds, reserves which can be called into operation, used for solving some task or achieving some goal’. Speaking about innovation development of a region the term *potential* can be reasonably referred to the Latin word *potential*, i.e. ‘possible in case there are respective conditions’.

However, as for the structure itself or types of potential, there is a big difference in the way they are interpreted. In particular, K.M. Misko uses a concept of ‘consolidated resource potential’, which comprises:

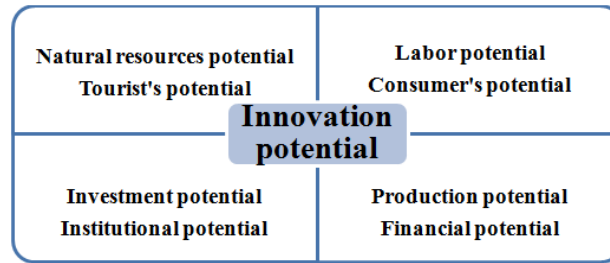

- potential of agricultural land resources;
- potential of forest resources;
- potential of animal world resources;
- potential of urban land resources;
- potential of water resources;
- potential of primary mineral resources;
- labor potential of population;
- potential of assets;
- potential of intellectual property resources.

We believe such a classification requires certain clarifying, namely: the first six components include a consolidated natural potential whereas labor potential, potential of assets and intellectual potential comprise elements of a company’s market potential.

B.K. Plotkin says that ‘any intellectual human activity ... (which, correspondingly, includes production activity) ... is based on mental and material potential.’ Here by mental potential we mean ‘accumulated scientific and technical knowledge, skills and abilities to generate ideas, creativity’. Material potential exists in the form of all types of material resources. However, it is worth mentioning that such division corresponds to the macro and microeconomic approach rather than to the general economic one. E.M. Bukhvald uses the term ‘economic potential’. It implies both natural resources and fixed assets. This concept excludes such important components as labor, innovative and intellectual potential of a company. Likewise, we cannot agree with equivalency of the notions ‘production potential’ and ‘fixed assets’. B.A. Riseberg interprets economic potential as a general ability of a country’s economy, its sectors, companies and enterprises to perform production and economic activities, produce goods and provide services, meet public needs, ensure development of production and consumption. When looking into economic potential of a region as a whole system, some researchers highlight the following potentials as its key elements: labor, investment, natural resources, and innovation potential. In our view, the innovation potential is the backbone element of the potential for competitiveness growth. Other subsystems of economic potential can be, at the same time, innovation potential subsystems.

In order to identify ways for better competitiveness of a region, it is important to assess, first of all, its innovation potential as a basis for competitiveness factors’ development.

System of a region’s economic potential

EVALUATION OF INNOVATIVE POTENTIAL OF REGION

The problem of innovation potential assessment of Russian regions has been investigated by different researchers. Thus, G.A. Wintir has been researching the innovation potential of the regions. The authors of the project 'Strategies of innovation development 'Innovative Russia – 2020' also distinguish successful innovatively active subjects of the Russian Federation (regions), which include St. Petersburg, Novosibirskaya Oblast, Tomskaya Oblast, the Republic of Tatarstan and Mordovia.

The work of G.I. Zhits defines the innovation potential as a system of resource provision for the system to function at the level which corresponds to the world's level or higher. The system of the innovation potential nominally consists of four interconnected segments.

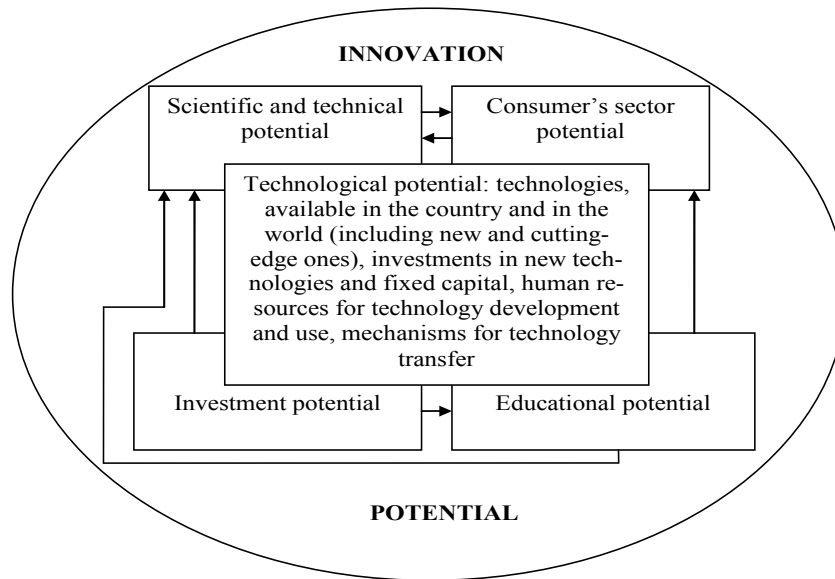

1. Technical scientific potential, which ensures availability of innovations meant for production use in the macro-system.
2. Educational potential, which characterizes abilities of the micro-system to create and use technical scientific innovations.
3. Investment potential, which characterizes abilities of the macro-system to implement production use of technical scientific innovations and to diffuse them in the whole macro-system.
4. Potential of the consumer's sector – all individuals and legal entities, which, on one hand, are consumers of the innovations that are offered for use and, on the other hand, initiate subsequent activity of other segments due to creation of new needs.

Technological potential lies at the centre of innovation potential and embraces all the four mentioned elements in the sphere which is related to creation, mastering and distribution of cutting-edge technologies. It comprises available domestic and global technologies, including new and cutting-edge ones. Thus, technological potential is based on the aforementioned potentially available knowledge stock (PAKS).

Place of technological potential in innovation potential

Main elements of innovation potential include:

1. *Human resources' element*: number and qualification of technologists, their educational level, creative abilities, experience, background, knowledge of progressive technologies, ambition for continuous education, readiness for development and implementation of the new made and open-mindedness towards innovations.
2. *Institutional element*: the number of organizations which supply specialists into key technologies, their status, departmental identity, dimensional structure and so on. The same information about organizations which are key consumers of technologies.
3. *Investment and financial element*: the amount of investment into development of new technologies within a certain period of time; volume and structure of financial resources for investment in technologies; available equipment, material, devices, office appliances and computers, etc.
4. *Organization and management element*: control mechanisms for development and transfer of technologies, protection of intellectual properties.
5. *Consolidate indices*: involvement of a region in technological exchange, share of innovation products in the gross regional product, etc.

It is worth considering that various regions have specifics, which cannot but influence the level of innovation potential and its structure. The literature which is dedicated to innovation activities of regions covers different approaches towards the ways how regional specifics has to be taken into account when assessing innovation potential of a region.

1. As a rule, innovatively active companies and research institutes are concentrated in large conurbations.
2. Industrial and industrial innovative clusters help knowledge and new technologies spread and at the same time they can be located quite far away from big regional centers.
3. Commonly, regions located on the outskirts of the country are notable for lower innovation activity comparing to the ones which are close to the largest scientific and financial centers.

CONCEPT OF REGIONAL INNOVATION SYSTEMS

The concept of regional innovation systems is used to control innovation potential of regions with due consideration of their differences.

The idea of a regional innovation system and regional network economy, which appeared at the end of the 20th century, was based on the changes that were happening in the economic policy: adequate measures were needed to increase a region's competitiveness. Many countries and unions of states (EU) began to introduce measures to stimulate 'regional growing points' or regional clusters. In their research, the authors have relied on the following characteristics of modern business environment and achievements of economic conception.

1. Research of industrial regions with fast development due to innovations. The first of the region under research is the so called "Third Italy", region Emilia-Romagna in the north of Italy where a large number of small innovation companies are concentrated. Fast economic growth of this region has illustrated one of the dominating features of modern economy – shift from mass production to a flexible, customer-oriented, specialized production, which requires a large cooperation of companies and which is possible in the conditions of network economy. The second region – Silicon Valley in the USA – is an example of hi-tech industrial region, based on the integration of universities, venture capital and advances of modern information technology.

The theoretic basis for further research is the work of M. Porter, who suggested an idea about production or industrial clusters as locomotives of economic development. If such a cluster is located in a region, it makes the region somehow different from other regions of the country due to the specifics of its economy. Such a region has a higher competitiveness.

One more basis for terminology development of regional innovation systems has become a more evolved conception of a national innovation system, which can be, to an extent, applied to a regional level. According to the authors, a regional innovation system has the same components as a national one. However, organizations within the framework of a regional innovation system function within the limits of a certain region. Consequently, the development goals for such a system have to be the goals which are primarily important for this region.

A theoretical justification of regional innovation systems can be found: from the perspective of ‘evolution theory’ and ‘new theory of growth’, which see innovations as a socially important process influenced by many factors, both internal and external for the companies which implement these innovations. The models of new theory of growth accounts for the fact that profitability of investments in human capital assets, new technologies and knowledge grows in course of time as a result of the so-called ‘innovation added effect’. This effect, which foreign authors refer to as ‘spillover’, shows that firms cannot use, in full, the advantages of their investments in R&D on their own, without their partners being involved and relevant infrastructure being developed. Therefore, investments in new knowledge, technologies and human capital assets bring economic advantages to the society as a whole. Thus, effectiveness of innovation activities can increase in case there is systematic interaction, cooperation of different agents, which allows speaking about innovation systems from the perspective of regional economy, which emphasizes the importance of a region’s competitive advantages as a location where innovatively active companies are concentrated. Consequently, it is essential to reinforce interaction between companies, universities, and research centers, small and big companies in a region in order to create long-term competitive advantages with the help of regional intellectual resources. Recently, foreign scientists carried out comparative research in order to study and identify specific features of regional innovation systems. The specification of the most known studies is given in Table 2.

Table 2: Specification of research of regional innovation systems

Research	Target of research	Goal of research	Main results
Regional innovation systems: designing for the future (REGIS)	11 European regions (Baden-Württemberg, Wallonia, Brabant, Tampere, Lower Silesia, Basque Country, Friuli, Stiria, Wales)	To study theoretical basis of the organization and measurement direction of effective performance of RIS	Innovation potential of regions is described in detail, strong and weak regions are identified
European research of regional innovation systems (ERIS)	11 European regions (Vienna, Stockholm, Barcelona, Alsace, Baden, Lower Saxony, Girona, South Holland, Saxony, Slovenia, South Wales)	To identify quality and quantity characteristics of a region’s innovation potential, establish interconnection between participants of innovation processes	Innovation activity is a result of network interaction. Innovation policy should be directed on increased effectiveness of such interaction
Regional evaluation of innovations and policy with regard to small and medium business (SMEPOL)	11 European regions (Upper Austria, Wallonia, Jutland, Lombardy and Apulia, North and South-West Norway, Valencia, London boroughs and Hertfordshire)	To carry out comparative research of regional innovation policy tools with regard to small and medium enterprises in Europe	Innovation policy should increase effectiveness of interaction between small and medium enterprises and should stimulate team teaching
Scandinavian small and medium enterprises and regional innovation systems	13 regions in Scandinavia and Northern Europe (Oslo, Stockholm, Helsinki, Malino, Aalborg, Linköping, Jyväskylä, etc.)	To research similarities and differences between regional clusters of small and medium enterprises in Northern Europe and Scandinavia	It has been found out that the most effective systems are the ones where knowledge is transferred through informal relationship

Innovations of regional clusters in Canada	9 regional clusters	To study the phenomenon of companies involved in different industries which are concentrated in regions	Two types of clusters have been revealed: in the regions with strong innovation potential and in the regions that need to obtain and distribute new knowledge (often through its transfer from other regions)
Research of regional innovation clusters	10 European regional clusters	The problem of cluster approach suitability in innovation policy	Regional clusters in every country (region) have specific features, they can distribute the results of innovation activities outside the boundaries of countries and regions and they are important for choosing innovation policy

The main goal of RIS is to create conditions for permanent emergence and successful development of new innovation projects, which are designed to implement competitive advantages of a region. The structure of a regional innovation system is schematically shown in Figure.

CONCLUSION

The Innovation strategy of Russia 2020 suggests a number of tools which encourage innovation development of some regions and emergence of innovation clusters. The regions are to be supported on the basis of a selection, which happens twice a year with the help of comprehensive evaluation of innovation potential in the regions and effectiveness of innovation policy which is implemented in the regions.

Thus, on the basis of the research which has been carried out, one can conclude that competitiveness of Russian economy, which is a priority task in the conditions of it joining the World Trade Organization, can be provided only with due consideration of regional specifics. Russia is a country with federal structure and its 83 regions have quite different competitive advantages.

The shift towards provision of competitiveness on the basis of innovation development factors will result in increased competitiveness of Russian goods and attraction of better and cheaper resources. In order to achieve this, it is necessary to develop competitive advantages of regions which base on innovations. It becomes especially important for the regions which have no other competitive advantages, such as natural resources or availability of transport infrastructure.

In order to increase innovation potential of a region there should be control mechanisms, which will boost evolution of effective regional innovation systems. Our next article will be dedicated to methodological approach towards the way such mechanisms can be designed.

MANAGEMENT ACCOUNTING IN PORTUGUESE HOTEL ENTERPRISES – UPDATE RESEARCH

Luís Lima Santos, Conceição Gomes, Nuno Arroiteia and Paulo Almeida
Tourism Research Group. Polytechnic Institute of Leiria, Portugal

ABSTRACT

Management accounting (MA) techniques have evolved in the recent years in the various companies. We have studied the MA techniques that are currently being used by different types of hotels. The sample includes 61 hotels, which were analyzed between 2010 and 2012. MA is a tool incorporated in the daily management practices of Portuguese hotels. However, we verified that the hotels have different behaviors in this area, which entailed a comprehensive study on the causes of this diversity. We applied the contingency theory to explain our findings, because this theory is based on the premise that the MA techniques are not used equally by all organizations.

INTRODUCTION

MA supports hotels to improve their performance, thus becoming relevant to study MA adopted by them, particularly which instruments and techniques. It is important the use of MA information to allow the optimization of the decision making processes by hotel managers, due to the fact of them facing a big competition (Downie, 1997). Some authors suggest that MA techniques are different among companies from different industries (Downie, 1997; Williams & Seaman, 2001; Rowe et al. 2008), presenting some arguments that cause this diversity: product life-cycle, structure of costs, technology and production, intensity of competition, uncertainty and price flexibility, competitive strategies and organizational designs.

This study consists on update of our another paper (Gomes et al, 2011) with the objective of characterizing MA in the Portuguese hotel enterprises, identifying the techniques adopted, the deepness of their use, the degree of satisfaction of management with these techniques and their adequacy for the decision-making process, understand the extent to which the industry adopts and use the Uniform System of Accounts for the Lodging Industry (USALI). We have also the expectation of identify the factors that influence the behavior of the hotels in their practices of MA. We have kept the contingency theory to explain the behavior of hotels managers in this subject, because we believe that this theory, which has been applied successfully in several accounting studies, indicates the right way to achieve our goals. The present research project as selected as object of the study, the Portuguese hotels. The sample includes 61 hotels, which were analyzed in the years 2010, 2011 and 2012.

LITERATURE

According to Harris & Brown (1998), the hotels offer products with significantly different characteristics, if we compare with others kinds of business activities. However, the lodging industry must observe the MA techniques in other industries, and then should adapt to the specific needs of hospitality products. This economic activity is characterized by having a great volatility in demand and fixed costs structure, perishable goods, high competition and a great diversity of services due to the heterogeneity of clients (Downie, 1997; Mia & Patiar, 2001). As a consequence of several specificities of the hotels, the information required by managers to make decisions is different from other industries (Mia & Patiar, 2001). The MA techniques have an important role in the decision making process (Oliveira et al., 2008; Zounta & Bekiaris, 2009). Downie (1997) refers several decisions related with accounting information, for example, the compilation of marketing plan needs a financial budget. Hotels

have two sources of information: market research and accounting information. The ideal is that this information could be aligned and coordinated thus supporting the managers (Downie, 1997). The organizations make decisions based on information provided. MA can satisfy this need.

There is a growing desire to understand the practice of MA in hotels (Harris & Brown, 1998; Pavlatos & Paggios, 2009). It has been found a difference between theory and practice of MA. The contemporary techniques are very developed in theoretical terms but contrasting they have a relatively reduced adoption within companies (Jones, 2008). According to Fowler (2010), it doesn't mean that the contemporary techniques are irrelevant, because in several cases they are not adopted due their high costs of implementation. The MA techniques, according Ferreira (2002) may be divided into traditional and contemporary (Table 1).

Table 1: Traditional versus contemporary MA techniques

Traditional techniques		Contemporary techniques	
Budgeting;	Return on investment;	Activity-based budget;	Customer profitability analysis;
Budget deviation analysis;	Sales break-even;	Activity-based costing;	Economic Value Added;
Product costing;	Strategic Planning;	Balanced Scorecard;	Product life cycle costing;
Product profitability;	Tableau de bord.	Benchmarking;	Target costing.

Source: adapted from Ferreira (2002).

In Portugal, Gomes (2007) analyzed the MA techniques used by industries in different sectors, where the lodging industry was also represented. The mostly used traditional MA techniques were Budgeting, Tableau de Bord and Return on investment. The contemporary techniques are less used, though having some relevance the Balanced Scorecard, Activity-based budgeting, Activity-based costing, Target costing and Benchmarking. Pavlatos & Paggios (2008) made a research in Greece, concerning the accounting techniques adopted by hotel units. They concluded that traditional techniques are widely used when compared to the contemporary techniques less widespread. Gomes et al. (2011) reached the same conclusion regarding the Portuguese hotels.

Budgeting and Budget deviation analysis are the commonly wide technique used by hotels (Phillips, 1996; Jones, 2008; Pavlatos & Paggios, 2008; Uyar & Bilgins, 2011; Urquidi, 2013). Cruz (2007) concludes that budgets are a valid tool to the budgeting control process within a hotel, thus remarks that budgets used in hotels have some specific aspects when compared to the budgets elaborated to other industries. The budgets should not be rigid but flexible. A budget committee and a budget manual are common for Turkish hotels. These hotels use Budget deviation analysis for evaluating performance and providing information. The main objectives are to find out the problems and a timely cost control (Uyar & Bilgins, 2011). Urquidi (2013) say that some hotels in Spain use this technique. Product costing is very important in a managerial accounting information system of a hotel (Zounta e Bekiaris, 2009). The main goal of costing is the accurate recording and allocation of costs to products, services and customers. The Greek luxury hotels use the costing product, but they only allocate costs to profit and cost centers. Urquidi (2013) say that some hotels in Spain use this technique. Strategic Planning is widely mentioned in the field of hotel management (Phillips, 1996). He remarks that the Strategic Planning existent in hotels is quite incomplete since it is commonly an expansion of the financial budget with less emphasis on strategic issues. According to Cruz (2007), planning is an essential tool for their management and budgets are a part of the process. Activity-based budget have a good influence in the management of hotels like activity-based costing (Cruz, 2007). It is more relevant the use of Activity-based costing than the traditional cost center approach, if the hotel is using the customer profitability analysis (Downie, 1997). Vaugh et al. (2010) refer that activity-based costing was implemented with success in a kitchen in a Las Vegas casino, which allowed understand a hotel's cost structure. Balanced Scorecard has several of measures (financial and non-financial). The hotel modern performance system should be multidimensional (Sainaghi et al., 2013). Customer profitability analysis has a positive influence in the management of hotels (Cruz, 2007). It should be more developed (Downie, 1997). By using this technique, hotels can determine the profit contribution of clients. The last three MA techniques are used by some hotels in Spain (Urquidi, 2013). Benchmarking is a common accounting technique due to the internationalization of hotel chains operations, allowing the comparison among different hotels business units (Cruz, 2007). Lee and Kim (2009) analyzed if the Economic Value Added technique influenced the market profitability for the hotel industry, but found out that this technique was not a good way to measure this.

As a conceptual framework USALI is generalized in the world, particularly among multinational hotel chains. However, Faria (2007) presents that less than a half of hotels use the USALI. Pavalatos & Paggios (2007) found few national hotels utilizing de USALI in Greece. Gomes et al. (2011) concluded that there are evidences of a progressive knowledge and use of this framework by Portuguese hotels to support the information processing.

In the literature there may be found several studies that refer the determinants that make one company adopt for some MA techniques, supported by the theory of contingency. The contingency theory is based on the premise that the MA techniques are not used equally by all organizations (Haldma & Laats, 2002; Urquidi, 2013). The contingency theory explains the relationship between the environment and the techniques used for achieving the objectives of a hotel (Urquidi, 2013). These techniques depend upon the specific characteristics of an organization, like as organizational context and structure. The contingency theory helps to explain the impact of factors in MA. Zounta & Bekiaris (2009) argued that hotel managers should monitor the external environment, before implementing an information system. Several authors use this theory when examined divers factors (Haldma & Laats, 2002; Cadez & Guilding, 2008; Urquidi, 2013). According to Hayes (1977), there are three subgroups factors that influence the organization management, such as internal factors, interdependency factors and environment factors. Haldma & Laats (2002) subdivided into two general groups: external and internal factors. The internal factors are organizational aspects, technology and strategy. Uyar & Bilgin (2011) refer that the differences in MA were attributable to hotels sizes, complexity of operations, uncertainties, coordination and communication among departments.

The fact of company being in a highly competitive market (Tayles & Walley, 1997; Urquidi 2013), organizational variables such as communication, coordination, decentralization and formalization (Luft & Shields, 2003) and business strategy and market orientation (Cadez & Guilding, 2008; Urquidi, 2013) influence MA techniques adopted by companies worldwide. The environmental uncertainties have been associate with the need of a wide data (financial or not). So, Oliveira et al. (2008) and Urquidi (2013) mention that competition, plays an important role in influencing the introduction of new accounting techniques in the industry. Sharma (2002) argued that a turbulent and a competitive environment imply a greater use of MA techniques. A competitive organization is more open to adopting contemporary MA techniques (Zounta & Bekiaris, 2009).

According to Adler (2011) and Urquidi (2013), the strategy, used by a hotel, influences the MA techniques. Acquaah (2013) argued that there is a link between MA and business strategies. MA should support the strategy. If a hotel adopts the strategy of leadership in costs, it will be more important the calculation of product cost and the implementation of information systems that help in the calculation and control of product cost (budgeting, budget deviation analysis and product costing). If a hotel adopts the strategy of differentiation, it will be more important the new products and markets. They want to know the client needs. So, it will be chosen the balanced scorecard and the customer profitability analysis. We can say that the techniques vary according to the goals defined for MA (Urquidi, 2013). The strategy of leadership in costs needs a diagnostic control system, whereas the strategy of differentiation needs an interactive control system, because encourages innovativeness (Acquaah, 2013). The firm size (measured through sales volume or number of employees) is also a factor that influences the MA techniques in a company (Cadez & Guilding, 2008; Adler, 2011; McManus, 2013). Cadez & Guilding (2008) refer that a large company implies an increase of complexity and sophistication in MA techniques. Such as, there are a positive association between the size of a company and the use of strategic MA.

Hypotheses

According to the literature, we found that the traditional MA techniques have a higher utilization compared to contemporary MA techniques. The main objective of MA technique is the decision making process for the most companies. There are studies that refer several determinants supported by the theory of contingency that influence the MA from a hotel. In this study we opted to analyze the competitive environment, the levels of competition, the strategy and the size of the hotel. In the light of these conclusions, we developed the following hypotheses:

- H1: The use of traditional MA techniques is higher than the use of contemporary MA techniques in lodging industry.
- H2: The main objective of MA is the decision making process.

- H3: Less than fifty percent of hotels use the USALI.
- H4: The hotels that are in a competitive environment are those that use more the MA techniques.
- H5: The hotels with more levels of competition are those that use more the MA techniques.
- H6: The use of a strategy of differentiation is significantly related to the use of the following techniques: balanced scorecard and customer profitability analysis.
- H7: The use of a strategy of leadership in costs is significantly related to the use of the following techniques: budgeting, budget deviation analysis and product costing.
- H8: The size of the hotel significantly influences the use of MA techniques.

METHODOLOGY

According to Yin (2009), it was decided to adopt the method of questionnaire through of personal interviews. The data was processed using SPSS (Statistics Packages for Social Sciences). In order to characterize the MA at the Portuguese lodging industry we utilized the univariate analysis. The relationships defined in the hypotheses were tested by univariate and bivariate analysis, for example, we have utilized: mean, mode, Spearman's Rho and Mann-Whitney test. According to Pestana & Gageiro (2008), Spearman's Rho measures the intensity of the relation among variables, and is commonly used to describe the relation among two ordinal variables or one ordinal and other scale variable. Due to the fact that this coefficient is not sensitive to asymmetric distributions, it does not require normal populations.

FINDINGS AND DATA ANALYSIS

In this study were analyzed 61 Portuguese hotels from different categories. From these, 17 belong to national chains, 2 are subsidiaries of multinational hotel chains. The annual turnover ranges from 16,000€ to 60,000,000€. We used the Porter's competitive forces model (Porter, 1985) to analyze the five competitive forces and we added a sixth factor the influence of the Government, in order to understand the relative influence of each force in affecting the industry. We conclude that the power of buyers is the strongest force, with a mean of 5.48, followed by the rivalry among existing competitors. Concerning the intensity of competitors within the industry, this is more evident in terms of the price, being the mode 7 "very high". Of the 61 inquiries, 78.7% (48) have implemented and use MA. The 13 units that do not use this practice are small hotels and work a long time ago. The users of MA have a greater power of "rivalry among existing competitors", "threat of new entrants", "suppliers", "buyers" and "government". The intensity of the competition is greater in the users at price, labor force and promotion. The hotels that use MA are included in environment more heterogeneous relatively to customers, competitors and market.

As previously discussed, MA has a vast scope of techniques, some of which are considered to be traditional MA techniques. From these, the ones that are most used by inquiries are Budgeting, Budget deviation analysis and Strategic Planning, with 81.3%, 68.7% and 69.3% respectively. This corroborates with what is described in the literature review. Concerning the contemporary MA techniques, the results are opposed to the previous ones, because all the techniques have a score below the null value. So, we have found that the **H1** is not rejected. The traditional MA techniques are more used than contemporary techniques. Both the mean and the mode are higher in the traditional techniques. The hotels use MA mainly with the purpose of supporting their decision making process and the budgeting process too. So, we can say that the **H2** is not rejected. The process of decision making is priority.

Concerning the use of USALI, we observe that only 27.9% of the hotels use. All hotels, that use USALI, have got implemented MA. So, the **H3** is not rejected, because less than a half uses USALI. We have chosen the Mann-Whitney test, where we defined the following hypothesis: H0: The distribution of turnover is the same across the two groups of hotels (that used or not USALI); Ha: The distribution of turnover is different across the two groups of hotels (that used or not USALI). We rejected the H0 with a significance of 1%. We found that smaller hotels don't use USALI.

When analyzing Spearman's Rho of the MA techniques with variables that characterize the competitiveness within the industry (Porter's competitive forces), we found some moderate associations thus the

correlation coefficient is between -0.456 and 0.433. This correlation is positive with Suppliers, Buyers, Threat of new entrants, Power of substitutes so we can conclude that generically, the hotels that use the MA techniques are the ones who recognize to face a bigger competition. However, we have a correlation negative with the government, in other words, if the government has a bargaining power, the hotels use less the MA techniques. So, the **H4** is not rejected, because based on Porter's competitive forces model (Porter, 1985), we can say that four forces (Threat of new entrants, Power of suppliers, Power of buyers and Power of substitutes) influence positively the use of MA techniques significantly. When analyzing Spearman's Rho of the MA techniques with variables that characterize the levels of competition (Price, Labor force, Buying of goods and Promotion), we found some moderate positive associations thus the correlation coefficient is between 0.287 and 0.47. So we can conclude that generically, the hotels that use the MA techniques are the ones who face high levels of competition. So, the **H5** is not rejected, because the levels of competition influence positively and significantly the use of MA techniques. Budgeting and Budget variation analysis are the techniques which highlights a higher level of association with labor force and promotion competition.

If we compare the mean of use from balanced scorecard and customer profitability analysis in the hotels that have a strategy of differentiation and those that have a strategy of leadership, we verify a greater use of these techniques by hotels that have adopted the strategy of differentiation. However, we have a nominal variable that characterizes the strategy of the hotel and several ordinal variables that characterize the use of MA techniques. So, we have chosen the Mann-Whitney test, where we defined the following hypothesis: H_0 : The distribution of use of balanced scorecard/customer profitability analysis is the same across the categories of strategy. H_a : The distribution use of balanced scorecard/customer profitability analysis is different across the categories of strategy. We rejected the H_0 with a significance of 5% for the balanced scorecard. . We not rejected the H_0 for the customer profitability analysis. We found that hotels with differentiation strategy use more the balanced scorecard. Thus, **H6** is not rejected for customer profitability analysis. If we compare the mean of use from budgeting, budget deviation analysis and product costing in the hotels that have a strategy of differentiation and those that have a strategy of leadership, we verify a greater use of these techniques by hotels that have adopted the strategy of differentiation. According to the budgeting/budget deviation analysis/product costing is the same across the categories of strategy. H_a : The distribution use of budgeting/budget deviation analysis/product costing is different across the categories of strategy. We only reject the H_0 with a significance of 1% for the budgeting. We not rejected the H_0 for the budget deviation analysis and product costing. We found that hotels with differentiation strategy use more the budgeting. Thus, **H7** is rejected. We cannot confirm what said Urquidi (2013). In Portuguese hotels with differentiation strategy there is a more common use of MA techniques, but only is significant for balanced scorecard and budgeting. The annual sales turnover could also be a variable that influences the use of MA techniques. We decided to analyze the intensity of the relation between the adoption of MA techniques and annual sales turnover through Spearman's Rho. The coefficients that have been found are all positive, and we can confirm that the hotels with higher annual sales turnover adopt a large number of MA techniques. Note that one MA techniques have significant coefficients, bigger than 0.5 (Budget deviation analysis). The **H8** is not rejected, because some MA techniques are correlated with the turnover of the hotel.

CONCLUSIONS

Management accounting (MA) techniques have evolved in the recent years in the various hotels. It is important the use of MA information to allow the optimization of the decision making processes by hotel managers, due to the fact of them facing different kinds of competition. The Portuguese hotel managers believe in that, because most of the hotels that have answered our inquiry use MA techniques, with the main purpose of providing information to decision making process. The traditional MA techniques are used frequently (*Strategic planning, Budgeting, Budget deviation analysis*), what corroborates with several authors cited in the literature. In the hotels that were subject to this study, there is a mismatch between theory and practice of MA, because some of the contemporary techniques are not known and thus not adopted by the hotels. This fact confirms the conclusions of Jones (2008). Nevertheless, the contemporary MA techniques frequently more adopted by the hotels are the ones more present in the literature (Activity based costing and Activity based budgeting). In Portugal, there is a weak use of USALI. It is not fully expanded yet across the hotels. It is more used in the large hotels.

We have tested several hypotheses, where we found some drivers of adoption of MA in lodging industry. By using *Spearman's Rho* we verified that there is a moderate association between variables that

characterize the competition within the sector and the degree of adoption MA techniques. Based on Porter's competitive forces model (Porter, 1985), we can say that four forces (Threat of new entrants, Power of suppliers, Power of buyers and Power of substitutes) influence positively the use of MA techniques significantly. When analyzing Spearman's Rho of the MA techniques with variables that characterize the levels of competition (Price, Labor force, Buying of goods and Promotion), we found some moderate positive associations. So we can conclude that generically, the hotels that use the MA techniques are the ones who face high levels of competition. Having that present, we confirm that competitiveness within the industry as a positive influence the MA techniques adopted by hotels, an idea previously transmitted by Tayles and Walley (1997).

We compared the use of balanced scorecard, customer profitability analysis, budgeting, budget deviation analysis and product costing in the hotels that have a strategy of differentiation and those that have a strategy of leadership. We verified a greater use of these techniques by hotels that have adopted the strategy of differentiation, but only are significant for balanced scorecard and budgeting. So, we cannot corroborate with Urquidi (2013). The size of the hotel (annual sales turnover) significantly influences the use of MA techniques, on this account some MA techniques are correlated with the turnover of the hotel. In conclusion, competition, strategies of business and annual sales turnover influence the adoption of MA techniques at hotels.

Managerial Implications

It is clear from this investigation that management accounting is very important to hotel managers, because it is a source of information for their decision making. However, the managers must optimize the process by choosing MA techniques according to external and internal determinants that characterize the hotel. This study could also help academic institutions to define their research orientation.

Limitations and future research

This study was done for three years, so our answers are not in the same cyclical period. We studied a few determinants, but according with the contingency theory there are more factors that can influence the management accounting techniques. So, in a future research, we will develop the study through the organizational and cultural variables.

UNDERSTANDING SHARED LEADERSHIP THROUGH THE APPLICATION OF SOCIAL IDENTITY THEORY

Nico Schutte and Nicolene Barkhuizen
North-West University , South Africa

ABSTRACT

The aim of the paper is to explore the phenomenon of shared leadership associated with social identity theory which highlights the attributes of the leader as a group member. Focus group sessions were conducted with 145 university leaders employed at a University in Namibia. The findings showed that leaders not only lead groups of people, but also are members of these groups, and that leadership processes are therefore authorised in the context of a shared group membership. Recommendations are made.

BUSINESS CASE

The University of Namibia (UNAM) as any other organisation operates in an unstable environment. To ensure business survival, strategic leaders must continually reconcile the paradox of performance delivery and strategic adaptation (Yukl, 2008). Rising operational and strategic complexity and continuous transformation have intensified the requirement for adaptable leaders at all levels (Huy, 2001, 2002; Balogun, 2003). At the university of Namibia as in other businesses significant resources are devoted to the selection and development of leaders (Northouse, 2007; Murphy & Ensher, 2008), effective leadership, considered a critical contributor to transformation success (Alimo-Metcalfe & Alban-Metcalfe, 2005), remains a scarce, corporate 'natural resource' (Tichy & Devanna, 1990).

Additionally, does Kotter (1990), argues that inadequate leadership remains a significant factor in the continued, low success rate of business transformation initiatives (Beer & Nohria, 2000); this represents a significant issue for organisations such as the university of Namibia. Katz and Kahn (1978) are of the opinion that when team members willingly and freely offer their influence to others in support of shared goals, shared leadership can provide organisations such as UNAM with competitive advantage through advances in commitment, in the personal and organisational resources detected on complex tasks, in openness to reciprocal influence from others, and in the sharing of information. Consequently, they argued, "Those organizations in which influential acts are widely shared are most effective" (p, 332).

Hence, the problem statement that this paper tries to answer is "How can shared leadership through the lens of a social identity theory perspective contribute towards UNAM leaders becoming more effective in achieving their organisational goals?"

BUILDING ON THE SOCIAL IDENTITY IN THE ANALYSIS OF LEADERSHIP

There are a number of definitions and views on the nature of leadership in the literature. According to Nirenberg (2001), leadership is a social function necessary for the achievement of collective objectives. In contrast, does Yukl (1989) states that "researchers usually define leadership according to their individual perspectives and the

aspects of the phenomenon of most interest to them (p, 252). However, numerous authors view leadership critical for enabling organisational and or team effectiveness (Cohen & Bailey, 1997; Hackman & Walton, 1986; Kozlowski, Gully, Salas, & Cannon- Bowers, 1996), and some equally maintained that it is the most critical ingredient for organisational survival, (Sinclair, 1992; Zaccaro, Rittman, & Marks, 2001).

Sorenson (2002) notes that Stogdill's Handbook of Leadership, first published in 1974, listed 4,725 studies of leadership and 189 pages of references, yet Stogdill himself concluded that the endless accumulation of empirical data has not produced an integrated understanding of leadership. Several different categories of leadership paradigms have been suggested by various researchers. For example, Bass (1985) stated that there are four dimensions of transformational leadership, three dimensions of transactional leadership, and a nonleadership dimension of laissez-faire leadership (Bass, 1985). Avery (2004) suggested categorising leadership into four leadership paradigms, while Goleman (1995) prefers six leadership paradigms.

Bass asserts that visionary (transformational) leaders are nearly always more effective than transactional leaders, but others (e.g. Judge and Piccolo, 2004; Wallace, 1997) dispute this. While this in itself does not invalidate the concept of visionary leadership, Bass attributes more to visionary (transformational) leadership than perhaps he should. As Avery (2004) suggested, both transactional and visionary leadership are valid forms of leadership, but visionary leadership may be applicable more broadly, including in situations where there are insufficient resources for the manager to rely on supplying external rewards (Judge and Piccolo, 2004), or where the situation is complex and ambiguous, and relies strongly on follower knowledge and commitment. Avery suggests that there are other situations in which transactional leadership is the appropriate form of leadership, such as when followers are unwilling or unable to commit to the leader's vision.

In contrast with Bass's (1985) model, Avery's (2004) paradigms provide a broad basis allowing for different forms of leadership that have evolved at different times and in different places. The paradigms are useful for showing that there is no single best way of thinking about leadership, rather that different kinds of leadership reflect social and historical roots. Avery's paradigms allow leadership to depend on the context, respond to organisational needs and preferences, and involve many interdependent factors that can be manipulated (Bryman, 1992; Shamir and Howell, 1999; Yukl, 1999).

While traditional and contemporary leadership theory often focuses on describing individual differences in leadership as either a function of the person (trait) or the situation (state) (e.g., Judge & Bono, 2000; Judge, Bono, Ilies, & Gerhardt, 2002; Vroom, 2000), advocates of each position acknowledge the importance of future research studying the interaction of the two (e.g., Sternberg & Vroom, 2002). The purpose of this article is to propose an interactionists framework to the science and practice of leadership that reflects contemporary social-cognitive models of human action.

It will be important for UNAM to note what Rost (1993) maintain in that the importance of studying leadership as a relationship rather than simply a list of personal or situational characteristics, and laments the misplaced focus on "the peripheral elements surrounding leadership and its content instead of on the nature of leadership as a process, on leadership viewed as a dynamic relationship" (p. 4). While most psychologists have accepted a conceptual person-situation interactional paradigm (Bem, 1982; Chatman, 1989; Pervin, 1989; Schneider, Smith, & Goldstein, 2000), the persistence of scholarly leadership research focusing purely or primarily on traits (e.g. Judge & Bono, 2000; Judge, Bono, Ilies, & Gerhardt, 2002) or situations (e.g., Vroom, 2000) indicates sporadic empirical application.

DEFINING AND CONCEPTUALISING ORGANISATIONAL IDENTITY

According to Dutton, et al. (1994) has organisational identity become an important theoretical discourse to explain the relationship between an employee and employer and has been defined as "a cognitive linking between the definition of the organisation and the definition of self" (p, 242). In principle strong organisational identity arises when an individual incorporates their perception of their employer's values into their own belief system, thus individual and organisational ideals are compatible. Such a process arises from two routes, firstly, affinity with an employer where individuals self-select to join an organisation whose values match their own

long standing beliefs, or secondly, emulation, where an individual's beliefs change during the period of employment to become closely tied with those of their employer (Pratt, 1998).

The theoretical basis of work in the field concentrates on social identity theory and self-categorisation theory. Albert and Whetten's (1985) seminal work made a case for organisational identity being a distinct form of broader social identity, an area explored in the 1970s by academics such as Tajfel (1978). Organisational identity examines the process of how employees define themselves through their relationship with their employer. The process of identification essentially occurs firstly through social comparisons between themselves and distinct groups. Thus identity is defined by "the individual's knowledge that he/she belongs to certain social groups together with some emotional and value significance to him/her of this group membership (Tajfel, 1972, p. 292). In short, individuals define themselves by joining social groups that have meaning or importance to them.

For example, a Dean may define himself/herself as being part of the University of Namibia whose goal is to help educating the Namibian Nation. In addition a Dean may also be part of a profession, which enhance their self-esteem and self-identity. Subsequently, in order to clarify an individual's identity a second process of social connection occurs between groups. Those in the same social group are perceived to be alike, with a shared frame of reference and norms, and become part of the 'in-group'. As a consequence differences with others are amplified and thus are categorised as the 'out-group', thereby making the in-group membership more distinctive and attractive (Pratt, 1998). The implications of the process of social identity is that individuals define themselves through group membership and ascribe to characteristics of the group; the stronger the identification the more an individual's attitudes and behaviour are governed by group norms (Sparrow and Cooper, 2003).

Moreover, organisational identity is a distinct manifestation of social identity. The construct has often been associated with three related concepts: internalisation, affective commitment and positive organisational fit (Pratt, 1998). The distinction between organisational identity and these other concepts is that it is self-explanatory; hence an employee shares organisational values and beliefs rather than merely accepting them. Sparrow and Cooper (2003) briefly summarise the distinction; commitment raises the question of 'should I maintain membership with my employer', whereas identity revolves around the issues of 'who am I' and to 'what extent do I define myself through the organisation'. In essence an individual can be committed to an organisation without necessarily defining themselves by its values.

Much of the research on organizational identity builds on the idea that identity is a relational construct formed in interaction with others (e.g. Albert & Whetten, 1985; Ashforth & Mael, 1989; Dutton & Dukerich, 1991). For example, Albert and Whetten (1985: 273, citing Erickson, 1968) described the process of identity formation:

in terms of a series of comparisons: (1) outsiders compare the target individual with themselves; (2) information regarding this evaluation is conveyed through conversations between the parties ('polite boy, 'messy boy') and the individual takes this feedback into account by making personal comparisons with outsiders, which then; (3) affects how they define themselves.

Albert and Whetten concluded on this basis 'that organizational identity is formed by a process of ordered inter-organizational comparisons and reflections upon them over time.' In social identity theory and identity theory, the self is reflexive in that it can take itself as an object and can categorize, classify, or name itself in particular ways in relation to other social categories or classifications. This process is called self-categorization in social identity theory (Turner, Hogg, Oakes, Reicher, and Wetherell 1987); in identity theory it is called identification (McCall and Simmons 1978). Through the process of self-categorization or identification, an identity is formed.

In social identity theory, a social identity is a person's knowledge that he or she belongs to a social category or group (Hogg and Abrams 1988). A social group is a set of individuals who hold a common social identification or view themselves as members of the same social category. Through a social comparison process, persons who are similar to the self are categorized with the self and are labelled the in-group; persons who differ from the self are categorized as the out-group. In early work, social identity included the emotional, evaluative, and other psycho-logical correlates of in-group classification (Turner et al. 1987:20). Later researchers often separated the self-categorization component from the self-esteem (evaluative) and commitment (psychological)

components in order to empirically investigate the relationships among them (Ellemers and Van Knippenberg 1997).

The two important processes involved in social identity formation, namely self-categorization and social comparison, produce different consequences (Hogg and Abrams 1988). The consequence of self-categorization is an accentuation of the perceived similarities between the self and other in-group members, and an accentuation of the perceived differences between the self and out-group members. This accentuation occurs for all the attitudes, beliefs and values, affective reactions, behavioral norms, styles of speech, and other properties that are believed to be correlated with the relevant intergroup categorization. The consequence of the social comparison process is the selective application of the accentuation effect, primarily to those dimensions that will result in self-enhancing outcomes for the self. Specifically, one's self-esteem is enhanced by evaluating the in-group and the out-group on dimensions that lead the in-group to be judged positively and the out-group to be judged negatively.

As Hogg and Abrams (1988) make clear, the social categories in which individuals place themselves are parts of a structured society and exist only in relation to other contrasting categories (for example, black vs. white); each has more or less power, prestige, status, and so on. Further, these authors point out that the social categories precede individuals; individuals are born into an already structured society. Once in society, people derive their identity or sense of self largely from the social categories to which they belong. Each person, however, over the course of his or her personal history, is a member of a unique combination of social categories; therefore the set of social identities making up that person's self-concept is unique.

THE ROOTS OF IDENTITY

Much of social identity theory deals with intergroup relations—that is, how people come to see themselves as members of one group/category (the in-group) in comparison with another (the out-group), and the consequences of this categorization, such as ethnocentrism (Turner et al. 1987). Therefore in the case of UNAM one might believe that the leaders that participate in the research all fit in the university setting and such belong to a particular social identity which means that they all should foster oneness with this particular group, being like others in the group, and seeing things from the group's perspective. However, most of the individuals belonging to the group also have a particular role identity meaning they act to fulfil the expectations of the role (Deans, Directors etc.), coordinating and negotiating interaction with role cohorts, and influencing the environment to control the resources for which the role has responsibility.

Herein lays an important distinction between group- and role-based identities: the basis of social identity is in the uniformity of perception and action among group members, while the basis of role identity is inherent in the differences in perceptions and actions that accompany a role as it relates to counter roles. In group-based identities, the uniformity of perception reveals itself in several ways (Hogg and Abrams 1988; Oakes, Haslam, and Turner 1994). These may be characterised as cognitive, attitudinal, and behavioral dimensions.

Social stereotyping primarily occurs amid the cognitive outcomes. Therefore in the case of UNAM stereotyped perceptions of in-group members and out-group members will be increased and will be made more homogeneous by those individuals whom identify with the in-group (Haslam, Oakes, McGarty, Turner, Reynolds, and Eggins 1996). In accordance the individuals' group identification will also influence the view of the self as prototypical in the group (Hogg and Hardie 1992). Yet, others have found that in-group homogeneity is especially strong when no motivational forces exist to distinguish the self from others within the group (Brewer 1993; Simon, Pantaleo, and Mummendey 1995).

According to the attitudinal dimension, the leaders of UNAM uniformly make positive evaluations of a group, when they become group members. For example, social identity researchers have found that individuals who identify with the group feel a strong attraction to the group as a whole, independent of individual attachments within the group (Hogg and Hardie 1992). Subsequently, they have found that in-group identification leads to greater commitment to the group and to less desire to leave the group, even when the group's status is relatively low (Ellemers, Spears, and Doosje 1997).

Finally, people behave in tandem within a group with which they identify. Even in a low-status minority group, for example, individuals who use the group label to describe themselves are more likely than not to participate in the group's culture, to distinguish themselves from the out-group, and to show attraction to the group in their behaviour (Ethier and Deaux 1994; Ullah 1987). Similarly, groupthink or extreme concurrence in decision-making groups is much more likely under conditions of high social identification (Turner, Pratkanis, Probasco, and Leve 1992). In addition, social identification is one of the principal foundations for participation in social movements (Simon, Loewy, Stuermer, Weber, Freytag, Habig, Kampmeier, and Spahlinger 1998).

METHOD

Grounded theory is an accepted and fitting method to enrich our knowledge of leadership. Grounded theory uses qualitative research methods with the aim of generating theory which is grounded in the data, rather than testing existing theories (Glaser, 1978, 1992; Strauss & Corbin, 1990). The importance of the grounded theory approach in the present study was that it anticipated the complexities of the Namibian University under inquiry without rejecting, ignoring, or suppose missing relevant variables. Therefore, the richness of the data ensured that the resulting theory was able to provide a holistic understanding to the leadership process for participants and fellow researchers alike.

The grounded theory methodology involves integration of data collection and data analysis to achieve 'constant comparison' (Creswell, 1998). In this study, data collection involved a variety of interviews. The leaders were assembled at a 2 day workshop to gather basic background information on the leaders. Next, the leaders were break up in smaller groups to explore the emergent themes from prior data and yielded a set of ideas and models of the leader development process. Finally, a group interview was conducted to finalize model specifications and contingencies. All interviews were open-ended and semi-structured conversations focusing on the leaders' developmental experiences. Feedback were recorded and later transcribed by the researcher.

The concurrent procedure included jotting down ideas that came to mind, making a list of key topics and passages, coding, turning topics into categories, and assembling the material belonging to each category in one place to perform the preliminary analysis. This grounded theory coding process allowed the researchers to both construct codes and generate a description of the themes for analysis. The agreed upon themes, coupled with meaning derived from information gleaned from the literature, will be described in detail in the following section.

FINDINGS

From the analysis of field data, a theory was developed including a model portraying leadership and alignment in UNAM. This model was composed of four major themes: (1) Communication and relationships, (2) social identification (3) culture, and (4) leadership paradigms of development. In the following passages, themes of the model will be described, theoretical suggestions will be formally stated, and support for the model will be provided using the leaders' own descriptions.

Communication and Relationships

During selective coding and the follow-up discussions in the group discussion, it became clear that relationships were the central category in this theory. A central category in grounded theory has analytical power because it pulls together the other categories to provide an explanatory whole (Strauss & Corbin, 1998). Communication and Relationships were considered a central category because all other major categories were connected to it, it appeared frequently in the data, and linkages to all other categories were not forced. Therefore, communication and relationships were a core factor in the development of the UNAM leaders.

According to the data, communication and relationships led directly to effective corporate governance and development of leadership strategies. The three specific sub-themes of communication and relationships included the following: (1) values instilled in influential years through peer interaction, (2) establishing key

personal relationships both in and out of work, and (3) observing other leaders' interactions as well as observing human behavior, in general. The following four excerpts from interview transcripts demonstrate how these three sub-themes of relationships impacted the UNAM leadership development. In the dialogue, the following discussion of the first relationships sub-theme, corporate governance, and its impact on leader development was offered: — "UNAM must show a commitment to ethical behavior in our day to day business practices, operations and organisational culture — we know that it has become the competitive advantage of business governance and executive leadership, linked to our corporate reputation". In addition, for UNAM to create corporate citizenship it will require us as leaders to understand the demand to environmental, social and governance responsibility and it links directly to three fundamental functions of our leadership duties to the organisation and stakeholders we are serving, i.e. protecting stakeholder rights and interests, managing risk and creating long-term business value.

Social Identity

Relationships lead directly to the growth of leadership collegiality. This is reinforced by the Social Identity Theory in that it contends that group membership creates in-group/ self-categorization and enhancement in ways that favour the in-group at the expense of the out-group. The examples (minimal group studies) of Turner and Tajfel (1986) showed that the mere act of individuals *categorizing themselves* as group members was sufficient to lead them to display in-group favouritism. Therefore After being categorized of a group membership, UNAM leaders seek to achieve positive self-esteem by positively differentiating their in-group from a comparison out-group on some valued dimension. This quest for *positive distinctiveness* means that their sense of who they are is defined in terms of 'we' rather than 'I'.

Another important theme in the leadership development model was workload. Workload referred to effort and energy exerted over time and life experience. These leaders were not sitting idly by and magically becoming leaders. Rather, they were actively engaged in challenging educational experiences and challenging work assignments both in and out of the university setting. The three sub-themes of workload were (1) experiencing educational challenges, (2) experiencing challenging jobs, and (3) making mistakes. The following quotation supported the second proposition regarding the impact of workload on the leaders' development. Some leaders described their arduous jobs as educational heads as the following:

"Our day to day programs it very, very challenging. Throughout we need to organize ourselves and try to manage our time due to the fact that we do not have support structures as leaders. However, for a leader you've got to be able to do that. We also have an open door policy and people can come see us, to get our work done in a timely manner is a huge task"

Culture

A third vital variable in the model of leadership development in UNAM was culture. It is suggested that culture impacted the development of leadership strategies directly. The theme culture was composed of the following two sub-themes: (1) identifying personal and UNAM values and (2) understanding people, 'how things work' and 'how UNAM work.' The leaders in this study expressed that through increased self-awareness via feedback, they were able to develop effective strategies for leading.

Leadership Paradigms and Development

To summarize, key relationships led to both aspects of leadership paradigms, identifying with UNAM culture and understanding peers, 'how things work' and 'how UNAM works,' which in turn resulted in the development of leadership identity. Therefore, continuous communication and socialization was proposed as a partial mediator between relationships and the development of leadership paradigms and social identity. Furthermore, leaders asserted that important feedback also came from their workload and engaged experiences, including from job challenges, challenging tasks, and making mistakes. This linkage is shown in the following excerpts of data. First, when referring to how do communities brand UNAM's leaders commented on the link between their workload and engaging the community.'

DISCUSSION AND CONCLUSION

Taken together, the sub-themes of values instilled in influential years in position interaction, establishing key personal relationships, and observing interactions and human behavior demonstrated the central importance of communication and relationships to UNAM leadership development. Therefore, communication and relationships represented a central category in this theory of leadership development in UNAM. Subsequently UNAM leaders need to take cognisance of the fact that categorization is fundamental to human cognition because it serves a basic epistemic function: organising and structuring our knowledge about the world. Therefore, by identifying classes of stimuli that share important properties, categorization allows them to bring order and coherence to the vast array of people, objects, and events that are encountered in daily life (e.g., Smith & Medin, 1981).

UNAM leadership also need to take note of the fact that cognitive representations of social groups play a key role in (a) determining which of the individual leaders belong in to the UNAM category, and then (b) generating inferences about these identified category members. The classical view of categories held that category membership is established by a set of features that are individually necessary and jointly sufficient to define the category (e.g., Katz, 1972). Hence, when there is a shared social identity amongst the Leaders of UNAM there is a motivation to act in ways that advance the group's (UNAM) collective interests and goals and to ensure that one's own in-group is positively distinct from other (out) groups. Moreover, there are also greater opportunities for shared influence and persuasion with the UNAM in-group. Because other in-group members are viewed as similar to oneself, they become a valid source of information and a testing ground for one's own views on relevant dimensions.

Successively, a shared social identity will directs UNAM leaders to agree and to expect to agree where they confront a shared stimulus reality or object of judgement, and a consensual response to some identical situation subjectively validates the response as correct, right, appropriate and/or demanded by the objective situation (Turner 1987; 1991). However a reality is also that within this as in any other group it is the degree to which any response expresses the in-group consensus or norm in relation to a stimulus that makes it influential, that defines it as likely to be true, valid, right and so on. Thus, if UNAM shares a salient relevant identity, responses will differ in the degree to which they express, embody or represent that consensus and individuals will differ in the degree to which they embody that identity.

In conclusion, the social identity theory of leadership views leadership as a group process that arises from the social categorization and depersonalization processes associated with social identity. Prototype-based depersonalization and the behavior of followers play a critical role: They empower individuals as leaders, imbue them with charisma, and create a status differential between leader(s) and followers that has some of the typical characteristics of uneven status intergroup relations, and set up conditions that are conducive to the exercise and possible abuse of power. Additionally, it is also asserted by various authors that in self-categorisation theory, leadership does not flow from rigid, unchanging qualities of the individual, but from a person's perceived position contained by the relationship and or connection of intra-group and intergroup relations that define the identity of the group. Relative prototypicality and leadership are group properties of a person which change with the nature of the group as a whole and how it defines itself, as well as how a group defines itself varies (interacting with other things) with the context within which it is defined. Group identity is not defined simply by intra-group similarities, but by the meta-contrast between how we differ from each other compared to how we differ from them. It would be therefore imperative for UNAM leaders or managers to communicate and create a sense of *shared identity* as it is an important determinant of the likelihood that their attempts to energize, direct, and sustain particular work-related behaviours in their followers will be successful (see also Reicher & Hopkins, 1996). These ideas are a potentially rich source of conceptual explorations and basic and applied empirical research into social identity and leadership.

PREVALENCE OF HOUSEHOLD FOOD POVERTY IN A SOUTH AFRICAN TOWNSHIP

TJ Sekhampu
North-West University, South Africa

ABSTRACT

This study analyzed the prevalence of household food poverty in a township of Kwakwatsi, South Africa. A household was defined to be in food poverty when its monthly food spending is less than the cost of a basic food basket. A proxy food poverty line was used as a measure of food poverty in the area. It was found that about 68 per cent of the sampled households are in food poverty. Higher food poverty rates were found with increasing household sizes, lower educational attainment of the household head and increasing age of the head of household. The results of this study are at household level and provide reference to the types of households likely to be living in food poverty.

INTRODUCTION

Food security has been an important topic in the current environment of high food prices across the globe. Higher food prices have triggered an increase in hunger worldwide (FAO, 2008: 2). FAO (2012) estimates show that the number of chronically hungry people in 2007 increased by 75 million over and above FAO's estimate of 848 million undernourished in 2003–05, with much of the increase attributed to high food prices. The vast majority of the world's undernourished people live in developing countries. The proportion of people who suffer from hunger in the total population remains highest in sub-Saharan Africa, where one in three people is chronically hungry.

Research indicates that South Africa is food secure at a national level as it adequately produces its main staple foods and has the means to import what it needs to meet its food requirements (Frayne, et al., 2010). Household level analysis reveals a different picture. The South African reality is that approximately 14 million South Africans are vulnerable to food insecurity. Among these, women, children and the elderly are particularly vulnerable. Further analysis shows food insecurity is highest among the African population (Frayne, et al., 2010; Battersby, 2011; Rudolph, et al., 2012). A study by Jacobs (2009) concluded that approximately 80% of households could not afford to buy a basic nutritional basket of food costing an average of R 262 per person per month (at 2005 prices). A study by Rudolph et al. (2012) in selected Johannesburg townships found that 56% of sampled households were food insecure, with 27% severely food insecure. The study concluded that levels of food security are principally related to household income and the ability to access food through purchase. A study by the African Food Security Urban Network (AFSUN) in 11 Southern African cities demonstrates the strong links between urban poverty and high levels of food insecurity at household level, with the majority of poor urban households surveyed reporting conditions of food insecurity (Crush et al, 2012).

It is well documented that South Africa's historical circumstances have shaped the present configuration of poverty and opportunities along racial lines. Disadvantaged groups were systematically left with relatively little in the way of land and other resources. Food consumption is an important issue in South Africa, given its relation to poverty and deprivation. A number of policy changes have been implemented since 1994 in order to address these problems. Part of these has been the pronouncement that food security is part of the section 27 Constitutional Rights in South Africa. The Constitution states that every citizen has the right to have

access to sufficient food and water (RSA, 1996). Further efforts to address food security include the adoption of the Integrated Food Security strategy. The South African Integrated Food Security Strategy seeks to attain universal physical, social and economic access to sufficient, safe and nutritious food by all South Africans at all times to meet their dietary and food preferences for an active and healthy life (Department of Agriculture, 2002). With the pressing need to increase food security, understanding the determinants of demand for food has become a vital task.

This paper aims to report the results of a study which analyzed the prevalence of food insecurity by using a food poverty line measure. A household was defined to be in food poverty when it is unable to secure enough food to ensure adequate intake for all its members. The South African National Department of Agriculture's proxy food poverty line was used as a measure of food poverty. A household's total food expenditure was compared to the proxy food expenditure poverty line of R260 per adult per month (Department of Agriculture, Forestry and Fisheries, 2012).

BACKGROUND OF THE STUDY AREA

Kwakwatsi is a residential township in the northern region of the Free State Province. The area is a semi urban residential township for the town of Koppies. Koppies is located approximately 200 km south of Johannesburg. The population size of Kwakwatsi is estimated at 13 226 persons. There are 3 443 official residential sites, of which 3019 are occupied. The strategic national railway line from the Cape provinces to Gauteng province passes through Koppies. The area is part of the Ngwathe Municipality, with its head office in Parys (Ngwathe Municipality, 2009). Previous studies have found seemingly high poverty levels in the area; where 77% of the households were found to be living below their poverty lines when using an income poverty measure. On average, poor households had an income shortage of 56% of their poverty line (Sekhampu, 2012).

METHODOLOGY

This study provides an analysis of food poverty in a South African township of Kwakwatsi. The research is based on a quantitative survey method using questionnaire interviews. Maps were obtained for the different areas of Kwakwatsi and a stratified sample was compiled by taking into account the geographical distribution and concentration of people in different areas of the township. Plots/sites at which field workers were supposed to complete questionnaires were identified individually from the map before the field workers went out. However, where people could not be obtained for an interview, or where it was impossible to trace the house, a next pre-selected household was interviewed. Respondents were under no obligation to participate in the survey if they wished not to do so. The questionnaire included information on demographics, participants' income and expenditure patterns and their general view about their socio-economic status. Data were collected on monthly household expenditure for food and non-food items.

Participants

A total of 270 questionnaires were randomly administered in the area through face to face interviews. Two field workers completed the survey via a structured questionnaire. Of the 270 questionnaires administered, 8 respondents refused to participate. A total of 12 questionnaires were discarded due to incomplete responses. Data from 250 households was analyzed to serve the purpose of this study. To obtain a sample size that would supply statistically reliable results and be representative of the population of the area, the researcher relied on the experience and convention regarding similar surveys (Sekhampu, 2004; Slabbert and Sekhampu, 2009; Dubihlela, 2011) conducted in similar locations in South African townships.

Measuring food poverty

A household was defined to be in food poverty when it is unable to secure enough food to ensure adequate intake for all its members. The Department of Agriculture's proxy food security poverty line was used as a measure of food poverty. Each household's total monthly food expenditure was compared with their specific food poverty line based on household size, gender and age distribution of the household members. The South African food

security policy recommends an adult individual daily energy consumption of 2650 kilojoules. The policy sets an adult equivalent food poverty line of R260 per individual expenditure for food every month to serve as a proxy indicator for food security. This amount is said to cover 70% of the basic nutrition basket (Department of Agriculture, Forestry & Fisheries, 2012). Stats SA (2007) notes that the cost of a child in South Africa is roughly the same as the additional cost of an adult when estimating poverty rates. This suggests that the additional complexity of adult equivalence calculations may be unnecessary

RESULTS

Characteristics of the sample group

The sample data was based on responses from the head of the household. The results showed that the youngest head of household was 22 years, with the oldest at 76 years old. The number of persons per household varied from 1 to 12 members. The average household had 4 members. There were greater variations in household income, with the lowest household income recorded at R30 (\$3.3) per month and the highest at R18 000 (\$2000). Household income is the total income earned/ received by the various household members. Furthermore, 46.2% of households were headed by female. The average number of years of schooling of the respondents was 5.3 years, which equates to primary schooling education. An analysis of the marital status of the respondents shows that 44.5% were married. Regarding the employment status of the respondents; 56.3% were not employed. The lowest monthly food expenditure was R85 (\$9.4) and the highest at R3 250 (\$361) per month. The monthly average food expenditure was recorded at R693 (\$77).

Prevalence of food poverty

For the purpose of this study a food poverty line was individually calculated for each household, and the household's food expenditure compared to its own individual poverty line. On average, households in Kwakwatsi spent 87% of the cost of a basic food basket. Household food spending averaged 87% of the food poverty line. The severity of food poverty depends on the distribution of food spending on either side of the food poverty line. Figure 1 show the distribution of household food expenditure in relation to the food poverty line. Food poor households are those to the left of the solid bar – these are households in which food expenditure was less than 100% of their adequate cost of a basic diet. The results of the survey showed that 68% of sampled households were food poor. Of the poor households about 23% had their food expenditure which was less than 40% of the cost of their adequate food basket.

Figure 8: Household food expenditure as a percentage of food poverty

An analysis of food spending and poverty rates in relation to the various demographic characteristics was undertaken. Female-headed households had a higher average food spending (88% of the food poverty line) compared to male-headed households (85%). This is despite the fact that male-headed households had a lower poverty rate (71%) than female-headed households (75%). Households where the head has higher educational

attainment (measured by the number of years schooling) had lower food spending than those with lower educational attainment. Households where the head is younger than 30 years had a lower food poverty rate (61%) compared to those in older age groups (50 years and older had a food poverty rate of 73%).

Table 1: Household food spending and poverty rates by demographic characteristics

	n	Household food expenditure (% of food poverty line)	Households in food poverty (%)
All households	250	87%	68%
Education of household head			
No schooling	31	76%	77%
1 - 5 years	39	70%	86%
6-10 years	174	93%	70%
> 10 years	6	59%	79%
Age of household head			
< 30 years	19	109%	61%
31 - 40 years	65	90%	76%
41 - 50 years	62	82%	77%
> 50 years	104	84%	73%

Households were further ranked by total monthly income and compared to the average food poverty rate in each category (figure 2). Food poverty rates were averaged for income deciles of R500 (\$ 55.60). Food poverty rates were inversely related to household income. Households with income greater than R8000 (\$889) had a food poverty rate of 0.7%. Food poverty was more prevalent in lower income households. A comparison of household size and food poverty rates seem to suggest an opposite relationship (figure 3). Household size was positively related to food poverty – food poverty rates were seen increasing with household size. Households of seven or more persons had the highest food poverty rate (96%), while one or two persons household had lower poverty rates, 52% and 60%, respectively. Food poverty rates were similar across various age categories for the household head in both male and female-headed households, except for one person households. Households headed by a male on average spent 35% of household income on food - this is in comparison to 27% for female-headed households.

Figure 9: Food poverty rates by household income

DISCUSSION AND CONCLUSIONS

The aim of the study reported in this article was to analyze the prevalence of food poverty in a South African township of Kwakwatsi. The results indicate that 68% of the sampled households are food poor. Food poverty rates were highest among households headed by female compared to male. Higher food poverty rates were found

with increasing household sizes, lower educational attainment and increasing age of the head of household. Levels of food poverty in the area are primarily related to household income and limited financial means to attend to the needs of the household. Household income is important as it determines how much can be spent on various needs of the household. These findings are consistent with similar studies on the topic. A study by Onianwa and Wheelock (2006) in the USA found a positive relationship between a household's food security status and household income. Similarly, a study by Crush et al (2012) in selected Southern African cities concluded that lowest income households experienced the highest level of food insecurity.

Figure 10: Food poverty rates by household size and gender of household head

Larger household sizes had increased incidence of food poverty. Large households were seen to be spending more of their income on food compared to smaller households. Households with seven or more members spent on average 32% of household income on food, in comparison to 27% for households with less than 3 members. It was expected that household size would make a significant contribution to household food poverty. The negative impact could be as a result of an increase in the dependency ratio in larger households. Food poverty incidents varied with the age of the household head. Households where the head is younger than 30 had a lower food poverty rate (61%) compared to those in older age groups (50 years and older had a food poverty rate of 73%). In a related study, Bashir et al. (2012) found that an increase of one year in the age of household head decreases the chances of a household to become food secure. A study by Omonoma & Agoi (2007) in Nigeria found an inverse relationship between the age of household head and food security. The results of this study seem to agree with a study by Arene and Anyaeji (2010), who concluded that the increased age of the household head had a positive effect on food security status.

The results of this study can provide useful information for policy-makers in efforts to improve urban household food security in South Africa. Food production at household level needs to be encouraged in order to ensure increased opportunities to access food. Improvements in income earning opportunities should also be made. Targeted programs to female-headed households need to be investigated, as female bears the brunt of food poverty. Public work programs targeting women might have a significant dent on food poverty as research indicates that women's income is likely to be spent on food. It is worth noting that a major shortcoming of the methodology used in this study is that it asks whether a household's food expenditure represents a proxy for an adequate nutritional basket. This measure of household food poverty does not consider intra-household food allocation. Further research could compare results of various assessment tools. Information provided through this study is at household level and provides reference to the types of households likely to be living in food poverty in a South African township context.

MULTI-DISCIPLINARY SITUATION GAME “FACTORS OF GROWTH” DEVELOPMENT AND PRACTICAL APPLICATION

**Ludmila Serova and Iya Churakova
Saint Petersburg State University, Russia**

ABSTRACT

Russia has now reached a point where the economy and social sphere are in demand of thousands of competent managers. At the same time, a huge number of applicants are ready to storm universities and business schools to become not just managers, but world-class specialists in the field of management science and international management. To make education interactive and dynamic students are offered with a business game “Factors of Growth” (“In” - tray game). Central concept of the game is to connect theoretical methods and practical needs, in easy form to summarize and refresh skills learned in several disciplines.

INTRODUCTION

Global process in economics causes a radical change of methodological approaches in managerial education. The business environment imposes new requirements for business school and universities graduates. They should be able quickly integrate into the business process of any company that operates both on the domestic and foreign markets. Usually two approaches to internationalization of education are distinguished:

1. Academic mobility of students and teachers.
2. Changes in the training of specialists using international standards.

Academic mobility is interpreted as the exchange of students, academic and administrative staff through training in foreign universities and participating in joint scientific researches; opening international offices or campuses and summer schools. Export of educational services for European and American universities and business schools is a matter of survival and saving of teaching traditions, because the birth rate in developed countries falls, the pension burden on the population grows. Experts estimate that 70% of all countries are engaged in exporting their educational services, market leaders are educational institution from Western Europe and North America as well as Australia, New Zealand and Japan [Liday, 2012].

Internationalization of education models is displayed in the application of educational standards. Being local or international, those standards regulate quality of educational services. Business environment is not interested in the theoretical knowledge but in the concrete, measurable results. That is the reason of applying ‘learning by doing’ concept in managerial training programs. This concept is fully realized in business games specially developed for different level students.

In developing a management situation games for Bachelor program students, we could draw upon more than ten years of experience with management games in higher education, which allowed us to select the most effective didactical means in order to reach the learning outcomes. This paper shows the experience of the implementation of situational business game in the practice of management education as an example of application of the ‘learning by doing’ concept.

LITERATURE REVIEW

The first business game was developed by professor Maria Birshstein (Russia) in 1932 and it was carried out in Leningrad Engineering-Economic Institute as organizational and production test and was based on real data. [Бельчиков, Бириштейн, 1989]. Her idea was simple: to train top management as commanders in the war games. The results showed that the experience gained by participants in the game can be successfully applied to the real management situations.

Despite the game method in economic practice was first developed and applied in our country, their popularity and computer realization came a quarter of a century later in the USA. Since the mid 1950s, the United States became the world center of business games development and application. Leading role in the process belonged to the American Management Association [Graham, Gray, 1969]. In 1955, the U.S. Air Force developed and applied the game «Monopolog», which reproduces the logistic process of the U.S. Air Force bases [Renshaw, Heuston, 1957; Jackson, 1959]. The goal was to prepare the purchasing managers. This experience inspired businessmen from the American Management Association, as they realized that decision-making process in military affairs and business are very similar. As a result, in 1956, a well-known business game «Top Management Decision Simulation» was developed [Shim, J.K., 1979]. In the early 1960s in the USA was developed the first business computer game that simulated the activities of producers in competition. It's very sad to realize that in the late 30's business games in our country have been banned, and only in the 70s revived the creation and application of business games. Now there are many business games developed in Russia and other countries which are available for teachers and learners. But at the same time they are not widely used for undergraduate students in our universities and business schools [Kazantsev, Serova, 2000, 2006].

Business game can be used, on the one hand, as a kind of interactive management textbook with a large amount of examples created with students involvement into the process; on the other hand, as a competition facilitator allowing young managers to assume the role of decision-makers in safe, friendly environment.

BUSINESS GAMES IN MANAGEMENT EDUCATION

Generalization of domestic and foreign business games development experience allows us to formulate a number of requirements that ensures the effective implementation of games in educational programs in the context of globalization of business and education. The most important of these requirements are as follows:

1. *Interdisciplinary approach.* The development of science and education now mostly defined by the interdisciplinary integration of different areas of knowledge. The ability to operate with different types of information, easy combine different skills to solve practical and theoretical problems becomes a competitive advantage of the manager.

Chebishev (2000) noted:

In the preparation of the expert who knows how to use the methodology, key concepts and positions of each discipline in interdisciplinary, integrative communication with others, as a means of solving problems in their professional activities.

2. *Team work.* Team work performed as a game is one of the methods of cooperative learning, the best way to train professional interaction. Learners have to find the way to join differently-oriented students in one business process and reach the goals. They can learn from each other, try to split responsibilities and understand individual input in common success. Teamwork allows them to get the solutions and train different decision-making procedures.

3. *Global informational and communication environment use.* During the period of transition to a global information society technology is playing a great role in unification of educational standards. Strategies for internationalization of the leading business schools include, along with the traditional, full-time education, training via the Internet or an intranet environment, so-called online education. Business games can also be implemented using the online learning instruments as in the regime of real-time and deferred interaction mode [Batista, Cornachione, 2005].

4. *Universal learner educational model use.* In one game students can play several different roles, to interact with colleagues at the bargaining table and through the computer, use the video, audio and tactile information sources. Thus, students can choose the type of activity that is closer to them. In general, students evaluate the knowledge and skills learned in the course of the game much more than the traditional lecture format classes [Kabeil, 2009; Siewiorek, 2012].

In addition to the universal characteristic of managerial games, each game has its own characteristics, arising from its target audience and purpose. Business game "Factors of growth" was designed to combine and update the skills learned in previous years, a number of training courses, taking into account the practice in companies and included training in the partner schools.

MULTI-DISCIPLINARY SITUATION GAME “FACTORS OF GROWTH”

General Description

This game is designed for the group of 18-21 participants organized in teams, 3 members in each. Teams are fixed, so it's not possible to leave or change the team during the game, because achieving success in the game requires collaboration. Factors of Growth game is designed to develop team building, analysis, reporting and time-management skills. Participants' work against the clock, in competition with other teams, to complete a carefully prepared series of tasks designed to enhance awareness, discovery and communication skills.

Storyline of the game is as following: the bank received as collateral for bad loans a small company, whose owners were unable to repay the loan. The young managers' team worked as consultants for the bank. This team is tasked to improve the viability of the company and to propose a development scenario for the next 6 months, after which the company should be sold with profit.

Instruments of the game are: expert assessments, mapping, time series forecasting, ratings, market research instruments, NPV-analysis, Blackboard tools.

Key features of the game are:

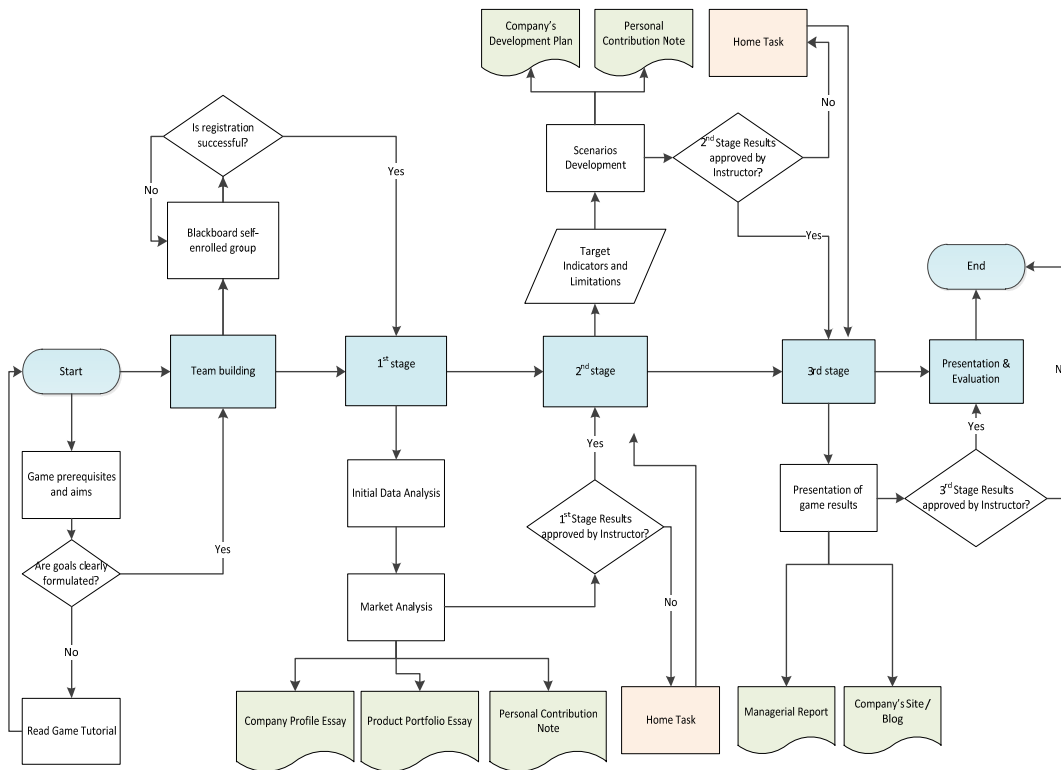

1. Interdisciplinary task. Students need to use financial, marketing, management and IT instruments being limited in time and number of participants.
2. Creation of the evaluation matrix (payoff-matrix) with changeable structure and content. Payoff values partly are defined before the game starts (Fixed cluster), but other values are defined during the game (Non-fixed cluster) using interactive voting instruments and ranks.
3. Business-incubation elements included into final results. Students have to perform managerial report, presentation on the open-floor and site template for the new developed company. Self-assessments are included into managerial report form.
4. Teamwork skills development and evaluation of individual contribution to the common result.
5. Integral coefficients are based on teams work key parameters and summarize students' efforts in different areas of knowledge and developed skills.

Didactic Design

Factors of growth game is designed as situation game, based on real data. Game business units are small business entities which have real prototypes. In this game students interacted within a specially modeled environment that represents real business situation. These interactions are following one base course (see central line on Fig.1) where participants choose some actions, discuss them within the team and prepare reports. They act on the open floor, but use closed group accounts of the Blackboard system (blogs, journals, discussion boards) where results of the game are collected and instructors can evaluate and comment them after each stage. Cooperation between teams is also included into game design as supply chain simulation elements (teams should find suppliers or customers inside using special area) and brand appeal voting on the final presentation.

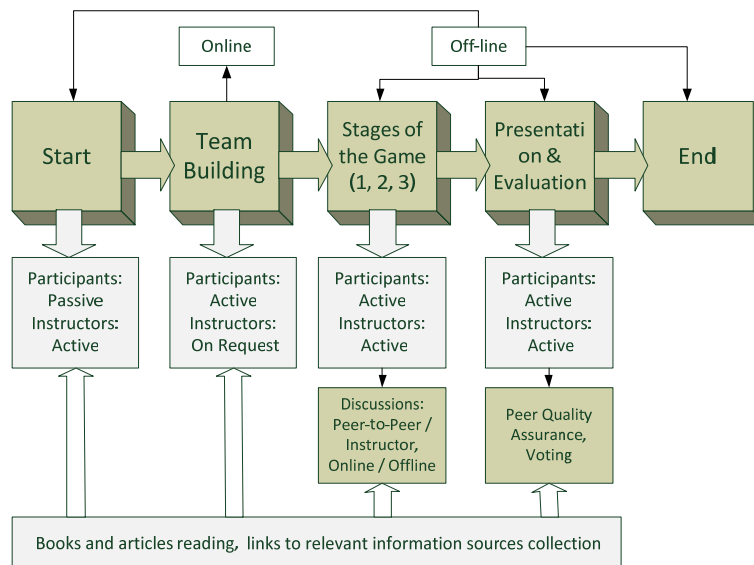

The didactic concept of this managerial game is illustrated in Fig.2. Before the game is started participants are briefed on the overall settings of the game, decisions they have to make, devices they can only use. Then students may analyze the requirements and register in one group of 3 participants in each. So, teams are self-enrolled; after that each group should make the first entry in the group journal about their expectations for the upcoming game. This online task is used as a team-building element in game design.

Fig.1. General course of the Factors of Growth game.

Main part of the game is performed as in-class activity with on-line help (using e-mails and discussion boards). This approach has several advantages. Firstly, the instructor can react to questions and problems without time lag, as it is typical for on-line games. Secondly, the decision making process could be easily observed by instructor, it may eliminate different mistakes, improper time use or skimming. Also atmosphere within the group can be monitored in order to help participants to avoid frustration as a consequence of unexpected results or misunderstanding between team members. Moreover, sitting in one class participants very easy understand their roles and positions of other teams: competitors, potential partners, customers or suppliers.

Fig.2. Overview of the didactic concept of the management game

Each stage of the game is performed in separate day in accordance with the schedule, because game actually is included in teaching plan as a part of the Effective Management course. So, usually it consists of 4 classes (1-3

stages and presentation) of three hours each. Game details related to each stage are given to participants just before the stage begins. Results should be uploaded in essay form before groups leave the class. Between game stages students are usually reading books, articles, discussing results and collect links to relevant information sources.

The first stage starts as lottery, when each team leader pulls out an envelope with the task created as a Consulting project detailed information. The team provides consulting services for one of the following businesses: small coffee-shop, coffee packaging company, bakery or delivering company. Each information pull includes company description, products portfolio (10 positions in each), initial balance-sheet, products quality expertise results, company's mission and project requirements. The 1st stage task is to provide market analysis and to check the status of each product. Results should be summarized in essays "Company profile", "Product portfolio" and small note about personal contribution in team work. Scores are given for following components use:

- SWOT-analysis;
- financial statement analysis;
- description of the competitive environment;
- product rating (based on expert survey);
- product rating (based on method of paired comparisons).

On the second stage participants have to use results of the previous work and additional package including target indicators for business development and limitations (investment returning time is 6 months, size of the company not more than 15 people, i.e. they should keep the company in SME sector). Participants can use virtual bank loan (amount and interest are fixed) and internal sources for business development. The 2nd stage task is to formulate 2-3 possible scenarios for business development, indicate advantages and weaknesses of each and identify possible points of growth for the company. Results should be summarized in essay Company's development plan and small note about personal contribution in team work. Scores are given for following components use:

- description of 2-3 scenarios for business development based on previous results, limitations and market situation;
- business process map for the best scenario;
- product portfolio optimization based on effectiveness indicators;
- 30% of output (or input) is
- calculated set of aggregates which can be obtained after a specified period by renovated business entity.

On the third stage participants use results of previous work and technical requirements to presentation. The 3rd stage task is to prepare managerial report, presentation of team work and blog or site for the client company. Scores are given for following components use:

- managerial report contains all sufficient results from stages 1 and 2, it follows the specific requirements defined in technical section of the task;
- company's site (or blog) contains 5-7 pages and shows competitive advantages of the client company;
- presentation is understandable, prepared in business style and reflects specificity of the particular team work.

Public presentation of game results imitates managerial report to the bank or client company about creation of new value of the business. Participants can use only materials prepared on stages 1-3, additional text or slides are not allowed. Other teams can ask questions or make comments. Instructors check the report and presentation validity and aggregate scores from all the stages of the game. After all presentations came time to vote for the best presentation (teams-"competitors" are not allowed to vote). Leaders of voting gain extra scores. Then instructors prepare teams rank list and announce the end of the game.

This design allows involving different types of learners and switching participant's activity from passive to active and back. Competitive part makes the game more interesting and close to real life, because from equal start each team will come to really different results using only paper, computer plus activity and knowledge of each team member.

Benefits for Teachers and Learners

The first objective of Factors of Growth is to demonstrate challenge of running real business in order to bring forth the whole to which the participants' own work will be connected in future, i.e. to develop managerial skills. The second one is to develop a holistic view of the organization specificity, how it is established and operating in a competitive environment, how its functional structures are interacted.

Use the business game in the learning process allows:

- to practice a competence-based approach to learning;
- to take into account the basic requirements of an effective use of business games in the context of globalization business and education (interdisciplinary, team work, the use of global information and communication learning environment for a "universal learner");
- increase the competitiveness of graduates in the labor market with a focus on international standards;
- to move an accent from knowledge to skills development;
- to keep the situation close to reality, since the role of the decision making person is given to real people (participants), but not to imitators (computer programs);
- to change student's activity from passive to active form;
- to solve the problem of the integration of teaching, research and professional activities of students.

As benefits for participants we can identify the following:

- transformation of the methods and management tools discussed in the various disciplines (management, strategic management, marketing, logistics, project management, financial management, business statistics) into the complex knowledge;
- activation the process of thinking instead of remembering and reflecting;
- applying the concept "learning by doing", where skills are correlated with particular situations, resulting in the development of cognitive and professional motivation;
- working in interactive groups is playing role of the professional environment and helps to adopt principles of social communication;
- additional motivation for learning;
- complex approach to outcomes and learning processes.

For teachers (instructors) the game provides the following advantages:

- easy to get a feedback and correct the details, complexity of the course;
- apply new pedagogical techniques and computer programs designed for educational purposes;
- engage students into educational process and stimulate their motivation;
- create comfort environment for teaching and learning.

CONCLUSION

The management game introduced in this paper complements more traditional methods of teaching commonly used in management education in a blended-learning course design and provides an excellent opportunity for students to gain relevant first-hand experience through learning-by-doing. Offering a game, instructors use the following methods: mapping, managerial report approach, case approach, on-line instruments and game scenario. Participants of all learning styles may decide to attend this game based on the convenience or opportunity rather than their personal style. But the game includes many opportunities to all styles learners to show their attitude and develop new skills with a help of peers and instructors.

This management game may be complemented in several directions. First, the integration of online communication directly into the management game would make the game more interesting and activate different student's roles. We plan to create a bulletin board and a meeting room for supply chain formation. Learning blogs could be used to allow the participants to record and analyze their strategies and decision-making processes during the game. Dashboard or informational exchange will be used for problems solving and publication of interim results. Also additional game options like market simulation module would allow for new possibilities.

TRADE SECRET MISAPPROPRIATION VIS-À-VIS THREAT TO COMMERCIAL ESPIONAGE

Prasidh Raj Singh and Manu Maheshawari
National Law University Odisha, India

ABSTRACT

Trade secret law utilizes a functional definition for determining what protectable subject matter is. Almost anything that is maintained in secret, that is not generally known to competitors and which provides a competitive advantage is potentially protectable via trade secret law. The International Trade Commission (ITC) estimates that misappropriation of trade secrets in China cost the U.S. IP-intensive economy \$1.1 billion in 2009. Trade secret misappropriation typically falls into two areas - where the trade secret is misappropriated by someone who had proper access to it (internal thefts) and where the trade secret is misappropriated by outsiders (external thefts). The EU does not have any specific legal provisions to protect trade secrets or undisclosed information although the laws in various European countries have long standing traditions of protecting trade secrets. Some EU Member States like Italy, Germany and Bulgaria provide strong protection for trade secrets. Injunctive relief, damages and third-party liability available to the private litigant exists in France, Germany, UK, whereas other jurisdictions including India, Singapore, Malaysia, and Hong Kong do not provide statutory protection for trade secrets. The main aim of this paper is to examine the current state of law related to trade secret and to deeply scrutinize the impact of trade secret misappropriation. The authors will also analyze the codified law of trade secret in USA and come up with the possible solutions that whether the European Union and Asian sub-continent also requires the codified law to protect their trade secret. This paper (will) also examines the labour value theory and original position theory to provide a philosophical justification of trade secret.

INTRODUCTION

Intellectual property has always been utilized by enterprises. However, modern businesses have substantially increased reliance on intellectual property. To some extent this is a consequence of the explosion of technological innovation that has occurred over the past few decades. In broad strokes, a trade secret is some sort of information that has value because it is not generally known. The notion of secrecy exempts trade secrets from preemption by patent law. In contrast to patent law, no specific categories exist for defining subject matter eligible for trade secret protection. Trade secret law utilizes a functional definition for determining what is protectable subject matter. Almost anything that is maintained in secret, that is not generally known to competitors and which provides a competitive advantage is potentially protectable via trade secret law.

In countries with a weak rule of law, trade secret theft is so pervasive and so clearly a part of a strategy in certain intellectual property-intensive industries that supply chains in operation in those countries inevitably create vulnerabilities and access points for theft of trade secrets. Companies have suffered crippling financial losses, been forced to eliminate jobs, and scaled back or even terminated their operations because of trade secret theft in countries where there is weak rule of law.

In the present scenario of aggressive competition, industrialization and liberalization every corporate house has certain information with regard to idea and technology. Every firm whose profits depend upon the use of confidential business information runs the risk of incurring serious losses if such information were to be acquired and used without authorization by another firm. The information that enables a company to compete effectively is a 'trade secret' and is therefore of commercial value and worth safeguarding. A successful

company can help to safeguard against the loss of a trade secret, for example, by signing non-disclosure agreements or taking security precautions against business partners. Information that is not known to the public was widely known to an industry is not a trade secret. In the digital age, trade secret misappropriation has become rampant. With flash drives and CD burners, the ease of disseminating large amounts of electronic information in a small package has created new complexities and pitfalls in protecting trade secret rights. The main aim of the authors is to analyze the contemporary issue with regard to trade secret and come up with possible elucidation in this regard.

A trade secret claim can be broken down into three essential elements. First, the subject matter involved must qualify for trade secret protection: it must be the type of knowledge or information that trade secret law was meant to protect, and it must not be generally known to those in the industry. Based on the TRIPS Agreement a trade secret is commonly defined in broad terms in many countries as any information, including but not limited to, technical or non-technical data. In the modern era the number of cases involving trade secret misappropriation was increasing very rapidly. There is no clear definition of the type of “improper” conduct that will result in a finding of trade secret misappropriation. As a general matter, however, if a trade secret was not acquired by permission of the owner as a result of independent creation or through reverse engineering, its acquisition was most likely improper.

Trade secret theft occurs everywhere. Less than three months after California-based Jolly Technologies set up an R&D center in India, an Indian employee was caught uploading proprietary Jolly source code and confidential design documents to her personal web-based email account so that she could ship the files out of the research facility. Moreover, a single attack can affect companies worldwide. For example, between July and September 2011, Symantec documented a cyber attack against numerous companies involved in the development and production of chemicals and advanced materials. The attackers were apparently targeting design documents, formulas, and manufacturing processes, and doing so on a global scale: they were able to compromise the computers of organizations headquartered in Belgium, Denmark, Italy, Japan, the Netherlands, Saudi Arabia, the United Kingdom, and the United States. Trade secrets are vital to the livelihood of many companies and business entities. Companies tend to invest significant time, energy, and money into restructuring various processes, techniques, and methods of operation that generate revenue. Without trade secret protection, competitors would have access to that same knowledge, which could potentially threaten a company’s survival in the marketplace. As such, trade secrets must be heavily guarded.

TRADE SECRET MISAPPROPRIATION

The information is secret when it is not generally known or readily accessible. Such an objective standard means that the information already in the public domain cannot be treated as a trade secret. Moreover this unknown requirement is defined in contact with the persons who normally deal with the secret information in question. This seems to attach a relative standard of secrecy meaning that information generally known or readily accessible to the persons dealing in a particular industry or a business is not a trade secret. Thus, in the international trade context, information is not trade secret if it is within a particular industry or business public domain. It is very necessary to find out the extent to which the information is known outside of the business, by the employees and other involved in the business.

Trade secret does not provide the owner with the exclusive right to use the confidential information. Therefore a person is not legally precluded to use a trade secret, as long as the trade secret was acquired by the improper means. The acquisition of the trade secret a person using improper means is known as misappropriation. Misappropriation is an amorphous tort that is a part of state unfair In the terms of law, the misappropriation is the intentional, illegal use of the property or funds of another person for one’s own use or other unauthorized purpose, particularly by a public official, a trustee of a trust, an executor or administrator or a dead person’s estate or by any person with a responsibility of care for and protect another’s assets. As the trade secrets also constitute a property so the intentional or illegal use of the trade secret is also a misappropriation. Misappropriation of a trade secret involves improper means used to acquire or use a trade secret. Trade secret law outlaws three different acts:

- Acquisition of a trade secret—merely obtaining the information;
- Disclosure of the trade secret—merely telling the information to another; and

- Use of the trade secret—using the information to one’s advantage.

The Uniform Trade Secrets Act (the Act) is a model law drafted by the National Conference of Commissioners on Uniform State Laws. The Act not only defines a trade secret, but it outlines remedies for violations of trade secrets. The Act also permits courts to grant protective orders so that secrecy of trade secrets is ensured during the discovery process, which occurs during preparation for a trial. (Courts can also issue orders to prevent witnesses and others from revealing trade secrets as part of their inherent power to supervise court proceedings and prevent injustice.) The Act is not binding law upon the states. Instead, it merely serves as a guide to those states who wish to draft their own statutes to protect trade secrets. If a state chooses to enact trade secret legislation, it may adopt the Act’s provisions in whole or in part. Furthermore, a state is free to make modifications to the adopted provisions. As of 2006, approximately forty-eight states and territories have adopted some form of the Uniform Trade Secrets Act. Under the UTSA, “‘improper means’ includes theft, bribery, misrepresentation, breach or inducement of a breach of a duty to maintain secrecy, or espionage through electronic or other means. In large part, “improper means” includes acts that are actionable in and of them—trespass, breach of contract, conversion of physical property, and, under modern laws, the misuse of computer networks. Trade secret misappropriation occurs where someone acquires, uses and/or discloses a trade secret without permission and in an improper manner. Typical examples include illegal acts such as theft, bribery, or obtaining protected information fraudulently or through illegal surveillance, or espionage by electronic or other means.

Industrial espionage is another common method to misappropriate a trade secret. The industrial espionage belongs to the external threats to trade secrets of an organization or company. External threats include corporate spying with professional criminals targeting specific technology, initiating network attacks (hacks), laptop computer thefts accessing source code, product designs, marketing plans, customer lists, approaching employees to reveal company information, etc. Intense competition in domestic and International markets had also lead to an alarming increase in theft by outsiders. Industrial espionage is increasing due to the global competition, shorter product cycles, thinning profit margins, and declining Employee loyalty.

The possibility that trade secrets are high value assets that may be used, sold or traded especially in technology led businesses has gradually brought many companies to take reserve of their trade secret identification and management policies, procedures and day-to- day practical measures and activities. Fierce competition in domestic and export markets has also led to an increase in industrial sabotage and espionage when trade secrets may also be lost easily if proper protection measures are not put in place to cover employees, partners, web sites and physical or electronic systems owned or used by a company. With increasing competition in markets and rising cost of R&D, loss of trade secrets is gathering bigger importance. In *Saunders v. Florence Enameling Company, Inc.*, 540 So. 2d 651 (Ala. 1981) is an excellent example. There, the employee left the employment of the pipe manufacturer and used the trade secret information in competition with his former employer. Of course, if the employee takes documents or things, the employee may be liable for conversion as well as for misappropriation of trade secrets. Another theory used against ex-employees is that they were disloyal and therefore breached a duty owed to their principal. There is an increasing recognition of the importance of trade secrets and trade secret protection in the Europe and across the world. It has been estimated that the majority of working technologies worldwide is protected as a trade secret rather than by patent. Also the globalization of the commerce requires even small companies to protect their trade secret on international basis. If the companies fail to protect their trade secret internationally, then during business in abroad or foreign countries they have to sacrifice competitive advantage. Various treaty and the agreements are enacted to protect the intellectual property on global basis that also protect the trade secret. Both the North American Free Trade Agreement (NAFTA) and the Agreement on Trade Related Aspects of Intellectual Property (TRIPs) ratified during the Uruguay Round of the General Agreement on Tariffs and Trade (GATT) include specific provisions directed toward increasing the protection of trade secrets. There are no comprehensive international treaties pertaining to the trade secret. NAFTA and TRIPs provide only brief attention to the topic. Furthermore, in the past ten to fifteen years, there has been a trend toward the adoption of domestic statutes specifically directed at the increased protection of trade secrets, particularly among Asian nations. There is a little difference in the protection provided by the various international treaty and agreements. Depending on the legal system, the protection of the trade secret is base upon the case law on the protection of confidential information or on specific provisions enacted in the different countries. The protection of the trade secret is slightly different under various nations but the aim and nature of protection is same. There is no law on the trade secret protection,

which provides them protection in all countries at once. So for the trade secret protection, the individual countries are doing well and there was a noticeable movement towards increased protection of trade secret in many countries of the world. There is found a surprising uniformity in the treatment of trade secret.

TRADE SECRET LAWS IN DIFFERENT COUNTRIES

Serial no	Country	Trade Secret Law
1.	United State of America	Uniform Trade Secret Act, The UTSA allows the recovery of the plaintiff's actual losses and the amount by which the defendant has unjustly benefited from the misappropriation
2.	Brazil	Brazil revamped its intellectual property laws in 1996. Trade secrets are protected under the statute of "unfair competition" in Brazil
3.	Italy	Italy also provides strong protection for the trade secrets. The trade secret theft is a crime in Italy ⁴¹ . The full panoply of the trade secret misappropriation are available
4.	Poland	The provision of the unfair competition Law of April 16, 1993 ⁴⁵ as amended cover disclosure, unfair acquisition, and unfair use of trade secrets. The law provides injunction and other available remedies for the infringement of trade secret, along with this damages and monetary relief
5.	France	France also provides protection for the industrial and commercial secrets. France law recognizes three types of the trade secrets: Manufacturing secret. French law provides for the penal sanctions against the theft or misappropriation of the manufacturing trade secrets. Companies that are victims of manufacturing trade secret theft may also file complaint before the civil courts.
6.	United Kingdom	The UK provides broad and effective protection for the trade secret. There exists the full panoply of the remedies for "a <i>breach of confidence</i> " including the injunctive relief, damages and the third party liability.
7.	China	Article 10 of the Anti-Unfair Competition Law, prohibits business operations from engaging in any of the following acts: Obtaining the trade secrets of any rightful party by theft, inducement, duress, or other illegal means

PHILOSOPHICAL JUSTIFICATION OF TRADE SECRETS

Labour value theory

This theory is often called a "Lockean" theory after John Locke and his theory of property. Locke posited that one who improves the land with his or her labor should be entitled to ownership of that land. Under this theory, even information that is not secret could still be property. This theory is the implicit basis for any business owner's consideration of trade secrets as valuable property. The value of the trade secret is not its novelty (like a patent) or its originality (like a copyright) but rather its secrecy. It follows that the labor used to discover or assemble such information may "belong" to the originator if that information is not generally known. Thus, under this Lockean view, we would not necessarily expect trade secret rights to be lost upon inadvertent or wrongful disclosure. Finally, the strong form of Coase theorem assumes that transaction costs are zero, but in the real world, transaction costs are common and often high, especially with respect to licenses of secret information.¹⁵⁶ As a result, the right should initially be vested in the person whereby value and transaction costs are optimized. It is true that the theory as applied to trade secrets is insufficient to justify any particular bundle of rights, but the protection of secrets in general is certainly supported, as is the notion that others can independently develop the same information.

Original position theory

Contractarian theories relate to hypothetical bargaining of a set of rules by hypothetical individuals who have an interest in the outcome. The result of such bargaining is theoretically normatively justified by ex ante agreements to be bound by a set of rules. John Rawls popularized one such contractarian theory called the “veil of ignorance. Rawls suggests that those forming a society under the veil of ignorance would implement the “maximin” principle— namely selecting a distribution of wealth that maximizes the wealth of the person with the least. Professor Bone criticizes contractarian theories in general on the grounds that “real world” companies would protest following the agreements made during hypothetical negotiations by those who do not share their “real world” preferences. This leads to a more specific criticism of the veil of ignorance in particular—there is no reason to believe that any particular distribution of rights associated with trade secrets would be the outcome. One might be able to consider the balancing those in the original position might have considered given the current set of rules. This may be sufficient for justifying the existence of trade secret law.

POLICIES TO PREVENT TRADE SECRET

The business should implement certain procedure to maintain the secrecy of their important information. Because of intangible nature of trade secret, the extent of the property defined therein is defined by the extent to which the owner of the secret protects his interest from disclosure to others. The owner must take reasonable steps to protect trade secrets. The various steps that can be taken by the owner to keep their information secret, some of them are given below. A non-disclosure agreement (NDA), also known as a confidentiality agreement, confidential disclosure agreement (CDA), proprietary information agreement (PIA), or secrecy agreement, is a legal contract between at least two parties that outlines confidential materials or knowledge the parties wish to share with one another for certain purposes, but wish to restrict access to. It is a contract through which the parties agree not to disclose information covered by the agreement. An NDA creates a confidential relationship between the parties to protect any type of confidential and proprietary information or a trade secret.

The most important thing to emphasize to clients is that they must institute a policy to protect their trade secrets. Examples of steps which could be used to protect trade secrets may include the following:

1. Employee confidentiality agreements which
 - Are signed by every employee (usually a part of the orientation process),
 - Include a general definition of what is proprietary information and a catch-all definition,
 - Include a promise to return to the company upon termination all written or tangible material embodying confidential information, (
 - Include a promise not to undertake during a term of employment a consulting or moonlighting position in a competitor's business,
 - Include a representation that the employee is not subject to any other obligations,
 - Include an agreement by the employee to assign to the employer all ideas or inventions developed during his employment, and
 - Include the employee's consent to injunctive relief;
2. Agreements with contractors or temporary employees for confidentiality;
3. Non-disclosure agreements by any other parties such as vendors, customers, or potential business partners or purchasers;
4. Control of physical access to the facility, including requiring identification badges, limiting access to sensitive rooms, requiring all visitors to sign in, locking important documents or rooms, using monitoring cameras, marking documents as confidential or secret, and conducting exit interviews. Further, employers should consider special bins for confidential trash, requiring a clean desk policy, and not locating copying machines in close proximity to public areas

Burden to proof is on the owner of trade secret

To establish **violation of trade secret rights**, the owner of a trade secret must be able to show that:

1. Infringement by or competitive advantage gained by the person/company, which has misappropriated

- the trade secret.
2. The owner had taken all reasonable steps to maintain it as a trade secret.
3. There is misuse as information obtained has been used or disclosed in violation of honest commercial practices.

Remedies against trade secrets violations

A court order to stop the person from further illegal acts (injunction)

1. A court order for getting monetary compensation (damages, lost profits, unjust enrichment, etc.)
2. Seizure order (to check defendant's premises, to take evidence, etc.)
3. Precautionary confiscation/seizure of articles that include misused trade secrets, or products resulting from its use or misuse

CONCLUSION

In the new economy, in the Information Age, and in the international arena of global competition, the protection of trade secret assets is now paramount. As more companies look to capitalize on the benefits of expansion to global markets, trade secret theft in global supply chains will continue to grow—in scope, frequency, complexity, and magnitude. To preserve their economic competitiveness, companies whose supply chains extend to countries with weak or no trade secret protection must take proactive measures to safeguard their most valuable trade secrets. Trade secret protection is now longer a national legal issue. It is now become an international issue with a great demand for the protection of trade secret. The transnational trade and investment scenario has created for the new legal development of the protection of industrial and business secret information. The international agreement like TRIPS and NAFTA are also minimal legal standard for trade secret protection, leaving behind the rooms for the national legislation of the member countries. EU has not address the protection of trade secret directly. The theoretical approach from where the trade secret protection arises, create various difference in the national law. Therefore there is still need to think over the harmonization of the trade secret protection. There is need to legislate a common framework to protect the trade secret across the world.

RESUME REVIEWS, INTERVIEW CONDITIONS, AND ACCEPTANCE DECISIONS: AN EXPERIMENTAL STUDY IN THE HOTEL INDUSTRY

Che-Jen Su
Fu Jen Catholic University, Taiwan

ABSTRACT

The present study examines effects of recruiters' pre-interview inferences about applicant abilities drawn from entry-level resumes and consequent hiring recommendation on their post-interview acceptance decisions in a laboratory setting of selection. It also looks at the moderating effect of the applicant gender and their use of impression management (IM) tactics during interviews. Data from 229 responses by undergraduate students majoring in hospitality management in Taipei indicate that resume-based cognitive abilities (CAs), rather than resume-based interpersonal abilities (IAs), resume-based job-related knowledge (JRK), and hiring recommendations, was positively related to applicants' chance of acceptance after the interview. Furthermore, the effect of IAs on the chance of acceptance was stronger for female applicants in the interview than their male counterparts. The effect of CAs on the chance of acceptance was also stronger when applicants used excuse than justification as defending tactics during interviews.

INTRODUCTION

We incorporate primary dimensions of applicant IM condition in the interview, that is, applicant gender, proactive behaviors and reactive behaviors, as moderators in our hypotheses and compare simultaneously their moderating effect with corresponding inferred abilities on the probabilities of acceptance. We adopt well-categorized verbal IM typologies (Kacmar et al., 1992; Stevens & Kristof, 1995; Tedeschi & Melburg, 1984) that consist of both applicant assertive IM tactics and defensive IM tactics with the interviewer, to design interview conditions that reflect applicants' strategic considerations on their choice of image-manipulating behavior, so that the moderating role of each dimension of IM conditions would be compared.

HYPOTHESES

H1: For hotel entry-level employment, resume-based CAs and hiring recommendations have a stronger positive relationship with the probability of acceptance after the interview than resume-based IAs and resume-based JRK.

H2: For hotel entry-level employment, the relationship between resume-based IAs and the probability of acceptance after the interview is stronger in the female applicant condition than in the male applicant condition.

H3: For hotel entry-level employment, the relationship between resume-based JRK and the probability of acceptance after the interview is stronger in the SFIM condition than in the OFIM condition.

H4: For hotel entry-level employment, the relationship between resume-based CAs and the probability of acceptance after the interview is stronger in the excuse condition than in the justification condition.

METHOD

Procedure

We employed three confounding variables of the IM conditions of an interview, that is, applicant gender, assertive IM tactics, and defensive IM tactics, to examine their moderating effects on the relationships between pre-interview judgments and the post-interview acceptance, in a between-subjects experimental design. Participants were randomly assigned to one of eight (2×2×2) IM conditions of an interview, that is, “SFIM tactics vs OFIM tactics” × “justification tactics vs excuse tactics” × “female vs male.” to assure the prior equality of the comparison groups that controlled extraneous factors. Data were collected from 229 voluntary students (mean age = 20.71 years old, 15.7% male, 84.3% female) majoring in hospitality management of a private university located in Taipei who received shopping coupon from the authors as an incentive to cooperate to finish the experimental process. All participants received the same documents across the experimental conditions except for the applicants’ photo and gender that help the subject to identify the actor of the videotaped interview in the condition, building them a more lifelike recruitment situation.

Measures

We asked participants to rate the applicants on a 5- point Likert’s scale (1 = poor, 5 = excellent) on: (1) IAs by three items (Cronbach’s alpha = .718) covering “attitude toward serving customers” (Bagri et al., 2010), “effective communication skills” (Bagri et al., 2010), and “keeping people informed” (Ineson, et al., 2011); (2) CAs by two items (Cronbach’s alpha =.623) encompassing “responsive to criticism” (Ineson et al., 2011) and “problem solving skills” (Bagri et al., 2010; Ineson et al., 2011); and (3) JRK by two items (Cronbach’s alpha =.644) consisting of “critical awareness of current issues in business and management” (Ineson et al., 2011) and “job skills” (Bagri et al., 2010). Results of principle component analysis with Varimax rotation confirmed a three-factor structure of evaluation indicators as we maintained. The total variance explained by these items was 67.77%. All of the standardized factor loadings were positive and quite high (ranging from 0.64 to 0.89) on the intended dimensions, while the loadings on other factors were weak, thus simultaneously demonstrating convergent and discriminant validity. In addition, they judged whether or not the applicant was recommended for hiring on a dichotomous scale (0 = not recommended, 1 = recommended). Participants provided their post-interview acceptance decisions on a dichotomous scale (0 = not accepted, 1 = accepted).

RESULTS

Hierarchical Logistic Regression Analyses

Table 1 summarizes the results of a series of hierarchical logistic regression analyses conducted in order to test if subjects’ inferences about applicant abilities and consequent hiring recommendations explained their post-interview acceptance decisions and interacted with the IM conditions of the interview, as hypothesized. All predictors were factor-scored to avoid low variation that might lead to underestimations of their effect size and multicollinearity caused by the creation of the interaction term. In model 1, subjects’ male (vs female) gender and age, and the IM treatment categories which contained in the experimental conditions, including applicant male (vs female) gender, OFIM (vs SFIM) and justification (vs excuse); were controlled for in the logistic regression due to their possible confounding effects on recruiters’ acceptance decisions.

Table1. Results of logistic regression analyses predicting applicant chance of acceptance

Variables	Model 1		Model 2		Model 3	
	B	Exp(B)	B	Exp(B)	B	Exp(B)
Constant	3.297†	27.034	3.029	20.674	3.867†	47.816

JRK						
			.180	1.197	.393†	1.482
Recommended (vs. not recommended) for hiring			.454	1.575	.443	1.558
Interactions						
IAs \times interviewee male (vs. female) gender					-.619*	.538
JRK \times OFIM (vs. SFIM)					-.427	.653
CAs \times justification (vs. excuse)					.833*	2.301
					*	
Δ -2LL from base model	8.522		25.299**		39.056***	
Δ -2LL from prior step	8.522		16.778**		13.757**	
-2LL	297.345		280.567		266.810	
Cox & Snell R^2	.037		.107		.161	
Nagelkerke R^2	.050		.144		.215	
Hosmer & Lemeshow χ^2	9.599 ($p = .294$)		2.649 ($p = .954$)		3.123 ($p = .926$)	
Overall hit ratio (%)	59.6		64.6		67.3	

† $p < .10$, * $p < .05$, ** $p < .01$, *** $p < .001$ (two-tailed tests)

In model 2, to test H1, which concerns a comparison of the main effects of subjects' judgments based on resume information, we added the four independent variables, that is, IAs, CAs, JRK and hiring recommendations, to the logistic regression model. As shown in Table 1, model 2 was acceptable overall (Δ -2LL from base model = 25.299, $p < .01$; Δ -2LL from prior step = 16.778, $p < .01$; Hosmer & Lemeshow $\chi^2 = 2.649$, $p > .05$; overall hit ratio (64.6%) > chance level (50.7%)). To test H2, H3, and H4, which concern the interaction effects of IAs by applicant gender, JRK by assertive IM tactics, and CAs by defensive IM tactics, we included the three interaction terms, that is, interpersonal abilities \times applicant male (vs female) gender, JRK \times OFIM (vs SFIM), and CAs \times justification (vs excuse), in the same regression model (model 3), so that the effect of each interaction term was revealed simultaneously and compared with others accordingly. Results show that model 3 was acceptable overall (Δ -2LL from base model = 39.056, $p < .001$; Δ -2LL from prior step = 13.757, $p < .01$; Hosmer & Lemeshow $\chi^2 = 3.123$, $p > .05$; overall hit ratio (67.3%) > chance level (50.7%)). Moreover, intercorrelations for confounders, predictors, and interaction terms included in analyses indicate that there was no correlation greater than $\pm .90$ (maximum coefficient of correlation = -.663 for JRK and JRK \times OFIM (vs SFIM)), suggesting that our interpretation of the logistic coefficients should not be affected adversely by multicollinearity.

The Main Effects of Judgments Based on Resume

Table 1 (see model 2) shows that of the four predicting terms for the subjects' acceptance decisions, only the term of CAs was positive and significant (exp (B) = 1.801, 95% CI [1.26, 2.57], $p < .001$), whereas the term of IAs was negative and marginally significant (exp (B) = .716, 95% CI [.50, 1.02], $p < .1$). The main effect of hiring recommendations was positive (but non-significant) as we expected (exp (B) = 1.575, 95% CI [.84, 2.97],

n.s.), while the main effect of JRK was not supported. Our statistic estimates indicated that CAs is 2.515 times (1.801/.716) as important as IAs in determining applicants' chance of acceptance. In sum, CAs appeared more effective than other predictors in the light of leading to the odds of becoming accepted. These results provide partial support for H1, which states that CAs and hiring recommendations have a stronger positive effect than JRK and IAs on applicants' chance of acceptance.

The Moderating Effects of IM Conditions of the Mock-Interview

The results of model 3 shown in Table 1 indicate that IAs \times applicant male (vs female) gender was negative and significant (exp (B) = .538, 95% CI [.29, .99], $p < .05$), providing support for H2 stating that the relationship between IAs and the probability of becoming accepted is stronger in the female applicant condition than in the male applicant condition. However, JRK \times OFIM (vs SFIM) was negative (but non-significant) as stated in H3 (exp (B) = .653, 95% CI [.36, 1.20], n.s.). To graphically picture the significant interaction, we examined separate simple slopes depicting the relationship between IAs and predicted probability of becoming accepted across groups defined by applicant gender based on the logistic regression outputs. As shown in Figure 1, the female applicant group's slope representing the relationship between IAs and the predicted probability of becoming accepted was positive and steeper than the male applicant group's, providing evidence that females rather than males as applicants have a higher probability of being accepted when they are perceived high in IAs by recruiters.

Figure 1. The moderating effect of applicant gender on the relationship between applicant IAs and the predicted probability of acceptance

Consistent with H4 arguing that the relationship between CAs and the probability of becoming accepted is stronger in the excuse condition than in the justification condition, Table 1 reported that CAs \times justification (vs excuse) was positive and significant (exp (B) = 2.301, 95% CI [1.26, 4.21], $p < .01$). Likewise, as depicted in Figure 2, the slope representing the relationship between CAs and the predicted probability of being accepted was negative for the group of excuse condition, whereas it was positive for the group of justification condition, suggesting that applicants who applied excuse tactics rather than justification tactics in the interviews have a higher probability of being accepted when they are perceived low in CAs by recruiters. In sum, these figures are in line with the expected shape of the supported interactions.

Figure 2. The moderating effect of defensive IM tactics on the relationship between applicant CAs and the predicted probability of acceptance

CONCLUSIONS

The current study makes three primary contributions of the literature on mechanisms of resume-based judgments and the roles that interview IM tactics play in the hospitality employment. First, the present study advances Dipboye and Macan's (1988) three-phased selection model and incorporates pre-interview judgments (that is, CAs, IAs, and JRK inferences drawn from entry-level resumes and consequent hiring recommendations), interview IM conditions (that is, applicant gender, assertive IM tactics, and defensive IM tactics), and post-interview decisions (that is, the probability of acceptance) into an integrated model for clarifying how hotel recruiters' acceptance decisions were influenced by factors of each phase of the selection process. By applying hierarchical logistic regression analyses, we have provided evidence of the assertion that inferred CAs have a stronger and positive effect on post-interview acceptance chance than inferred IAs and inferred JRK do. The findings echo past research that has shown attributes inferences drawn from academic qualifications are important in predicting recruiters' post-interview decisions, even after controlling for applicants' interview performance (Hazer & Jacobson, 2003). In addition, as recruiter-perceived CAs mediated the positive relationship between academic qualifications and recruiters' perceptions of applicant-job fit (Chen et al., 2011; Tsai et al., 2011), our finding add to previous research that argued the primary role of applicant-job fit in predicting hiring decisions (Cable & Judge, 1997; Kristof-Brown et al., 2002). Despite non-significant support, we found that recruiters' post-interview acceptance related positively decisions hiring recommendations based on resume review as speculated. Perhaps the discrepancy is attributable to dichotomous forms of hiring recommendations measured that might not vary as much as other factor-score predictors did and failed to demonstrate a significant effect on the probability of acceptance. Overall, our results consider both object credentials of resume and subjective credentials of interview (Hazer & Jaconson, 2003), suggesting reasons for why resume items should be distinguished from attributes inferences, and why applicants' behavioral patterns during interviews should be elaborated before we advance current insights into the complexity of employment practices of the hospitality industry, which have be criticized as intuitive and unprofessional (cf. Kusluvan et al., 2010).

EXPOSURE TO EWOM AND CONSUMER BEHAVIOR: DOES GENDER MATTER?

Rym Srarfi Tabbane, University of Manouba, Tunisia
Manel Hamouda, University of Tunis El Manar, Tunisia

ABSTRACT

In the marketing literature, gender has been considered as having a great impact on consumer behavior. However this concept has remained insufficiently studied in the research on marketing theory and practice. The purpose of this study is to explore the specific role of gender while being exposed to an electronic word-of-mouth (eWOM) communication. To do so, a conceptual research will be led. This study is a preliminary work which aims at developing research proposals about the role of gender during an eWOM exposure. It would help to better understand how the consumer can behave in front of this specific type of communication.

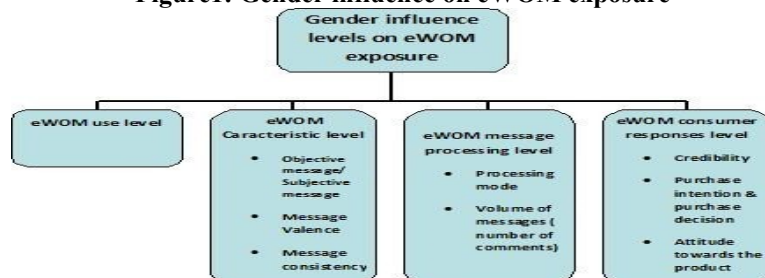

INTRODUCTION

During the decision making process, consumers tend to seek for information before making a decision. This information can be based on internal sources (such as previous experiences with the product or the brand) or external sources (such as public sources, marketer-dominated sources or personal sources). Personal sources are usually perceived by the consumer as one of the most credible sources (Kotler & Dubois, 2000). eWOM is considered by the marketing literature as a personal source that can strongly influence Internet users' opinions and their purchasing decisions (Cheung et al., 2009). eWOM can be defined as "a statement made by potential, actual or former customers about a product or company, which is made available to a multitude of people and institutions via the Internet" (Henning-Thurau et al., 2004). Marketers need to be aware of the impact of eWOM on their marketing efforts. As communication barriers continue to fall due mostly to the ongoing growth of the Internet implementation, effective use of eWOM communication will be of even greater importance in the future for local and foreign markets. E-WOM owes its growth to the new opportunities offered by the Web 2.0, and also to the ongoing enthusiasm of consumers for the user-generated content (UGC). Thanks to these new communication media, consumers have acquired the habit to give their opinions about products, services, companies and to describe their own shopping experiences via the Internet (Gupta & Harris, 2010). Due to the impact of eWOM communication on consumer behavior, professionals and academicians have become more interested in this concept. Several studies have been conducted to better understand this new form of communication in a consumer behavior context (Cheung & Thadani, 2012). However, despite the growing number of studies dealing with the influence of eWOM on consumer behavior, several aspects of this relationship remain not-yet-studied. Thus, in a meta-analysis about eWOM, Cheung and Thadani (2012) emphasized the importance of developing further research in the field of eWOM. They have also focused on the usefulness of studying the impact of gender on eWOM adoption as well as on the consumer's purchasing decisions after being exposed to an eWOM communication. In fact, although the degree of adoption and the use of Internet depend on the consumer's gender (Kim et al., 2007), research on the relationship between consumer behavior and online information according to the consumer's gender are rare and under-studied (Richard et al., 2010). In what follows, we will study the potential role of the gender variable in the relationship between consumer behavior and eWOM. More specifically, we will try to answer the following question: do women and men react differently to an eWOM exposure? To respond to this issue, we will focus on the different levels of influence of gender on the eWOM, namely on the use of eWOM, on its features, on its processing and on the consumer's different responses after being exposed to eWOM. We will finish our work with a discussion and a conclusion.

LEVELS OF GENDER INFLUENCE ON EWOM

On the basis of a literature review, we can distinguish four levels of gender influence on the eWOM: The way that the eWOM is used, its characteristics, the way of processing the message and the responses to the eWOM depending on the consumer's gender (see Figure 1). For each level of influence, research proposals about the role of gender in an eWOM context will be suggested.

Figure1: Gender influence on eWOM exposure

Gender and eWOM use

Gender appears to significantly influence the exposure to information, information research and the processing of information. Indeed, men and women do not perceive the same source of information in the same way and do not show the same motivation in using them. For instance, women usually use virtual communities in order to give and receive social support, whereas men tend to use virtual communities to improve and protect their own social status (Awad & Ragowsky, 2008). Similarly, a study has shown that men have more favorable beliefs and more favorable attitudes towards online advertising than women (Wolin & Korgaonkar, 2003). Kempf and Palan (2006) found out that women are likely to describe themselves as more receptive to traditional WOM than men. Similarly, it has been shown that friend's recommendation for a shopping website allowed women to have a greater reduction of perceived risk and a stronger online shopping intention (Garbarino & Strahilevitz, 2004). More particularly, it seems that gender can affect the use and the recognition of the eWOM (Gefen & Ridings, 2005).

Proposition 1: *Women are more receptive to eWOM than men.*

Proposition 2: *Women are more favorable to the use of eWOM than men.*

Gender and eWOM characteristics

EWOM can be categorized according to different characteristics that can influence in a different way the message receiver (Cheung & Thadani, 2012).

Objective versus subjective message : Chatterjee (2001) indicates that the eWOM messages may be labeled in two different types: Objective messages and subjective messages. In the same way, Park and Kim (2008) distinguish between two types of reviews: attribute-centric and benefit-centric reviews. In the case of the attribute-centric review, the arguments that support the reviewer's evaluation are essentially based on technical description and objective data. Whereas, in the case of the benefit-centric review, the arguments that support the reviewer's comments are rather subjective and is liable to personal interpretations. More generally, several marketing studies have shown that men and women are inclined to respond differently to objective and subjective messages (Darley & Smith, 1995). Early research that had examined the impact of gender on information processing had often described men as being more analytical and rational in their processing, while women were described as more intuitive and subjective (Broverman et al., 1968). It was also found out that men have a propensity to conceptualize the items based on physical attributes, whereas women are more likely to use emotional and evaluative concepts (Poole, 1977). Finally, it has been assumed that men are prone to respond more favorably to messages and goals while women are likely to respond more favorably to subjective messages.

The works of Meyers-Levy call into question these early theories (Meyers-Levy, 1994). In fact, Meyers-Levy, argues that women have the tendency to consider information in a broader manner. They do not only consider the objective attributes but they are also interested in non observable information and subjective considerations that might help them to better explain and understand the evaluated subject. In contrast, men are likely to focus on the objective attributes in particular those that are salient and readily available. Thus, the selectivity model suggests that men are more receptive to objective messages, while women are more likely to process messages more extensively; and therefore they tend to regard both objective and subjective messages, equally.

Proposition 3: *Men tend to expose themselves to objective eWOM messages.*

Proposition 4: *Men tend to be sensitive to objective eWOM messages.*

Proposition 5: *Women tend to expose themselves to both objective and subjective eWOM messages.*

Proposition 6: *Women tend to be sensitive to both objective and subjective eWOM messages.*

Valence of eWOM messages: The valence of the eWOM message is a concept that has received considerable attention by researchers. A positive valence eWOM focuses on the strengths or on the benefits of the product while a negative valence eWOM focuses on the product weaknesses or on the problems related to the product (Grewal et al., 1994). Several previous studies had shown that a negative valence message would have a greater influence than a positive valence message (Kanouse, 1984). This could be partly explained by the fact that a negative message reduces the probability that the information is posted by the company or someone who wants to promote the product. This could also be explained by the fact that individuals have the tendency to avoid taking risk. trusting the negative eWOM message can, in fact, help consumers avoid making a bad purchase decision (Cheung et al., 2009). The impact of eWOM valence seems to be also moderated by gender. Indeed, the effect of negativity stating that consumers are more influenced by negative rather than by positive comments seems to be more evident for women than for men (Bae & Lee, 2011).

Proposition 7: *Women are more sensitive to the eWOM valence than men.*

eWOM consistency : In general, it appears that higher level of incongruity and inconsistency drives individuals to greater attention and more developed information processing (Houston et al., 1987). Meyers-Levy and Sternthal (1991) showed that when the cue incongruity is low, these messages do not attract people's attention (whether they are males or females). In this particular case, the receivers will not engage in extensive message cue elaboration. However, when the incongruity of messages is sufficiently high, they are, therefore more likely to attract women's attention. In this particular case, women are somewhat expected to engage in a more extensive message elaboration than men. The concept of consistency is also discussed in the research related to eWOM. Zhang and Watts (2003) defined the recommendation consistency as the degree to which the eWOM message is consistent with other contributors' experience about the same product. The eWOM consistency also seems to have an impact on the receiver. Indeed, in a study on the forums, Cheung et al. (2009) showed that when the comment is consistent with other comments, it is generally perceived by the reader as consistent and credible. According to past studies about the perception of eWOM consistency among men and women, we can assume that:

Proposition 8: *When the level of eWOM inconsistency is very high in comparison to other eWOM messages, the attention paid to this post is greater for women than for men.*

Proposition 9: *When the level of the eWOM inconsistency is very high in comparison to other posts, women are more likely to engage in a developed and extensive evaluation process than men.*

Gender and eWOM message processing

Marketing communication literature put forward that the gender variable may moderate stimuli processing (Putrevu, 2004). This proposal can be verified during an eWOM communication exposure insofar as the gender seems to influence the processing mode of the eWOM (elaborated vs. heuristic) message. This processing may depend among others on the messages volume to which the consumers are exposed.

eWOM Processing mode: A study conducted by Pogun (2001) shows that the cognitive and behavioral skills vary depending on the gender. More particularly, research tend to support the idea that the information processing depends on the individual gender (Duff & Hampson, 2001). Indeed, the work of Meyers-Levy and Sternthal (1991) found differences at the cognitive elaboration level whether the receiver is a male or a female. In fact, women seem to have a lower elaboration threshold as they are easily engaged in more detailed processing than men, whereas men prefer to limit their cognitive effort. Therefore, they tend to use a heuristic processing. Indeed, according to the selectivity model, women process all the available information and consider both subjective and objective product attributes. So, Women usually respond to “subtle cues”. On the counterpart, men process information with selectivity and tend to perform heuristic processing (Darley & Smith, 1995). The information conveyed by the eWOM message can also be considered as a basis during the purchase process. Therefore, consumers exposed to this type of communication will be engaged in processing of this eWOM message information. Thus, we can assume that:

Proposition 10: *Women exposed to information based on eWOM tend to engage in an elaborated information processing.*

Proposition 11: *Towards information based on eWOM, men will tend to engage in heuristic processing rather than elaborated processing.*

Volume of messages: Todorov et al. (2002), argue that during systematic and elaborated information processing, individuals take into account all the relevant pieces of information. However, if individuals have enough cognitive resources, they can engage in heuristic processing. For this reason, the receivers take into consideration less information. As suggested by the selectivity model, men tend to use a heuristic processing mode and therefore, they do not require a large amount of information, while women engage in a more systematic processing based on a wide range of information. Then, while exposed to communication, females need a large volume of information to perform their elaborated message processing (Kim et al., 2007). In the literature dealing with eWOM, the volume of information is represented by the number of posted comments. Based on these theoretical suggestions, we can argue that:

Proposition 12: *Women tend to make a more elaborated eWOM processing; therefore they will be more favorable to a higher volume of online comments than men.*

Gender and eWOM consumer responses

After an eWOM exposure, consumers can have several types of responses. We will try in what follows to highlight the potential role of the gender variable on some of these responses.

Credibility: The eWOM influence on purchase intention could be more important when the eWOM is perceived as credible. In fact, when the perceived credibility of the eWOM is high, it could affect the consumers' perceptions and attitudes. More precisely, the perceived credibility seems to have an impact on the acceptance of the eWOM (Fan & Miao, 2012). Moreover, the eWOM perceived credibility seems to have a greater effect on the acceptance of the eWOM by women than by men (Fan & Miao, 2012). As a consequence, we may make the assumption that:

Proposition 13: *Greater eWOM perceived credibility leads to a greater acceptance of the eWOM by women than by men.*

Purchase intention and purchase decision: Bae and Lee (2011) have tried to determine whether gender differences influence the consumer's response to the online comments. Their findings revealed that the impact of the online reviews on the purchase intention were more important for women than for men. The online comments are considered as a form of eWOM, so, it is possible to put forward the following suggestion:

Proposition 14: *The eWOM effect on the purchase intention is more important among women than among men.*

More precisely, the purchase intention expressed after an exposure to eWOM could also be influenced by the perceived credibility towards this eWOM. The eWOM perceived credibility seems to be greater among women than among men (Fan & Miao, 2012). Hence, it would be possible to suggest the following proposition:

Proposition 15: *Greater eWOM credibility will have more effect on purchase intention among women than among men.*

According to the study of Bae and Lee (2011), purchase intention seems to be influenced by the message valence. Indeed, the authors suggest that positive comments have higher impact on women's purchase intentions than on men's. Also, Bae & Lee's study reveals that the purchase intention of women who were exposed to negative comments was lower than those of men. The discrepancy between the decrease of the purchase intention after reading negative comments and the increase in purchase intention after reading positive reviews is greater and more important for women than for men.

Proposition 16: *The eWOM message valence has a greater impact on the purchase intention of women than of men.*

Finally, previous academic studies have mainly used the purchase intention as a proxy for the final purchase act. The individual intention is often an accurate predictor of its behavior (Ajzen, 1991). Purchase intention seems to be influenced by the gender differences during an eWOM exposure (Bae & Lee, 2011). Based on these theoretical arguments, we may assume that:

Proposition 17: *Women are more influenced than men by exposure to an electronic WOM when making online purchase decisions.*

Attitude towards the product: Sen and Lerman (2007) have studied the effects of eWOM on the consumer attitudes. Their findings show that the online comments significantly affect the receiver's attitude towards the recommended product. Fishbein and Ajzen (1975) have found out that the attitude towards the product has a positive effect on the purchase intention. The literature related to the eWOM highlights the existence of a significant relationship between the attitude towards the recommended product and the consumer's purchase intention (Cheung & Thadani, 2012). Given the confirmed role of the attitude towards the product as a predictor of purchase intention, and according to the influence of the gender differences on this consumer's response (Bae & Lee, 2011) (women have greater purchase intention than men after eWOM exposure), we can suppose that the same gender differences can influence the attitude towards the product, and we can claim that:

Proposition 18: *The eWOM effect on the attitude towards the product is higher among women than among men.*

DISCUSSION AND CONCLUSION

This research fits within the framework of better understanding one of the most popular forms of information dissemination on the Internet which is the eWOM (Kim et al., 2001). The main purpose of this work was to highlight the potential role of gender in the consumer's evaluations as well as the consumer's responses during and after an eWOM exposure. Through a literature review, the gender influence was analyzed on four levels: eWOM use, eWOM characteristics, eWOM evaluation (or processing mode) and consumer's responses to eWOM. Several research proposals have been identified thanks to this theoretical analysis. From a theoretical perspective, this research can provide a significant contribution to eWOM studies. Indeed, to our knowledge, there are few studies conducted in the virtual context dealing with the influential (or moderating) role of gender on the relationship between the consumer's behavior and their exposure to eWOM. From a managerial perspective, the understanding of the role of gender in the use, the evaluation and the consumers' responses towards an eWOM could firstly help managers to better use the eWOM communication (especially in the targeting strategy which could be more relevant). Secondly, the content relevance as well as the presentation of an eWOM message seem to affect the understanding and the message processing, which depend on the receiver's gender (Darley & Smith, 1995). It is interesting for companies that operate exclusively online or for

those that have a website to set up a demographic recommendation system. It is a system based on the use of demographic data (including gender) to recommend the suitable product according to the customer's gender. Finally, eWOM can also increase the awareness and the attractiveness of the company's products among potential consumers in foreign markets. Therefore, eWOM is considered to be a very useful tool, especially for international marketers who have been enabled to compare consumer's behaviors from a range of target markets. In order to compete successfully in today's global online markets, a cross-national analysis for market segmentation has become a more important issue. In this case Gender could be a good cross-national segmentation criterion especially for marketers who are planning a global campaign. Some limitations should be mentioned, as well. Other study levels of the effect of gender during an eWOM communication exposure have not been taken into consideration in our research. In fact, there are some moderating variables that may influence the gender effect such as the nature of the recommended product or the degree of the receiver's involvement (Dubé & Morgan, 1996). Future studies could therefore broaden this theoretical analysis according to a specific recommended type of product for example. To conclude, this literature review provides an overview of the current state of knowledge in the eWOM communication research field from a gender differences perspective. This topic remains insufficiently investigated. The study could stimulate future research on this communication mode by drawing attention on variables and moderating links which need further exploration.

AN INTERGRATIVE VIEW OF SOCIAL MEDIA AND BRAND PERCEPTIONS: A THEORETICAL ORIENTATION

**Kerri Tan, London School of Business and Finance, United Kingdom
Wilson Ozuem, University of Hertfordshire, United Kingdom**

ABSTRACT

A growing body of research has acknowledged the role of social media in facilitating effective marketing communications and community cohesion in the evolving technological environments. Conceptually, scholars have begun to examine how social media engagement influences effective brand strategy. Whilst empirical evidence is scarce, the current study reviews a number of disparate extant theoretical domains related to social media and brand perceptions. This study provides a unique context to analyse the knowledge benefits of social media and brand perceptions for two primary reasons. First, it highlights that understanding social media and brand perception interfaces offers marketers a much more differentiated platform in the development of their marketing plans. Second, it elucidates the role of reference groups in facilitating online brand communities, and invariably offers additional insights into how practitioners could tap into the potential benefits of reference groups in social media platforms.

INTRODUCTION

Social media is a relatively new construct in the communications world. However, a growing number of practitioners and researchers have provided different interpretations and perspectives on the meaning of social media (Mathur et al., 2012; Nair, 2011; Dann and Dann, 2011; Strokes, 2009). Despite increasing interests and interpretations however, the one thing that remains constant about social media is the fact that it is growing at a phenomenal rate (Lipsman et al., 2012; Lee et al., 2011; Smith, 2009; Gangadharbatla, 2007). It is transforming consumer behaviours and marketing communication patterns (Remidez and Jones, 2012; Lee et al., 2011; Prendergast et al., 2010; Smith, 2009), thus playing a part in moulding consumer brand perceptions. The terms social media and Web 2.0 have often been used interchangeably, however researchers have identified that they are simply closely related (Kaplan and Haenlein, 2010; Constantinides and Fountain, 2008; Cooke and Buckley, 2008). Therefore, it is imperative that the two concepts are clarified in any theoretical discussion. According to Kaplan and Haenlein (2010), Web 2.0 is a term that was first used in 2004 to describe a new way in which software developers and end-users started to make use of the World Wide Web. They described it as a platform whereby content and applications are no longer created and published by individuals, but instead are continuously modified by all users in a participatory and collaborative fashion. Similarly, it has also been described as software that supports group interactions with significant attributes; namely the ease of sharing, cooperating and co-creating content (Cooke and Buckley, 2008). Implicitly, these authors seem to look at social media from technical and mechanistic perspectives in that the concept of social media is seen as a technological platform for content creation.

In a recent study, Mathur et al. (2012, p.14) describe social media as “a set of applications (e.g. Facebook, Twitter, Flickr) that are built to run on a ‘Web 2.0’ platform – in essence, ...the ‘place’ where an application/program resides and runs, or is called upon for use. This Web-based platform inherently enables the creation and distribution/sharing of information created by users/consumers and this is referred to as user-generated content.” As such, social media is widely recognisable by the occurrence of user-generated content (UGC). A study by Mayfield (2008) identified seven kinds of social media as follows:

1. *Social Networks* are sites that allow people to build personal web pages and then connect with friends to share content and communication. The biggest social networks are Facebook, Twitter and LinkedIn (Hung et al., 2011; Boyd and Ellison, 2008).
2. *Blogs* are perhaps the best-known form of social media; blogs are online journals, with entries appearing with the most recent first.
3. *Wikis* are websites that allow people to add content to or edit the information on them, acting as communal documents or databases. The best-known wiki is Wikipedia, the online encyclopaedia that has over 2 million English language articles.
4. *Podcasts* refer to audio and video files that are available by subscription, through services like Apple iTunes.
5. *Forums* are areas for online discussion, often around specific topics of interest. Forums came about before the term 'social media' and are a powerful and popular element of online communities.
6. *Content Communities* organise and share particular kinds of content. The most popular content communities tend to form around photos (Flickr), bookmarked links (del.icio.us) and videos (YouTube).
7. *Microblogging* is the combination of social networking and bite-sized blogging, where small amounts of content ('updates') are distributed online and through mobile phone networks. Twitter is the clear leader in this field.

Additionally, Nair (2011) suggested that widgets—pieces of software that perform a task of some sort on the web—are another type of social media. According to Mayfield (2008), all social media sites share all or most of the following five characteristics. Firstly, social media is all about *participation*. It encourages contributions and feedback from everyone who is interested and it blurs the line between media and audience. The second characteristic of social media is *openness*. Most social media services are open to feedback and participation, which encourages voting, comments and the sharing of information. There are rarely any barriers to accessing and making use of content, and password-protected content is frowned upon. Whereas traditional media is about 'broadcast' content (transmitted or distributed to an audience), social media is better seen as a two-way *conversation*. The fourth characteristic of social media would be *community*. Social media allows communities to form quickly and communicate effectively and communities share common interests, such as a love of photography, a political issue or a favourite TV show. Lastly, most kinds of social media thrive on their *connectedness*, making use of links to other sites, resources and people.

Although it is true that many social media sites share all of these characteristics, it is at the same time crucial to recognise that 'openness' is more often than not the one aspect not associated with social media sites that do not share all of the five attributes. This is in view of the fact that there are social media sites that require consumers to create a password-protected account to access information available through that designated web community. Additionally, Boyd and Ellison (2008) found that social networking sites also provide their users with the option of creating a public or semi-public account within an enclosed system. Hence, not all data on social media sites are accessible, and password-protected content is considered commonplace.

THEORETICAL FRAMEWORK

Nair (2011) describes social media as online platforms where content, opinions, perspectives, insights and media can be shared. For Strokes (2009), social media encompasses various media that is published, created and shared by people on the Internet, such as blogs, images, video and more; however, the author failed to elaborate on the other types of media. Many researchers argue that there are two primary reasons as to why individuals use social media, and these are for communication and relationship maintenance (Diffley et al., 2011; Hutton and Fosdick, 2011; Kim and Ko, 2010). Apart from these factors, Heinonen (2011) discerns four other motivators for social

media usage; namely socialising, entertainment, self-status seeking and information gathering. Furthermore, Hutton and Fosdick (2011, p.566) argued that when consumers engage socially online, it is to fulfil certain needs. Those needs include the desires “to promote themselves, to share new experiences with others, and to simply have fun or waste time”.

Jevons and Gabbott (2000) identified that as consumers actively participate in online content creation and sharing, they become highly influential. Consequently, consumers today have indirectly diminished the role of marketers as they become more dominant. As the accessibility and reach of the Internet enables users to retrieve all types of information, businesses are now also facing some difficulty in adhering to traditional organisational communication frameworks of non-transparency and hierarchy.

Social media is today's most advanced and popular way in which individuals share and discover information. It facilitates social interaction through the digital realm, disregarding geographical and physical boundaries. Moreover, it helps individuals, consumers, retailers, employees and employers engage with each other like never before, essentially providing them with a whole new online experience. Dann and Dann (2011) offer a wider spectrum but simplify the meaning on the concept of social media, suggesting it is all about the interconnection between content, users and communication technologies.

While consumers nowadays are spending increasing amounts of time on the Internet, it is assumed that online communities play a significant role in moulding consumer brand perceptions. Perception is the process by which stimuli are selected, organised or interpreted (Solomon et al., 2010; McDonald, 2012; Potgieter, 2011). Sadeghi and Tabrizi (2011, p.698) describe brand perceptions as the ability to identify a brand under different conditions, as reflected by brand recognition or recall performance. Brand perceptions play a critical role in consumer purchase experiences because they are assumed to influence consideration and evaluation, and can eventually lead to the purchase of a product or service (Keller, 2003). Drawing on previous research, some factors that influence brand perception are physical qualities, containers, packaging, price, advertising, promotion and merchandising (Munn, 1960). On the other hand, Wanke et al. (2007) have also identified phonetic variations and semantic meanings as factors that affect perception.

EVOLUTION OF THE DOMAIN OF SOCIAL MEDIA

There are conflicting schools of thought regarding the dawn of social media. Some suggest that social media began before the emergence of computers as it started out ‘online’, on the phone. These early social media explorers built boxes/homemade electronic devices that could generate tones allowing them to make free calls and get access to the experimental back end of the telephone system (Borders, 2009). In 1988, Internet Relay Chat (IRC) was developed for file and link sharing, and keeping in touch (Chapman, 2009). It is known today as the ‘father’ of instant messaging. Conversely, others argue that social media only came about in more recent years. “The first recognisable social network site launched in 1997. SixDegrees.com allowed users to create profiles, list their Friends and, beginning in 1998, surf Friends lists” (Boyd and Ellison, 2008, p.4). Each of the features, however, existed in other forms of social media before SixDegrees, but SixDegrees was the first to combine them. This site then saw the development of two other major social networking sites, Friendster in 2002 and MySpace in 2003.

ICONIC SOCIAL MEDIA: FACEBOOK

Facebook has been described by its creator as “a social utility that helps people communicate more efficiently with their friends, family and co-workers” (Mauri et al., 2011, p.723). A Harvard sophomore student named Mark Zuckerberg founded the social-networking site in 2004. Previously known as The Facebook, the site was launched as a social networking platform limited to the students of Harvard University, but it gradually allowed other schools and business communities to register as users over time. During these developmental years, Mark Zuckerberg continuously evolved the platform by introducing innovative ideas and useful features such as comments and relationship status updates.

In 2006, the site officially became public due to overwhelming interest. Facebook is today's most dominant social-networking site, with more than a billion monthly active users as of December 2012 (Facebook,

2013) as a result of its unprecedented growth. It allows users to create their own profile by adding pictures and personal information, and to form a certain image of themselves, be it to develop a personal or professional reputation. Lipsman et al. (2012) identified that Facebook is highly popular amongst the younger generation; therefore, it accounts for 90 per cent of time spent on social-networking sites.

THE RELEVANCE OF DIMINUTIVE PLATFORM: BLOGS

Blogs are one of the first and most popular social media platforms. A Swarthmore College student, Justin Hall, created an online personal journal in 1994 called Links.net, now recognised as the first Web log or blog (Mayzlin and Yoganasimhan, 2012). As described by Miller and Pole (2010, p.1514), "...a blog is a Web site containing dated entries, or posts, presented in reverse-chronological order. Blog features commonly include archives (previous posts, typically grouped by month and year), a blogroll (a list of recommended blogs), and a reader comment section". Some researchers state that the term 'blog' was first introduced in 1997, whereas Kaplan and Haenlein (2010) counter that it was truncated from the word 'weblog' in 1960 when one blogger jokingly altered the noun into the phrase 'we blog'.

Blogs allow individuals with Internet access to share anything they want with their readers, such as personal stories, reviews, interests and ideas. Most blogs are interactive in the sense that they allow readers to leave comments and socialise with other readers and authors through different 'widgets'. Increasingly, blogs are becoming popular sources of UGC and are highly popular amongst marketers. Saxena (2011) proposes that companies use blogs for marketing and PR for three purposes: to observe what millions of readers are saying about the company, its products and competitors; to participate in the discussion between the bloggers by commenting on the bloggers' quotes; and to give product information to people by starting their own blog. Moreover, influential bloggers who reach millions of readers have come to take on a terminology of distinction as "celebrity bloggers" (Colliander and Dahlen, 2011).

Today, there are three very popular blogging platforms, namely Livejournal and Blogger, both founded in 1999, and Wordpress, founded in 2003. On top of that, there is another type of blogging that is experiencing a rapid increase in popularity: microblogging (Hutton and Fosdick, 2011). Microblogs are much the same as other blogs except for the fact that they restrict the length of posts (e.g. 140 characters on Twitter). Twitter was invented in 2006 and is today's most favoured microblogging site (Mayfield, 2008).

REFERENCE GROUPS AND SOCIAL MEDIA: INTERPLAY

Reference groups are described as "actual or imaginary institutions, individuals or groups conceived of having significant relevance upon an individual's evaluations, aspirations or behaviour" (Lessig and Park, 1978, p.41). Nowadays, the use of spokespersons in product and service endorsement is highly prevalent. It is a belief that when individuals who are looked upon as belonging to a group, they inspire others and such individuals have the power to influence information processing, attitude formation and purchase behaviour (Bearden et al., 1989). Flynn et al. (1996) suggest that consumers disseminate product information through word-of-mouth (WOM), as consumption is a leading topic of discussion in the context of social media commentary. They then influence each other further by offering advice to those who seek it. Some even become so influential that they inspire other consumers, who observe their behaviour to emulate them in various ways. More often than not, the influence of reference groups on individual behaviour is manifested in the types of products and brands purchased by individuals (Keller and Fay, 2012; Christodoulides et al., 2012; Trusov et al., 2009; Childers and Rao, 1992).

Opinion leaders and opinion seekers are two prevalent constructs of WOM (Wojnicki, 2006). Solomon et al. (2010) define opinion leaders as people who are knowledgeable about products and whose advice is taken seriously by others. These individuals are often respected in their field of knowledge in terms of the topics they share, and other people usually go to them for recommendations and advice. Hence, opinion leaders are highly influential. Shoham and Ruvio (2008, p.282) also state that they tend to be "competent technically vis-à-vis being able to use new high-tech products, are heavy consumers of the mass media, and are socially active". Though it has been widely established that opinion leaders are informed and experienced about/with products, many researchers have argued that an opinion leader's expertise is product-class-specific, meaning they are only wellversed about a specific product category (El-Omari and Shane, 2010; Higie et al., 1987; Feick and Price,

1987; Price et al., 1987). Thus, an opinion leader's influence only extends to consumers who seek information of a specific category.

Feick and Price (1987) postulate that opinion leaders have a desire to provide marketplace and shopping information to other consumers. Price et al. (1987) further elaborate that when opinion leaders convey brand information, they achieve a sense of satisfaction, as they feel they help to reduce the cost of information searches for their fellow consumers. Opinion seekers, on the other hand, are individuals who are more likely to discuss and ask for product information with other consumers (Solomon et al., 2010), and they are "highly attentive to social comparison information" (Rose and Kim, 2011, p.204). Consequently, that is how the two constructs have an impact on each other; opinion seekers search for specific product information, and they receive it from opinion leaders who are keen to share.

Within online communities, family members are often considered as a type of reference group as well. The younger members (opinion seekers) may regard their older family members as opinion leaders, who are naturally highly influential. That being the case, they may consciously or subconsciously allow their older siblings or parents to influence their brand preferences and loyalties, the way they search for information, their dependability on certain media, their price sensitivity and their adherence to price-quality beliefs. This type of socialisation is known as intra-family communication or intergenerational influence—where the effect of the family in the socialisation of offspring impacts on the individual's norms, attitudes and values (Childers and Rao, 1992).

Acar and Polonsky (2007) put forth that opinion seekers spend more time online and have larger networks in comparison to opinion leaders, and opinion leaders are more likely to share their brand experiences online. In addition, the study also concludes that opinion leaders can significantly influence the behaviour and attitudes of opinion seekers when it comes to the purchase of new products in particular. Evidently, although consumers may search for information from a variety of sources, there are just some people whose advice is taken more seriously as they are more credible than others.

Escalas and Bettman (2003) found that individuals are more likely to develop a self-brand connection when there is a strong usage association between reference groups and brands, and when there is a strong connection between reference groups and consumer self-concepts. This basically infers that brands that are well liked or have usage rates within certain reference groups and consumers who are part of these groups are likely to be positively influenced by them too. Lessig and Park (1978) identified and examined three motivational reference group functions (RGFs) from the perspective of individual motivational functions.

Informational Reference—While the researchers argue that an informational reference group inflicts zero standards on an individual, they state that an influence will be internalised if a consumer perceives that it enhances their knowledge about the environment and/or their ability to cope with certain aspects of it. As such, the likelihood of an individual accepting information from this reference group increases according to his reality if he feels uncertainty associated with the purchase and/or lacks relevant purchase-related experience. This suggests that when consumers want to make a purchase, they may refer to Facebook or to a blog written by people they know personally or by an opinion leader, to attain more information about the product.

Utilitarian Reference—This group function can be described as individuals who are motivated to comprehend a reward or to avoid a punishment brought about by some other individual or group that is expected to conform to the other's influence. This adherence only occurs if the individual feels that his actions are visible or will be known. This suggests that when a consumer is in a product-purchasing situation, he or she is expected to follow the preferences or expectations of opinion leaders. As such, a consumer who participates in certain Facebook brand pages or blogs would tend to allow others to see their profile, as it would display their group associations.

Value-Expressive Reference—This group function communicates that an individual motivated to enhance or support his self-concept would be expected to associate himself with positive referents and/or dissociate himself from negative referents. Lessig and Park (1978, p.42) explain, "The degree of cohesiveness or norm specificity of the reference group is irrelevant for this function. What is important is the psychological image associated with the group whether the group is real or imaginary." This suggests that a consumer's

association with a Facebook page or blog is not attributed directly to a search for its main function (information), but because they are seeking to fulfil other personal needs.

In our current digital age, firms are no longer in control of brand-related media (Campbell et al., 2011). “The truth is that corporate marketing never had control of the brand. The ownership of the brand and its reputation has always belonged to the consumer” (Booth and Matic, 2011, p.185). Social media sites in the form of these online communities have given consumers a group space in which they can be a part of creating and sharing information about brands to influence wider perceptions of those brands. Therefore, it is crucial to understand the dynamics of these online communities to be able to implement an effective marketing strategy.

According to Zafar and Rafique (2012), the meaning of a brand is retained in a consumer’s mind based on what they have learned, felt, seen and heard about it over a period of time. It is therefore crucial for marketing professionals to carefully promote their brand in a way that will successfully appeal to and satisfy consumer interests, needs and wants. As Steward (2008) noted, a brand’s reputation is its most valuable asset, therefore it is worth careful management and monitoring. Vigneron and Johnson (2004) identified that luxury brands in particular, can trigger five different aspects of consumer perceptions. While it is vital in identifying factors that affect brand perceptions, understanding how the characteristics of luxury brands affect brand perceptions should be looked into as well, as this conceptual framework provides insight for marketers in terms of how to alter their brand strategies to effectively influence their target audience. The five aspects are as follows.

Perceived Conspicuousness—The consumption of luxury brands may be important to individuals in search of social representation and position. Having said that, social status associated with a brand is a significant factor in conspicuous consumption. According to Dodds et al. (1991), the price and quality of a product are positively related. That means if a product is priced high, it is more likely to be perceived as a high-quality product. Consumers who are status conscious would gravitate more towards the purchasing of a product that is expensive because it is an indicator of luxury. As such, consumers would perceive luxury goods as the products that would fulfil their need to be associated with a high social status.

Perceived Quality—Consumers expect that luxury brands offer the finest product qualities and performance as compared with non-luxury brands. Perfectionist consumers may perceive more value from a luxury brand because they may assume that it will have exceptional brand quality and reassurance. Once the decision is made to position a brand as ‘luxury’, specific actions are required and crucial for creating and maintaining the position (Emile and Craig-Lees, 2011). Some actions include the company advocating attention to quality and craftsmanship, design signature and premium pricing (Fionda and Moore, 2009). Not only do these aspects of luxury brands fulfil a need to achieve an affluent status, but they also make the brands more desirable.

Perceived Uniqueness—Past research reveals that scarcity or limited supply of products heightens consumer preferences for brands. Individuals express a ‘need for uniqueness’ when they are searching for something that is difficult to acquire. Kapferer (1998) lists quality and uniqueness as two of the few key attributes of a luxury brand that need to be integrated with exclusivity. This goes to show that consumers want products of a particular brand that are not readily available so they could be perceived as one of a kind (being one of the few customers with a specific product). Furthermore, it enhances their self-image and social image by adhering to their personal taste, or stepping out of the norm, or simply avoiding similar consumption (Vigneron and Johnson, 2004). Conversely, Berger et al. (2007) argue that product variety also has its benefits—it influences perceived brand quality and it can also enhance a consumer’s repeat purchase rate, though this mainly applies to consumable goods.

Perceived Extended Self (Personal)—Individuals may use luxury brands to classify or differentiate themselves in relation to others, but they may also try to blend symbolic meaning into their own identity. This suggests that consumers regard their possessions as part of their self. Kapferer and Bastien (2009, p.314) claim that, “with luxury recreating some degree of social stratification, people in a democracy are therefore free—within the limit of their financial means—to use any of its components to define themselves socially as they wish”. Accordingly, materialistic consumers may regard luxury brands as a way to attain happiness, and may use these brands to assess personal or others’ success (Vigneron and Johnson, 2004).

Perceived Hedonism (Personal)—Luxury seekers are considered hedonic consumers when they are looking for personal rewards and satisfaction obtained through the purchase and consumption of products evaluated for their subjective emotional benefits and innate pleasing characteristics, rather than for their functional benefits. As much as there are consumers who seek luxury products to fulfil or conform to a certain image, there are also other people who purchase luxury goods to simply achieve sensory gratification and sensory pleasure.

The core of a luxury brand is a strong brand identity. Keller (2009) argues that for a brand to assume a luxury status, certain actions are required that will result in a premium image. Undoubtedly, the whole intention is for consumers to see the brand as special in some way at both a personal and public level (Emile and Craig-Lees, 2011). With these pre-noted perceptions that consumers could have of luxury brands, marketers can take advantage of this knowledge to craft an effective marketing strategy to enhance and create more positive perceptions of luxury brands.

MANAGERIAL IMPLICATIONS AND FUTURE RESEARCH DIRECTIONS

This study offers several potential contributions to the concept of social media and the aspects of social media sites that play a part in influencing consumer brand perceptions. The implications of this investigation are of significance for marketing professionals and researchers in the field of social media and brand perceptions. It establishes a structured analysis of social media and proposes particular features of this growing phenomenon that influence consumers' brand perceptions. The findings of this research could serve various purposes, but perhaps it could be specifically applied to the creation of effective integrated marketing strategies by including social media, or to address the issue of how to utilise social networking sites to effectively enhance and maintain positive brand perceptions of consumers.

The present study reveals that social media is a highly dynamic medium that is supported by Web 2.0, together with the constant flow of user-generated content. Although social media greatly diminishes the need for physical contact between a marketer and a consumer, which can be difficult in the marketing of products that are sensory by nature, the platform encompasses other significant benefits (Khang et al., 2012; Smith, 2009; Gangadharbatla, 2007). The two main advantages of this relatively new marketing platform are its ability to facilitate direct real-time interactions between marketers and consumers, or more specifically, their distinct target audiences, as well as to provide marketing professionals and managers with a comprehensive realm of valuable consumer feedback on various products and services.

In summary, the findings of this study articulate in-depth explanations of the fundamental aspects of social media, and the impact of WOM through various reference groups on social media, on brand perceptions. These findings help explain the key features of social media that marketers must establish, utilise or monitor for creating a lasting marketing strategy. In other words, marketers should proactively explore the benefits and drawbacks of social media and experiment in terms of effectively using WOM as part of their marketing strategy to become opinion leaders on social media sites, namely Facebook and blogs, to construct an effective marketing strategy.

In addition, the elucidation of the set of preconceived perceptions that consumers could have of luxury brands (in particular) is particularly useful for marketing professionals to recognise competitive advantage. As the set of associations that consumers have about a brand become critical components of brand equity, having identified this favourable insight provides marketers and managers with the opportunity to construct a brand strategy that is certain to positively influence consumer perceptions of luxury brands. Seeing that social media is a platform that is constantly evolving, it is also important for marketing professionals and managers to consistently monitor social media (for notable developments) in order to maintain or improve the effectiveness of their marketing campaigns. This study has reviewed social media sites and how these can impact on the brand perceptions of consumers. However, the discussion of social media sites was limited solely to Facebook and blogs. Future research could identify and examine other social media platforms and related distinct features, as research into those could possibly develop upon this study.

THE INFLUENCE OF KNOWLEDGE COMPETENCE ON COMPANY PERFORMANCE OF SMEs IN KAZAKHSTAN

Gulzhanat Tayauova, International Academy of Business, Kazakhstan
Diana Amirbekova, Kazakh-British Technical University, Kazakhstan
Dababrata Chowdhury, University Campus Suffolk, UK

ABSTRACT

One of the most important factors affecting SMEs is knowledge competence. Knowledge competence is the ability of companies to use its elements of the knowledge in the most effective and efficient way. This study focuses on the analysis of the relationship between knowledge competence and company performance of 50 SMEs operating in Kazakhstan. Especially, in an environment which is characterized by dynamic changes and high turbulence knowledge competence does not limit the company from gaining other competencies but making the connection with the performance of the company. Based on that, this study analyzes the connection between knowledge competence and company performance of SMEs which operate in Kazakhstan in depth. Also in this study the relationship between knowledge competence of the small and medium enterprises are studied with the relationship to its performance.

INTRODUCTION

The knowledge – based view considers the knowledge competence as the most influential strategic resource of a company (Van Gils and Zwart, 2004). Especially, in an environment which is characterized by dynamic changes and high turbulence knowledge competence does not limit the company from gaining other competencies but making the connection with the performance of the company. Knowledge as a competence of SMEs positively affects on innovations and productivity in long-term perspective in Kazakhstan. However, SMEs usually are not willing to invest in knowledge management, and it limits possible outcomes. McAdam & Reid (2001) argued that SMEs have a less developed approach to knowledge management. Based on that, this study analyzes the connection between knowledge competence and company performance of SMEs which operate in Kazakhstan. This study focuses on the identifying the relationship between knowledge competence and company performance in the turbulent external environment caused by the global economic changes.

LITERATURE REVIEW

Knowledge competence

The quickly changing environment force companies to change. Nyhan (1998) argued that competence affects to company's competitiveness as a strategic factor. Meaning that, knowledge of a company as a competence can create a value (Teece, 1998). Knowledge competence includes stimulation of knowledge on all levels, when decision-making process become more transparent. However, external knowledge is also valuable source of knowledge competence, in this process companies learn from others and adjust that knowledge to internal conditions of a company (Menon, Pfeffer, 2003). From knowledge based theory, knowledge is a main source for competitive advantage. Thus, knowledge competence is considered as a key competence which includes experience of a company, knowledge of employees, competitors of a company and environment. Knowledge

competence is crucial in sustaining competitive advantage, because its difficult to imitate and it leads to sustainable differentiation (Wiklund and Shepherd, 2003).

Knowledge

Knowledge itself is considered as an influential to improve company performance. It can be used as a resource to “create gains from the uncertainties in business” (Liao et al., 2011). . Intangible asset of a company - knowledge is created by human capital (Fuller,2001).Human knowledge is important in organization because it connects tacit and explicit knowledge of an organization (Nokana and Takeuchi, 1995). Kolb (1984) identified learning as a process whereby knowledge is created by the transformation of experience. Because knowledge defines companies competitiveness for existence on market, they had been developing own knowledge which differentiate them from competitors Nonaka (1994) suggested knowledge creating process which has 4 components: socialization, externalization, combination and internalization. Moreover, he argues that knowledge is created by both by tacit and explicit knowledge and there are no certain boundaries between them.

Competence

Competence is consists of necessary skills and resources which allows company to provide its service. Therefore, strategic or core competencies are the main sources for competitive advantage of a company. Prahalad and Hamel (1990) highlighted influence of competence management in organizations by introducing concept of core competencies. Competence can be divided into theoretical and operative (Westera, 2001). From this perspective, knowledge as a competence relates to operative because it relates to responding in different unplanned situation where theoretical competence considered as more known and identified. At the end of 1970s t the term competence was first introduced by Hofer and Schendell (1978). They defined it as a resources that influence to companies achievements. Because of high level of competition on market, companies need to constantly search for new resources of competencies. Yang (2010) argued that competencies are based on knowledge-based theories because of nature of its development inside organization which at the end leads to sustainable competitive advantage. These competencies are strategic where company improve performance its strategic functions through financial and strategic performance (Porter, 1991).It also help to develop most useful competence in the company.

Knowledge-based theory

Many scholars consider the knowledge-based theory is developed on the basis of the resource-based theory which focuses on company’s capabilities and resources leading to profit of a company. Because knowledge considered the most strategic resource the knowledge-based view started to develop (Tayauova, 2012). The knowledge-based theory of the firm highlights strategic importance of organizational knowledge in managing of a company (Nonaka, 1994). Also, it considers company as an integrator of knowledge. However, companies can integrate knowledge by specific mechanisms which apply knowledge to individual level (Grant, 1996). Moreover, Scarbrough (1998) argued that the knowledge-based view of a company is focused on creation and gathering of knowledge of employees by connecting organization inside and developing external connections of a company. Kogut and Zander (1992) stated that a company can create, transfer and transform knowledge to competitive advantage.

Competence based theory

The competence-based perspective considers company’s ability to exist on market when skills and tacit knowledge supported by organizational structure, conditions. Competence based theory directed to achieving sustainable competitive advantage of a company. Sanchez and Heene (2004) define competence based management theory as a theory which connects organizational itself with an external environment. They identified four aspects of organizational competencies such as dynamic, systemic, cognitive and holistic. These aspects are about managing internal and external environment in different conditions.

Knowledge management theory

Knowledge management creates value by existing intangible assets of a company. Therefore, it can be defined as a creation, acquisition, sharing, and utilization of knowledge for improvement of organizational performance (J. Laurie, 1997). Knowledge management use methods, which are aimed to direct and manage company's employees in appropriate way to constantly create changes. Knowledge management was researched by different authors. Snowden (2002) identified three generations of knowledge management. The first generation of knowledge management connected knowledge and technologies. The second generation defined tacit and explicit knowledge. The third generation of knowledge management considers knowledge as a system which is able to create innovations. Gronhaug and Nordhaug (1992) stated that mission, objectives of a company which are identified by the business strategy directly influence knowledge management process. The knowledge management has several activities such as KM activities as: (i) knowledge creation; (ii) knowledge retention; (iii) knowledge sharing; and (iv) knowledge innovation (Alleee, 1997). Therefore, knowledge management capability is a creation of knowledge, refraining, of knowledge, sharing, and its application. The knowledge management concentrates in developing and using knowledge within a company (Gold et al., 2001). Therefore, it could make a bit change of organizational objectives at the end.

Competitive advantage

The competitive advantage of company occurs when capabilities inside it adopt existing knowledge to external environment. Rouse and Daellenbach (2002) argued that competitive advantage relates to company performance through knowledge. At the same time, company's performance is achieved by organizational learning process. In this case, competitive advantage of a company depends on the knowledge about competitors financial position, strategies etc (Zack, 2002) which will make some changes.

Company performance

Dess et al (1995) identified that management capabilities, technical knowledge are the main factors which identify company performance. Management capabilities and technical knowledge are differ from company to company because they concentrate unique information. However, company performance can be measured in two ways: financial and non-financial performance. Many scholars more likely to consider knowledge competence as a factor influencing company performance because it affects job performance, increase quality of a product (Daud, Yusoff, 2010). Although, Becerra-Fernandez, Gonzales and Sabherwal (2004) identified that knowledge management can affect performance of a company in two ways: directed influence to improved company performance or creation of knowledge which improves it. However, knowledge-based theory confirms importance of knowledge for company performance because it influences competitive advantage by creating, acquiring, applying, sharing and preserving knowledge (Daud, Yusoff, 2010). De Gooijer (2000) introduced knowledge management model which fits to overall business performance management.

METHODOLOGY

Significant and objectives of research

The objective of this research is to study relationship between knowledge competence and company performance using data gathered from interviews conducted with managers of SMEs which operate in Kazakhstan. We selected 36 private firms from the initial database that included companies of Kazakhstan. Selection criteria included those that are small and medium sized enterprise. The number of interviews was 50, only those companies confirmed willingness to answer questions. In particular, we wanted to identify how knowledge competence influence performance of firms operating in Kazakhstan does. We have conducted interview with managers of SMEs. Before interview, we have sent questions of our interview and identified which companies want to take part in research.

Sample, Data Collections, Measures and Limitations of Research

Sample of our research consists of 50 companies. We have given questions of our interview beforehand, so that respondents will have some information about interview structure. Interviews were conducted in Russian language. Moreover, we asked 20 questions about knowledge competence and its impact on company performance. In order to identify impact of knowledge competence we used questions by Hsin-Jung Hsein (2007).

We then undertook a comprehensive literature review of knowledge management to derive a list of relevant questions. The semi-structured interviews and literature review formed the basis for developing our questionnaire, which contained five Likert-type scale. The subject of this work has some limitations caused by different sizes of business, industries where companies operate.

ANALYSIS AND RESULTS

In this research we have interviews with fifty top managers of companies, which are owned by those people. We have started our interviews with asking general information, such as type of business, operating industry, number of employees, year of opening a business. The companies were from different industries with different external environment, level of competition, skills and knowledge required to do a business in each sphere. Results of our interview showed that majorly knowledge become a competence of six companies which leads to improvements in performance. However, encouragement of development of knowledge is not used properly by top managers. At the same time, companies develop and implement strategies for the development of knowledge management. Six top managers of companies stated that only recently knowledge has become core competence of their company and since then financial results improved. Further, analysis reveals that companies sustaining knowledge as a competence. Companies sustain it by investing in human capital, knowledge of employees. The most popular practice in SMEs in Kazakhstan for development knowledge management strategy is developing manuals, formal documents which help to create and collect knowledge and later use it in developing competence. Because SMEs in Kazakhstan mostly managed by owners including family members where informal conversation is influential in sharing knowledge inside organization, in our interview with top managers we identified that there are 5 companies which are family managed and owned. But it doesn't mean that only family-owned company use informal conversation to share knowledge, in our case the impact on performance is greater in those companies which are family-owned and managed. Top managers proved it by annual growth of a company in industry. Interviewed top managers highlighted process of acquiring new knowledge in their companies. Three top managers stated that they acquire knowledge from business partners "by creating trustable and long-term relationship with them". From the other side, creating trustable relationship with partners are not achieved by all interviewed SMEs meaning that it's more difficult for them to compete, apply best practices. Tacit knowledge which is crucial in knowledge management is valuable in each interviewed organization and the managers. From this point, SMEs in Kazakhstan tend to develop this type of knowledge because it's more likely to positively influence to company performance. Moreover, to develop knowledge as a competence interviewed SMEs trying to encourage employees through motivation by empowering and horizontal flow of information. Performance of SMEs in relation to knowledge competence is measured by market share, success, profitability, and innovativeness and growth rate. In order to identify these indicators respondents were asked to answer these questions with five Likert-type scale. Results showed that three out of eleven respondents considered their companies more successful compared to competitors giving "5". That means, only three companies consider knowledge competence as a real source for improving company performance which affects positively on market share. However, growth rate and profitability were measured by 7 SMEs as "4", meaning that level is higher than the average. Innovativeness – important factor in assessing knowledge competence was measured as "3" by all companies meaning that generally innovativeness does exist in organizations but impact of it not so high in relationship with knowledge competence.

CONCLUSION

Knowledge competence becomes one of the key competencies of companies. Development of it requires constant employees' involvement in organizational process. Knowledge management as a part of company's

strategic management can enhance knowledge. Knowledge management strategy of organization is influenced by different issues such as behavior, culture which affect differently in each SME. Several results can be taken from this work. SMEs of Kazakhstan develop knowledge of employees by organizing trainings for them. These activities aimed to stimulate them as well as provide with more horizontal organizational structure and flow of information. But still it doesn't completely stimulate knowledge competence for development because it lacks more structured and planned knowledge management practices. As a result, company performance is difficult to change. However, SMEs only starting to develop knowledge as a competence of an organization meaning that in future, the strategy of knowledge management will be different more complicated. Moreover, it would be influenced more by human capital of organization. Nowadays, knowledge management is very popular in Kazakhstani government owned companies, but still SMEs lacking experience in this field. Therefore, improvements of knowledge competence and its impact on company performance of SMEs could be identified and developed in future analysis. Also it will take more positive action for the company in Kazakhstan.

AN INVESTIGATION INTO MEASUREMENTS AND DETERMINANTS OF ENERGY POVERTY: EVIDENCE FROM CROSS-SECTION DATA IN MALAWI

Betchani H. M. Tchereni
North West University, South Africa

ABSTRACT

Using economics approaches of measuring energy poverty, the findings of the study suggest that over 90 percent of the households sampled were energy poor. The Logit model of energy poverty reveal that household expenditure on transport, income level, age, and education level of head of household, household size and home size, are important factors in explaining the state of energy poverty in South Lunzu Township. . Households who spent more on schooling were also spending more on food items and their expenditure on energy resources was less than 10 percent of the total expenditure per month. The major recommendation of this study is that campaigns emphasising on the abilities of Renewable Energy be developed and disseminated. Also there should be a deliberate effort to make cheaper sources of renewable energy like solar available to poorer townships

INTRODUCTION

Most households and industries in the Sub-Saharan Africa use traditional and unclean energy resources for many activities such as cooking, lighting and drying of farm produce. In Malawi currently household energy consumption accounts for 84 percent of the total energy used, the dominant energy source being biomass (99 percent) (NSO, 2012; GOM, 2006). The attainment of the Millennium Development Goals (MDGs) rests on the availability and access of affordable energy to all people. To achieve the MDGs and sustainable development in general, policies and strategies that will encourage the use of green energy both at the household and industrial level are important. Energy is important to eradicate poverty through improved education, health services and even provide employment to many people with a variety of skills.

The objective of this study was to analyse the state of energy poverty in an urban poor society environment. Specifically, the paper aimed at identifying the determinants of energy poverty in South Lunzu Township by first computing the energy poverty level and secondly econometrically analyse factors that determine its level.

LITERATURE REVIEW

Energy is a basic commodity in the same class as food, water and health. However, the majority of the population in Africa still cannot access it in its modern form (Biro, 2007). Energy poverty has been defined as the state of deprivation where a household or indeed an economic agent is barely able to meet at most the minimum energy requirements for basic needs (IEA, 2010; Modi *et al*, 2005; Foster *et al*, 2000). Many authors have provided the definition in theory but in practice they fail to agree on what exactly is the minimum level below which a household can be classified as being energy poor (Pachauri & Spreng, 2003; Pachauri *et al*, 2004; Mirza & Szirmai, 2010). The International Energy Agency believes that there is a minimum level of energy consumption for the rural areas on the one hand and urban locations on the other. For rural areas, the minimum

estimated comprises of two light bulbs, 5 hours of radio while for the urban areas with additional appliances such as television and refrigerator, the requirements would be higher (Foster et al, 2000). However, other important energy needs such as cooking, ironing, and washing are not included.

More and more efforts in modern times are leaning towards an investigation that should establish an energy poverty line. Authors such as Fahmy (2011), Foster et al (2000), and Pachauri et al (2004) have established an energy poverty line for specific areas based on techniques that are scientific from both engineering and economic sciences.

Using access as a method of determining whether a household is energy poor or not, many studies have shown that Africa is lagging behind in the provision of modern energy facilities. According to the International Energy Agency (2006), 554 million people did not have access to electricity in Africa in 2006. The SSA had the highest number of people without electricity at 547 million. This suggests that generally the SSA has the lowest electrification rate compared to the Northern Africa. Compared to Asia, Africa is still the lowest. This leads to a clear conclusion that energy poverty is more pronounced in the SSA than anywhere else in the world.

Poor countries have low energy intensity measured by the ratio of total amount of energy consumed to Gross Domestic Product (GDP). Low energy intensity levels are an indication that a country is consuming very low amounts of energy which might imply that access is also very poor. However, care has to be taken as low energy intensity figures might also be an indication of energy efficiency per unit of output.

RESEARCH METHODOLOGY

Random Sampling was used to collect survey data in Blantyre City's high density area of South Lunzu Township (SLT) which lies to the east of Ndirande Mountain. SLT has twelve sectors of which data was collected in areas Five, Six, Seven, Eight and Ten. Households were randomly chosen and in total, the survey collected data through questionnaire administration to 319 heads of household or their spouses.

South Lunzu Township is a relatively new area compared to other Townships around Blantyre. It emerged mainly due to its closeness to two main industrial areas of Chirimba and Limbe. It is therefore preferred by such people who work in the nearby industrial areas. Stratified random sampling was used to choose households from where respondents were drawn. If a head of household was not available, the spouse or partner was requested to respond to the questions. A semi structured questionnaire was given to the enumerators to be used for the collection of information. It had a set of questions on demographics (age, sex, and household size), socioeconomic aspects (employment, education, knowledge) and energy use. Discrete choice analysis using logistic models for binary were adopted to analyse determinants of energy poverty

Analysis of determinants of energy poverty

This study adopted energy expenditure methods to identify those energy poor households. Energy poverty measures calculated in this way are referred to as Economics Measures (Pachauri et al, 2004). In expenditure terms, a household is considered to be energy poor if 10 percent or more of its expenditure is on energy facilities (Fahmy 2011). This definition therefore demands a clear explanation and data on energy expenditure at the household level and total income.

Expenditure approach of measuring energy poverty

In this study expenditure on energy is calculated by adding together all the money-metric costs incurred to fetch energy facilities. These include:

- i. Transport cost to and from the place of fetching the energy facility;
- ii. Actual purchase cost of the facility;

The formula for this calculation is given by:

$$EEX_{ij} = ETPT_{ij} + APC_{ij} \quad (1)$$

Where EEX_{ij} total expenditure on energy facility i by household j ; $ETPT_{ij}$ is transport expenses incurred towards the acquisition of energy facility i by household j ; and APC_{ij} is the actual purchase cost of energy facility i by household j . since the expenditure on transport as a recurrent activity mainly involves purchases of energy, ETPT includes therefore transport expenses the household incurred per month. For those who commute, bus fares are a direct function of the price of petrol and diesel on the energy market. Particularly, walking and cycling do not involve the use of energy whose cost can be quantified in monetary terms. For those who used cars for travel, the cost of petrol and diesel was added.

Empirical model of Energy Poverty

Those who were deemed to be energy poor were identified based on the energy expenditure budget of the household. Households whose energy expenditure budget exceeded 10 percent were regarded as being energy poor and therefore they were coded 1 and those who were spending less than 10 percent on energy facilities got a code of 0 (zero). A binary variable was consequently created which renders the reliance on Ordinary Least Squares (OLS) method of regression analysis unfit.

In the present case, one class of categorical models, a logistic regression, was estimated. This class of regressions use predictors to estimate probabilities that an event does or does not occur relying on similar inferential statistical methods as in OLS (Gujarati, 2004; Green, 2003). Theoretically, a decision maker, n , faces J alternatives. The utility that the economic agent obtains from alternative j can be represented as:

$$U_{nj} = V_{nj} + \varepsilon_{nj} \quad (2)$$

Where, U_{nj} is total utility; V_{nj} and ε_{nj} utility known by the researcher and stochastic utility, respectively. The logit function is obtained by assuming that each ε_{nj} is independently, identically distributed extreme value. The density for each unobserved component of utility is:

$$f(\varepsilon_{nj}) = e^{-\varepsilon_{nj}} e^{-e^{-\varepsilon_{nj}}} \quad (3)$$

and the cumulative distribution is given by:

$$F(\varepsilon_{nj}) = e^{-e^{-\varepsilon_{nj}}} \quad (4)$$

From this the following empirical model is suggested:

$$f(EPVY) = (\exp_tpt, \exp_food, \exp_sch, gender, educ, \exp_home, hhsize, hmsize, marital, s)$$

Consequently, an econometric analysis of the factors that influence the level of energy poverty in South Lunzu was performed relying on inferential statistical methods to interpret the results. A dummy variable, EPVY representing energy poverty was created taking on the value of 1 if a household was found to be energy poor and 0 otherwise.

RESULTS

Table 1 provides a summary of energy poverty statistics using the income or economics approach. From the table, 62 households representing about 19 percent of the sample were not energy poor. These households were spending less than 10 percent of their income on energy commodities including transportation. On the other hand out of a total of 319 households, 257 were found to be energy poor representing about 81 percent of the sample.

Table 1 Frequency for energy poverty

Energy Poverty Dummy Variable	Frequency	Percent	Cumulative frequency
Energy well-off	62	19.44	19.44
Energy Poor	257	80.56	100

Total	319	100	
--------------	-----	-----	--

Source: Energy Poverty and Sustainable Development survey data, 2012.

When looking at the econometric analyses table 2 shows that there is a positive and statistically significant relationship between energy poverty and transport expenditure. The null hypothesis that the level of transport expenditure does not affect the level of energy poverty is therefore rejected at the 1 percent level of statistical significance. The results suggest that the odds ratio of 1.0008 was in favour of transport expenditure to increase the energy poverty level. In terms of elasticity as reported in table 2 the relationship between transport expenditure and energy poverty was inelastic. A 1 percentage increase in transport expenditure could increase energy poverty by 0.2 percent.

Table 2 Results of the Logit Model and elasticities

EPVY	Odds Ratio	ey/ex	z-score	P> z
exp_tpt	1.00081	0.2	5.75	0.000***
exp_food	0.9999	-0.49	-4.23	0.000***
exp_sch	0.99989	-0.19	-4.28	0.000***
Gender	1.20806	0.02	0.47	0.637
Educ	1.00925	0.02	0.15	0.881
exp_home	0.99997	-0.02	-0.58	0.562
Hhsize	1.21124	0.18	1.87	0.061*
Hmsize	0.99699	-0.03	-0.54	0.591
Marital	1.26664	0.11	1.66	0.097*
_cons	1.47712		0.43	0.665

Where *, **, and *** means statistically significant at the 10%, 5% and 1% level of significance.

There was a statistically negative relationship between food expenditure as represented by exp_food and energy poverty rejecting the null hypothesis of no relationship between the two. At 1 percent level of significance, the odds ratio predicts that households which spend more on food are likely to be better off in energy access. As table 2 shows, for every 1 percentage point increase in food budget, there is likely to be a 0.49 percentage decrease in energy poverty.

At 1 percent level of statistical significance, the null that there is no relationship between expenditure on education and energy poverty is. In terms of elasticity, the relationship is however inelastic as increasing education expenditure by 1 percentage points is likely to lower energy poverty by 0.19 percent. Said differently, low energy poverty levels are likely to be associated with higher expenditures in education for members of household as funds are released from spending on energy and the gains are moved towards improved and quality education.

There was a positive relationship between Gender and energy poverty although the association was statistically insignificant to reject the null hypothesis that there is no relationship between the two variables. The odds ratio however show that one is likely to be energy poor if they are male than female. Culturally men do not go to the forest to fetch firewood the way women do in Malawi and many other parts of Africa. The gender elasticity of energy poverty is inelastic at 0.02 percent. That means a 1 percent increase in males is expected to increase energy poverty by 0.02 percent.

At any level of standard statistical significance, education of the head of household could not be a statistically significant factor in explaining the behaviour of energy poverty in South Lunzu although there was a positive relationship between level of education and energy poverty. This result is strange considering that higher education levels are associated with higher income levels and therefore the energy share in the expenditure budget should be smaller.

There was a statistically insignificant relationship between home expenditure as represented by *exp_home* and energy poverty. Higher expenditures on accommodation were likely to be associated with lower energy poverty levels. In terms of elasticity an increase in home expenditure by 1 percent was likely to lead to a 0.02 percent decrease in energy poverty. Households that were spending higher amounts of their income on housing were likely to be less energy poor compared to those that were staying in low cost accommodations.

Household size represented by *hhsz* had a statistically significant positive relationship with energy poverty at the 10 percent level of significance. The odds were that it was more likely for a household with more members to be energy poor than those with fewer members. The household size elasticity of energy poverty was inelastic at 0.18 implying that a 1 percent increase in household poverty was likely to increase energy poverty of the household by 0.18 percent.

There was a negative relationship between size of the dwelling unit as represented by *hmsz* and energy poverty. The relationship however was statistically insignificant to suggest that the size of the dwelling unit (house) can be relied upon to explain the behaviour of energy poverty at the household level in South Lunzu. However although insignificant, the negative relationship suggests that households dwelling in larger houses were likely to be less energy poor compared to those living in smaller units.

On marital status which was represented by *marital*, the relationship was positive and statistically significant at the 10 percent level of significance suggesting that homes with married couples were more likely to be energy poor than those who were not.

CONCLUSION

South Lunzu Township is an energy poor stricken community with more than 80 percent of the households living below the energy poverty line. In this area, more than 40 percent of the households depend on biomass for their cooking needs. For those who have electricity, only less than 10 percent use it for both cooking and lighting, about 70 percent of the households did not rely on electricity for their cooking needs.

In terms of factors that affect the level of energy poverty which include expenditure on transport, income levels, age of the head of household, education level of head of household, household size and home size, relate differently. The results of this study shows that gender, expenditure on housing and marital status cannot be relied upon as important predictors of the probability of energy poverty in South Lunzu. Expenditure on education was associated with lower levels of energy poverty. Households who spent more on schooling were also spending more on food items and their expenditure on energy resources was less than 10 percent of the total expenditure per month. In addition, those households which spent more on food were also likely to be energy well-off. This could be explained in the sense that higher expenditures on food might imply that the household was also well-off in terms of income poverty.

SELF-GENERATED LIVELIHOODS AND POVERTY ALLEVIATION IN RURAL SOUTH AFRICA

Piet Thobakgale
University of Limpopo, South Africa

ABSTRACT

Rural poverty studies demonstrate that the best possible route for alleviating rural poverty is through poor people's self-generated livelihoods (Harrigan, 2008; Scoones, 1998). Rural households that venture into self-generated strategies have tended to generally generate employment, income and food at rates that alleviated their poverty conditions. To this extent, the value which rural livelihoods add to poverty alleviation depends on their ability to generate income and/or produce foods for households. In many developing countries, poor economic context in rural areas and legacies of colonialism have rendered severe and extreme poverty. These circumstances are typical to rural South Africa where the majority of people are vulnerable to such eventualities because of the legacies of colonialism and apartheid policies. South Africa is regarded as one of the countries that have progressed in terms of addressing socio-economic challenges of post-apartheid period. However, poverty has remained as a predominant challenge that numerous policies and strategies are formulated and implemented currently to address. Less has been achieved since poverty continued to affect the large majority of people in rural areas. Currently, households in rural areas across South Africa venture into various livelihoods activities to generate income and produce food to alleviate poverty. The paper argues that self-generated livelihoods are significantly contributing towards households' poverty alleviation in rural areas through food production and income generation. Therefore, the purpose of this paper is to assess the contributions of self-generated livelihoods as an intervention for household poverty alleviation in rural South Africa. Thus, literature review is used to establish the theoretical arguments of livelihoods as an approach to poverty alleviation and their capacity to generate income and produce food for poor people. The paper concludes that self-generated livelihoods contribute to household poverty alleviation differently depending on the nature of poverty that households experience and the type of livelihood(s) that they are practicing.

INTRODUCTION

Poverty is a common rural phenomenon in many developing countries. According to the World Bank (2007), rural poverty of developing countries accounts for about 75% of the world poverty and it is estimated that a billion individuals are affected by absolute poverty. Therefore, various poverty eradication policies are formulated and implemented by different countries across the globe to remedy the challenge of poverty in rural areas. However, the failure of some poverty alleviation policies has compelled a large number of poor people in rural areas to practice self-generated livelihoods to generate income and/or produce food for consumption and/or for commercial purposes (Mishra, 2007). The literature demonstrates that the contributions of self-generated livelihoods to household poverty will depend on the context of poverty, economy and environment where all these livelihoods are practiced (Foeken & Owuor, 2008). The practice of self-generated livelihoods is predominant in developing countries where poverty is severe and deep. Indeed, it is recognized that best approach for poverty alleviation in rural areas should involve poor people's self-reliance. Theoretically, the performance of rural self-generated livelihoods depends on the geographical, environmental and economic contexts of the area and the nature of poverty that households' experience (Ellis & Mdoe, 2003). Thus, some of the contexts marginalize livelihoods to the extent that their level of contributions does not alleviate poverty particularly in developing countries such as South Africa. The purpose of this paper is to assess whether self-generated livelihoods as an intervention contributes to household poverty alleviation in rural South Africa. In order to address this purpose, the paper firstly provide theoretical perspective of dimensions of rural poverty to

provide an understanding of various causes and conditions of poverty that are experienced in rural areas. Furthermore, the types and characteristics of self-generated livelihoods which are practiced by poor rural households are discussed. Finally, the paper provides a theoretical perspective as well as South African experience of self-generated livelihoods and poverty alleviation.

DIMENSIONS OF RURAL POVERTY

Rural poverty can be defined as a state or condition in which a person or community lacks the financial resources and essentials to enjoy a minimum standard of life and well-being that's considered acceptable in society (Robert, 2005). The concept of poverty comprises various dimensions that are wide, complex and the realities of it vary between regions, countries, communities and individuals (Niehof, 2004). The poverty dimensions are material and non-material and they interact and interlink with each other in a complex manner (Robert, 2005). Poverty dimensions that are material include lack of shelter, low income and food insecurity, while non-material dimensions include vulnerability, powerlessness and gender inequality and poor economic conditions and unemployment (Kepe, 2008). The combination of both material and non-material poverty dimensions worsen the conditions of poor people in rural areas by trapping them in a poverty cycle (Niehof, 2004). In most cases, the poor lack the capacity to liberate themselves from the shackles of poverty causing the conditions of extreme poverty to persist and to be transmitted from generation to generation (Pauw, 2007).

Material dimensions of poverty

Food Insecurity is the inability to access and possess sufficient food for consumption. Part of root cause of food insecurity in developing countries relate to the inability of people to gain access to food due to a lack of land for agriculture, unfavorable climatic conditions, over-reliance on primary agriculture, low fertility soils, minimal use of external farm inputs, environmental degradation, significant food crop loss both pre- and post-harvest, minimal value addition and product differentiation, and inadequate food storage (Gentle & Maraseni, 2012). Conversely, food insecurity additionally results from stresses such as natural disasters, wars, income variations, price volatility (Scoones, 1998). The large numbers of chronically undernourished people in the world today are testimony to the food insecurity of many households. For many households, food insecurity leads to hunger, malnutrition and when extreme it leads to a partial collapse of the socio-economic order and excess mortality famine (Kang & Imai, 2012)

Low Income is when households are unable to afford their basic necessities such as food, clothing, health services and education to obtain a decent life. Poor people consistently emphasize the centrality of work to improve their lives through income. The root cause of low income is unemployment. A country's overall wealth or economic growth is an important influence on the income of individual or households (Ferreira & Lanjouw, 2001). This can be evident with the experience of South Africa, while the economy in the country was constantly growing the number of unemployed people was reduced as more job opportunities were created. Economic contraction leads to the increase and persistence of income poverty. Households experience low income due to unemployment and inability to engage in any income generating activities. Income

Lack of infrastructure and services is a common character of underdevelopment in rural areas where the majority of people affected by lack of basic necessities such as, health services, shelters, water, sanitation and education (World Bank, 2007). This lack of essential services and infrastructure in rural areas deteriorate the standard of living and make poverty to increase and persist (Sanfo & Francaise, 2012). Moreover, shortage of health services, water and good sanitation affects the health of rural people, making them vulnerable to diseases, lower life expectancy and increases infant mortality (Zezza & Tasciotti, 2010). Lack of services and infrastructure create a cycle of poverty wherein the majority of poor people are trapped in and unable to move out.

Non-Material Dimensions Of Poverty

Vulnerability refers to exposure to contingencies and stress that households are unable to cope with. Vulnerability greatly contributes to household poverty in the sense that people are easily exposed to natural disasters, economic shocks and diseases, and; they are unable to cope, often lack access to resources, both

natural and social, and political power, to reduce their vulnerability (Zezza & Tasciotti, 2010). In addition, vulnerability trap people into a cycle of poverty that leaves them in worse conditions and exposed to shocks such as climate variability and fluctuations of micro and macro economy. Furthermore, economic disparity is likely to make some individuals, communities in developing nations more vulnerable to loss of jobs, experience low income leading to low purchasing power (Robert, 2005). Some of these factors are the real causes of poverty leaving people powerless to reduce or mitigate risk or cope with shocks as they are interlinked, intercepted and influencing each other. Additionally, poor people are also exposed to risks beyond their community that affects the economy, the environment, and the society in which they live (Park, Howden, & Crimp, 2012).

The concepts of *Marginalization, Powerlessness and Gender Inequality* are very close to each other and they contribute to household poverty (World Bank, 2007). These three non-material dimensions of poverty are related to lack of resources as well as social exclusion from participation in decision making, social services and economic activities (Kepe, 2008). Rural areas are often politically marginalized more specifically women that result in high prevalence of poverty experiencing low income levels, vulnerability, voicelessness and powerlessness (World Bank, 2007; Kepe, 2008). Women are mostly affected by gender inequality, marginalization and lack of power especially those residing in rural areas of developing countries. Poor rural people have less power to take advantage of new economic opportunities or engage in activities outside their immediate zone of security. Social norms and barriers can also contribute to voicelessness and powerlessness. While local cultures have intrinsic value and can sometimes be inimical to reduce human deprivation since men are given more preference in rural areas than women in terms of resource distribution (Veldeld, Juman, Wapalila & Songorwa, 2012).

Poor Economic Conditions and Unemployment are closely interlinking concepts that thought to have direct effects on income poverty. Unemployment is a significant contributor to household poverty and impoverishes a large number of people regardless of race or gender (Kepe, 2008). Poor economic conditions compel large proportion of poor people in rural areas who are unemployed to engage themselves in livelihoods activities (mostly informal) to generate income and/or produce food for subsistence or commercial purposes (Niehof, 2004). Poor economic conditions created less employment opportunities for poor people in rural areas result in low income and poverty.

TYPES AND CHARACTERISTICS OF SELF-GENERATED LIVELIHOODS

Rural livelihoods take a variety of forms; and, they are broadly categorized as income-generating and food-producing livelihoods. Income-generating livelihoods are practiced by people to increase income of the household and widen their choices as well as their purchasing power (Carter & May, 2001). Conversely, food-producing livelihoods are established mostly by rural households who are experiencing food insecurity and possessing arable land (Lanjouw, 2001). However, people assume that livelihoods are dominating in rural areas, it has been demonstrated by various rural poverty studies that even in urban areas people are experiencing poverty and the situation compels them to establish their own livelihoods activities mainly for income generation purposes (Park *et al.*, 2012). This section discusses the two broad categories of rural livelihoods which are income-generating and food-producing to establish the models of each livelihoods category and their processes of generating income and producing food for poor households in rural areas of South Africa.

Income-generating livelihoods

Income-generating livelihoods include labour migration that generates remittance for households and businesses such as car repairing, welding, fruit and vegetable selling, livestock selling, petty cash commodity and, street hawking, spaza shop, shoe repairing and salon (Bhandari & Grant, 2007). Other businesses include supermarkets, general dealers and taverns which may be categorized under medium or small businesses depending on their annual turnover. These businesses buy products in bulk and sell them to people within the community of operation and other communities for profit. Formal businesses are thought to generate more income by selling different products such as food, clothing, and various equipment that enable owners to increase household income and alleviate poverty (Ferreira & Lanjouw, 2001). Income-generating livelihoods

such as car repairing, welding, fruit and vegetable selling, livestock selling, petty cash commodity, street hawking, spaza shop, shoe repairing and salon operate differently from each other and the levels of contributions to households varies (Zezza & Tasciotti, 2010).

Food-Producing Livelihoods

There are three broad categories of food-producing livelihoods namely: crop production, livestock farming and horticulture. Crop Production can be divided into 10 categories: grain crop, food grain legumes, seed crops, root and tuber crops, sugar crops, fiber crops, tree and small fruits, nut crops, vegetables, and forages (for support of livestock pastures and range grazing lands for hay and silage crops) (Zezza & Tasciotti, 2010). However, majorities of poor people in rural areas cultivate crops for food consumption and/or sell to generate income. These crops are cultivated in arable land on different seasons. Fiber crops, sugar crops, root and tuber crops are harvested and sold to manufacturing companies to be processed into final goods for consumption. Conversely, small fruits, nuts crops and vegetable are harvested when ready for consumption. Livestock livelihoods involve farming of cattle, pigs, goats, chickens, donkeys, and sheep among others (Rigg, 2006). Livestock are generally kept in an enclosure, fed by human-provided food and are intentionally bred but some livestock are not enclosed but are fed by access to natural foods by allowing them to breed freely (Rigg, 2006). Availability of water, good grazing lands and animal diseases are some of the factors that influence the enclosure and disclosure of animals. Livestock serve as livelihood when households sell to generate income or slaughter them to acquire food such as meat and milk (Stifel, 2010). Horticulture includes activities such as gardening of fruits, vegetable and flowers. These types of livelihoods differ in terms of characteristics, practices and their outcomes are influenced by seasons (Pauw, 2007). Fruits and vegetable gardening livelihoods are predominant in rural areas while flower gardening is common in urban areas. Fruits gardening livelihoods include mangoes, oranges, strawberry, pawpaw and grapes among others. Vegetable gardening involves spinach, onions, tomatoes, green and red peppers and potatoes. Additionally, horticulture has various sectors such as plant propagation and cultivation, crop production and plant breeding (Zezza & Tasciotti, 2010). Moreover, horticulture focuses on plant cultivation including the process of preparing soil for the planting of seeds, tubers, or cuttings (Stifel, 2010). Fruits and vegetable are cultivated, harvested, sold and/or consumed in different seasons during the year in attempt to increase household food and income. However, the practice of these livelihoods varies due to geographical location.

A THEORETICAL CONSIDERATION OF SELF-GENERATED LIVELIHOODS APPROACH

Theoretically, self-generated livelihoods are globally acknowledged as potential approaches for households' poverty in rural areas of developing countries (Carter & May, 1999). Given the adverse conditions of poverty that prevail in rural areas, livelihoods have continued to play a significant role for households in producing foods and generate income (Chianu & Ajani, 2008). Self-generated livelihoods do not only provide the household with food that would otherwise have to be purchased at the market (thus at the same time saving money that can be spent on other basic necessities), it often gives them a monetary income as well by selling some of the produced goods (Stifel, 2010). However, there is no consensus on the issue of whether food-producing livelihoods are the most appropriate strategies to fight poverty in developing countries compared to income-generating livelihoods (McDowell & Hess, 2012). Theory has demonstrated that the contributions of food-producing and income generating livelihoods vary since there are factors such as economic opportunities which provides households access to market for their products as well as creating a platform for expansion to generate more income (Machete, 2004; Asenso-Okyere, 2008).

There are factors which includes environmental that influence the performance and outputs of food-producing livelihoods. Therefore, when the environmental conditions are not propitious for certain seasons it might negatively affect the performance of livelihoods (Machete, 2004). Thus, in some rural areas self-generating livelihoods are making huge contributions to household poverty while other households are sinking deeper into poverty due to poor performance of other livelihoods (Ellis, 2000). However, recent research also indicates that rural livelihoods are now thought to be more dynamic and important than previously believed (Radeny, van der Berg & Schipper 2012; Jagger, Luckert, Banana & Bahati, 2012). Food-producing and income-

generating livelihoods are positively accepted and gained grounds as poverty alleviation strategies by copious households. Indeed, literature has demonstrated the effectiveness of livelihoods as poverty alleviation strategies as various studies globally have shown their reliability and efficiency in diminishing powerlessness and reducing poverty by providing poor people with income and food (Aguero, Carter & May, 2007).

SELF-GENERATED LIVELIHOODS AND POVERTY ALLEVIATION IN RURAL SOUTH AFRICA

The concept of livelihoods has become increasingly popular in development thinking as a way of conceptualizing the economic activities that poor people undertake in their areas. The focus of development thinking in the 1970s on economic growth and employment creation has given way to the realization that while job creation continues to be one important strategy for poverty alleviation. The reality for poor people is that survival and prosperity on household poverty alleviation depends on themselves by taking advantage of different opportunities and resources at different times (Niehof, 2004; Valdes & Foster, 2010). South Africa is regarded as middle income country; however, food and income poverty remains as a challenge to copious households particularly in rural areas. The majority of households in provinces that are predominantly rural and experiencing poverty are venturing into livelihoods activities to produce food and/or generate income.

Machete (2004) found that food-producing livelihoods are practiced purposely for household's consumption and contributes less to households' income and concluded that income-generating livelihoods are very significant as they provide poor people with various options and purchasing power. Income-generating livelihoods make significant contribution to the income of rural households in certain areas of South Africa. It is acknowledged that the performance of self-generated livelihoods vary from province to province and the type and performance of these livelihoods depends on various factors such as environmental, economic, social and rainfall patterns (Jagger, Luckert, Banana & Bahati, 2012). Self-generated livelihoods serve as a source of security and as a safety net for poor and vulnerable groups. It is argued that the availability of own-produced food for consumption provides a fallback in times of need. Thus, poor households produce more food for consumption and for commercial purposes. However, this perception of income generated from food-producing livelihoods as reliable seems misplaced, given the high-risks associated with farming in South Africa. Food production in South Africa has regularly been threatened by severe droughts, forever changing rainfall patterns as well as recurrent crop and livestock diseases (Machete, 2004). Given the risks that food production is associated with, large numbers of rural households prefer income-generating livelihoods since income provides them with a variety of choice and increasing their purchasing power (Radeny, van der Berg & Schipper, 2012). Income from self-generated livelihoods provides poor people with the opportunity to purchase adequate nutritious food that reduces their vulnerability to diseases that might lead to low life expectancy

The study by Anseeuw, Mathebula & Perret (2005) which was conducted in several rural areas in Limpopo Province including Mamone and Rantlekane, has demonstrated that food-producing and income-generating livelihoods are significant for large number of poor people particularly those who are unemployed and experiencing food insecurity. The majority of households practice income-generating livelihoods as they argue that income afford them more opportunities, options and they are able to use it for various purposes that will alleviate poverty. Conversely, food-producing livelihoods are also considered by numerous households as vital since it provides them with various types of food that in some seasons is more than enough and they are able to sell them to generate income. Theoretically, households which are overcrowded with individuals have more chance of experiencing worse conditions of poverty compared to those which have little number of members (Stifel, 2010). Large numbers of households that are overcrowded and experiencing income and food poverty are headed by females and relying on incomes from livelihoods and remittances from their spouse or family members who migrated to the cities in search of better opportunities (Aliber, 2003). As a result they are the one who experience severe poverty than those headed by males. The migration of people from rural areas in South Africa is influenced by poor economic opportunities and unemployment that they experience in rural areas. However, poor people who remain in rural areas practice livelihoods to produce sufficient food and income that increased their chance of alleviating poverty and experiencing more improved standard of living. Anseeuw, Mathebula and Perret (2005) concluded that, the role which self-generated livelihoods play is significant to the majority of poor households that are unemployed and experiencing food insecurity.

CONCLUSION

The failure or least achievements of various poverty alleviation strategies globally have pushed poor people in many developing countries to venture into different self-generated activities that could combat poverty (Blank, 1997). This paper has demonstrated variety of food-producing and income-generating livelihoods that poor households have adopted to alleviate poverty in rural South Africa. Moreover, poverty is yet been considered as a global challenge that manifests itself in various ways depending on the geographical location, environmental and economic contexts. The practice of self-generated livelihoods varies and their performance to poverty alleviations also differs as their contributions depends on the type of livelihoods households practice, outcomes and the nature of poverty that households are experiencing. The paper furthermore demonstrated that the practice of self-generated livelihoods is global and a large number of households are alleviating poverty through it. Additionally, livelihoods have reduced the dependency of poor people on the government to create opportunities for job and poverty alleviation particularly in rural South Africa. Various studies of livelihoods and poverty in South Africa have demonstrated that large numbers of poor households that engage in livelihoods manage to reduce poverty and improve their standard of living.

A HYBRID APPROACH USING ANALYTICAL HIERARCHICAL PROCESS AND CASE BASED REASONING FOR ORDER SCREENING MECHANISMS

Hwai-En Tseng and Chi-Cheng Liao
National Chin-Yi University of Technology, Taiwan

ABSTRACT

Under the customization production environment, the variation in the customized product specification often leads to problems in the enterprise such as an improper design or an uncoordinated manufacturing procedure that causes a much higher or loss. Therefore, enterprises will be able to take profits under control more precisely if they can tell whether the customer's order is acceptable and estimate the new product cost. In this study, customer's orders are evaluated by a two-stage model. First, the Analytic Hierarchy Process (AHP) is used for the initial screening of orders. In the acceptable orders, the Case-Based Reasoning (CBR) is used to pick up the case most similar to the new product case for the evaluation of product cost and price setting. At last, the PC product is used as an example to illustrate the proposed methodology.

INTRODUCTION

In the current few diverse product manufacturing environment, many enterprises have adopted the customization production strategy. In these enterprises, R&D departments are required to provide a more variety of products which not only cope with the individual customers' demands but also meet the cost and production requirements in the company. (Tseng et al., 2005). In such a customization production environment, product configuration management is a key issue. A product configuration is composed of various materials and components whose constitutions and required quantities are described in the bill of material (BOM). Tseng et al. (2005) applied the theory of case-based reasoning for the construction of product configuration. Fogliatto et al. (2012) made an overview regarding the studies on customization.

Zhang, et al. (2010) proposed an integrated order fulfillment process composed of four parts, including order processing, product configuration and process plan generation, production execution, and product delivery. During the order fulfillment procedure, many communication and coordination jobs among different sectors in a company are involved. Therefore, if we can solve the product configuration problem in the earlier stage of order fulfillment process, the burden the enterprise has to bear will be reduced. It is clear that the error rate of BOM will reduce if we can take advantage of the previous successful cases where modifications are made to cope with customized demands. In this study, the authors attempt to develop a customer order evaluation methodology under the customization environment. The customization order screen mechanisms are primarily dealt in two stages:

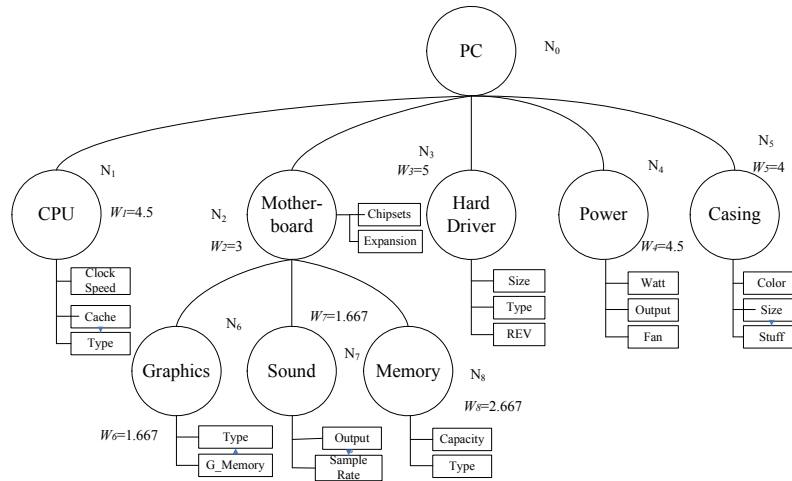

1. At Stage 1, the Analytic Hierarchy Process (AHP) is adopted for the initial order screening.
2. At Stage 2, for the accepted order, a previous case most similar will be picked up through Case-Based Reasoning (CBR).

PRODUCT FEATURES AND INITIAL SCREENING

Product Features

In this study, the product feature graph defined by product feature is used to describe the related configuration information in the customization environment. The so-called product feature represent the information property attribute such as the product form, function, quality characteristics, technical specification, and so on, which can serve as the reference for the product selection. As can be seen in Figure 1, the example of computer parts (<http://tw.asus.com/Desktop/Gaming/CG6191/>), the parent-child hierarchical relationship in the tree structure can express the relations between nodes and their sub-nodes. The nodes represent parts/ sub-assembly and N_i represents their part numbers. Feature attributes are terms used to describe the product characteristics. In the example of PC parts, the product features of PC to be chosen are nine modular parts and 20 features. And a code of CG6190 may be given after the identification of the order.

Figure 1: Product feature tree for PC

Initial Screening of Order

In this study, AHP is used for the initial screening of order. The steps is briefly listed below:

1. Set up the hierarchical structure according to the decision criteria and alternatives of the problem.
2. If there are n elements under the criteria, set up a $n \times n$ pairwise comparison matrix A.

$$(1) \quad A = \begin{bmatrix} 1 & a_{12} & \cdots & a_{1n} \\ a_{21} & 1 & \cdots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{n1} & a_{n2} & \cdots & 1 \end{bmatrix}$$

The values in Matrix A represent the relative importance between element i and element j . $a_{ij} = 1/a_{ji}$, and $a_{ij} > 0, i \neq j$.

3. The Maximized Eigenvalue (λ_{\max}) and its responding Eigenvector can be generated from the pairwise comparison matrix. The eigenvectors are generated from the normalization of the row average where the column elements are added and then normalized.

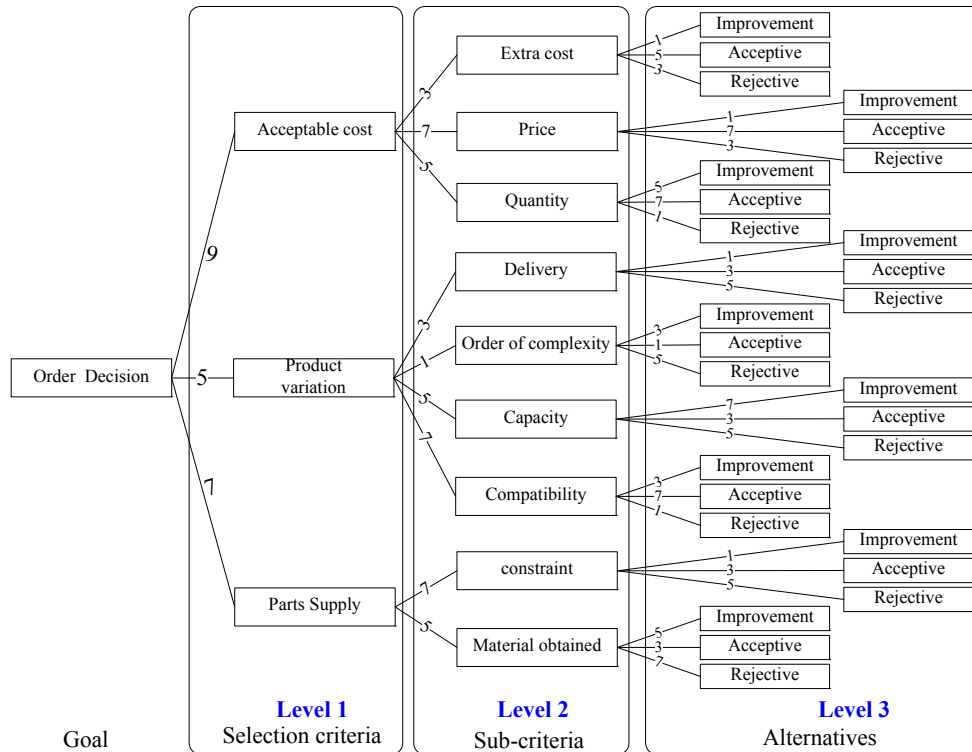

$$(2) \quad w_i = \sum_{j=1}^n a_{ij} / \sum_{i=1}^n \sum_{j=1}^n a_{ij}, i, j = 1, 2, \dots, n.$$

The paired comparison matrix A is first multiplied by the eigenvector W to obtain a new vector W' (Formula (3)). Each W' is then divided by the original corresponding vector. At last, λ_{\max} can be obtained by Formula (4).

$$(3) \quad \begin{bmatrix} 1 & A_{12} & \dots & A_{1n} \\ 1/A_{12} & 1 & \dots & A_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ 1/A_{1n} & 1/A_{2n} & \dots & 1 \end{bmatrix} \times \begin{bmatrix} W_1 \\ W_2 \\ \vdots \\ W_n \end{bmatrix} = \begin{bmatrix} W'_1 \\ W'_2 \\ \vdots \\ W'_n \end{bmatrix}$$

$$(4) \quad \lambda_{\max} = \frac{1}{n} \left(\frac{W'_1}{W_1} + \frac{W'_2}{W_2} + \dots + \frac{W'_n}{W_n} \right)$$

Figure 2: Hierarchical structure for the PC order

4. Check the consistency. It is quite often that the strategy makers are not consistent in the pairwise comparison; therefore, a Consistency Index (C.I.) and Consistency Ratio (C.R.) are used to check whether there is the inconsistency phenomenon. Formula (5) and (6) illustrate the calculation of consistency:

$$(5) \quad C.I. = \frac{\lambda_{\max} - n}{n - 1}$$

$$(6) \quad C.R. = \frac{C.I.}{R.I.}$$

In which n is the number of criteria; λ_{\max} the maximize Eigenvalue; from different hierarchies of criteria matrix, different values of C.I. can be obtained, called Random Index (R.I.) whose values vary with

different numbers of n , as can be seen in the article by Saaty (1980). Through a group discussion, the evaluation criteria for the order of PC is listed in Figure 2.

Based on the selection criteria, the strategy makers set up the scores to evaluate the priority of the alternatives. At last, AHP method is used to generate the final priority of alternatives. The calculation of details is shown in Liao (2011). Consequently, according to the order specification of CG6190, it is suggested that the strategy makers adopt the strategy of order acceptance.

TWO-LEVEL WEIGHT AND CBR DESIGN

In the database of CBR, a two-level weight design is used to handle the feature tree in Figure 1. In this figure, a node is composed of nodes in its child layer and their feature attributes, the heterhomogeneity between the modified product and the old product can be generated from the two-level weight design algorithm.

(1) Calculate first level weights: Based upon the product feature units under each node, the decision maker can calculate the weights for product features using AHP method according to their relative importance.

(2) Calculate second level weights: This is designed according to the number of variance of feature attributes in each node and the hierarchical relationship among nodes.

The process of the weight for first level CBR is similar to Quality function deployment (QFD), originally designed to investigate the relationship rating between customer requirements and design conditions (Park et al., 1998). In this study, three levels of 1, 5, 9 are used to represent weak relationship, moderate relationship, and strong relationship respectively. The Absolute Importance Rating (AI) is calculated from (7):

$$(7) \quad AI_j = \sum_{i=1}^m W_i R_{ij}$$

AI_j : the absolute importance rating of a product feature, $i=1, \dots, m$.

W_i : weight for product feature, $i=1, \dots, m$ (calculated from AHP, refer to Table 10).

R_{ij} : the relationship rating between selection criteria and product feature, $i=1, \dots, m, j=1, \dots, n$.

m : number of the selection criteria for order.

n : number of product features.

Accordingly, the Relative Importance Rating (RI) can be calculated from the Absolute Importance Rating as Formula (8).

$$(8) \quad RI_j = \frac{AI_j}{\sum_{k=1}^n AI_k}$$

Formula (9) is used to calculate the second level weights of nodes W_i

$$(9) \quad W_i = [N_i / level]$$

W_i : weight of node.

i : code of node.

N_i : number of variants in each node.

Level: the hierarchy in the BOM tree structure; in the study, the level of root node is set to 1, and 1 is added for each layer from top to bottom.

INTEGRATED FRAMEWORK AND CBR ALGORITHM

The CBR algorithm for product specification is illustrated in Figure 3. Steps are described as follows:

Step 1: The customer selects the product specification according to the product configuration the company offers.

Step 2: The weights can be obtained through AHP method.

Step 3: Calculate two level weights. The first level deals with the weights of product features and the second level deals with the weights of part modules.

Step 4: Pick up the case whose similarity is highest from database.

Step 5: Estimate the order cost from the most similar case.

By CBR, several cases of highest similarity will be compared and retrieved from the case library. If f_{ij}^I represents the j th feature of i th clusters of nodes in the input Case (I), f_{ij}^R represents the j th feature of i th clusters of nodes in Case Library (R), and $S(f_{ij}^I, f_{ij}^R) \in [0,1]$ represents the function of similarity, a similarity of 1 will be assigned if $f_{ij}^I = f_{ij}^R$ and a similarity of 0 will be assigned if $f_{ij}^I \neq f_{ij}^R$. With the similarity coefficients and comparison algorithm, a case closest to the customized order can be retrieved from the library database.

$$(10) \quad S_{N_i} = \sqrt{\sum_{j=1}^n w_{ij} S(f_{ij}^I, f_{ij}^R)}$$

$$(11) \quad S_{I,R} = \frac{\{\sum_{i=1}^m W_i S_{N_i}\}}{\sum_{i=1}^m W_i}$$

In Formula (10), the calculation of w_{ij} comes from the first level weight and in Formula (11), W_i is generated from the second level weight, $i=1$ to m . The Variable Cost Rate (VCR) is calculated by Formula (12).

$$(12) \quad VCR_j = \sum_{i=1}^m w_i \times CR_{ij}$$

w_i : the i th weight for product feature cost.

CR_{ij} : the Cost Rate of the i th feature of j th nodes, adapted by Martin and Ishii (2002).

m : the total number of product features.

The new product cost is calculated by the following formulas:

$$(13) \quad NC_j = CC_j \times (1 + VCR_j)$$

$$(14) \quad NC = \sum_{j=1}^n NC_j$$

NC_j =the new case cost of j th Node modules.

CC_j =the Case Cost (CC) of the j th Node modules.

A PRACTICAL EXAMPLE

In this study, the PC example illustrated in Figure 1 is used to illustrate the algorithms and Boland C++ was used for the programming. The programming performs under the following specifications: Microsoft Windows XP system, Intel(R) Pentium(R) 4 CPU 3.60GHz, Memory 1526MB. The algorithm is listed below:

Step 1 Discuss the specification and confirm the final order.

Step 2 Conduct the initial order screening. As a result, accept the order under the code of CG6190.

Step 3 Calculate two level weights.

Figure 3: Flow chart of product specification and cost setting

- Step 4 The output of comparison is shown in Figure 4, where the circular nodes indicate the node modules, and rectangles indicate the feature nodes. When the feature nodes are identical in the comparison, the same features and node modules will be in a colorless way. In Figure 4, (a) CG6145 and (b) CG6190 are different in nodes of CPU, Hard disc and Memory, so these nodes are of gray scale and their corresponding feature nodes are filled in black. When the customized product CG6190 and a case in the library, CG6045, are picked for comparison where the dark gray parts indicate their differences.
- Step 5 Estimate the order cost. The cost variation rate (*VCR*) is listed in Table 1. Add 1 to the cost variation rate and then multiply by the cost of modules of CG6145 and we can get the final cost of the customized product. $NC = NT\$24583.51$.

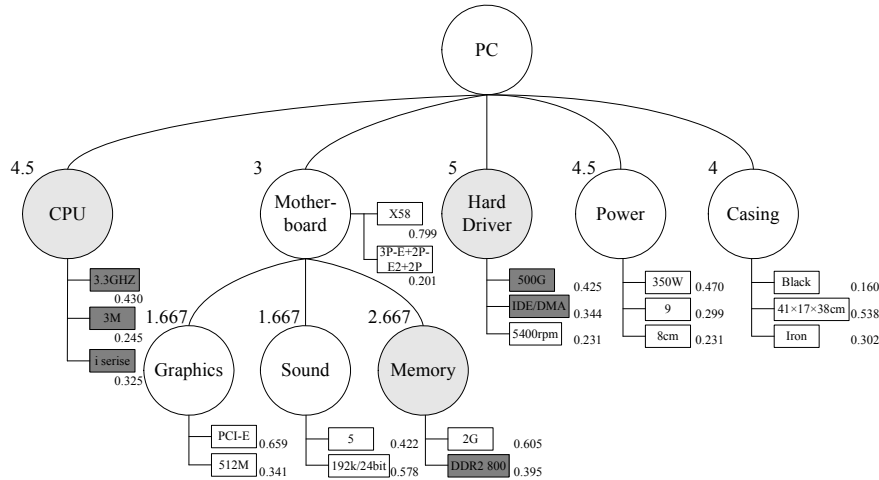

Figure 4: Differences in product features of the most similar case CG6145

Table 1 lists the estimate of new product cost. The total cost of the case CG6145 is NT\$20790. And the cost variation of CG6190 required from the customer's order will have a total cost of NT\$24583.51. If a 10% of profit policy is made, the set price for the PC will be $24583.51 \times (1 + 0.1) = NT\27041.861 .

Table 1: New product cost calculation

Modules Part features			cost weight	CPU	Mother board	Sound effect	Memory	Hard disc	Graphics	Power	Casing	Cost (NT\$)
				3900	2800	2250	2400	2350	3190	2000	1900	20790

New product cost (NC)			6247.78	2800	2250	3062.8	3133.6	3190	2000	1900	24583.51

CONCLUSIONS

In the customized environment, accepting the wrong order will cause enterprises to fall into a hard situation in R&D, production and quality control. To solve such kind of problem, a more objective evaluation at the signing of order contracts is necessary. A two stage methodology for the solution is proposed in the study. In this study, AHP is first used to select orders, which are divided into acceptable, rejected, and revised ones. At second stage, two-level weight calculation and techniques related to Case-based Reasoning are adopted for the comparison of cases in the library on the basis of product feature tree structure. With these evaluation methods incorporated, strategy makers will have more sufficient information for the screening of customer's orders.

SOUTH AFRICA IN BRICS AND THE GLOBAL AGRO-FOOD SYSTEMS: CONVENIENCE OR PRAGMATISM?

Johannes Tsheola & Phophi Nembambula
University of Limpopo, South Africa

ABSTRACT

Together with the Next-11 (N-11) grouping, BRICs was identified by Goldman Sachs as one of the two conglomerations of emerging economies on account of the large population sizes of the countries in question. In a somewhat hyperbolic way, the BRICs of Brazil, Russia, India and China was heralded as one of the future growth centres with potential to stimulate increased income elasticity of demand for a wide range of commodities, including food. That is, buying power and global capital interests, rather than practical challenges facing member states, were paramount in the conception of the BRICs. Given their large populations and attendant potential to expand buying power, China, India and Russia were recently forecast to be on the verge of substantially increasing their expenditure on imported agri-food. The paper concludes that South Africa's self-selection and ceding of membership of the BRICS is for conceptual convenience rather than a pragmatic strategic option to gain capabilities necessary for resolving domestic food insecurity challenges.

INTRODUCTION

The significance of the power of emerging markets (re)structuring global governance has been increasingly recognized over the previous decade, with China, India, Brazil, South Africa and Mexico, self-described as the G5 of “big emerging states” (Cooper, 2009). But the G5 was overshadowed by the now famous BRICs, conceived by Jim O'Neill of the Goldman Sachs in 2001 to club together Brazil, Russia, India and China on the assumption that as the economic growth in developed countries slowed down and that for developing countries continuing to be more rapid, increasing attention and global growth prospects would be focused on these emerging markets (Armijo, 2007; Cooper, 2009; Haq & Meilke, 2009a, 2009b; Tandon & Shome, 2009; Wilson, Kelston & Ahmed, 2010; Bell, 2011; Kimenyi & Lewis, 2011; Shaik & Narain, 2011; Cairns & Meilke, 2012). The BRICs is one of the two groupings of emerging economies identified by the Goldman Sachs since 2001; and, the second one identified in 2005 is named the Next-11, consisting of Bangladesh, Egypt, Indonesia, Iran, South Korea, Mexico, Nigeria, Pakistan, Philippines, Turkey and Vietnam (Haq & Meilke, 2009a, 2009b; Tandon & Shome, 2009; Page, 2011). South Africa was not part of the original conception of the BRICs nor the Next-11, because the two groupings were primarily selected on the basis of having large populations (Cairns & Meilke, 2012) with four core factors (macro stability, institutions, openness and education) that create the conditions necessary for achieving the growth as forecast (Bell, 2011). Instead, South Africa was included in the “self-described G5” of “big emerging states”, characterised by Cooper (2009) as the B(R)ICSAM. But the BRICs and Next-11 were heralded as the future growth centres with the potential to stimulate increased income elasticities of demand for a wide range of commodities, including food (Cairns & Meilke, 2012).

Whereas the acronym remained famous over the past decade, with South Africa ceding membership, “the strength of the BRICS weakened as the members displayed differential rates of growth in most macro indicators” (Tandon & Shome, 2009, p.273). One of the four factors that Goldman Sachs reported as core to the creation of conditions for the BRICs to achieve the growth predicted, is the adoption of economic freedom policies for “openness, specifically to trade and foreign direct investment” (Bell, 2011, p.20). Studies of income elasticities of import demand for agri-food products establish that the import behaviour of the BRICs and the N-11, as groups, is similar to that of other low-, middle- and high-income countries (Haq & Meilke, 2009a, 2009b;

Cairns & Meilke, 2012). These groupings do not show potential of transforming the global agri-food trade and agro-food systems and networks. In these two groupings, Cairns & Meilke's (2012) import demand model forecasts that only China, India, Indonesia, Russia, South Korea and Vietnam have the income and population capacity necessary to substantially increase expenditure on imported agri-food products. This eventuality would entail increased global food prices as the six countries expand their income elasticities of import demand for agri-food products. Given that South Africa is already a food importer, ceding membership of BRICS cannot be expected to create downward pressure on global food prices. Whereas South Africa is largely food insecure, its food production for exportation is severely limited and its income elasticity of import demand for agri-food products is statistically close to zero, amidst evidence that the potential of the BRICS influencing the global agri-food trade and agro-food systems is virtually non-existent (Haq & Meilke, 2009a, 2009b; Cairns & Meilke, 2012).

From the food security/insecurity perspective, South Africa's ceding of BRICS membership appears to be for sentimental convenience than pragmatism. The expectation that the BRICS states would adopt economic freedom policies for crossvergence (conforming, static or deviating) would in the final analysis enforce global openness. Cooper (2009) observes that whereas the BRICs share some common characteristics in their diplomatic styles, member states have been more marked for their differences, such as geographic location in dissimilar regions, unique historical circumstances and individual uniqueness, rather than a sense of collective identity. The inclusion of South Africa in BRICS should, therefore, provide for more traction to this observation. South Africa has experienced deficits in production and consumption of energy-intense foods, such as meat (Altman et al., 2009; Makhura, 2013). Using the 2005 National Food Consumption Survey (NFCS), Labadarios et al. (2008) estimate that 52% and 33% of South African households experienced hunger and risk of hunger, respectively. It is extrapolated from the NFCS that about 80% of households could not afford a basic nutritional basket of food at an average cost of R262 per person per month at the 2005 prices (Labadarios et al., 2008; Altman et al., 2009). Upward pressure on global food prices that could be precipitated by the expansion of income elasticities of demand for agri-food imports by some BRICS states would exacerbate South Africa's domestic food insecurity questions should be raised: is South Africa's ceding of membership of the BRICS for conceptual convenience or pragmatism? This question follows-up on Haq & Meilke's (2009a, p.3; 2009b, p.3) enquiry whether the changes in the global economic landscape precipitated by the entry of the BRICs "have the potential to change traditional patterns of global agri-food trade?" According to Cooper (2009: n.p), the BRICS is "more striking for its declaratory than operational force"; instead, it "sets up a scenario in which the relationship between the West and a big state component of the Rest is based on competition not cooperation". From the agro-food systems and agri-food trade perspective, there can be no competition because the very essence of the hyperbolic conception of the BRICS is grounded in four of its member states becoming elastic markets for agri-food imports from developed economies. The potential to precipitate increased demand for agri-food imports and, by implication, upward pressure on global food prices, renders South Africa's BRICS membership highly questionable given recent experiences of soaring food prices. Given that the BRICS would most likely evolve through combinations of conformity, static and deviating crossconvergence in different spheres, this grouping cannot be tenably expected to create competition that would reduce global food prices for emerging economies.

The supply-and-demand economic logic dictates that an increase in demand of commodities almost always precipitates upward pressure on prices under economic freedom policies, which are prescribed as core for the BRICS success. Recent drastic rise in food prices, together with the reality of excessive levels of vulnerability to food insecurity, should raise eyebrows about South Africa's motive for securing membership of the BRICS. This paper argues that the BRICs would not create capabilities to transform the global agro-food governance. The same logic of the BRICS success of more rapid growth, income elasticities of demand of agri-food imports of some member states, supports global capital interests and increased exportation from developed economies. The paper shows that one of the major practical challenges facing South Africa is the soaring food prices precipitated largely, if not exclusively, by the dynamics of the global agro-food systems and the discrepancies between capital accumulation and social regulation, exacerbated by supermarket chains expansionism into remote rural areas. The paper deduces that South Africa's membership of the BRICS exacerbates the severity of the exposure to a variety of global gyrations, including commodity price fluctuations, eloquently evidenced by the abrupt March 2013 80c increase on a litre of petrol. The paper concludes that South Africa's self-selection and ceding of membership of the BRICS is for conceptual convenience rather than for pragmatism as a necessary strategic option to gain capabilities for resolving domestic food insecurity challenges.

THE BRICS AND NEXT-11 IN THE GLOBAL AGRO-FOOD SYSTEMS AND AGRI-FOOD TRADE

The 2001 Goldman Sachs' conception of the BRICs, consisting of the four emerging markets of Brazil, Russia, India and China "that would become increasingly important in the world economy" (Haq & Meilke, 2009a, p.2; 2009b, p.2), did not include South Africa. The first BRICs summit in June 2009 in Russia on financial matters revealed a greater appreciation of this grouping's geo-political implications (Cooper, 2009; Tandon & Shome, 2009). The CIGI extended and accentuated the BRICs concept to encompass diplomacy by inclusion of Mexico and South Africa, to coin BRICSAM (Cooper, 2009). In the Goldman Sachs' *"Dreaming with the BRICS: the path to 2050"* and the follow-up of May 2010, respectively, Wilson & Purushothaman (2003) and Wilson, Kelston & Ahmed (2010) express hyperbolic projections of the potential of the BRICs states to dominate the global economy by, among other things, comparison with the G6 of France, Germany, Italy, Japan, United Kingdom and the United States. Conversely, Cooper (2009) raises concerns with BRICS' external and internal "club" competitions, respectively, between G8 and G20 as well as G8 and G5. Whereas all the BRICS states are members of the G20, only Russia belongs to the G8. However, as captured by Cairns & Meilke (2012, p.3), it is assumed that,

"The combination of higher economic and population growth in the N-11 and BRICs, coupled with a larger proportion of income spent on food in developing countries ... could translate into significant increases in expenditure on agri-food. The anticipated increase in agri-food expenditures has the potential to increase agri-food imports as consumers begin to diversify their diets and/or if domestic food production rises slower than consumption – an important development for major agri-food exporters facing stagnant growth prospects in developed country markets. In short, there may be gains to be had by agri-food exporters targeting these developing markets ..."

According to Haq & Meilke (2009a, p.11; 2009b, p.14) economic freedom policies "increase the importance of economic growth in expanding global agri-food trade". Rapid economic growth in emerging markets is expected to increase expenditures on imports of agri-food products because "income is an important determinant of trade in middle and high-income countries" (Haq & Meilke, 2009a, p.12; 2009b, p.14).

In their study, Haq and Meilke's (2009a; 2009b) estimate the impact per capita income growth of agri-food products trade using data for 52 countries and 20 agri-food products for 1990 to 2006. Cairns & Meilke (2012) use the import demand model to examine the influence of income on agri-food imports per capita expenditure in 63 countries and find that the BRICs and the N-11, as groupings, do not conduct imports differently from other low, middle, or high income countries. Of the N-11 and BRICS states, only China, India, South Korea and Vietnam were found to have significantly larger expenditure elasticities (Cairns & Meilke, 2012). Haq & Meilke (2009a; 2009b) find that the income elasticities of import demand for China, Russia and Brazil are more than that for India, which is "statistically equal to zero", in spite of the latter's economy growing faster than that for Brazil. The forecast growth of China, Russia, Brazil and India could potentially increase demand on food importation from developed countries, with the result that upward pressure on global food prices could be sustained, notwithstanding the realization of this grouping's ideals. That is, the gains for the agri-food exporters from the developed economies with the expansion of the agri-food expenditure in some of the BRICS and the N-11 states would involve two significant implications for emerging markets. First, the increased demand on the agri-food would precipitate upward pressure on global food prices. Second, targeting emerging markets by agri-food exporters from developed economies could undermine the domestic agro-food systems and agricultural development potential for food self-provisioning in emerging economies. Notwithstanding the startling appreciation of potential performance of the BRICs, Haq & Meilke (2009a; 2009b) question the potential of this grouping in impacting transformation of global agri-food trade and imposing downward pressure on global prices.

The 2008 global slowdown has indeed affected all economies, including those of the BRICs and the N-11 (Tandon & Shome, 2009). The probability of the global food price hikes remains realistic with the increased demand for agri-food imports and income elasticity, to which some BRICS and N-11 states would contribute hugely, if the economic growth forecasts (Wilson and Purushothaman, 2003; Wilson, Kelston and Ahmed, 2010) of the Goldman Sachs are realised. Whereas finding that "the income elasticities of import demand are higher in

middle-income countries than in high-income countries”, Haq & Meilke (2009a; 2009b) conclude that the elasticity estimates are greater only in China and Russia. Of the N-11 and the BRICS states, Cairns & Meilke (2012) forecast that the capacity of income and population growth to substantially increase imported agri-food products expenditure is discernible only in China, India, Indonesia, Russia, South Korea and Vietnam. China, Russia and India are the three core BRICS states. Logically, if the BRICS realises crossvergence of any form (conforming, static or deviating), it would still not resolve the challenge of soaring global food prices because these three member states and Brazil would potentially increase demand for agri-food imports and income elasticity due to their expanding populations.

Compared to the N-11, the BRICS is evidently weaker on the global stage. From both the income elasticity model and correlation statistics, the BRICS is found to be weaker and incapable of changing the import demand for global agri-food products trade (Haq & Meilke, 2009a, 2009b; Tandon & Shome, 2009; Cairns & Meilke, 2012). That is, as a grouping the BRICS would hardly be a bargaining tool to exert downward pressure on global food prices. Hence, Tandon & Shome (2009, p.275) conclude that analysis of correlation of the macro economic variables show that “the BRIC nations which were started as a common entity with similar trends in most macro-variables is no longer showing much unison”. There can be no hope that the BRICS would be able to transform the global agro-food systems and networks; importantly, Tendon and Shome (2009: 276) demonstrate with evidence that “the strength of the BRIC economies as a sustainable entity in the future is perhaps weaker”. Cooper (2009: n.p) sums the BRICS health as a grouping thus:

“In many ways, nevertheless, the BRICs are more interesting for their differences than their similarities. Brazil and India are robust democracies. Russia is a managed democracy. China is a one party state. India has a fast rising population. Russia is in serious demographic trouble with a sharply reduced life expectancy. Brazil and Russia are resource rich. India and China are resource dependent”.

That is, the capability for the BRICS states to attain conforming crossvergence in diplomacy is tenuous; and, the potential for the grouping to constitute an amalgamation bloc for agro-food systems and agri-food trade bargaining is negligible. Whereas the direct involvement of corporate agro-food capital in the farm production sector was limited, their indirect influence was exerted “through networks of marketing contracts, technical services and credit arrangements with independent farm businesses” (Whatmore, 1995, p.43). By the mid-1980s, the fiscal costs of maintaining the institutional foundations of the global agro-food system, especially its mode of food production, distribution and consumption, escalated dramatically because of a combination of financial interests in the agro-food sector, speculative trading in agricultural futures and corporate investment strategies (Whatmore, 1995). Consequently, the cumulative impact of these networks of the “off-farm” sector of industrialization of agro-food system was to compound the crisis in the industrial agro-food system, which has persisted globally (Whatmore, 1995).

GLOBAL AGRO-FOOD GOVERNANCE: CAPITAL ACCUMULATION AND SOCIAL REGULATION

The post-war restructuring of the agricultural production involved adoption of capital intensive farming methods, deep integration into the global networks of agro-technology and food industries through the “ties of technological dependence, debt and production contracts”, as well as highly skewed differentiation of food consumption (Whatmore, 1995, p.46). Equally, hegemonic neoliberalism purported global agro-food markets as practicable governance for the rural poor too, if the state allows market pricing mechanism to function without impediments (Jacobs, 2009). In practice, capital accumulation and social regulation coalesced into a nexus of global agro-food governance, which emphasises the agro-food sector restructuring dynamics generated by private sector search for profit and the state’s concerns with securing social order (Whatmore, 1995).

Capital Accumulation

Capital accumulation restructuring of global agro-food governance involves the “social, economic and technological ties between three sets of industrial activities”: those for food raising and farming as a rural land-use; agricultural science, technological products and services to farming; and, food processing and retailing (Whatmore, 1995, p.38). To this extent, “globalization of the industrial agro-food system” is metaphorically portrayed “as a lattice, or network, of locally embedded nodes in which transnational corporate agro-food capital

strategies are variably, rather than uniformly, articulated with farmers (and consumers) through specific regional compromises and institutions, and sectoral regimes” (FitzSimmons, 1990 cited in Whatmore, 1995, p.46-47). The interstices of these networks, rather than being “black holes” of the global agro-food governance, are “tangential spaces” and “sites of alternative strategies which build on traditional production practices centered on subsistence and ‘informal’ market networks, or are bound up with new social movements associated with non-agricultural or non-food issues” (Whatmore, 1995, p.47). The wider reorganization of capital accumulation involved deregulation and liberalization of the agricultural market environment into one riddled with frequent shocks and volatile food prices (Jacobs, 2008). A hegemonic discourse now serves capitalist class interests by overemphasizing that “private property and capital accumulation are essential to economic growth” (Gill, 1993 cited in Peet, 2002, p.57). Domestically, therefore, the integration of smallholder producers into the deregulated free markets exposes them to increased risks and uncertainties (Jacobs, 2008). Shocks operate synergistically with the prevailing structural conditions of globalised agro-food systems to sustain food insecurity and, at times, to deepen it. The ascendancy of agro-food markets has, as a result, meant that virtually all staple foods are priced according to the liberalized global pricing regime wherein “the instabilities of global prices” are transmitted directly into “domestic price fluctuations” (Jacobs, 2008, p.6). Simultaneously, capital-intensive commercial producers profit from the liberalised agricultural markets whilst smallholder producers and informal traders are squeezed out of business (Jacobs, 2008). The potential for four of the BRICS member states to create upward pressure on global agri-food prices and to erode domestic self-provisioning in the emerging economies cannot be discounted.

Social Regulation

If gaining wage income is a key route through which households escape hunger and malnutrition (Aliber, 2009), then food insecurity cannot be understood in isolation from other developmental questions such as social protection, sources of income, rural and urban development, changing household structures, health, access to land, water and inputs, retail markets, or education and nutritional knowledge (Altman et al., 2009), all of which are mediated through macro-policies and state interventions or lack thereof. Social regulation focuses on the role of global agro-food governance in the wider institutional fabric of politics and policy processes applied by nation-state or supra-national agencies to underpin agricultural markets through regulation of terms of trade and the food component of wage costs (Whatmore, 1995). Forecast of the BRICS growth is predicated on the adoption of economic freedom policies, which entail global openness, commonly associated with the curtailment of state activism for social regulation (Tsheola, 2013).

Capitalism “operates mainly through markets” with the “‘free markets’ form of speculation on stock exchanges, currency, and futures markets”; for these reasons, neoliberal development is “utterly unsuited to the conditions prevailing in post-apartheid South Africa” (Peet, 2002, p.59, 59, 65-66). Based on the principle of market efficiency, the global networks of agro-food accumulation have excluded rural agricultural products deemed to be marginal to the predominant mode of consumption, out of the “food regime” and “commodity chain” (Whatmore, 1995). Increasingly, “the language of ‘choice’ is at odds with ... widespread realities of food scarcity and uncertainty by those without the money-income to secure their basic needs through the market”, especially in emerging economies (Whatmore, 1995, p.36). In practice, the potential for BRICS as a grouping to transform the global agri-food trade patterns and the agro-food industry remains undetermined (Haq & Meilke, 2009a, 2009b; Cairns & Meilke, 2012). Haq & Meilke (2009a; 2009b) conclude that China and Russia strongly support the proposition that emerging economies are the agri-food import growth markets of the future. But the realization of this potential could simultaneously agitate for soaring global agri-food prices. Perhaps, the most adversarial, dramatic and long-lasting impact of the prominence of the global agro-food industrial governance has been the reorientation of the entire food production capacity of emerging economies away from staple foods to exportation crops and products (Makhura, 2013). Much agricultural production in emerging economies has increasingly been vertically tied into Western markets for unseasonal, luxury primary goods and bulk feed crops for intensive livestock production (Whatmore, 1995; D’Haese & Van Huylenbroeck, 2005; Makhura, 2013). Expansion of income elasticity of demand for agri-food imports in China, Russia, Brazil and India would most probably be satisfied by exports from developed economies, thereby deepening the undesirable vertical relations.

Food security for the majority of rural households in developing countries is a function of purchasing power, the ability to earn off-farm cash income and the food prices, which are determined by marketing efficiency and

distribution systems (Baiphethi & Jacobs, 2009). Inevitably, the calorific and food intake among poor rural people dropped as global food prices escalated, precipitating experiences of hunger, malnutrition and food insecurity. The 2007 global food price crisis caused a sharp increase of food insecure people in the world from 900 million to 1 billion (Labadarios et al., 2008; Aliber & Hart, 2009; Altman et al., 2009; Food & Agricultural Organization, 2009). By 2005 already, over 790 million people in emerging economies, mostly in Africa, and 34 million in developed economies experienced malnutrition, largely because they did not have enough food to eat (Oldewage-Theron et al., 2006). Additionally, there were 150 million malnourished children, 32 million of whom were in Africa (Oldewage-Theron et al., 2006). The potential of the four BRICS states' income elasticities of demand for agri-food imports from developed markets would exacerbate this impending crisis for emerging economies such as South Africa.

Appropriationism and Substitutionism of Food Products

The primary purpose of capitalist restructuring and industrialisation of the agro-food system was, therefore, to reduce “dependence on agro-food accumulation on ‘nature’” and to increase “the market size and value of agro-food products” (Whatmore, 1995, p.41-42). To this extent, commercialisation of agriculture involved “technological modification of biological processes in farming itself” as well as valorization of agricultural products “‘off-farm’ in the manufacture of technological farm inputs and the increased processing and packaging of food products after they have left the farm”, which grew through processes of appropriation and substitution (Whatmore, 1995, p.42). These processes exclude and undermine the rural poor’s food self-provisioning systems. Through appropriationism, elements that were once “integral to the agricultural production process” are extracted and transformed into industrial activities; and, are ultimately reincorporated into agriculture as inputs (Whatmore, 1995, p.42). Simultaneously, substitutionism reduces agricultural products to industrial inputs and replaces them by “fabricated or synthetic non-agricultural components in food manufacturing” (Whatmore, 1995, p.42). In the process of industrialisation of agro-food systems, most emerging economies were converted into net importers of “staple and processed foodstuffs” from Western economies (Whatmore, 1995). Fundamentally, the BRICS is founded on forecasts of increased consumerism and perpetuation of this status quo. Just like the economic system that informs its underlying assumptions (see Orrell, 2010), the global agro-food system is uneven and unstable, riddled with overlapping crises of production, regulation and legitimation which have adversarial consequences on food security status at all geographic scales (Whatmore, 1995). Recent hikes in food prices and changes in the global food situation (Hart, 2009) affirm interconnectedness with the volatility of foreign exchange rates, the import parity pricing, lack of tradability of locally produced food staples and variability of domestic production in escalating food insecurity. In South Africa too, “the ability to access food is strongly influenced by the broader context ... and (agro-food) systems or networks” (Hart, 2009, p.366).

To be precise, global deregulation of agricultural markets and withdrawal of agricultural subsidies have increased vulnerability of poor households to food insecurity (Drimie 2005; Jacobs 2009; Makhura, 2013). Despite deeply valuing farming and food self-provisioning, rural households are increasingly forced to seek for non-agricultural income sources due to the proliferation of cash needs (Drimie, 2005; Jacobs, 2009). Whereas the “articulation between farming and corporate sectors of the agro-food system” is complex and contested (Whatmore, 1995, p.45), bio-fuel production introduced new drivers of global food prices involving the reallocation of resources and outputs to the supply of feedstock, speculation in commodity markets and the power of agents within the agro-food chain, namely supermarkets, processors and distributors (Altman et al., 2009). For these reasons, household purchasing power is dependent upon market integration, pricing and marketing, that are intricately embedded with complex configuration of society, both historically, culturally, socially, economically, politically and geographically (Webb et al., 2006; Devereux, 2009; Drimie & Casale, 2009; Hart, 2009). Rural South Africa too is embedded with these longstanding, yet highly volatile, systems and networks of agro-food globalism, wherein household access to adequate food increasingly depends on the functioning of food markets and distribution systems rather than only on total agro-food output (Aliber & Hart, 2009; Altman et al., 2009). South Africa has deregulated maize, wheat and fruits production, marketing and distribution (Jacobs, 2008); and, the BRICS grouping would not create a supra-national agri-food trade and agro-food systems bloc to leverage power on global prices.

FOOD SECURITY CHALLENGES IN SOUTH AFRICA AND COMMODITY PRICES

Whereas there is no single universally regularised meaning and measure of food insecurity, (Altman et al., 2009), the majority of rural households in emerging economies such as South Africa have given up the fight against under-nutrition by placing greater emphasis on avoidance of hunger through intake of more grain products than energy-intensive foods (Drimie, 2005). Within the globalized agro-food systems, households' purchasing power, which is dependent on markets, marketing and pricing, is one of the key requirements to accessing nutritious food because it creates the possibility of meeting the dietary needs and preferences for healthy and active life (Webb et al., 2006; Devereux, 2009; Drimie & Casale, 2009). Most rural households in South Africa that previously achieved food self-provisioning through subsistence production have increasingly purchased most of their foods, just like the urban populations, from the market, consisting of about 90% of their supplies in some cases (Baiphethi & Jacobs, 2009). Simultaneously, upward pressure has been exerted on food expenditure of poor rural households, reaching between 60% and 80% of total household income (Baiphethi & Jacobs, 2009; Aliber, 2009). A Report by Oxfam, entitled *Growing a Better Future: Food Justice in a Resource-Constrained World* projects that the price of maize would likely increase by 180%, which would exacerbate the demand for increased food budgets in sub-Saharan Africa where already calorific intake is the lowest in the world (Tolsi, 2011, p.7). Raj Patel argues that the South African government has "made poor choices in its agricultural policies" which expose poor rural households to higher food prices (cited in Tolsi, 2011, p.7). Membership of the BRICS would not reverse this policy status because the founding conceptual justification identifies adoption of economic freedom policies as one of the core factors necessary for these states to grow more rapidly in the future.

Evidence show that, along with deregulation, the contribution of the agricultural sector to South Africa's Gross Domestic Product (GDP) declined from 20% in 1912 to about 3% in 2012 (Makhura, 2013). Whereas this shrinkage is more relative than absolute, the drop in the number of commercial farmers from 40 000 in 2007 to about 37 000 in 2012 (cited from Agricultural Census and Statistics South Africa, in Makhura, 2013) cannot be discounted as inconsequential. Simultaneously as the number of commercial farmers dropped, South Africa remained a net importer of wheat and meat (Makhura, 2013). Whereas South Africa was an exporter of maize to some African states, government's withdrawal of marginal lands from grain production and allocation for grazing and meat production in the 1980s has agitated for sharp reduction in grain production, especially maize which provides for the majority of the population's staple food (Makhura, 2013). Despite the substantial increase in the area allocated for grazing and meat production, development of the feedlot industry and the phenomenal growth in broiler production, South Africa has become "a net importer of meat" (Makhura, 2013, p.90) under the agricultural market reforms of 1984 and 1996. Consequently, the "rand weakness and sharply rising international oil prices pose the biggest risk to producer prices moving even higher" (*Business Day*, 29 August 2002, 30). On the basis of the 2000=100 index, the average producer and consumer prices of horticultural and food products, respectively, increased by about 140 and 100 percentage points between 1990 and 2007. The systemic structure underlying the pattern of price hikes has its origins in the global networks of food production, trading, marketing and consumption, which membership of the BRICS would exacerbate. The consistent increase in the percentage annual change in producer prices of domestically produced goods is reflective of the increased adoption of the transfer and import parity pricing by South African producers. The 2001 maize price crisis was a direct result of import parity pricing where a locally produced commodity was priced in dollars in accordance with world market prices. The sharp increase of the average prices of all vegetables sold on the fresh produce market in South Africa from R1 310/ton in 2000 to R2 500/ton in 2007 cannot be conclusively explained outside the global agro-food systems.

Since at least 2006, food prices have been responsible for driving inflation (Tolsi, 2011). Being a "wage good", maize has been integral to food-price sensitivity chain in South Africa and the global economy requires maize to produce beef, milk, cheese, chicken and eggs, just to name a few; and, Van Niekerk describes food and oil prices as the main stubborn culprits behind the production inflation pressures (*Business Day*, 29 August 2002). The escalation of the maize producer prices for South Africa by about 165 percentage points between 2000 and 2007, based on the 2000=100 index, cannot be understood outside the global commodity pricing dynamics and the introduction of the new global price drivers such as biofuels. The on-going agricultural products' producer and consumer price increases in South Africa are associated with reformed agricultural

market regime in the mid-1990s. In the absence of a convincing alternative interpretation, Raj Patel's conclusion that "the international food trading system" is the "real culprit" remains plausible, because the globalized agro-food system "discourages grain reserves, encourages the world to be dependent on a few grain-producing countries and requires oil-fuelled industrial agriculture" (cited in Tolsi, 2011, p.7). Food insecurity in rural South Africa, especially in the territories of the former Bantustans, cannot be explained outside the multifaceted agri-food trade and agro-food systems and networks. South Africa's membership of the BRICS, given that four members thereof have been demonstrated to hold the potential to increase income elasticities of demand for agri-food imports from developed economies, is not a pragmatic choice.

SOUTH AFRICA'S GOVERNANCE OF AGRICULTURAL MARKETS

Notwithstanding the interventions for upscaling and promotion of subsistence and small-scale emerging farmers, the simultaneous deregulation and liberalization of the agricultural industry thrust South Africa into the unforgiving global agro-food systems and networks that membership of the BRICS would most likely exacerbate. South Africa's domestic agri-industry is now locked with the global agro-food systems and networks. As a result, "domestic producer prices are also influenced by the international prices of commodities and the exchange rate" (Makhura, 2013, p.94). Within the BRICS, China and Russia would potentially expand their income elasticities of import demand for agri-food products, thereby contributing to the escalation of global food prices, adversely affecting the capability of most South Africans to be food secure. The Marketing Act of 1968 was repealed through the Marketing of Agricultural Products Act of 1996 which phased-out the agricultural control boards and deregulated the agri-industry (Makhura, 2013). The consequences of liberalization and deregulation of the agricultural markets is eloquently summed by the Land and Agricultural Development Bank thus:

"The boards' withdrawal created a vacuum in the marketing of agri-products. Individual farmers were required to market and export their own produce and could import freely. This created chaos in certain industries, as there was no coordination between exporters. Domestic interests were competing against each other in international markets" (Makhura, 2013, p.60).

Unavoidably, the composition of agricultural products produced, exported and imported has changed over the years whilst production of staple food products declined in relative terms (Jacobs, 2008, 2009; Traub & Jayne, 2008; Makhura, 2013). Presently, South African farmers are able to hedge grain prices through the South African Futures Exchange and/or presel to food processors and wholesalers (Jacobs, 2008, 2009; Traub & Jayne, 2008; Makhura, 2013). Since at least 2008, the South African consumers have endured soaring food prices arising from combinations of all these factors.

National sub-Hegemonic Agro-food Governance and Supermarket Chains Expansionism

South Africa's agricultural marketing policies have since 1996 sought to liberalize and deregulate the full agricultural value chain in an approach described as "big-bang", creating agro-food sub-hegemonic regional systems in which the most food-insecure households experienced perpetual risks and threats as the cost of their staples escalated drastically (Jacobs, 2008, 2009; Traub & Jayne, 2008). The 1984 White Paper on Agriculture imposed far-reaching market-oriented reforms; and, the Marketing of Agricultural Products Act No 47 of 1996 provided for a liberalization and deregulation template within which all other policies, including the 1997 Land Reform Programme, the 2001 Strategic Plan for Agriculture and the 2006 Broad Based Black Economic Empowerment in Agriculture (Agri BBBEE), unfolded (Jacobs, 2008, 2009; Traub & Jayne, 2008). Section 2 of the Act extends deregulation and liberalisation to all other spheres of agriculture (Jacobs, 2008, 2009). Together, Section 2(2) and 16 of this Marketing of Agricultural Products Act of 1996 thrust smallholders into agro-food globalism and agricultural export chains (Jacobs, 2008, 2009). Under this Act, and the National Agricultural Marketing Council (NAMC) it established, market forces were unleashed as the key drivers of agricultural business activity and resource allocation (DoA, 2001). The 2001 Strategic Plan for Agriculture merely endorses this market-oriented approach and accepts that supermarket chains have become dominant in the agro-food value chains where they are powerful in negotiating and determining producer prices, locally and internationally (DoA,

2001; Jacobs, 2008, 2009). With this governance, the focus of farming in South Africa “shifted from maximum output to producing quality produce for a particular market” (Makhura, 2013, p.94).

On the back of these reforms, supermarkets were able to expand into remote locations where they intensified competition over local demand, forcing poor households and smallholders to become net consumers, rather than producers, of food (Jacobs, 2008, 2009; Traub & Jayne, 2008). Whereas the initial effects were to lower food prices significantly, the ultimate destiny was upward price pressure as the local smallholders and households increasingly became net consumers simultaneously as the real wages stagnated or dropped (Jacobs, 2008, 2009). Thus, Altman et al. (2009) observe that a significant and increasing proportion of households are unable to afford the average nutritionally adequate food basket as food prices escalate and wage incomes fall. Evidently, the agricultural market reforms in South Africa have created a deeply competitive market structure exposing small-scale producers to the harsh globalized agro-food systems and networks (Traub & Jayne, 2008). Presently, only two food-retailing companies, Shoprite Checkers and Pick ‘n Pay, control about 80% of retail food sales in South Africa (Traub & Jayne, 2008).

Most developing countries, especially those in Africa, Asia and Latin America, have experienced the phenomenon of supermarket food chains expansionism into small remote rural towns; and, the largest expansion of supermarkets in Africa has occurred in South Africa (D’Haese & van Huylenbroeck, 2005). This phenomenon has virtually created competition for local demand with informal traders and smallholder producers (D’Haese & van Huylenbroeck, 2005). With rural South Africa being radically transformed through agricultural market reforms since 1984, the agro-food system converted poor rural households from net producers to net consumers of foods (Drimie, 2005; Jacobs, 2008, 2009; Baiphethi & Jacobs, 2009). The supermarket food chain has since the late 1990s dominated the local rural markets in South Africa; and, increasing proportions of rural households purchased foods from these networks, and this trend became predominant especially after 1994 (D’Haese & Van Huylenbroeck, 2005; Jacobs, 2008, 2009; Baiphethi & Jacobs, 2009). Analysing Statistics South Africa’s (2007) 2005/06 Income and Expenditure Survey, it was found that 92%, 94%, 94% and 72% of black rural households purchased most of their grain products, meat, dairy products and vegetables from the supermarket chains and other formal retailers (Jacobs, 2008, 2009; Baiphethi & Jacobs, 2009). Only four main supermarket chains (Shoprite, Pick ‘n Pay, Spar and Woolworths), out of a total of 1 700 in South Africa, dominated the sector since 2005, controlling about 90% thereof (D’Haese & Von Huylenbroeck, 2005). These supermarket food chains’ embeddedness with global agro-food systems and networks would be strengthened further as and when the BRICS states intensify, collectively and individually, their economic freedom policies for crossvergence.

In practice, supermarket food chains expansionism intensified the exposure of the poor rural households to hunger and malnutrition, by undermining subsistence and smallholder production. Most of the foods sold in the small rural towns’ supermarkets are imported into these localities. Hence, the primary effect of the hegemonic agro-food systems has been to sustain household food security “stressors” (Aliber, 2009). There is evidence of persistent annual deficits in the staple food maize and energy-intense meat between 1990 and 2007. Logically, importation of food can be expected to fuel price hikes due to import parity pricing (Hendriks & Maunder, 2006; Seekings & Matrass, 2006; Labadarios et al., 2008). The year-on-year food price increase rate of 16.7% in 2008 from a mere 6.7% of 2006 (National Agricultural Marketing Council (NAMC), 2009) cannot be halted through membership of the BRICS. Despite the drop of this year-on-year food price increase to 8.4% in 2009 (NAMC, 2009), food price escalations have continued with fluctuations in the global commodity prices, which the BRICS cannot transform. Von Braun (2007), Evans (2009) and Hart (2009) agree that it is highly unlikely that low food prices would ever return because of the irreversible changes in the global food system, the introduction of the new drivers of food demand, such as biofuels, supply and pricing. The upward trend in prices is evident in almost all of South Africa’s important foods, including grain products and vegetables.

CONCLUSION: SOUTH AFRICA’S BRICS MEMBERSHIP FOR CONVENIENCE OR PRAGMATISM?

This paper argued that the requirement for openness and economic freedom policies as one of the core factors for the growth of the BRICS would enforce subjugation of these countries’ domestic agro-food industries to global agro-food systems. The strife for confirming “crossvergence” among the BRICS states is destined to occur at the expense of other member states because, whereas there are some common features among these emerging

economies, there are also deep discrepancies to the extent that the Standard and Poor Report dismissed their recognition as a grouping (Tandon & Shome, 2009). Russia is divergent from the BRICS, China and India are on different growth trajectories (Tandon & Shome, 2009); and, the strength of the BRICS on the global stage remains questionable. Cairns & Meilke (2012, p.28) conclude that “as a group, the N-11 and BRICS are not unique in terms of their agri-food import demand elasticities”, but China, India, South Korea and Vietnam have large expenditure elasticities. It is forecast that by 2016 China would be the largest agri-food import market, followed by Russia, South Korea, India and Indonesia (Cairns & Meilke, 2012). Given the consumerism perspective underlying the conception of the BRICS, this paper argued that the rapid growth of income and increased demand for consumption of imported agro-food products by some states would place upward pressure on the already soaring global food prices and exacerbate the challenges of food insecurity for most emerging economies, including South Africa.

The paper insinuated that the stated economic ideals of the BRICS grouping are questionable, because there is suspicion that the 2003 and 2010 Goldman Sachs Reports are equally “peppered with subtle sales pitches” for global securitization (Bell, 2011, p.24). Notwithstanding the strength of the sentiment about BRICS, Jim O’Neill who coined the acronym appears to insinuate that its conception was influenced by the September 2001 terrorist attacks in the United States, which revealed the dangers of globalization being misconstrued as Americanization (Tandon & Shome, 2009). It is hoped that the BRICS’ “impressive population numbers would become the drivers of the future global growth” (Tandon & Shome, 2009, p.273). But the BRICS states are not monolithic in a variety of ways. According to Tandon & Shome (2009, p.273-274), the strength of Brazil and Russia is in “the natural resources”, whereas that for India and China draws out of their “fast consuming populations”. South Africa does not feature significantly in both cases. Importantly, there is competition among the BRICS states, externally between G8 and G20 as well as internally between G8 and G5 (Cooper, 2009), making for static or deviating crossvergence (Bell, 2011). As a result, the BRICS has remained “a sideshow to the main ‘club’ competitions” (Cooper, 2009: n.p). Whereas crossvergence of the BRICS began in the early 2000s, questions continue to be asked “whether BRIC performance influenced the Goldman Sachs report” or if the converse held in the short-term, at least (Bell, 2011, p.24). Consequently, the global agro-food systems and agri-food trade are real, rather than sentimental. The paper deduced, therefore, that South Africa’s ceding of membership of the BRICS would not transform the global agro-food systems and networks that have persistently created upward pressure on global prices. The escalation of food prices in South Africa confirms the validity of the interconnectedness of the hegemonic and sub-hegemonic agro-food systems, the new drivers of global food chains, as well as their impacts on local rural food insecurity (Von Braun, 2007; Hart, 2009). Hart’s (2009, p.365) observation is accurate in this regard:

“South African consumers experience the effects of changes in the global food system as well as those taking place in the local food chain.... (because the) processes of modernization and change (have strengthened) the linkages between households and complex commodity chains and economic networks Even the most remote rural households feel the impacts of certain global events and changes (political, economic, social and environmental)”.

In this context, the paper proposed that rural food insecurity, especially within rural South Africa, is perpetuated by stressors associated with the hegemonic and sub-hegemonic agro-food systems whose agents include supermarket food chains. The paper asserted the conclusion that, rather than create downward pressure on global agri-food prices, four BRICS states hold income elasticity potential to precipitate increase in the agri-food import demand, which would be served by the exporters from developed economies.

STATE-OWNED ENTERPRISES AND STATE CAPITALISM: SOUTH AFRICA'S DEVELOPMENT PATH DILEMMA?

Johannes Tsheola, Matshidisho Ledwaba and Jafta Maphatane
University of Limpopo, South Africa

ABSTRACT

South Africa's development path continues to be contested; and, the trajectory followed since 1994 remains a moot point and difficult to categorise. However, there is evidence that a democratic South Africa has flirted with state capitalism, backed by a nuance hybrid of state-owned enterprises (SOEs). Whereas government has not conceded to this characterization of the post-apartheid development trajectory, the National Planning Commission recently released the National Development Plan (NDP) 2030 which acknowledges that South Africa has, far from political rhetoric, failed to create a developmental state. Nevertheless, the NDP 2030 sets the restructuring of SOEs as one of the "enabling milestones" for the creation of an ethical, capable and developmental state. The development dilemma, though, is that the few state-funded SOEs that have been awarded the status of "national champions" are expanding into the global business arena where they virtually operate like private multinationals. This paper delineates the dilemma of South Africa's development trajectory in order to demonstrate that whereas the state recognizes the need to address economic equity and social stability, it is heavily goaded by powerful free market capital interests through SOEs.

INTRODUCTION

Corporatization of state governance in the past 15 years has demonstrably thwarted scope for democratization of the politics and economics of most emerging markets (Tsheola, 2012a, 2013). As an emerging economy, a democratic South Africa has shifted from the apartheid Weberian state model to flirt with entrepreneurial and regulatory welfarism and then state capitalism (Tsheola, 2012a, 2013). Unsurprisingly, the discourse and political rhetoric of a South African developmental state has rung hollow over the past decade (Maserumule, 2012), leading to the National Planning Commission's (NPC, 2011, 2012) admission that such a state is yet to be established. The National Development Plan (NDP) 2030 Vision, therefore, provides for the establishment of an ethical, capable and developmental state that would successfully implement the national development agenda (NPC, 2012; Tsheola, 2013). In South Africa, such a state would lead development as transformation of the structures of poverty and inequality as well as imperative to redress colonial and apartheid legacies (Edigheji, 2010; Tshishonga & Mafema, 2010; Tsheola, 2012a). A democratic South Africa's state governance and transformation agenda require "policy coherence and co-ordination" for effective (re)allocation of resources, given the yawning developmental needs of the majority of the population (Edigheji, 2010, p.24; Tshandu, 2010, p.47). The hand that the state can capably manoeuvre in this regard is that of state-owned enterprises (SOEs).

The concept of state as a social relation, a site, a product and an agent of social and political struggles and transformation, eloquently demonstrates the reasons for the resurgence of SOEs on the global stage precipitating philosophically and ideologically. Equally, examinations of state governance and structuring of the nuance hybrid of SOEs would potentially provide invaluable insights about the development trajectories and varieties of capitalism adopted by emerging economies (Gabriel, 2003; Musacchio & Flores-Macias, 2009a, 2009b; Xu, 2010; Bacon, 2012; Yi-Chong, 2012; Musacchio, 2013). The South African state has incrementally substituted itself for society, thereby simultaneously creating a bloated welfare regime amidst a plethora of economic freedom policies. The implementation of the Growth, Employment and Redistribution (GEAR) in

1996, the pursuit of the Accelerated and Shared Growth Initiative for South Africa (AsgiSA) in 2006, and the recent New Growth Path and National Development (NDP) 2030 Vision hope to deregulate and liberalize markets (Tsheola, 2012b; Makhura, 2013). Following years of hollow pronouncements of the developmental state in South Africa's public administration corridors, the NDP 2030's hope of creating a capable and developmental state through SOEs as an "enabling milestone" raises philosophical and ideological questions about the state's role, the state-market paralysis and the variety of capitalism contemplated. Whereas the nuance hybrid of SOEs has the capability of supplementing the rules of the market through state power (Musacchio cited in Harvard Business School, 2013, p.3), questions of their objectives being public or purely financial are inconsequential because they are partly- or fully-state funded. But South Africa's "national champion" SOEs have persisted with their quest for increased autonomy and pursuit of "profit maximization". This paper delineates the dilemma of South Africa's development trajectory in order to demonstrate that whereas the state recognizes the need to address economic equity and social stability, it is heavily goaded by powerful free market capital interests as evidenced through major SOEs' conduct of business. The paper briefly draws indications from a few of South Africa's most prominent SOEs to demonstrate discrepancies and incoherence between their founding public policy objectives and their conduct of business.

STATE-OWNED ENTERPRISES, STATE CAPITALISM AND SOUTH AFRICA

The exultation of neoliberal macro-policies, encapsulating a plethora of dualistic and linear conceptions of development, has virtually truncated discourses of alternative development paths by entrenching "immutable laws" and overtaking politics (Legum, 2002; Peet, 2002). Whereas Keynes' economics involve the pursuit of political justice and gratification of the electorate's interests, neoliberalism seeks to promote the interests of capital and profiteering (Legum, 2002). Recently, as the financial crisis struck the developed economies, call for state regulation and participation in the economy were made in the form of state capitalism governance (Glemarec & Puppim de Oliveira, 2012; Tsheola, 2013). Studies of state capitalism eloquently propose that states too can invest in business with expressed commercial and financial objectives (Gabriel, 2003; Musacchio & Flores-Macias, 2009a, 2009b; Bradley & Donway, 2010; Xu, 2010; Bacon, 2012; Yi-Chong, 2012; Harvard Business School, 2013; Musacchio, 2013). Almost all states in the world have experimented with varieties of state capitalism model by typically establishing monopolistic, oligopolistic and/or duopolistic SOEs in "strategic sectors", thereby seeking to play a critical role in shaping the national development agenda (Yi-Chong, 2012). The resurgence of SOEs in emerging economies is indicative of attempts to supplement the invisible hand of the market with the visible hand of the state (Glemarec & Puppim de Oliveira, 2012; Tsheola, 2013). That is, state capitalism governance seeks to ensure adequate ingenuity where public policies and institutions govern diverse modes of governance (Glemarec & Puppim de Oliveira, 2012; Yi-Chong, 2012). But the resurgence of SOEs on the global business stage has involved blurring of public policy with commercial financial objectives, the consequences of which manifest in the domestic political-economy of emerging markets through the formation of "bureaugarchs", corruption and dearth of civic virtues (Yi-Chong, 2013).

However, governance of politics and economics is, at all geographic scales, highly contested and, sometimes, controversial, because of vested interests in how societal change and development are to proceed (Desai & Potter, 2002). For emerging economies such as South Africa, the selection of governance model is significant to understanding the development trajectory chosen by the state (Yi-Chong, 2012). However, corporate governance tends to be incoherent because it is produced directly through the dynamics of political and economic systems, institutions as well as politicians' preferences and choices (Gabriel, 2003). As a result, most emerging economies' choice of the model of governance has increasingly become a balancing act for overcoming the discrepancies embedded with political and economic power relations of the society (Glemarec & Puppim de Oliveira, 2012; Yi-Chong, 2012). In practice, though, the triumphalism of market capitalism and the ascendancy of the state-market paralysis, have virtually excised policy alternatives, with emerging markets coerced to adopt economic freedom policies of the Washington Consensus. To this extent, emerging economies such as South Africa have in the past 15 years implemented deeper market reforms that corporatized conventional state-owned enterprises (SOEs) for conduct of business on global stage with unambiguous commercial, rather than public policy, objectives (Tsheola, 2013). The "free market ideology" now has a firm foothold in South Africa's governance of politics and economics, rendering national development hostage to

commercial and financial interests of companies, inclusive of the nuance hybrid of SOEs (Tsheola, 2013), because post-apartheid South Africa's macroeconomics too became mere replicas of Western conceptions of selfhood (Nabudere, 2006), thereby accentuating the development dilemma of a popular democratic state's visible hand supplementing the invisible hand of the market. The adoption of economic freedom policies has meant that the democratic governments would be faced with a tenuous balancing act of political, economic equity and social stability, on the one hand, and pragmatism and technocratic efficiency, on the other (Smith, 2004; Jaglin, 2008; Tsheola, 2012a). Post-2000, the South African state was increasingly confronted with the public market and private market dilemmas of balancing efficiency and equity objectives (Smith, 2004; Jaglin, 2008; Tshandu, 2010). But as inequality persisted at levels above 0.60 gini-coefficient, questions of the democratic government being dysfunctional or developmental arose (Southall, 2007). Arguably, "a strong state" and state agencies are "imperative" for resolving colonial and apartheid legacies (Mitlin, 2004; Bontenbal, 2009; Tshandu, 2010), but a democratic South Africa selected state capitalism, rather than developmental state (Tsheola, 2012a). State capitalism manifests in the form of corporatized governance model wherein state transformation and restructuring is undertaken 'in order to adhere to a private market logic' (Smith, 2004, p.382). The post-2000 centralization of the South African state sheds invaluable insight into the wanting state activism and lacking public entrepreneurship (Atkinson, 2007).

Rather than resolve the dilemmas of the state-market paralysis, emerging economies' so-called "state-led" development governance became, perhaps, "elite-led" (Gibb, 2009). With the gradual acceptance of the Keynesian state-centrism model and the watering-down of the neoliberal market capitalism triumphalism, state participation in commercial affairs through giant corporates surged and the divide between private and public interests blurred (Tsheola, 2012a). A dangerously simplistic and uncritical conception of state-centrism was adopted for corporatization of public utilities (Tsheola, 2012a, 2013). Gibb (2009, p.714, 715) proposes that "states should continue to form the focus of attention", but cautions that state interests are not necessarily "national self-interests". Conversely, the conception of state-centric model of development governance has entailed concessions of state authority, power and, in some cases, sovereignty to commercial interests and SOEs that seek for autonomy and profiteering. Given the complexities of state governance, it has appeared that a democratic South Africa is legitimizing continuities of transposition of the Westphalian state model, risking to deliver evidence that would reinforce cultural determinism stereotypes of successive cohorts of African leaders being incapable of corporate governance.

A developmental state is indispensable for South Africa where the stark societal inequalities would be impossible to resolve through the operations of market forces alone (Levin, 2008). However, this observation does not insinuate a mere supplementation of the invisible hand of the market with the visible one of the state, which has in recent years manifested through SOEs. A developmental state, rather than state capitalism, embraces simultaneous qualities of embeddedness with capital and social movements, as well as insulation from being goaded (Jahed & Kimathi, 2007; Bodibe, 2008; Mukhithi, 2008). Such a state would capably assume the role of driver of development wherein it purposefully guides "capital towards new activities while maintaining broad-based support" of public and commercial interests (Makgetla, 2007, p.31), because it possesses the capability to sustain the pragmatic inseparability and mutual constitutive nature of the economic and political processes (Mukhithi, 2008; Tsheola, 2012a). It may not be necessary to be excessively conscious whether a state is developmental or otherwise, but the form of the state (re)shapes the model of governance and the (re)structuring of SOEs, which provide the most pragmatic and visible hand necessary for states' critical role in fostering development (Jahed & Kimathi, 2007; Tsheola, 2012a). Rather than clarity of definition of national public mandates, it is the state's qualities of directing both private and social capital towards universally shared public development interests, largely through the SOEs, that characterizes the South African dilemma.

South African governments have for almost the past decade declared interest in building a developmental state (Maserumule, 2012). There are varied theoretical interpretations of developmental state, ranging from the neo-classical, neo-liberal minimalist to the neo-Keynesian orthodoxy (Jahed & Kimathi, 2007; Maserumule, 2012). But governments have struggled to govern investments because of the complexity and unpredictability of the decisions involved, notwithstanding increased appreciation of the role of the state in development (Erwin, 2008). Theoretically, a developmental state is expected to "make a decisive structural transformation and intervention within a political-economy, and then sustain those changes over time and against powerful counter-forces in the global economy" (Erwin, 2008, p.29, 30). South Africa's progressive governments have, however, corporatized SOEs in order that they conduct business on the global stage on behalf

of government. Contrary to public policy pronouncements, the ANC-led government has consistently redefined the role of the state away from genuine national developmental goals through the corporate governance and structuring of SOEs.

But the varieties of capitalism are manifestations of reflexive developmentalism that reinvents the state-market paralysis in a nuance state-capital nexus to exclusively serve commercial interests (Peet, 2002; Kolo, 2008; Bradley & Donway, 2010; Dean, Browne & Oster, 2010; Karon, 2011; Coy, 2012; Goryunov, 2012; Lubman, 2012; Webb, 2012; Yi-Chong, 2012). Hegemonic capital has mastered the art of restructuring and readjusting in order to shift to reflexive developmentalism that incorporates its own critiques into an ever-more refined and unchanged version (Peet, 2002). The melding of state powers with those of capital through a nuance hybrid of SOEs, overseen by “bureaugarchs” has meant that proclaimed development path would be paradoxical because of the discrepancies between the state interests and national public self-interests. If not goaded by capital, then the state should be recognized to be marketized through its SOEs participation on the global business stage.

Indeed, Bacon (2012, p.1) cautions that “the spread of a new sort of business in the emerging world will cause increasing problems” because the governance and structuring of the “national champion” SOEs that single-handedly define the national development path gain autonomy for profit maximization but retain entitlements of their public policy objective foundations. The provision of SOEs’ distinct legal form that allows them to operate in commercial affairs with unfettered financial goals, making irrecoverable losses, whilst reserving the right to justify their existence through public policy objectives as companies of strategic national interests, is a manifestation of the development dilemma in which emerging economies are immersed (Gabriel, 2003; Xu, 2010; Yi-Chong, 2012). Within emerging economies such as South Africa, corporate governance for business operations of SOEs (re)shapes the “distribution of income, power and authority; and, profitability, efficiency and sustainability of firms” (Yi-Chong, 2012, p.3). Restructured and transformed in the past 15 years, the nuance hybrid of SOEs has transferred their accountability to shareholders, away from their owner-publics (Bradley & Donway, 2010; Yi-Chong, 2012). The on-going controversies and crises among South Africa’s “national champion” SOEs is evidence that their autonomy is now license to conduct business on the global stage recklessly only to return to National Treasury poorer. These SOEs are in monopolistic, oligopolistic and/or duopolistic positions within emerging economies, justifying their national public policy strategic objectives, whilst simultaneously destroying state’s capability to serve public development agenda. Hence, there is a double-pronged criticism of their conduct of business. From a free market perspective, public ownership and control of SOEs is seen as the primary cause of inefficiencies, cronyism and corruption, whereas proponents of economic equity and social stability highlight the potential threat to these civic virtues which may eventuate as SOEs “gain increasing autonomy in their pursuit of profit maximization” (Yi-Chong, 2012, p.2). Given almost 15 years of neoliberal reforms in most developing countries, these “national champions”, Yi-Chong (2012, p.3) questions the logic of ownership, if it matters in their conduct of business on the global stage.

SOUTH AFRICA’S DEVELOPMENT TRAJECTORY

Post-apartheid governments in South Africa have made public policy pronouncements about the intent to create developmental state governance (NPC, 2012; Maserumule, 2012; Tsheola, 2012a). In practice, post-apartheid South Africa trotted state capitalism variety. Unsurprisingly, the NDP 2030 accepts the transformation of SOEs and clarity of definition of their public interest mandates as one of the “enabling milestones” in the construction of a capable developmental state. Varieties of capitalism are endless, and attempts to restructure almost always reproduce and resituate states into another variety (Kolo, 2008; Bradley & Donway, 2010; Dean, Browne & Oster, 2010; Karon, 2011; Coy, 2012; Goryunov, 2012; Lubman, 2012; Webb, 2012; Yi-Chong, 2012). The first democratic government adopted a mix of economic growth and people-centred approaches to development in the RDP, in an attempt to strike a balance between growth-orientation, people-centeredness and environmental sustainability (Cloete, 2006; Padayachee 2006; Tsheola, 2012). But the ascendancy of GEAR macroeconomics escalated the economic freedom policies underpinned by quantitative-development and growth-orientation. Perhaps the RDP’s avoidance of simplistic binary conceptions of economics was its downfall because the simultaneous drivers for growth, redistribution and sustainability were too ambitious for an emerging economy (Tsheola, 2012b). By mid-1996, GEAR macro-policy superseded the RDP, becoming hegemonic (Padayachee, 2006). GEAR conceives economics as “the logic of a system”, rather than a “servant of humanity’s

development”, unambiguously proposing “a pro-growth strategy” (Cassim, 2006, p.56), in the hope that domestic businesses would participate in global competition to generate jobs and income for the national publics (Legum, 2002; Padayachee, 2006). With GEAR, South Africa embraced the state-market paralysis (Tsheola, 2012a, 2012b). Reverence of GEAR’s political-economy found expression in questions of how its growth could be shared in AsgiSA. The latter was adopted to provide “a set of interventions to promote and create conditions for accelerated and shared growth and development” (RSA, 2006, p.3). But its provisions did not seek to transform the macroeconomic norms for re/capitalisation of the bottom-half of the society. As a result, AsgiSA’s Programme of Action and ‘interventions in the “First Economy”, just as GEAR, were cosmetic (RSA, 2006, p.2). According to the former National Treasury director-general, Lesetja Kganyago, South Africa will continue to apply “economic orthodoxy” wherein development and investment are “driven by the selfish interest that is meant to drive capitalism” (Creamer, 2007, p.9).

However, the NDP 2030 expresses “a real risk that South Africa’s development agenda could fail because the state is incapable of implementing it” (NPC, 2012, p.54). Also, it affirms that South Africa’s SOEs are not focused on serving national public interest and conceives a capable developmental state as active in, among other spheres, “building constructive relations with all sectors of society”, while insulating itself from capture by sectional interests (NPC, 2012, p.409). The SOEs’ conduct of global business suggests, however, that the democratic state has been purchased and captured by private capital. Eskom presents a typical SOE monopoly whose governance and structuring allowed for low electricity rates for multinationals and high prices for the owner-publics. Unsurprisingly, the NDP 2030 observes that “accountability in state-owned enterprises has been blurred”, given that public interest mandates too are poorly defined (NPC, 2012). Whereas the NDP 2030’s enabling milestone of realising “a developmental, capable and ethical state that treats citizens with dignity” (NPC, 2012: 34) is benign, the plan does not create the possibility for SOEs to restructure their relationship with the owner-publics. The NDP 2030 hopes to resolve the discrepancy by clarifying the national public interest mandates of SOEs, which would merely agitate for a more refined variety of capitalism. The NDP 2030 sets a capable, ethical and developmental state as an outcome of restructured SOEs, rather than the former being instrumental in redefining the relationship of these public entities with owner-publics. This form of governance and structuring of SOEs is embedded with state capitalism, which allows for risk-averse applications of public resources in the uncertainties of global business market. Finally, the NDP 2030 calls for improved governance of SOEs as a measure for the creation of an ethical and capable developmental state (NPC, 2012; Donnelly, 2013).

NUANCE HYBRID OF STATE-OWNED ENTERPRISES: DEVELOPMENT DILEMMAS

SOEs are a common feature of the world economy, straddling the developed-developing nations divide, captured in variable nomenclature such as government-owned corporations (GOCs), public sector undertakings (PSUs) or public sector enterprises (PSEs) (Investopedia, n.d.). The most significant characterization of the SOEs is that of “a legal entity created by government to undertake commercial activities” on the owner-government’s behalf (Investopedia, n.d.; Wikipedia, n.d.). That is, whereas SOEs “can be either wholly or partly owned (and funded) by a government” and, typically, “earmarked to participate in commercial activities” (Investopedia, n.d.), their primate founding public policy interests are eroded with their search for increased autonomy and conduct of business on the global stage. There can be no doubt that “the main purpose of all the policies, actions, and practices in the South African public administration are aimed at developing public value, accountability, development, and improved living conditions through effective and efficient service delivery for all South Africans” (Auriacombe, 2010, p.1). With GEAR superseding the RDP, the “relevance of conventional social policies” (Jaglin, 2008, p.1897) came under questioning, simultaneously as the public market and private market dilemma underscored state policy conundrums in “trying to twin efficiency and equity (who gets what and where) objectives” (Smith, 2004, p.375). Evidently, the democratic government has not struck a judicious balance between neoliberalism and redistributive policies; hence, the hegemonic discourse about “efficiency” and “equity” considerations has persisted (Jaglin, 2008, Tsheola, 2012a). South Africa’s so-called developmental state governance degenerated into reflexive developmentalism of varieties of capitalism that “symbolizes a more sophisticated form of neoliberalism by virtue of how the state restructures in order to adhere to a private market logic” (Smith, 2004, p.382).

Notwithstanding despire for bureaucratic potential to create an environment rife with inefficiencies, cronyism and corruption, there is universal acceptance that states have the capacity to provide for capable institutions necessary for optimal governance of capital and business (Glemarec & Puppim de Oliveira, 2012). The scramble to conceive nuance forms of governance that would create state capabilities to participate in global business has characterized the past 15 years of neo-liberalization in most emerging economies (Yi-Chong, 2012). This search coincided with the resurgence of a nuance hybrid of SOEs that are established for public interest policy motives as legal entities for operation on the global business stage with, paradoxically, unambiguous commercial and financial objectives, on behalf of their owner-governments (Kolo, 2008; Bradley & Donway, 2010; Dean, Browne & Oster, 2010; Karon, 2011; Bacon, 2012; Coy, 2012; Goryunov, 2012; Lubman, 2012; Webb, 2012; Yi-Chong, 2012). Metaphorically described as “coddled state giants”, the nuanced hybrid of SOEs is increasingly dominating the global business stage (Gabriel, 2003; Musacchio & Flores-Macias, 2009a, 2009b; Bradley & Donway, 2010; Xu, 2010; Yi-Chong, 2012; Harvard Business School, 2013; Musacchio, 2013). This restructuring of SOEs was an exercise in reflexive developmentalism designed to ensure that their relationship with owner-publics remains unaltered.

In the present day South Africa, the ANC-led state has evidently been weakened whilst the governing regime gained relative stability and apparent strength. Increasingly, the ANC-led state governance incorporates elements of “personalized rule”, “elite subservience to the core” and “a shadow state” (Gibb, 2009), where differentiation between the public and private spheres of governance is blurred. The propensity of the present South African state governance to be focused on personal power, patronage, clientilism and, perhaps, corruption, cannot be tenably discounted. Rather than the “order-inducing propensities”, South African politics are increasingly captivated by state control of resources and power of the governing regimes, and the ruling elites’ apparent reluctance to uphold civic virtues, democratic principles and ideals. The seat of control of the democratic state has in recent times struggled to manage the pursuit of “personal power and prestige”. These ills appear to be synonymously associated with the state governance and structuring of the nuance hybrid of “national champion” SOEs such as Eskom, PetroSA, Sentech, Post Office, Telkom, South African Airways (SAA), Transnet, Denel, Broadband Infraco, and so on.

Just to highlight the crisis-ridden operations of these SOEs, the former National Treasury director-general, Lesetja Kganyago, “likened SAA to a drunk that pretended to reform, only to return to the pub once it had the money in hand” (Smith, 2012, p.2). On its part, PetroSA has been rocked in recent months by allegations of impropriety, misspent R200 million and placement of R800 million at unnecessary risk (Donnelly, 2013). Not to be left behind, the SAA is often characterised as an “ailing” carrier in “permanent crisis” (Barron, 2013; Smith, 2013a, 2013b). Recently, revelations about the electricity public utility, Eskom, which appears to fail to secure adequate power supply for the nation, show that it has entered into a secret contract with BHP Billiton that would expire in 2028, wherein this multinational company pays an average of R0.2715 for kWh of electricity (Yelland, 2013) when the cost of production is about R0.4000 per kWh, whilst the general publics pay R140.00 for the same amount of electricity. Also, whereas the energy regulator approved 8%, rather than the 16%, rate increase per kWh of electricity for the next three years, effective from April 03, 2013 (Benjamin, 2013), the state-capital nexus continues to serve capital interests through this “national champion” SOE. Concerns should be raised further because Eskom has over 140 large industrial and mining customers; and, the lack of transparency in the contracts for electricity pricing arrangements is now proven to be palpable (Benjamin, 2013). Simultaneously, the democratic state has not capably directed “the behaviour of private investment” (Habib, 2008, p.43); and, political discourse is increasingly overtaken by “bureaugarchs”, wherein political masters who were supposed to serve as public entrepreneurs are now profoundly shaped into “*apparatchiks*”. Hence, South Africa’s public policies are largely formulated to serve the capital interests of companies listed on global stock exchanges, which are erroneously assumed to coincide with state and national publics self-interests, have uniformly failed to inculcate a sense of civic duty, “public value, accountability, development, and improved living conditions through effective and efficient service delivery for all” (Auriacombe, 2010, p.1).

There is palpable national development dilemma of balancing the interests of SOEs’ productivity and their increasing economic power, amidst the decline of state-sector and encroachment of private-sector into all spheres of life of poor people, as well as the shaping of political masters and public policy, together with the pre-eminence of market efficacy over political deliberations about how widespread poverty, inequality and discriminatory distribution of national resources could be resolved, through common perpetrators. Most of these

SOEs have been “permanently” marked by controversy and allegations of corruption, instability over the past years; and, a Presidential Review Commission was constituted in 2010 in order to transform these commercial national champions, by “strengthening government oversight ... and aligning them to the state’s developmental agenda” (Donnelly, 2013, p.6). According to Wooldridge (2012) governments are capable of providing “the seedcorn for innovation”, but they are incapable of turning it into bread. South Africa’s governance of SOEs can best be described, as a “boulevard of broken dreams” and “Valley” of “Ghosts” (phraseology borrowed from Lerner, cited in Wooldridge, 2012, p.14). In supplementation of the invisible hand of the market, the visible hand of state is perpetrating the status quo of a deeply fragmented society through the SOEs in emerging economies.

CONCLUSION

This paper has argued that the most distinct differentiation of society occurs through governance and structuring of SOEs. A democratic South Africa has with a development path that could be described as state capitalism, using SOEs and thereby lending the state into dilemmas of balancing economic equity and social stability, on the one hand, and commercial efficiency and profiteering, on the other. The paper insinuates that the NDP 2030 would merely reproduce yet another variety of capitalism because the SOEs it seeks to exploit as “enabling milestones” for the creation of an ethical and capable developmental state are themselves operating as though they were private multinationals on the global business stage. The discrepancies and incoherence in the SOEs’ founding public policy objectives and their conduct on the global business stage are deep and can be expected to continue unabated under the hegemony of economic freedom policies.

THE IMPACT OF CORPORATE SOCIAL RESPONSIBILITY PERCEPTION ON THE JOB SATISFACTION AND ORGANIZATIONAL COMMITMENT

Arcan Tuzcu
Ankara University, Turkey

ABSTRACT

Today, corporations are not only responsible on the economical or legal basis, but also liable on ethical and philanthropic grounds. Corporate social responsibility activities influence the stakeholders in the first place, hence the employees, one of the vital stakeholders of the organizations. Social responsibility activities can have a direct effect on the job satisfaction and organizational commitment of employees. This paper investigates the employees' perception on corporate social responsibility, and examines the effect of this perception on organizational commitment and job satisfaction. Hence, the individual factors that have an impact on this perception, namely gender, age, education level, the hierarchical position in the organization, the working time and the participation to the company's social responsibility projects, are considered. The data collection is through a survey conducted among the employees of Turkish Petroleum Refineries Corporation (TUPRAS), the third most profitable and the largest private firm quoted to the Borsa Istanbul. From the findings obtained through chi square, t – test and ANOVA, one can observe an insignificant relation between organizational commitment and job satisfaction, and perceptions of corporate social responsibilities.

INTRODUCTION

The implementation of corporate social responsibility (CSR) has become an inseparable part of today's business environment. In the past, CSR activities were perceived only an obligation which was used to improve the public opinion towards the company, but not a basic component of business strategy. As a result, they were only limited to financial aids. Nowadays, on the other hand, CSR has been evolving to a concept where its implementations have become a complementary element of the business life. In contrast to the previous thought that states CSR wastes the valuable sources, now companies are eager to use CSR implementations as a new and efficient tool to struggle with the wild competition conditions in the market.

In fact, CSR is not only an instrument to compete in the market, but also a means of gaining the confidence and support of stakeholders. The companies that show that they are responsible against the stakeholders as well are more likely to gain this confidence. The increase in the organizational commitment and job satisfaction is very natural when the employees observe that their company also works for the social wealth through CSR implementations. Hence, it is possible to create a working environment that fulfills the expectations of both the company and the employees.

Because of the above mentioned reasons, this study takes the employees, one of the most important stakeholders, as a unit of analysis. The aim is to examine the employee perceptions against the CSR implementations through the individual factors, including age, gender, education level, position in the company, working time, and to participate to the CSR projects. The main research question is whether there is a significant difference among the employee groups according to these individual factors. Although there are several studies that consider these individual factors and the differences they create on the CSR perceptions, there is no

agreement on their specific impacts. This study plans to add to the literature by presenting new evidence from one of the largest companies' employees in Turkey as a developing country example.

The remainder of the study is as follows. First, the concept of CSR and its importance as well as the individual factors that affect the employees' CSR perceptions will be documented. Subsequently, the linkage between the CSR perceptions, and organizational commitment and job satisfaction will be explained based on the literature. The analyses and findings will be presented in the next section. The study will conclude in the final section.

CONCEPT OF CORPORATE SOCIAL RESPONSIBILITY

According to Bowen (1953), one of the first among those that defines the concept, "*CSR refers to the obligations of businessmen to pursue those policies, to make those decisions, or to follow those lines of action which are desirable in terms of the objectives and values of our society*" (Carroll, 1999:270). In other words, CSR is to make an effort for the society as well as the company itself. Davis (1973: 312), on the other hand, describes the social responsibility for a company as such: to consider and to answer the issues further than its limited economical, technical and legal liabilities. Another definition for the concept is that the implementations and participation policies of a company for social benefit that are above and beyond the legal responsibilities (Bronn et al., 2001: 209). The common point of all these definition is the emphasis on the aspect that reflects more than the company's economical and legal responsibilities.

Smith (2003) indicates that CSR, in a general definition, is the liabilities of the company against to the society, but more specifically against to its stakeholders. The concept of stakeholders embraces most importantly shareholders and employees, but also suppliers, customers, governments, unions, local administrations, and NGOs (Freeman, 1984). From these definitions above, one may conclude that CSR is a concept that takes into account the needs of different stakeholder groups.

It is well known that the CSR implementations improve sales and market shares, empower the brand position, provide a better corporate reputation, decreases costs such as advertisement, waste management and energy consumption, and most importantly draw investor attention (Kotler and Lee, 2004). For instance, Preston and O'Bannon (1997) show a positive correlation between financial and social performances. Waddock and Graves (1997) find a positive association between social performance of firms and their past and future financial performances. Again a similar finding is put forth by Robbins and Coulter (2002). Moir (2001) specifically points out that companies themselves also benefit from the CSR implementations.

CSR literature also indicates a positive effect of company participations to the social projects on the current and potential employees as well as the society itself. Kotler and Lee (2004) note two researches in this field. The first research reports that employees in the companies that have social responsibility programs are 38% more happy with the corporate values than those that work in other companies. The second one demonstrates that 80% of the participants are more likely to reject to work in companies that display negative corporate citizenship applications.

Without a doubt, employees are the stakeholders that are affected most from the company operations and the organizational decisions. They are crucial in the realization of company goals. Likewise, employees themselves expect economical and social benefits in return to fulfilling their responsibilities against the company. If these economical, social and emotional expectations are not satisfied, employees will be reluctant, even quitting the job is likely. This lack of support from the employees would risk the realization of the fundamental goals of the company.

In the light of the above mentioned studies, one may conclude that the companies that provide more than their stakeholders' economical and legal expectations are successful to reach their goals and satisfy the different needs. As a corollary, CSR implementations that fulfill the needs of the employees, one of the most essential stakeholders, can increase the organizational commitment as well as job satisfaction.

THE INDIVIDUAL FACTORS THAT IMPACT THE EMPLOYEE CSR PERCEPTIONS

Literature suggests gender, age, education level, position in the company as the individual factors that affects the employee CSR perceptions. Different studies highlight the gender differences in perceptions. For instance, Peterson (2004) shows that men are more eager to realize economical CSR implementations, while women put more importance on voluntary CSR activities. Along the same lines, women are more bounded by the ethical standards than men (Peterson, 2004). Another study by Ravlin and Meglino (1987) shows that women are more sensitive to be helpful than men. Ibrahim and Angelidis (2004), in a similar manner, find that women members of board of directors are more interested in voluntary CSR implementations, while men members pay more attention to the economical dimension.

Following the legal dimension, ethical behavior differences between genders are a well examined topic. Schminke indicates that women exhibit more ethical behavior than men. The findings of Hoffman, on the other hand, cast a shadow over the previous results of Schminke, and demonstrate that more ethical behavior is displayed by women and men depending on the situation (McDaniel et al., 2001). Fritzche cannot provide significant differences among women and men managers. Similarly, the results of Barnett and Karson cannot present a significant difference between women and men managers according to their reactions to the ethical dilemmas (Ekin and Tezölmez, 1999). Derry (1987) also cannot demonstrate a statistical association between gender and ethics. Again, another study by Marz (1999) cannot reject the null hypothesis stating that there is no gender difference between managers in the perception of ethical behavior. These studies reflect the attitudes of different genders towards ethical dilemmas or ethical behavior.

Another individual factor that affects the CSR perception of employees is age. Literature mainly suggests that older people are less tolerant against unethical behaviors than younger people. However, Browning and Zabriski show that younger sales managers have higher ethical standpoints regarding to older ones (Ekin and Tezölmez, 1999). The study by Ravlin and Meglino (1987) still reports that the age factor plays an important factor in the individual value system. This paper indicates that older people are more sensitive in helpfulness and justice issues than the younger. Nevertheless, there are studies that point out no effect of age on the employees perceptions about the voluntary company activities. Based on these studies, it is not possible to observe a strong association between age and CSR implementations.

The relation between education level, the next individual factor, and CSR perception of employees is also investigated in many papers in the literature. Ekin and Tezölmez (1999) indicates that the higher the level of education of employees is related to the more importance put to the CSR activities. Jones and Gautschi note that employees having a university degree pay more attention to CSR than those do not have (Marz, 1999). There is contradictory evidence as well. Dubinsky and Ingram (1984), and Harris, Kidwell and Serwinek show that education level is not a determinant of ethical behaviors (Ekin and Tezölmez, 1999). In sum, there is no common view in the CSR perceptions and education level relation studies.

The CSR perceptions of employees may also show differences according to the position in the company. Lusch and Laczniaik note that higher level managers are more prone to execute CSR implementations than their subordinates (Marz et al, 2003). Accordingly, Mehta and Kau present evidence indicating that employees display more ethical behaviors as they ascend through the higher levels of the organizational hierarchy. Kam-Hom confirms these previous findings by demonstrating that middle level managers are less ethical comparing to the higher level ones (Ekin and Tezölmez, 1999).

The contradictory evidence is put forth in the study of Posner and Schmidt. They illustrate that the level of sensitivity to the ethics becomes lower as the managers gets higher hierarchical levels (Ekin and Tezölmez, 1999). Similarly, Ravlin and Meglino find lower CSR perceptions in the management levels relative to the non – management levels (Marz et al, 2003). Delaney and Skell sets forth that lower level managers shows more unethical behaviors in order to be promoted to the higher levels (Ekin and Tezölmez, 1999). Ostlund, on the other hand, cannot provide evidence in favor of differences of high and middle level managers' CSR perception. Israeli also finds no evidence of position effect on the ethics perception of different level managers (Marz, 1999).

THE IMPACT OF CORPORATE SOCIAL RESPONSIBILITY PERCEPTION ON THE ORGANIZATIONAL COMMITMENT

Porter, Steers and Mowday define the organizational commitment as the identifying the individual herself with the organization and work for the organizational goals and values (Swales, 2004:187-189). In another definition by O'Reilly and Chatman (1986) notes that organizational commitment is the psychological commitment to the organization that the individuals feel for. Commitment is shaped by the interest to the job, loyalty and the strong beliefs in the organizational values (Caldwell, Chatman and O'Reilly, 1990:247). In sum, organizational commitment definitions can be gathered as such: accepting the organizational goals and values, work for these goals, a strong will to increase the organizational success, and the determination to be a member of the organization (Drummond, 2000:10), the degree to which an individual identify herself with the organization and involve to the organizational goals (Kreitner and Kinicki, 2001:15), the powerful desire to pursue the membership in the organization, and make an effort for the organization and strong acceptance to the organizational goals and values (Morrow, 1983: 491). Even though there are several definitions of organization commitment in the literature as one may observe above, these studies mostly emphasize the psychological state of the employee in the association of her organization.

Motivation is the influencing process and the creation of the willingness to inspire the individual by designing a business environment that satisfies both the needs of the organization and its employees. Since the employee needs are taken into consideration inside the organization, the organizational commitment will increase. It is a fact that employees have not only economical, but also social and emotional expectations from their companies. Hence, CSR implementation can be used as a means of fulfilling such expectations. As the needs of employees are satisfied in such a way, their affective and normative commitments are expected to be higher.

It is natural that as the company shows more interest to the social issues and its employees participate to the social projects, the company reputation strengthens, and the affective commitment enhances. Employees will be proud of their own jobs, if the company itself realizes activities to be proud of. This will undoubtedly reinforce the organizational commitment of employees (Peterson, 2004). Sanders and Roefs indicate a positive relation between CSR perceptions and affective commitment of the employees (Gilder et al., 2005). Many others in the literature confirm that the companies' ethical responsibilities affect organizational commitment (Herndon et al., 2001; Valentine et al., 2002).

According to Chatman, employee organizational commitment is closely related to the organization's attitude in ethical issues as well as the consistency of this attitude to the employee's own value judgment. Employees are willing to work in companies that have parallel values to their own values. O'Reilly and Chatman emphasize that this value judgment consistency provides organizational commitment (Dutton et al., 1994). As the employees observe that the companies display ethical behaviors, they believe that these attitudes will be valid for their association to the company as well; and hence their organizational commitment level will be positively affected (Peterson, 2004).

Peterson (2004) indicates that organizational commitment also depends on the employees' own interest to the CSR activities. As a result, the employees who place emphasis on the CSR activities will show a higher degree of organizational commitment to a company that implements CSR successfully. Dutton points out that charity activities are very effective in the establishment of the organizational perceived identity. These activities improve the company reputation, and hence the organizational commitment is positively impacted (Upham, 2006). It is found that the employee satisfaction is three times higher in the companies where voluntary participation to the social projects is possible. Likewise, there are various studies demonstrating that voluntary participation is closely associated to organizational commitment (Peterson, 2004; Gilder et al., 2005).

Employees will display more organizational commitment as they believe that people outside of the company have a positive attitude towards their company. In addition, the outside reputation is positively

perceived by those who do not attend to the voluntary program as well as those who actually attend (Gilder et al., 2005). All in all, observing that companies perform voluntary responsibilities will affect the employees' organizational commitment, because working in a philanthropic organization creates more employee identification with the company, and hence powerful organizational commitment.

THE IMPACT OF CORPORATE SOCIAL RESPONSIBILITY PERCEPTION ON THE JOB SATISFACTION

Adams (1963) defines job satisfaction as the balance between the perceived inputs and outputs of an individual. An employee will be satisfied if she believes that the inputs such as effort, education, experience etc are equal to the outputs like wage, and status. Robins (2000) explains the job satisfaction as the general attitude of the employees towards their job, and suggests that those who have positive attitude will have higher job satisfaction. According to Luthans (1995), job satisfaction is a result of compensation degree perception of an employee to which the job provides the important values of the worker. Davis (1998), on the other hand, defines job satisfaction as the pleasure or the discontent that an employee displays towards its company. Last, the job satisfaction may be explained as the perception degree to which the important things for an employee are fulfilled in her job (Luthans, 1995:126; May, Korczynski and Frenkel, 2002:794).

Riordian et al. (1997) finds that in the companies that manage their social environment positively, employees have higher job satisfaction levels. It is also possible to mention a positive association between organizational ethics and job satisfaction, however. The employees that believe that their organizations are fair to its workers; also think that the ethical responsibilities of the company are also accomplished. The corollary of this situation is the increase in the job satisfaction (Koh and Boo, 2004). Consistent with the previous findings, Vittel and Davis set forth that less job satisfaction is observed when the company do not obey the ethical rules, whereas an increase in the job satisfaction when the high level managers behave conversely (Satish, 1996). Furthermore, there is a relation between voluntary social responsibility activities and job satisfaction. The companies which execute voluntary activities will have a better reputation from the point of view of the employees and the society, and hence more job satisfaction will be observed (Upham, 2006). Another factor that affects the job satisfaction is the voluntariness level of the employees. Through the voluntary programs, employees have a chance to improve themselves in the areas of team working, problem solving, communication, creativeness, and leadership (Satish, 1996).

METHODOLOGY

TUPRAS oil refinery provides the population for the study, where 867 people are employed. The white collar and blue collar employee numbers are 141 and 726 respectively. A questionnaire is applied to total number of 104 TUPRAS employees. All of them are randomly selected. 55 employees have been a part of CSR projects before, while 49 of them have not participated for these projects. Participants were asked 24 closed end questions in 3 different categories. The first 6 questions are to determine the descriptive of the participants such as gender, age, education level, working time, position in the company and joining to the CSR projects. The subsequent 9 questions measure the impact of CSR' perceptions on the organizational commitment; while the last part of the questionnaire is designed to show the same impact on job satisfaction. A Likert type scale is used, in which the items are from 1 to 5 representing an opinion of strongly disagree to strongly agree. In order to assess the internal consistency of each dimension, Cronbach's alpha is computed. For the organizational commitment items and job satisfaction, Cronbach's alphas are found respectively 0.943 and 0.948, which are well above the lower limit of 0.70 (Hair et al., 2005). Next, to explore the dimensionality of the scale, explanatory factor analysis is conducted. Both the organizational commitment and job satisfaction scale items provide one factor that explains the 0.69 and 0.71 of the total variance. These findings suggest that the scale items are unidimensional.

Once the reliability issues are checked, one may continue with the hypotheses of the research. The main hypotheses of the study can be stated as follows:

H₀₁: There is no difference in the organizational commitment created by the CSR projects across genders.

H0₁₂: *There is no difference in the organizational commitment created by the CSR projects across educational levels.*

H0₁₃: *There is no difference in the organizational commitment created by the CSR projects across positions in the company.*

H0₁₄: *There is no difference in the organizational commitment created by the CSR projects across various working times.*

H0₁₅: *There is no difference in the organizational commitment created by the CSR projects across ages.*

H0₁₆: *There is no difference in the organizational commitment created by the CSR projects among the employees who actually participate to a CSR project and who do not.*

H0₂₁: *There is no difference in the job satisfaction levels created by the CSR projects across genders.*

H0₂₂: *There is no difference in the job satisfaction levels created by the CSR projects across educational levels.*

H0₂₃: *There is no difference in the job satisfaction levels created by the CSR projects across positions in the company.*

H0₂₄: *There is no difference in the job satisfaction levels created by the CSR projects across various working times.*

H0₂₅: *There is no difference in the job satisfaction levels created by the CSR projects across ages.*

H0₂₆: *There is no difference in the job satisfaction levels created by the CSR projects among the employees who actually participate to a CSR project and who do not.*

In order to test these hypotheses, first, the dimensions of CSR perceptions among the employees are constructed. To do so, factor analysis by the aid of principal component method and varimax rotation is utilized. Subsequently, chi – square test, t test and ANOVA are employed to assess whether there is a significant difference between the mentioned groups. For a further investigation, all of the items are compared according to gender, education level, positions, working times, ages and actual participation to a CSR project.

ANALYSES AND FINDINGS

CSR perception dimensions are constructed by using principal component analysis and varimax rotation. From the anti image matrix, each of the measure of sampling adequacy values are checked and observed that all of them are above the critical level of 0.50. The overall sampling adequacy is controlled by the Kaiser Meyer Olkin Measure of Sampling Adequacy (KMO) and Bartlett Test of Sphericity. Both measures show that the overall analysis performs a good fit. KMO Measure of Sampling Adequacy is 0.909 (>0.50) and Bartlett's Test is significant at 0.01 significance level (p value = 0.000). After the varimax rotation, two factors are extracted based on the latent root and Eigen-value criteria. They cumulatively explain 71.711 % of the total variance. The 9 items of job satisfaction load to the factor 1, while the remaining 8 items of organizational commitment load to second factor. Following Hair et al. (2005), the factor loadings below 0.55 are suppressed. Item 6 of the organizational commitment is decided to remove from the analysis to avoid cross loadings after examining the communalities. As a result, factor 1 is named as the job satisfaction, and the factor 2 is named as organizational commitment.

The following step is to test the above mentioned null hypotheses by the aid of these two factor scores. 2 parametric tests, namely t test and ANOVA, and a non parametric test, namely chi square test are employed. The findings are summarized in the Table 1.

The findings from the chi square and t test cannot demonstrate a gender difference in the organizational commitment and job satisfaction levels created by CSR projects at 5% significance level, since the p values are respectively 0.45 and 0.45 in the chi square tests, and 0.80 and 0.42 in the t tests. Hence, the H0₁₁ and H0₂₁ cannot be rejected. These results are in fact in line with the study of Fritzche, which cannot show a significant difference in the CSR perception across genders. In a similar manner, Barnett and Karson point out that women and men managers do not react differently against ethical dilemmas (Ekin and Tezölmez, 1999). Derry (1987), again, cannot find a relation between gender and ethical perceptions. Last to mention, Marz et al. (2003) indicate no significant difference among managers in different genders to perceive the ethics. As a result, the findings of this study are consistent with the gender difference and CSR perception literature.

Table 1. Results of the Impact of Corporate Social Responsibility Perception on the Organizational Commitment and the Job Satisfaction*

Variables	Chi-Square Tests	ANOVA	t Test
Gender & Job Satisfaction	89.020 (0.45)	NA	0.798 (0.42)
Gender & Organizational Commitment	89.020 (0.45)	NA	-0.251 (0.80)
Position & Job Satisfaction	88.865 (0.45)	NA	-1.193 (0.23)
Position & Organizational Commitment	88.865 (0.45)	NA	-0.770 (0.44)
Participation to CSR Projects & Job Satisfaction	90.221 (0.41)	NA	0.384 (0.70)
Participation to CSR Projects & Organizational Commit.	90.221 (0.41)	NA	1.036 (0.30)
Age & Organizational Commitment	176.268 (0.48)	1.269 (0.28)	NA
Age & Job Satisfaction	176.268 (0.48)	0.063 (0.93)	NA
Education & Organizational Commitment	177.865 (0.44)	2.088 (0.12)	NA
Education & Job Satisfaction	177.865 (0.44)	0.3 (0.74)	NA
Working Time & Organizational Commitment	178.067 (0.44)	1.641 (0.19)	NA
Working Time & Job Satisfaction	178.067 (0.44)	0.221 (0.80)	NA

* The values in parenthesis show p values of the mean differences between the two categories, i.e. job satisfaction mean values of women and men.

Next, the possible differences across various age levels and working times are investigated. The results conclude the null hypothesis of no difference, since the p values are much higher than all acceptable significance levels. In other words, organizational commitment and job satisfaction levels created by the CSR projects do not change depending on the different age levels and working times for an organization. As pointed out by Peterson (2004) and many others, age is not an effective factor on the evaluation of the companies' voluntary responsibilities by employees. Our findings are also in line with these studies.

From the education level comparisons, one may observe that the alternative hypotheses suggesting that a significant difference in the organizational commitment and job satisfaction level across employee education levels; are not supported. This finding is along the lines of Dubinsky and Ingram, and Harris Kidwell and Serwinek indicating that education level is not a determinant of ethical behaviors (Ekin and Tezölmez, 1999).

From the p values of both chi square test and ANOVA, one may observe that CSR based organizational commitment and job satisfaction levels do not change according to the various positions in a company. In fact, the previous literature, for instance Ostlund cannot show a difference in the CSR perceptions of high and middle

level managers as well. Consistent with our findings, Izareli indicates no managerial ethical perception differences among diverse company positions (Marz, 1999).

Last but not least, the differences in the organizational commitment and job satisfaction levels created by CSR projects based on actual participation are examined. Following the p values of Table 1, the null hypotheses cannot be rejected. No difference differences in the organizational commitment and job satisfaction levels can be detected.

Although the results of this study are consistent with the previous literature, one may explain the reasons behind the insignificant findings as follows: organizational commitment and job satisfaction levels are affected by the institutional and social factors as well as individual ones. Therefore, one may argue that CSR perception explanations based on only individual levels are not sufficient. Institutional based factors such as organization culture, communication inside the organization, institutional policies and human resources can also be influential on the employees' perceptions. If an organization is successful to create a "family" environment independently from the individual characteristics, it is very likely that all of the family members can adopt the family values regardless of their age, education or family position. In this case, the individual differences in the family will vanish, but new common values among the family members will flourish.

As of 2012, TUPRAS is the largest company in Turkey with the highest level of exportation. It also occupies the third position in the profitability ranking. Since the privatization in 2005, TUPRAS has been a part of Koc Holding, the largest Turkish firm which holds the 307th ranking in Forbes 500 list. Moreover, both Koc Holding and TUPRAS are the pioneers in the CSR implementations. In the international area, companies' ethical accountability capacities are evaluated by the Account Ability organization. CSR Institute, the accredited institute of Account Ability in Turkey, assessed TUPRAS as the second in 2008. As it is clear from these rankings, TUPRAS makes great effort to implement the CSR consciousness and culture which includes all of the employees. Thus, CSR becomes a corporate perception beyond the individual opinions. The human resources policies that include labor force supply are mostly shaped according to this understanding.

On the other hand, communitarian culture characteristics are more dominant in Turkey relative to individualism. The central thought can mostly be expressed by "we" perception, instead of "I" perception. Hence, the perceptions regarding to social issues such as cooperation, solidarity, cultural unity are widely formed by society's common values, but not individual norms. Then, it is possible to conclude that these common cultural and social values are affective on the employees' similar perceptions.

CONCLUSION

CSR implementations have become an inseparable part of business making in today's business environment. This process has evolved from time to time and short lived activities to long lasting and continues implementations. In order to improve the company reputation particularly from the point of view of its employees and all of the stakeholders, the companies should accelerate the CSR implementations. Thus, companies can obtain a valuable tool that provides competition advantage. By the aid of CSR implementations, companies can fulfill the emotional and social expectations of the employees; and hence improve organizational commitment and job satisfaction.

This study assesses the CSR based job satisfaction and organizational commitment level differences across various individual factors, and concludes that these factors are not influential. This result can mostly explained by Turkey's cultural features as well as institutional efforts of TUPRAS in CSR implementations.

Further researches may consider the society's cultural values as an additional aspect besides institutional factors in the formation of employee CSR perceptions. In addition, to observe the institutional culture effect more clearly, these results can be compared to the ones that will be obtained from a company that is not active in CSR projects.

FISCAL DEFICIT AND STOCK MARKET:EMPIRICAL EVIDENCE FOR TURKEY

Ecenur Ugurlu
Middle East Technical University, Turkey

ABSTRACT

This paper aims to empirically investigate the relationship between fiscal deficit and stock market for Turkey. Variable for money supply is also included to the model in order to avoid any biases. Monthly time series data of Turkey for the period between January 2004 and September 2012 are used. Multivariate Granger causality tests based on VECM is employed to find the direction of the relationship. The results of these analysis show that there is a unidirectional causality between fiscal deficit and share prices from share prices to fiscal deficit both in the short-term and in the long-term. The causality between money supply and share prices are also unidirectional from money supply to share prices in both short run and long run. Finally, although there is unidirectional relationship between money supply and fiscal deficit from fiscal deficit to money supply in short-term, in the long run there is bidirectional causality between fiscal deficit and money supply. The findings of this paper provide input, which might be used by investors while investing in stock market, and might be used by policy makers while taking actions to manage with the fiscal deficit.

INTRODUCTION

Economic theory and empirical studies have shown that there is a bidirectional relationship between many macroeconomic variables and stock prices. Some of these variables that are widely investigated are money supply, inflation, and interest rate. Some studies assert that fiscal deficit also affects the stock prices via affecting some macroeconomic variables like interest rates. If government increases their borrowing to manage with the budget deficit, interest rates will increase, which will reduce the discounted value of cash flows of the share. Likewise, if they increase the taxes, expected returns of shares will diminish. Therefore, budget deficit has a negative effect on share prices (Laopodis, 2009). On the other hand, other researchers state that financial deficit does not have any impact as long as individuals leave their net worth unchanged by correctly expecting and discounting future tax rise from the existing tax decreasing (see Barro, 1974). So there is no consensus on the effect of fiscal deficit on stock market.

This paper aims to fill this gap by empirically investigating the relationship between fiscal deficit and stock market for Turkey. Multivariate Granger causality tests based on VECM is employed to find the direction of the relationship. Monthly time series data of Turkey for the period between January 2004 and September 2012 are used. In order to prevent any biases, money supply variable, which might be affected by the government actions that are taken to manage with the fiscal deficit, is also included to the model.

This paper proceeds as follows. The following section briefly explains the existing studies. Third section discusses the data, the methodology and reports the empirical results. The final section concludes.

LITERATURE REVIEW

In the literature, it has been argued and empirically presented that by affecting future dividends and discount rates, many macroeconomic variables affect stock prices. Moreover, studies have shown that this

relationship can be bidirectional (see Chen et al. 1986). Fiscal deficit, which is the concern of this paper, has an impact on macroeconomic variables; therefore, is expected to affect stock prices via affecting macroeconomic variables (see Osamwonyi and Osagie, 2012). Although Ricardian Equivalence Proposition, which states as long as individuals leave their net worth unchanged by correctly expecting and discounting future tax increasing from the existing tax decreasing fiscal deficit will not have any impact, studies have presented mix results (seen Barro, 1974; Boothe and Reid, 1989; Darrat, 1987).

A budget deficit, which is the excess amount of government expenditures over revenues, can be financed via five ways that are by increasing money supply, by borrowing from the public, by borrowing from the external sources, by drawing on external reserves, or by combining all these four methods (Burney and Akhtar, 1992). If the government buys Treasury securities in order to increase reserves, money supply will increase, which will have a positive impact on stock prices by lightening the interest rate pressure. On the other hand, if government tends to increase borrowing, the interest rate will increase, which causes a diminish of the expected returns of stocks (see Geske and Roll, 1983; Roley and Schall, 1988). Moreover, some studies state that future tax rate is expected to increase as a result of the rise in budget deficit, which will reduce stock prices since current consumption will decrease (see Hall and Taylor, 1993; Ball and Mankiw, 1995). To make long story short, in the theoretical literature, there is no consensus of the net effect of fiscal deficit on stock prices. Empirical findings are also not clear. Although some studies find direct relationship between budget deficit and interest rates (see Wachtel and Young, 1987), others are not able to find any relationship between budget deficit and interest rates (see Mascaro and Meltzer, 1983; Findlay, 1990).

As it is mentioned above, future monetary policy decisions are affected by the government actions that are taken to manage with the fiscal deficit. As an example, if government tends to increase spending, the interest rate will increase. This rise put pressure on economic growth, and government increase money supply in order to relieve this pressure. So, monetary policy variable should be explicitly added to the model that examines the relationship between fiscal deficit and stock market (Laopodis, 2009). The relationship between money supply and stock market is also debatable. According to the efficient market approach, money supply does not have any effect on stock prices as all past information about money supply is reflected in the current stock prices (see Cooper, 1974). On the other hand, the portfolio approach states that increase in the money supply will change the equilibrium position of investors between money and equities until they replace some of this excess money with other assets like equities (see Hamburger and Kochin, 1971). Furthermore, increase in the money supply is expected to rise inflation, and this reduce stock prices by making investors to invest in real assets rather than in financial assets. Empirical studies conduct for the developed countries also prove this negative relationship between money supply and stock prices (see Davidson and Froyen, 1982; Rozeff, 1994, Osamwonyi and Osagie, 2012).

As can be seen above, the existing literature cannot offer a clear conclusion about the impact of fiscal deficit on stock prices. Therefore, an empirical study should be employed to examine the relationship between budget deficit and stock prices in developing countries such as Turkey. To the best of our knowledge, this paper is the first study that explores the relationship between fiscal deficit, money supply, and stock market for Turkey.

DATA, METHODOLOGY, AND STATISTICAL RESULTS

Data

In this paper, times series methodology is employed for the econometric analysis of the relationship between stock market, government deficit, and monetary policy. The analyses consisted of three steps. In the first step, the order of integration of the series is obtained. The second step established the cointegration. In the final step, multivariate granger causality tests based on VECM procedure are applied to get the causal relationship between series. Monthly time series data of Turkey for the period between January 2004 and September 2012 are used. Data for fiscal deficit is provided from the official webpage of the Republic of Turkey Ministry of Finance, and data for other variables are obtained from OECD databank.

To assess the relationship between stock market, fiscal deficit and monetary policy, share price index, hereafter SHARE, is employed as an indicator of stock market. Fiscal deficit is measured by the difference between general government revenue and general government expenses, hereafter FISCAL. Therefore, increase

in this variable means reduction in the deficit, and vice versa. Finally, broad money as a percentage of GDP, hereafter MONEY, is employed as monetary policy indicator.

Unit Root Tests

Classical regression model assumes the stationarity of both dependent and independent variables, and errors with zero mean and finite variance. Therefore, in order to avoid spurious regression and invalid results, the stationarity characteristics of the variables are examined via the unit root tests. Rejecting the null hypothesis of these tests indicates variables are integrated of order 0, in other words they are stationary. The order of integration shows the number that a series have to be differenced to become stationary.

In this paper augmented Dickey-Fuller (ADF) (Dickey and Fuller, 1979), generalized least squares (GLS)- detrended Dickey-Fuller (DF-GLS), and Phillips-Perron (PP) (Phillips and Perron, 1988) are employed to test stationarity characteristics of series. The lag lengths are determined by the Akaike Information Criterion (AIC). The results of unit root tests are shown in Table 1 and Table 2 for levels and first-differences, respectively. The results indicate that we are not able to reject the null hypothesis of the unit root tests for all variables; however, the null hypotheses of the unit root tests are rejected for all variables in the first differences. Thus, it is concluded that all series are integrated of order one, $I(1)$, and therefore, it is proper to continue to test for cointegration between these series.

Table 1: Unit root test results (Levels)

		ADF		DF-GLS		PP
		Statistics	Lag	Statistics	Lag	
SHARE	Intercept	-1.4583	3	0.0284	1	-1.2364
FISCAL		-1.1665	11	-0.773	11	-11.9313
MONEY		1.9255	4	2.0367	3	2.2107
SHARE	Intercept and Trend	-3.0777	5	-3.0077 ^c	5	-2.215
FISCAL		-1.96	11	-1.116	11	-12.1034
MONEY		-1.7833	4	-0.8014	4	-1.7245

Superscripts a, b, and c represent significance at 1%, 5%, and 10%, respectively. ADF, DF-GLS, and PP refer to Dickey-Fuller, Dickey- Fuller GLS detrended, and Phillips-Perron, respectively. Lag lengths are determined by Akaike Information Criterion (AIC). SHARE, FISCAL, and MONEY refer to share price index, fiscal deficit, and M2 as a percentage of GDP, respectively

Table 2: Unit root test results (First-Differences)

		ADF		DF-GLS		PP
		Statistics	Lag	Statistics	Lag	
SHARE	Intercept	-8.4163 ^a	0	-8.2350 ^a	0	8.4226 ^a
FISCAL		-6.7468 ^a	10	0.0414	15	108.9723 ^a
MONEY		-4.4913 ^a	2	-3.2233 ^a	2	-9.7875 ^a
SHARE	Intercept and Trend	-8.3747 ^a	0	-8.3455 ^a	0	-8.3811 ^a
FISCAL		-6.7419 ^a	10	-1.2962	12	-116.0802 ^a
MONEY		-5.3032 ^a	3	-4.9972 ^a	3	-10.2177 ^a

Superscripts a, b, and c represent significance at 1%, 5%, and 10%, respectively. ADF, DF-GLS, and PP refer to Dickey-Fuller, Dickey- Fuller GLS detrended, and Phillips-Perron, respectively. Lag lengths are determined by Akaike Information Criterion (AIC). SHARE, FISCAL, and MONEY refer to share price index, fiscal deficit, and M2 as a percentage of GDP, respectively.

Cointegration Tests

In order to examine the long-run relationship between share prices, fiscal deficit and money supply, cointegration test is applied. Since all variables are integrated of order 1, Johansen and Juselius (1990) cointegration test can be employed which requires the variables to show same order of integration. This test based on the vector autoregression (VAR) of order p, which can be shown as:

$$x_t = \mu + \Pi_1 x_{t-1} + \Pi_2 x_{t-2} + \dots + \Pi_p x_{t-p} + \varepsilon_t \quad (1)$$

where x is a 3x1 vector including SHARE, FISCAL, and MONEY, constant terms are shown by 3x1 vector of μ , coefficient matrices are represented by (3x3) matrices of $\Pi_1, \Pi_2, \dots, \Pi_p$, and ε is a (3x1) vector of error terms that have zero mean and constant variance. This VAR can be rearranged as:

$$\Delta x_t = \mu + \sum_{i=1}^{p-1} \Delta x_{t-i} + \Gamma x_{t-p} + \varepsilon_t \quad (2)$$

where $\Gamma = -I + \Pi_1 + \dots + \Pi_p$. Matrix of Γ determines the long-term relationship between variables and its rank is same as the number of independent cointegrating vectors presented by r. If r is equal to 0, the equation 2 is a standard VAR in first difference since the components of x are non-stationary. On the other hand, if r=n, then x are stationary. In case of r=1, Γx_{t-p} is the error-correction factor. Finally, there are several cointegration factors if $1 < r < n$. Significance of characteristic roots of Γ gives the number of distinct cointegration vectors (see Johansen, 1991, 1995).

Lag length determination is an important part of cointegration test as while insufficient lag length might cause a rejection of the null hypothesis that state no cointegration, over length might result with loss of power. The optimal lag length is selected as by using LR and Akaike information criteria (AIC).

Johansen and Juselius cointegration test results for SHARE, FISCAL, and MONEY is shown in Table 3. According to this table, while the trace eigenvalues state that there are three cointegration equations at five percent significance level and one cointegration equation at one percent significant level, max-eigenvalues state that there is one cointegration equation at five percent significant level. This finding confirms that there is a long run, systematic relationship between stock returns, fiscal deficit, and money supply in Turkey. Moreover, this finding suggests that there is causality in at least one direction.

Table 3: Cointegration test results (Lag=5)

H_0	λ_{trace}	5%	λ_{max}	5%	Eigenvalues
$r = 0$	42.2053**	29.68	23.3137*	20.97	0.2098
$r \leq 1$	18.8917*	15.41	13.7869	14.07	0.1299
$r \leq 2$	5.1048*	3.76	5.1048*	3.76	0.0503

The optimal lags are determined according to the LR, and Akaike Information Criterion (AIC). Critical values are sourced from Osterwald-Lenum (1992)

Granger Causality Tests

As it is mentioned above, finding cointegration between variables suggests the existence of Granger causality. In order to determine the direction of Granger causality of cointegrated variables, vector Error Correction Model (VECM) is employed rather than VAR (Granger, 1988). Moreover, by using this model, short-term and long-term causalities can be separated.

The model used in this paper is as follows:

$$\Delta SHARE_t = \mu_1 + \sum_{k=1}^r \eta_{1,k} ECT_{k,t-1} + \sum_{i=1}^n \alpha_{1,i} \Delta SHARE_{t-i} + \sum_{i=1}^n \beta_{1,i} \Delta FISCAL_{t-i} + \sum_{i=1}^n \delta_{1,i} \Delta MONEY_{t-i} + \varepsilon_{1,t} \quad (3)$$

$$\Delta FISCAL_t = \mu_2 + \sum_{k=1}^r \eta_{2,k} ECT_{k,t-1} + \sum_{i=1}^n \beta_{2,i} \Delta FISCAL_{t-i} + \sum_{i=1}^n \alpha_{2,i} \Delta SHARE_{t-i} + \sum_{i=1}^n \delta_{2,i} \Delta MONEY_{t-i} + \varepsilon_{2,t} \quad (4)$$

$$\Delta MONEY_t = \mu_3 + \sum_{k=1}^r \eta_{3,k} ECT_{k,t-1} + \sum_{i=1}^n \delta_{3,i} \Delta MONEY_{t-i} + \sum_{i=1}^n \beta_{3,i} \Delta FISCAL_{t-i} + \sum_{i=1}^n \alpha_{3,i} \Delta SHARE_{t-i} + \varepsilon_{3,t} \quad (5)$$

where ECT is the error correction term resulting from the long-run cointegrating relationship, μ s are intercept terms, η , α , β and δ are coefficients to be estimated, t and i denotes the period and lags respectively, and ε is the error term. LR and Akaike Information Criteria (AIC) are used as lag length determination criteria.

Table 4 shows the multivariate Granger causality tests results. ECT of fourth equation, in which the fiscal deficit is dependent variable, is significantly different from zero, which states fiscal deficit reacts to a deviation from long-run equilibrium. On the other hand, error correction terms in the third and fifth equations are not significantly different from zero, so share price and money supply do not share the burden of adjustment to a long-term equilibrium. Findings state that, unlike the literature, both short-term and long-term impact of fiscal deficit on share prices do not seem to be significant for Turkey. Money supply is significantly Granger causing for increase in share prices in both short-term and long-term. However, it is not significant Granger cause of fiscal deficit in short-term. On the other hand, in the long run, the money supply is significantly Granger causing the fiscal deficit. Fiscal deficit is a Granger cause of money supply both in the short and long run. This finding state that the government tend to increase money supply due the fiscal deficit in the short term; however, fiscal deficit do not respond immediately and it takes time that money supply will be Granger cause to reduce fiscal deficit. Moreover, share price is a significant Granger cause of fiscal deficit in the short-term and long-term, however share price is not a Granger cause of money supply both in short and long term. Unidirectional relationship between share price and fiscal deficit can be inferred as increase in the share prices reduce the demand of investors on the T-bills, which decrease the revenue side of the government, and consequently increase the fiscal deficit.

Table 4: Granger causality tests based on VECM results

Dep.Var.	Short-term F-statistics			ECTs	Long-term joint F-statistics		
	SHARE	FISCAL	MONEY	ECT _{1t-1}	ECT _{it-1} , SHARE	ECT _{it-1} , FISCAL	ECT _{it-1} , MONEY
SHARE		0.4157	3.4293 ^b	-0.0026 (-0.1001)		0.3499	2.7446 ^b
FISCAL	3.6328 ^a		1.8276	-1.2512 ^a (-5.1272)	8.2903 ^a		6.8247 ^a
MONEY	1.9926	2.2069 ^c		0.0031 (0.8141)	1.5015	2.9437 ^b	

ECTs were obtained by normalizing the cointegrating vectors. The values in parenthesis are t-statistics. Superscripts a, b, and c represent significance at 1%, 5%, and 10%, respectively. The optimal lags are determined according to the LR, and Akaike Information Criterion (AIC). SHARE, FISCAL, and MONEY refer to share price index, fiscal deficit, and M2 as a percentage of GDP, respectively.

CONCLUSION

This paper empirically studied the relationship between fiscal deficit, monetary policy and stock market. To this end, multivariate Granger causality tests based on VECM is employed for Turkey. Monthly data for the period between January 2004 and September 2012 are used. By using Johansen and Juselius cointegration test, it is found that there is one cointegration equation at five percent significance level. This finding approves that there is a long-run systematic relationship between stock returns, fiscal deficit, and money supply in Turkey. Moreover, this finding suggests that there is causality in at least one direction. Multivariate Granger causality tests based on VECM approach assert that both in short and long run, there is unidirectional relationship between share prices and fiscal deficit from share prices to budget deficit. This finding can be interpreted as increase in the share prices makes it preferable than the treasury bills so demand for the T-bills

decreases. As it is one way to reduce the fiscal deficit, government revenues from T-bills reduces. The causality between money supply and share prices are also unidirectional from money supply to share prices in both short run and long run. Although there is unidirectional relationship between money supply and fiscal deficit from fiscal deficit to money supply in short-term; in the long run there are bidirectional causalities between fiscal deficit and money supply. This last finding can be interpreted as, due to the fiscal deficit, government tends to increase money supply in the short-run, however increase in the money supply does not cause to diminish fiscal deficit in short run.

This paper contributes to the literature by examining the relationship between fiscal deficit, monetary policy, and stock market in Turkey. The findings of this paper provide input, which might be used by investors while investing in stock market, and might be used by policy makers while taking actions to manage with the fiscal deficit.

FROM RESTORING AMERICAN COMPETITIVENESS TO REENERGIZING GLOBALIZATION: FROM WHAT WASHINGTON NEEDS TO DO TO ISSUES THE WORLD NEEDS TO BE CONCERNED ABOUT NOW

**Robert G. Vambery
Pace University, USA**

ABSTRACT

In 2012, under the direction of Professor Michael Porter, the Harvard Business School completed an elaborate study entitled Competitiveness at a Crossroads: Findings of Harvard Business School's 2012 Survey on U.S. Competitiveness. Among other research tools the study surveyed about 10,000 executives who over many years graduated from Harvard's MBA programs. Among the accomplishments of the study is the creation of a set of eleven proposals related to actions to be taken by the business community in working toward the goals of not just maintaining but enhancing America's economic competitiveness. After a brief consideration of the proposals, this paper turns to considering a series of challenges related to conditions and practices that inhibit business and economic performance not only in the U.S. but also in many countries of the globe.

INTRODUCTION

In 2012, under the direction of Professor Michael Porter, the Harvard Business School completed an elaborate study entitled Competitiveness at a Crossroads: Findings of Harvard Business School's 2012 Survey on U.S. Competitiveness. Among other research tools the study surveyed about 10,000 executives who over many years graduated from Harvard's MBA programs. Among the accomplishments of the study is the creation of a set of eleven proposals related to actions to be taken by the business community in working toward the goals of not just maintaining but enhancing America's economic competitiveness.

GUIDELINES FOR CORPORATE ACTIONS

The eleven recommendations that are to be implemented not only by the business community as a whole but, to as great an extent as possible, by individual corporations also was:

1. Improve the competitiveness of the regional clusters in which your company operates.
2. Initiate improvements in the general business environment in your geographic region.
3. Upgrade the skills and productivity of your workforce through enhanced and expanded internal training programs.
4. Make your workers more employable both by your and other companies through the use of internships in formal apprenticeship training programs.
5. Join technical schools, community colleges and universities in offering programs that target the skill needs of your corporation and then commit to hiring graduates from these programs.
6. Purposefully work toward increasing sourcing from local, regional and domestic suppliers.
7. Help local suppliers to upgrade their capabilities so that they will become more useful collaborators for your firm and your firm becomes a more valuable and steady customer.

8. Collaborate with firms in your industry as well as with centers of research to develop improved products and future technologies.
9. Support startup companies relevant to your enterprise.
10. Repatriate from foreign venues business activities that can be gainfully pursued within the U.S.
11. Support and participate in efforts in favor of laws and regulations that enhance the nation's business environment in general and not just in those efforts that focus only on your specific firm and industry.

GUIDELINES FOR ACTIONS BY THE FEDERAL GOVERNMENT

Somewhat after the completion of this project Professor Porter and his co-author Jan Rivkin released another agenda for action under the title *What Washington Must Do Now*. The eight proposals included:

1. Ease immigration of highly skilled individuals.
2. Simplify the corporate-tax code.
3. Tax overseas profits only where they are earned.
4. Address trade distortions.
5. Simplify regulation.
6. Enact a multi-year program to improve infrastructure.
7. Agree on a framework for developing shale gas and oil.
8. Create a sustainable federal budget.

In the course of discussions and interviews, Dr. Porter emphasized that we (the U.S.) know for quite some time that these need to be done, that we know how to do them and yet somehow we don't seem to be able to get them done.

FACING CHALLENGES IN THE GLOBAL BUSINESS ENVIRONMENT

The practices may generate favorable levels of income to those who are engaged in them but cause misallocations of resources, reductions in potential outputs and contributions to national incomes, may add to inefficiencies or impede the accomplishment of environmentally sustainable economic growth, present threats to national and global financial markets and curtail transparency and ethical conduct in business and regulatory procedure.

The issues to be identified and discussed in this presentation include:

1. Financial services as money manipulating activities for the sake of creating fees-paying financial transactions rather than for financing real investments or the costs of operations.
2. The overestimation of real GDPs due to the large size of the unproductive portions of the financial sector such as the multi-trillion dollar volume of monthly foreign exchange conversions and also the misalignments of exchange rates.
3. The growth of the unreal economy through the vast growth of the information and communications sectors which at substantial total cost generate information and communications that have more entertainment than production increasing impacts.
4. Absurdities in the original Kyoto Protocol that left out from assigning environmental responsibilities to countries with huge populations and rapidly growing economies and even greater absurdity may be that these exemptions continue even now.
5. The challenges associated with unbalanced population growths with some countries having much too low population growth rates to assure an adequate labor force for the future while some other countries continue to have rapid additions to their populations whom they are unable to employ.
6. The amazing potential of increased savings rates as a partial solution to the challenges of low population growth.
7. Value creation through construction and the production of real assets versus value creation through changing numbers: the construction industry versus the numbers industry.

8. The lower utility of foreign direct investments when host countries interfere with or limit profit repatriation.
9. The perpetual threats of restructurings and defaults in debt markets: the devastating interactions of unworthy borrowers, irresponsible lenders, and incapable regulators.
10. Warning: The simultaneous interaction of all three forces (unworthy borrowers, irresponsible lenders, and incapable regulators) can result in the near collapse of the financial stability of the borrowing institution or country. In this case, even cooperative approaches by all three groups may not be sufficient to avoid enormous economic dislocations or societal chaos. The dislocations may be so severe that remedial measures can take years to implement and neither the unworthy borrowers nor the incapable lenders will be able to avoid incurring enormous losses.
11. The need to redefine the missions, goals and purposes of corporations:

The process of economic growth was transformed from the manufacturing of products and the construction of buildings to the manufacturing of numbers and the construction of inflated forecasts, leading to imagination-and-fantasy-based rather than reality-based expectations. Unrealistic expectations led to reckless and irresponsible conduct and actions by private individuals, by corporations, by financial institutions, by legislators and government administrators at the local, state, federal and international levels. The bigger the corporation, the bigger the financial institution, the bigger the government the more reckless, the more irresponsible, the more damaging the behavior was likely to become.

Does the rise of prices on equity markets partially brought about by the near zero interest rate monetary policies of the Federal Reserve Bank and other Central Banks constitute a victorious return of the numbers sector of the economy?

CONCLUSION

There is a great need for cooperation between academic communities and business communities to work toward a more productive and ethically stronger framework for the global business system.

FACTORS CONTRIBUTING TO A LONG TERM TALENT DEVELOPMENT FOCUS FOR UNIVERSITY ATHLETES

Liandi Van den Berg and Jhalukpreya Surujlal
North-West University, South Africa

ABSTRACT

Talent development in sport is a complex process involving the interaction of multidisciplinary aspects that directly and/or indirectly affect athletic progression and performance. The purpose of this study was to identify factors that contribute to a long term talent development focus so that the success of university athletes in South Africa is increased. Athletes over the age of eighteen years, who qualified to compete under the auspices of University Sport South Africa, were requested to complete the Talent Development Environment Questionnaire for Sport (TDEQ). Included in the questionnaire were twenty four items specifically measuring the extent to which athletes are exposed to development opportunities designed to form foundations for long term success rather than preparation for short-term results-driven outcomes. The results of the study revealed that five factors influenced the advancement of a long-term talent development focus which included the following: training support, coach guidance, skills development focus, work ethic and training goals. These factors are highly predisposed by the coach. Subsequently an implicit need for a theoretical model of effective sport coaching practice would be highly beneficial in providing coaches with the necessary knowledge required to provide a conducive developmental environment for athletes.

INTRODUCTION

Talented athletes have enjoyed remarkable attention throughout the ages (Abbot *et al.*, 2002, Arnot & Gaines, 1984; Vaeyens *et al.*, 2008). The lucrative incentive of financial gain both for the athlete and the investor has long since been the driving force behind numerous talent development projects (Bloomfield *et al.*, 1994; Vaeyens *et al.*, 2008; MacCurdy, 2010) and this has also been the case at Universities (Martindale *et al.*, 2005). The optimization of a talent development environment in which talented athletes could be fostered has also enjoyed much attention in recent years (Abbot *et al.*, 2002; Baker *et al.*, 2003; Vaeyens *et al.*, 2008). Administrators, coaches, parents and athletes realize that not only is the talent development process throughout the many different performance stages of utmost importance, but so too is the specific talent development focus from which the athlete is nurtured (Bloom, 1985; Côté, , 1999; Gould *et al.*, 2002; Jowett & Cockerill, 2003). However, because of the multi dimensional approaches of researchers regarding talent development processes to date, it was difficult to find a coherent approach to a successful talent development environment (Martindale *et al.*, 2010; Phillips *et al.*, 2010). In their efforts to clarify generic individual and environmental factors that are causative of effective and successful talent development, Martindale *et al.*, (2010) developed an integrated, holistic and systematic model with key features and key methods for effective talent development procedures. These key features describe the environment and focus needed in order to nurture and develop talent effectively.

Long-term talent development focus

Key features from the Martindale *et al.* (2010) model include aspects such as 1) Long term aims and methods, 2) Wide ranging coherent messages and support, 3) Appropriate development and 4) Individual and ongoing development. These key features indicate that a long term focus is required to become a successful athlete at elite

level (Bloom, 1985; Starkes *et al.*, 1996; Smith, 2003) as well as that long-term focus requires effective, integrated goals set to direct a variety of crucial aspects to ensure a processes that will guide athletes in achieving long-term results (Martindale *et al.*, 2005; Smith, 2003). It has often been the case that talented athletes focused too much on short term performance and success as opposed to learning (Ericsson, 1998; Balyi, 2002), which, at times, ignores crucial long-term development experiences (Zatsiorsky, 1995; Côté & Hay, 2002;). Ensuing from this scenario is not only the failure of athletes to make the transition to excel on a high performance level (Moore *et al.*, 1998), but also to reach their full potential (Bloom, 1985). Most university athletes are in a transition from junior to senior level and in some sports, may need a longer period for this progression to reach completion. According to Smith (2003), long-term development can span between 10-15 years of an athletes' competitive life, thus emphasizing the futile focus on short-term results. Once an athlete has reached the perimeter of advancing to the highest level of sport participation, another 6-8 years of competitiveness may be needed to truly succeed (Bompa, 1999; Balyi & Hamilton, 1999). Unfortunately, the pressure to perform and the rewards in short-term success often influence coaches to prioritize short-term training methods (Côté, *et al.*, 2003, Martindale *et al.*, 2005). Consequently their selection is based on athletes who can perform well at present even at the expense of that athlete's probable superior long-term potential (Martindale *et al.*, 2005).

Martindale *et al.* (2010) identified the need for long-term development opportunities afforded to athletes with the specific aim of holistic athlete talent development, clear long-term goals and the progression to senior level. Female athletes in sports such as gymnastics, figure skating, swimming and tennis may achieve their highest level of competition during their late teens or early twenties (the latter age representing that of university students) (Smith, 2003). However, athletes participating in rugby, soccer, volleyball, speed skating, distance running and cross country skiing tends to only achieve their full potential during their late twenties or early thirties (Smith, 2003), thus emphasizing the importance of a long-term development focus (Zatsiorsky, 1995). This study aimed to identify those factors which contributed to the long-term talent development focus among university athletes. Items from the TDEQ related to the long-term development focus factor include aspects that reflect a coach's own individual focus with regard to long-term athlete development. Consequently the coach's guidance, planning, mentoring, and co-operation with the athlete and other performance supplemental individuals involved with the individual athlete/team also come under the spotlight (Jowett & Cockerill, 2003; Martindale *et al.*, 2010). Effective communication, a variety of consistent opportunities, the coping with situational psychological pressure, the systematic development of physical components and the development of a long-term dedication attitude are also items indicative of the development of a long-term talent development focus.

PURPOSE OF THE STUDY

The purpose of this study was to identify factors that contribute to a long term talent development focus so that the success of university athletes in South Africa is increased.

METHODS AND PROCEDURES

An extensive literature study was conducted on the talent development environment and the influence of a long-term athlete development focus. The literature suggested that in order to research long-term talent development, a quantitative research approach was appropriate.

Sample

A non-probability sampling design in the form of convenience sampling was used to gather data for the study. The rationale for this approach was the fact that respondents were available and easily accessible and the data collection was less time consuming and inexpensive. While this approach has a shortcoming in terms of sampling errors and restrictions regarding generalizability, every attempt was made to overcome these by targeting a large sample (Sekaran, 2003). Student-athletes from two universities who participated competitively under the auspices of the University Sport South Africa (USSA) were recruited at random during their practice sessions at the different university stadia and after inter-university matches.

Instrument and Procedures

A two-section questionnaire was used to collect data for the study. Section A of the questionnaire comprised questions requesting demographic information of the participants. Section B of the questionnaire comprised the Talent Development Environment Questionnaire (TEDQ) (Martindale *et al.*, 2010). Twenty four items using a 6-point Likert-type scale anchored at 1 (strongly agree) and 6 (strongly disagree) were used to measure the long term talent development focus for developing athletes.

Trained research assistants using the same written protocol approached potential participants, explained the purpose of the study and requested their consent to participate in the study. Respondents were assured of anonymity and confidentiality and informed that they could terminate their participation at any time without any consequences.

Data analysis

The data was captured and analysed using the Statistical Package for the Social Sciences (SPSS – version 20). The data was analysed as follows: Firstly, descriptive statistics was conducted to describe the profile of the student athletes who participated in this study. Secondly, Cronbach alpha was used to ascertain the reliability of the long term development factor scale. Thereafter exploratory factor analysis was conducted to identify the factors which contributed to the long term talent development focus.

Results

Demographics

Of the 320 questionnaires that were distributed, 289 questionnaires were returned (response rate = 90%). Of the questionnaires which were returned 22 were incomplete. Hence, actual data analysis was conducted on 267 questionnaires.

Of the 267 participants, 50.6% ($n = 135$) were male and 49.4% ($n = 132$) were female with a distribution of different sporting codes as follows: rugby ($n = 52$), cricket ($n = 7$), hockey ($n = 40$), netball ($n = 30$), athletics ($n = 5$), body building ($n = 6$), basketball ($n = 44$), dance ($n = 14$), volleyball ($n = 18$), soccer ($n = 47$) and “other” ($n = 4$).

Exploratory factor analysis

The suitability of the data set for factor analysis was established using the the Bartlett’s Test of Sphericity and the Kaiser-Meyer-Olkin (KMO) Measure of Sampling Adequacy. Both tests (KMO = 0.898; Bartlett’s Test of Sphericity (sig) = 0.00) were found to be acceptable to conduct factor analysis. Using Principal Component Analysis (PCA) together with the varimax rotation and a minimum eigen value of 1, five factors were identified. The Cronbach alpha reliability coefficients for the factors as well as their operational definitions are illustrated in Table 1.

Table 1. Cronbach alpha reliabilities of the first order factors and operational definitions

Factor	Cronbach Alpha	Operational definition
Training support	.803	Effective and coherent relationships sustaining the effort needed during training to provide quality practice, assuring development.
Coach guidance	.786	Direct, influential relationship that incorporates elevated levels of trust, communication and respect among coaches and athletes, aids operation at the highest levels of sport.
Skills development focus	.685	Early foundations set for future progressions, through a consistent focus on improvements instead of current outcomes.
Work Ethic	.688	Engagement in sport with raised levels of commitment, tenacity and intentional effort.

Training goals	.650	Engagement of deliberate practice necessary for the attainment of sport expertise, usually deliberately planned by coach and motivated by athlete.
----------------	------	--

According to Nunnally (1978: 245), the recommended coefficient alpha to conclude that the proposed factors are reliable is 0.7. However, a study by Kim and Kim (1995) regarded a coefficient of 0.5 to 0.6 as sufficient to conclude that the extracted factors were reliable. Therefore, due to the exploratory nature of the study all the extracted factors (Cronbach alpha > .6) were retained for discussion purposes.

Discussion

The five factors that mainly contribute to the augmentation of a long term talent development focus among university athletes encompass various factors specifically concerning the coach. Aspects such as the direct coach relational influences on training support, projected at enhancing the acquisition of sport expertise were evident from the results as well as being underpinned by research (Baker *et al.*, 2003). The *training support* that is provided to the athletes is mirrored in the various roles which coaches perform. These include being an instructor, organizer, planner, counselor, communicator, trainer, appraiser and psychologist (Surujlal & Dhurup, 2011).

The *skills development focus* emerged as an important factor in long term talent development. This is supported by Jowett (2005:412) who views the coach-athlete relationship as the “foundation of coaching” which has a significant influence in promoting and enhancing the physical and mental skills of athletes in their charge. Furthermore the importance of the coach-athlete relationship is highlighted through the “*coach guidance*” factor, which elaborates the complementary role and task of the coach that significantly enhances the athlete even beyond the confines of sport (Jowett & Cockerill, 2003).

Coaches also increase athletes’ focus regarding skills development by creating appropriate and stimulating developmental training opportunities, aimed in progressing through stage specific and individualized levels, usually from junior to senior level (Vayens, 2008).

The fourth variable identified, integrate the athletes’ level of work ethic, mainly collaborating on their increased levels of effort, concentration, determination and commitment in exerting the required future training adaptations and performances for success (Baker *et al.*, 2003). Surujlal (2004) suggests that by coaches assuming both leadership and motivator roles, they are able to inculcate *work ethic* in their athletes.

The setting of *training goals* is an important function that the coach is required to perform. In this role it is the coach’s task to plan, organize, direct and control the activities of his/her charges towards the objective of winning or improved performance. Ericsson *et al.*, (1993) argues that training sessions should include the theory of “deliberate practice” which should result in specific training goals being incorporated. This can be accomplished through the meticulous planning of expert coaches, who in setting precision objectives for each practice session are able to foster optimal learning situations which will evidently become instrumental in the significant development of athletes (Baker *et al.*, 2003 & Voss *et al.*, 1983).

CONCLUSION

The purpose of the study was to identify the factors which contribute to long term talent development focus of university athletes. Five factors, namely *training support*, *coach guidance*, *skills development focus*, *work ethic* and *training goals* were extracted through factor analysis. The findings provide a useful insight into the factors that coaches need to consider in the long term talent development of athletes. The findings would be able to guide coaches to plan appropriately to create the ideal talent development environment for the long term progression of their athletes. Furthermore, the findings provide the opportunity for critical reflection by coaches regarding their current talent development environment.

THE SENSE OF ORGANIZATION IDENTITY (SoOI)... SYSTEMATICALLY INCHING FORWARD

Christian van Tonder

Tadayuki Miyamoto

Curtin University, Australia

ABSTRACT

Current global dynamics promise to deliver a continuing turbulent business environment, in which the meaning of organizational competitiveness, success and sustainability will require constant redefinition. Against this, organization identity (OI), a popular yet abstract and ambiguous concept, is regarded as a long-term survival factor and a powerful source of stability and coherence. Indeed, Organization Identity Theory (OIT) proposes that organizational sustainability in the long term hinges on a strong and clear organization identity (OI). The current study, which operationalizes OI as the sense of organization identity (SoOI), extends earlier research and proposes and validates a measurement model for the SoOI. The resultant structural model means that this intangible organizational asset is now amenable to some measurement, offering diagnostic value and a means (identity) with which to navigate the change hurdles of future sustainability.

ORGANIZATIONAL SUSTAINABILITY: A CHALLENGE OF CHANGE AND IDENTITY

“The liability of change”¹ and organizational sustainability

Rapid, exponential advances in information and communication technology (ICT) have had a far-reaching impact on the business landscape - in particular the global movement of information, capital, resources, but also organizations (and social concerns and ideologies). It has in particular influenced the profile of emerging (diversified) workforces and new generation employees born into this era, the proliferation of multinational companies (MNCs) (Chao & Moon, 2005), and escalating annual migration (Koser & Laczko, 2010). These factors act as major drivers of global change and instability. While this signals continued and significant discontinuity in the operating contexts in which businesses pursue growth opportunities, it also implies evolving concepts of ‘performance’, ‘competitiveness’, ‘risk’, ‘success’ and ultimately ‘organizational sustainability’ (in this study the latter is essentially equated to *organizational longevity* with the declining life expectancy of organizations being one indicator – cf. De Geus, 1997; Van Tonder, 2004a). Inasmuch as the proliferation of multinational companies suggest a change in organizational ‘species’ (e.g. notions of the *post-bureaucratic*, *21st century*, *new paradigm*, *networked and virtual organizations*), the nature of the emerging ‘new generation’ employee... his/her perspective, concept of work-life balance and, in particular, fundamental value set, signify similar discontinuity in the utility value of conventional management thinking and practice. Consequently, to contemplate institutional designs and approaches with which to harness opportunities in the late 21st century is to recognise that an entirely different frame of mind is required to engage this very different and constantly evolving business environment. Future organizational sustainability, *increasingly*, will be defined *more* by the prevailing context, concepts of organization and success, and profile of the employee **at that time** and less by our current understanding of these concepts. This poses a formidable challenge to management scholars and those institutions involved in educating business leaders of the future. Paradoxically though, while changes in the

operating context, the nature of the organization, the profile of the workforce and the ‘typical’ employee are substantial and evolving, currently taught management theory, though constantly re-contextualised, has hardly changed during the past three decades. Undoubtedly ‘historical’ organization and management theories in many situations remain relevant to a degree, but their explanatory power and predictive capability are rapidly diminishing... evidence of a paradigm approaching the limits of its useful life (consider, for example, conventional notions of ‘organizational culture’ applied to MNCs with their highly diversified multi-ethnic staff complements). The ‘search’ therefore would be for relevant organization and management theory with a firm perspective on *organizational longevity* i.e. for theory that has the latitude and versatility for ‘absorbing’ *era change*. Organization identity (see *Organization Identity Theory* – Van Tonder 1999, 2004ab) as *construct* but in particular as *theory* appears to reside at least partly in this conceptual space.

Organization Identity

Most often defined as the core, enduring and distinctive features of the organization (after Albert & Whetten, 1985), organization identity is increasingly recognized as a construct of substantial significance (e.g. Corley and Gioia, 2004; Corley et al., 2006; Dhalla, 2007). Indeed, it has been argued that *organization identity* would eventually eclipse *organizational culture* on grounds of its significant explanatory power in terms of organizational functioning and performance (cf. Van Tonder, 2011). This position is premised in part on the exponential growth in scholarly interest, and the observed shift in the Organization Identity (OI) discourse, which, for the greatest part since Albert and Whetten’s (1985) seminal paper, dwelled essentially at a tentative conceptual level. Empirical studies were rare and limited to the occasional case study. From the early 2000s onwards scholarly interest in this construct accelerated and spread beyond disciplinary boundaries, to the extent that organizational research incorporating identity and organization identity perspectives now proliferate. Indeed, the extant knowledge on the subject has assumed a complex, diversified character with debates beginning to assume a self-critical dimension (cf. Whetten, 2007) and theoretically probing more narrowly focused issues such as methodological challenges (e.g. cross-level dynamics – Ashforth et al., 2011). The escalating scholarly interest in *organization identity* nonetheless represents an interesting development, in particular as the paucity of empirical research remains tangible - a consequence of the many theoretical and methodological challenges that continue to plague attempts at empirical research (cf. Van Tonder, 2011). It is also a function of the abundance of alternative and/or novel perspectives that stem from this growing interest and which further confound rather than facilitate movement towards empiricism. Several distinct intellectual traditions can be discerned in the literature (Sugreen, 2012; Van Tonder, 1999) of which the most prominent are the *social identity approach* (Ashforth and Mael, 1996; Haslam, 2001; Haslam & Reicher, 2007; Haslam et al., 2003) and the so-called *classical approach*, which refers to studies that reveal parallels with or incorporates elements of a traditional (personal) identity perspective (after Erikson, 1959; 1968). Work that aligns with this approach includes, among other, Albert and Whetten (1985), Dutton and Dukerich (1991) and more recently work related to *Organization Identity Theory* (OIT) (Carstens, 2008; Sugreen 2012; Van Tonder, 1999; 2006; 2011). In general though, most of the many reported OI studies lack clear and coherent theory frameworks, which accounts for the paucity of both systematic theory-driven research and empirical research in respect of OI.

Organization Identity Theory (OIT) and the Sense of Organization Identity (SoOI)

The fundamental premise of OIT is that organization identity *tacitly* informs and directs organizational focus (e.g. operational decision making and resource allocation), which in turn drives behaviour and performance and facilitates long-term organizational sustainability. Sustainable and therefore change-resilient organizations are those that develop and maintain a strong and clear (appropriate) organization identity, while the converse will be true for organizations with weak or diffuse identities. From within an OIT framework *organization identity* is considered to be a tacit organizational self-description... a self-referential cognitive schema or meaning frame... embedded in individual (employee) cognitions of *who* and *what* the organization is (cf. Van Tonder 2011, p. 637). It comprises two interrelated and interdependent forms of identity, the first being the “fact of identity” (FoOI) which refers to those observable dimensions of the organization which, when viewed collectively, portrays the organization’s distinctive character (or otherwise) i.e. revealing it as a unique, enduring and unified entity. The second identity construct is the “sense of (organizational) identity” (SoOI), which refers to organizational members’ subjective awareness of the organization’s identity status – informed by the “fact of

organization identity” (FoOI). Both these constructs are tacit in nature and socially negotiated and constructed at a preconscious level.

During the past decade research in this tradition has systematically explored and affirmed various tenets of OIT and, in particular, the definitional parameters, existential nature and relevance of the OI construct(s) in terms of organizational functioning and performance (for an overview see Van Tonder, 2011). Exploratory factor analyses, for example, reveal the *Sense of Organization Identity* (SoOI) consistently as relating to perceptions of the organization’s enduring, unique and unifying qualities, but the ‘core’ dimension (cf. Albert and Whetten, 1985) did not surface as a meaningful component. Consistent with the exploratory focus of this research stage and the need to test the existential parameters of the OI constructs, studies were undertaken in different settings with diverse samples and methods (quantitative, qualitative and mixed methods designs), which ultimately precluded robust comparison and conclusions about the SoOI... signaling the need for research that probes beyond exploratory and boundary-defining objectives. Previous studies surfaced the main elements of the the FoOI and the SoOI but have not focused on the structural relations among these two identity forms and the various identity factors that feed into and reflect the identity constructs. This was the central focus of the current study: OIT proposes that employees’ preconscious awareness of the identity status of their organization (the SoOI) is determined by their tacit perception of those features of the organization that suggests it to be an enduring, distinctive, consistent and unified entity or otherwise (the FoOI). If organizational features convey it to be such, the resultant SoOI will manifest in a strong (certain) and clear sense of identity (SoOI), or the converse if the FoOI does not convey these features. The fundamental research question consequently was *to establish whether this theoretically-informed structure of the SoOI, when proposed as a measurement model, can be validated empirically?*

EMPIRICAL STUDY AND FINDINGS

Research Focus and Methodology

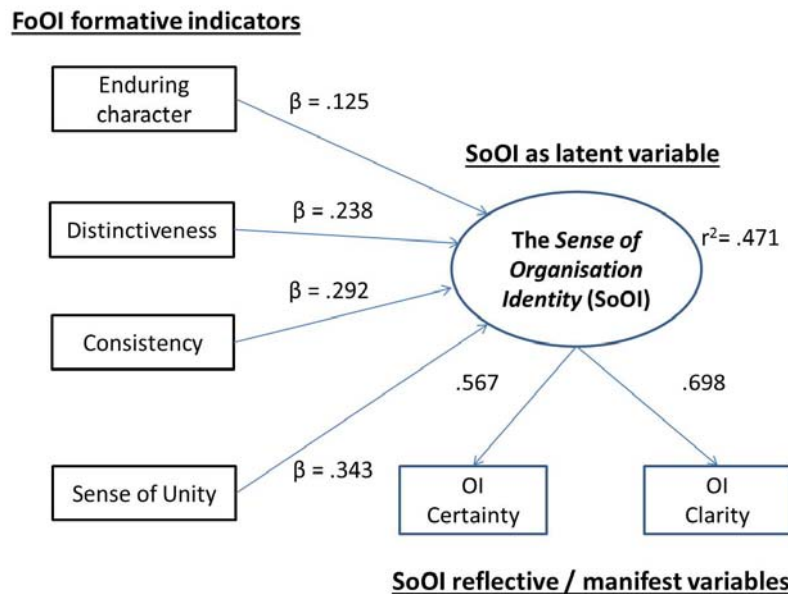

To test the structural relations and proposed measurement model for the SoOI i.e. examine the empirical validity of conceptualizing the SoOI in particular as a stand-alone or context-free formative construct, a cross-sectional study was undertaken. A previously used 21-item SoOI questionnaire that incorporates a 5-point Likert ‘agree-disagree’ response format was administered to an effective sample comprising 501 respondents from 49 organizations (on average 10 respondents per organization – typically a work unit that has recently undergone some form of change). Questionnaire items required respondents to indicate their views of their organization relative to similar institutions in the industry or sector and to do so in terms of several identity qualities (relating among other to founding member characteristics, organizational uniqueness, consistency in character, identity crises and organizational unity). Exploratory factor and principal component analyses and multilevel structural equation modeling (ML SEM) were performed². The data analysis process commenced with the development of a mixed measurement model and identified six groups of measurement items of which four (4) corresponded with the four facets of the FoOI (i.e., endurance, distinctiveness, consistency, and sense of unity), with a fifth group tapping into the SoI concept and the sixth relating to the six remaining indicators concerned with identity crises. Derived from OIT theory, the latent SoOI variable was then modelled with OI certainty (strength) and clarity and its correlation coefficients with each of the 13 items which denoted one of the four FoOI facets, were estimated, but also among the 13 items (to identify, for each of the four facets of the FoOI, the best formative indicator of the SoOI construct - ideal formative indicators should demonstrate large correlation coefficients with the SoOI, but small correlation coefficients with other formative indicators). Through this process three (3) alternative combinations of the four (4) formative indicators were identified and, as a result, three alternative SoOI measurement models were tested with ML SEM².

Findings

The best fitting of the three SoOI measurement models were retained and is presented in Figure 1 with each of the FoOI formative indicators and the SoOI reflective/manifest variables. Indicators and variables are presented as summaries of the relevant questionnaire items (goodness-of-fit statistics: $\chi^2(3) = 3.836$ ($p > .27$); CFI = .998, IFI = .998, and RMSEA = .034 (C.I. 90: .000-.116), with all model parameter estimates statistically significant ($p <$

.05)). The final measurement model comprises measurement items indicative of the *fact of organization identity* (FoOI) and which represent those attributes of the organization that contribute to a perception of endurance or enduring characteristics, uniqueness, consistency (in personality or character) and a sense of unity. These items collectively account for a significant proportion of the variance in the latent variable, the *sense of organization identity* (SoOI). Secondly, the SoOI can be measured through the reflective/manifest variables of *OI certainty* (strength) and *OI clarity*. Moreover, the formative variables (FoOI indicators) contribute disproportionately to the SoOI (as conveyed by the magnitude of the estimated path coefficients). The magnitude of the estimated path coefficients indicate that the ‘sense of unity’ was the most influential driver of the SoOI ($\beta = .343$, $t = 4.97$), followed by consistency ($\beta = .292$, $t = 5.75$), uniqueness ($\beta = .238$, $t = 4.88$), and enduring character ($\beta = .125$, $t = 2.80$).

Figure 1: Measurement model for the *Sense of Organization Identity* (SoOI)

Measured SoOI conveys the extent (in terms of certainty / strength and clarity) to which respondents / employees tacitly perceive the organization as possessing the qualities indicated as FoOI formative indicators. Variation in the SoOI consequently serves a diagnostic role (in terms of the FoOI, indicators) and has predictive power (see research on the relationship of SoOI and organizational performance measures – Sugreen, 2012, Van Tonder, 1999; 2006).

Theoretical and Empirical Contribution

The significance of the findings resides primarily in the domain of theory testing and extension and specifically through the empirical support it provides for several fundamental tenets of Organization Identity Theory (OIT) (Van Tonder, 1999, 2004a, 2006). It firstly reaffirms the existential nature of the Organization Identity construct. Secondly, the theoretical premise that OI comprises two constituting, interrelated and interdependent forms of identity – the fact of organization identity (FoOI) and the sense of organization identity (SoOI) - is empirically supported. Employees accordingly gain a sense of the organization’s identity (the SoOI) from their tacit awareness of organizational features that convey the organization’s enduring nature, its distinctiveness (uniqueness) relative to similar organizations, the organization’s consistency over time and its unity or solidarity (the FoOI). Thirdly, the findings confirm and further specify the *Sense of Organization Identity* (SoOI) construct (cf. Van Tonder, 2006) and do so through articulating a pertinent structure and coherence for the SoOI construct – embodied in the measurement model extracted (Figure 1). This model defines the relationship between composite or formative elements of the SoOI (the latent variable) but also the manifestation of the latter in terms of identity certainty (strength) and clarity. The further specification of the SoOI in terms of a context-free measurement model now means that the barrier (and threshold) associated with the complexity and ambiguity of the organization identity concept that historically prevented its reification in applied settings, is no longer of

concern. Acknowledging that previous OIT studies consistently observed complex causal relationships between the SoOI and organizational performance (Carstens, 2008; Sugreen, 2012; Van Tonder, 1999), the further specification of the SoOI now paves the way for a multitude of new research avenues apart from reinvestigating established models of organizational behaviour and dynamics, with the prospect of enhanced explanatory power.

Applied contribution: Implications for Management

With organizations evolving towards more virtual and notably transparent forms, competitive differentiation with its promise of improved returns on service or product delivery will emerge as a critical survival, sustainability and longevity challenge for organizations, *that is*, for mid-21st century organizations. In 1997 the average life expectancy of organizations was estimated to be around 40 years and declining (De Geus, 1997). The 2004 position that employees were likely to ‘outlive’ or out-serve their organizations (Van Tonder, 2004a) has since emerged as a very confronting and disconcerting contemporary reality - given the frequency and pace with which organizational deaths occur³. It is in this regard that the SoOI has applied value... A *strong sense of identity* emerged as one of four essential survival factors for long-living organizations... those that endured in excess of 200 to 300 years (De Geus, 1997). More recently it was also concluded that organizations with a strong and clear identity (manifest in the SoOI) outperformed organizations with a weak and diffuse identity (Van Tonder, 2006). These observations suggest that *organization identity* holds one of the *fundamental* and *inimitable solutions*, firstly for sustainable competitive differentiation of the organization and, secondly, for its medium to long-term survival. However, because of its abstract and ambiguous nature, organization identity is an exceptionally difficult concept to operationalize meaningfully. The context-free SoOI measurement model reported here now substantially alters the situation and because of the specification of constituting elements as well as specific manifest indicators of SoOI, the model now offers a substantial and reliable diagnostic capability. The relationship between organizational performance and sustainability and the *Sense of Organizational Identity* (previously established) further signifies that the data derived from the model are profoundly relevant and important – largely because “...it acts as a powerful perceptual filter [...] but also as a below-the-surface force and framework that directs and guides behavior and decision-making” (Van Tonder, 2004a, p. 74). The measurement model of SoOI consequently becomes a significant barometer of this *intangible asset* and indicates avenues for managerial attention and channelling energy if, for example, the SoOI is uncertain / weak and diffuse. If, on the other hand, the SoOI is certain / strong and clear, it signals a substantially crystallised identity which, at a tacit level, will significantly aid competitive differentiation - a critical survival and sustainability challenge for late 21st century organizations. With a strong and clear organization identity being a critical intangible asset at the core of competitive differentiation, the notion of identity-centric management (*cf.* Van Tonder 2011) becomes a necessity. Because of the stability and coherence of a strong and clear identity, this, accompanied by an appropriate and central focus on identity (identity-centric management), may prove decisive in sustaining an enduring competitive presence; buffering the organization against external environmental jolts and internal upheaval; and attracting and ‘locking-in’ a talented workforce that identifies with the organization (including otherwise capricious *new generation* employees).

CONCLUDING PERSPECTIVES

Global dynamics are reshaping the organizational landscape and redefining the nature of ‘competitiveness’, ‘performance’ and ‘success’, and the means of accomplishing this. An unavoidable consequence of this is the emergence of increasingly boundary-less and virtual organizational settings in which traditional notions of (organizational) boundaries and symbols of organizational coherence are eroding and disappearing rapidly. At a psychological level the organization as target of employee identification is becoming more obscure and the workplace an increasingly fragmented and disjointed ‘experience’. In these circumstances an appropriate, strong and clear organization identity becomes a crucial organizational consideration, not least because it facilitates (crucially) needed differentiation in a highly congested and contested competitive setting, but because it powerfully directs focus and consequently sustains behavior and performance. More pertinent though, organization identity at a tacit level crystalizes the organization as *target of employee identification*. Here, ‘below the surface’, a strong and clear organization identity simultaneously performs a powerful role as a source of stability, coherence and meaning for employees in an otherwise rapidly evolving, complex and confounding world. (*Organization Identity Theory* – *cf.* Van Tonder, 2004b; 2011). In specifying the measurement properties of the Sense of Organization Identity (SoOI) our understanding of organization identity has crossed a significant

conceptual and empirical barrier. Although substantial research is still required, our understanding systematically inches forward.

ENDNOTES

1 "The liability of change" was introduced by Van Tonder (2009, p. 1161) in reference to the threat that major organizational change poses to organizational growth and sustainability – as evidenced in the 65% to 75% failure rates reported for major change initiatives.

2 Multilevel Structural Equation Modeling (ML SEM) was performed using EQS 6.2 for Windows, to control for sample dependence in the data set not (not to test the model at two levels). The sample size at cluster / group level did not meet Hox and Maas' (2001) recommended minimum size of 100 for unbiased model parameter estimation in ML SEM analysis. As a consequence all manifest variables were allowed to covary freely at the organization-level with no latent variable involvement. ML SEM, furthermore was conducted with a multilevel, robust maximum likelihood estimation method (EQS) while model parameter estimates were tested with *Yuan-Bentler's robust standard error estimator* which is said to be robust against the departure of the multivariate normality assumption (Bentler 2006). A model re-specification strategy was adopted which entailed the identification of problematic variables in each model testing and retesting, but without ruling out the problematic variable in the preceding test of the model.

3 According to Van Tonder (1999, pp. 87-88) organizational death represents the final stage in the organization's life cycle and existence, and come about through bankruptcies, absorption of the organization through mergers and acquisitions, simply ceasing to exist as a legal entity, when the formal participants agree to it being obsolete / defunct and other character-altering change.

MANAGING THE WORK-LIFE BALANCE OF WORKING MOTHERS

Henrike van Zyl and Cecile Nieuwenhuizen
University of Johannesburg, South Africa

ABSTRACT

Changes in the corporate landscape and an increase in female participation rates in corporate workforces necessitate a better understanding of female career paths and how organisations can accommodate them better. The purpose of this study is to identify the most appropriate work-life balance benefits organisations can offer to female employees to assist them in achieving greater work-life balance. The study further aims to identify learning and development opportunities that females who have exited from their professions can follow to remain relevant and up to date in their fields. The relevant population for this study was all female professionals who endeavored to balance family responsibilities and work demands. The results indicate that the most appropriate work-life balance benefits are flexible working hours, on-site childcare facilities, parental leave, part-time work, mobile working and virtual or cyber working.

LITERATURE REVIEW

“The employment landscape is undergoing rapid changes and factors such as globalisation, technological advances, demographic shifts and the emergence of new occupations have vital implications for career management” (Wickramasinghe & Jayaweera, 2011:914). The most significant source of competitive advantage in the modern knowledge economy is human talent (Bartlett & Ghoshal, 2002:34). Because of this unique source of competitive advantage, attracting and retaining human talent becomes a pivotal strategic concern for organisations (Cabrera, 2008:187).

The past three decades have witnessed unmatched changes taking place in the composition of workforces globally with women’s participation in the labour force rising steadily (Tlaiss & Kauser, 2011:8). The International Labour Organisation reported that “more women work today than ever before” (Cross & Linehan, 2009:246). Female participation rates in the global workforce have grown substantially (Grady & McCarthy, 2008:599) from 43 percent in 1970 to 59 percent in 2004 (Cabrera, 2008:187) and nearly 60 percent in 2010 (Mather, 2007:1).

The benefits of having women in senior management positions have been well documented. Clarke (2011:498) indicates the reasons for increasing female participation rates in senior management levels as that organisations will gain the opportunity to select successors from a wider talent pool, thus securing the best people to fill senior management positions; females in leadership positions could act as role models for younger women in the workplace and also make organisations more attractive to potential female employees. Organisations that have a strong female representation at top management and board levels have a better organisational performance record than organisations without female representation at the top (Brady, Isaacs, Reeves, Burroway & Reynolds, 2011:85). Finally, female managers also bring a unique ‘gender edge’ that can lead to an increase in sales as they give different perspectives and investor confidence (Constant, 2006:465).

Ironically, as the competition for talent increases, organisations continue to fail in their efforts to retain female talent (Cabrera, 2008:187). Women and men enter the workforce at a similar rate, but as they ascend the corporate ladder their representation becomes increasingly unequal. Women are awarded more than half of all graduate degrees, but the majority of CEOs of Fortune 500 companies remain men (Hewlett & Luce, 2006:51).

In 2008 and 2009, women held 15.2 percent of board seats at Fortune 500 companies (Soares, Carter & Combopia, 2009). This number is slowly increasing with the number of women who held board seats at Fortune 500 companies increasing to 16.1 percent in 2011 (Soares, Cobb, Lebow, Winsten, Wojnas & Regis, 2011).

A number of studies have explored the 'female brain drain' phenomenon. According to Mainiero and Sullivan (2005:106), female professionals face three different career issues at the various stages of their careers. In their early careers, challenge or the need to do stimulating work, learn and grow, tends to dominate their career expectations. During the mid-career stage, family responsibilities are often at the forefront and force women to seek balance between work and family life. Finally, authenticity or the need to be true to oneself predominate female professionals' decisions during their late career stage.

Therefore, during women's mid-career stage, when work demands and family needs are incompatible, women often opt out of their professional careers or seek for positions which allow them flexibility in terms of working place and working hours to spend more time with their young children and the feasibility of entry and exit as family demands allow (Tlaiss & Kauser, 2011:12).

Organisations should be cautious not to lose their valuable female talent and strive to prevent the female brain drain of women in their mid-career phase who 'off-ramp' out of their professional careers to create more balanced alternative careers (Cabrera, 2008:187). According to Ten Brummelhuis and Van der Lippe (2010:174) and Sullivan and Mainiero (2007:57), organisations which notice the importance of assisting female employees in gaining greater work-life balance are introducing work-life balance benefits or alternative work arrangement options designed to give female workers more flexibility in scheduling their work time in a way that best suits their situations.

Female professionals with young children might consider utilising work-life balance arrangements as a solution to balance career and family responsibilities. This form of employment gives women the opportunity to contribute to the organisation and to remain relevant in their fields, while working where and at times that is convenient to them (Adams, 1995:21).

RESEARCH PROBLEM

Female professionals find it difficult to balance family responsibilities and career demands, especially when their children are still young and dependent and often decide to "off-ramp" out of full-time employment to tend to their children. Technological advances and an ever increasing body of professional knowledge results in women lagging behind when re-entering or on-ramping back into their professional careers (Regus Survey, 2011:1). This often leaves female professionals despondent about their future career prospects and frequently leads the female professionals rather opting-out of their professional careers, leaving organisations drained of their female talent.

Organisations cannot afford to lose their valuable female talent. It will be detrimental to their performance and public image, the large amounts of time, money and resources invested in their training and development will be lost, and the pool of skilled and talented female employees from which future leaders should be developed, will shrink, leaving the organisation deprived of female role models and mentors.

The objectives of this study are to:

- Identify appropriate work-life balance arrangements that organisations can offer to employees who strive to balance family responsibilities and career demands more successfully, which would prevent them from opting-out.
- Identify pro-active actions that female professionals can follow during a period of being off-ramped to enhance their re-entering ability.

RESEARCH METHODOLOGY

To achieve the best results for this research, a non-experimental research approach was adopted, wherein participants were asked to complete an online questionnaire. Questions were primarily close ended questions

where the most applicable answer could be selected from a list of possible options. Open-ended questions and questions where the participants had to specify or explain an answer were labelled and categorised.

The relevant population for this study was all female professionals who endeavoured to balance family responsibilities and work demands. They should ideally have young dependent children. Employment status could be any of the following: Working full-time, working part-time, working informally or not working.

Snowball and convenience sampling methods were used to reach members of the desired population to include in the research project. A sample of, n=191 female professionals from the described population participated in this research project.

Descriptive analysis and inferential statistics were used to draw conclusions. Non-parametric statistical techniques were used to compare differences between groups. The p-value of statistical significance, chi-square test, kappa measure of agreement and marginal homogeneity test were used to determine the statistical significance between the responses of groups or between the responses of the same group prior and subsequent to having children.

Content analysis was used to analyse responses to open-ended questions. The responses to open-ended questions were grouped into pre-prepared list of possible categories.

PRESENTATION OF RESULTS

The demographic information is summarised in Table 1 and indicates that the majority of the respondents who participated in this study were white, married females between the ages of 31-40 years, living in a dual-income household. Respondents' qualifications ranged from grade twelve to doctoral degrees, with most of the respondents having honours degrees, degrees and diplomas. Most of the respondents in all three groups are currently working full-time. However a large number of respondents with postgraduate qualifications work part-time, informal or are self-employed.

Table 1: Demographic information

CHARACTERISTICS	PERCENTAGE	CHARACTERISTICS	PERCENTAGE
Age		Race	
21-30 years	21.2%	Black	6.0%
31-40 years	63.6%	Coloured	4.3%
41-50 years	14.1%	Indian/Asian	4.3%
51-60 years	1.1%	White	84.8%
Household structure		Highest qualification	
Married	92.3%	Grade 12	15.8%
Widowed/Divorced	1.6%	Certificate	7.5%
Couple living together	2.7%	Diploma	19%
Single	3.3%	Degree	19.6%
Household income structure		Honours	20.7%
Dual income	84.2%	Masters	15.8%
Single income	15.7%	PhD	1.6%

Most of the respondents who participated in this study have either one or two children, significantly fewer respondents have more than three children. Almost half of the respondents indicated that the concern of balancing family responsibilities and career demands was preventing them from having more children.

The majority of the respondents indicated that the mother carries most of the child-caring responsibilities. Furthermore, most of these mothers are also working full-time.

Table 2 compares employment status of respondents prior and subsequent to having children and further summarises information about respondents' preferred form of employment. The employment status of most of the respondents stayed the same subsequent to having children as it had been prior to their having children. Only about 30 percent of the respondents who were working full-time prior to having children reported their employment status had changed to working part-time, informal, being self-employed or not working subsequent to having children. However, almost half of the respondents indicated that their current form of employment was not their preferred form of employment. Eighty six percent of the respondents, who would prefer a different form of employment, indicated that they would rather work part-time, informal or be self-employed.

Table 2: Information about respondents' careers

CHARACTERISTICS	PERCENTAGE	CHARACTERISTICS	PERCENTAGE
Employment status prior to having children		Employment status subsequent to having children	
Full-time	90.4%	Full-time	64.2%
Temporary/self/informal	9.6%	Temporary/self/informal	31.5%
Not working	0.0%	Not working	4.3%
Is this your preferred employment status		What would you prefer your employment status to be?	
Yes	55.0%	Full-time	6.9%
No	45.0%	Temporary/self/informal	86.1%
		Not working	6.9%

Thirty two percent of the respondents had previous career breaks. Only ten percent of the respondents indicated that they consciously took actions to equip themselves to remain relevant to successfully return to their field. The actions that they undertook included to continue with further studies in their field, attending Continuous Professional Development courses and doing ad hoc/consulting work. They were able to return to their professions successfully.

Table 3 indicates that the work-life balance benefits that were mostly available were flexible working hours. Respondents indicated that they would be interested in utilising flexible working hours, on-site childcare facilities, parental leave, mobile working, childcare allowance, part-time work and virtual work.

Table 3: Information about work-life balance benefits

CHARACTERISTICS	PERCENTAGE	CHARACTERISTICS	PERCENTAGE
Availability of work-life balance benefits	* Respondents could mark multiple responses	Which benefits respondents would consider utilising	* Respondents could mark multiple responses
Flexible working hours	50%	Flexible working hours	75.0%
Part-time work	14.1%	On-site childcare facilities	55.7%
Mobile working	12.8%	Parental leave	48.7%
Parental leave	21.8%	Mobile working	45.5%
		Childcare allowance	42.3%

The majority of the respondents who exited from their professions had initially returned to their professions, but found it too difficult to balance career demands and family responsibilities and decided to rather exit from their professions. Most had been out of their professions for less than three years, but indicated that they would like to be able to return to their professions in the future. Those working part-time, informal or being self-employed generally indicated that they would be adequately or at least somewhat adequately equipped to return to full-time employment.

SUMMARY AND CONCLUSION

The employment landscape is rapidly changing and is calling for a transformation in how one of organisations' most competitive advantages, its human resources, particularly their female employees, is managed. Female employees contribute unique perspectives that are crucial in the modern business world. However, female employees often find it difficult to balance career demands and family responsibilities and frequently off-ramp from their professional or corporate careers for the period when their children are still young and dependent to follow an alternative career over which they have more control and that allows them to have a more balanced life. Organisations should be concerned about the drain of female talent and the loss of investment they had made in the development of female employees.

An objective of the research was to identify the most appropriate work-life balance benefits or arrangements organisations can offer to employees who strive to balance family responsibilities and career demands

The six most appropriate work-life balance benefits were:

- flexible working hours
- on-site childcare facilities
- parental leave
- part-time work
- mobile working
- virtual / cyber working.

An additional objective was to identify pro-active actions that female professionals can follow during a period of being off-ramped to enhance their re-entering ability. Most of the respondents who had off-ramped from their professions indicated that they would like to return to full-time employment in their professions in the future. Respondents whose current form of employment was part-time, informal or self-employed indicated that they would be somewhat or completely successful at returning to their profession.

Respondents indicated that the following actions would also assist them to remain relevant in their professions and assist them to return to full-time employment:

- Continuous professional development courses and workshops
- Reading and further studies
- Keeping in touch with colleagues and updated with new developments at the office and the organisation
- Attending seminars
- Doing ad hoc, private, part-time or consulting work.

RECOMMENDATIONS

Organisations should primarily be concerned about retaining their valuable female talent. One of the most important steps organisations can take to accomplish this is by assisting female employees with young dependent children to achieve more balance between their work demands and family responsibilities. Organisations can do this by implementing appropriate work-life balance arrangements for female employees to utilise.

It is important to note that work-life balance arrangements should not only be available theoretically, and often, once a request has been made to utilise some of the arrangements, it is denied. A further important aspect to consider in terms of work-life balance arrangements is the negative connotations often associated with utilising them. Employees who consider utilising work-life balance arrangements often feel that they will be

discriminated against for utilising such arrangements and rather decide against utilising it. Other employees at organisations who do not utilise work-life balance arrangements, often carry resentment towards those employees who make use of work-life balance arrangements. Therefore, a sound performance measuring system becomes vitally important to measure performance outcome and not subjective measures of performance based on how much face-time employees spend at the office.

Female employees who opt-out of full-time employment for the period when their children are still young and dependent, but who have intentions of returning to their professions, cannot rest on their laurels because technological advances will leave them lagging behind and often unable to find suitable positions in their professions. These women should consciously engage in pro-active actions such as attending continuous professional development courses, workshops, engaging in further studies, reading literature applicable to their professions, attending seminars or doing ad hoc, private, part-time or consulting work to keep them relevant in their field and assist them to return to suitable positions in their professions.

Some female employees would want to off-ramp from their professions and organisations could make their internal learning and development opportunities available to these women, at their own cost, to keep them abreast of developments in their industries and relevant and equipped to return to their professions.

LIMITATIONS OF THE STUDY

As with most research projects, it is acknowledged that this research study had several limitations. The first limitation is that this project was a requirement for the partial fulfilment of a Master's degree in Business Management, therefore the scope of the research had to be extremely narrow and the timeframe allowed for the completions of this study was also particularly rigid.

It is also acknowledged that it is not only female professionals who find it difficult to balance family responsibilities and career demands, but for the purpose of this research project and the particular scope that had to be adhered to, only female professionals were included in this research project.

It is further acknowledged that this study focus on the work-life balance concern from a female perspective and not from an organisational perspective as well.

SUGGESTIONS FOR FURTHER RESEARCH

The scope for further research on this topic is vast. It is suggested that further research should include both men and women in the studies, and also look at the work-life balance concern from an organisational perspective.

In South Africa particularly, cultural influences and the different gender roles assigned to men and women should also be investigated to understand the work-life balance concern in more detail.

Possible future research projects could also include female professionals in executive positions to gain some insight from them as to what actions they took to balance their family responsibilities and career demands successfully, or what sacrifices they had to make to reach high managerial positions.

THE ASSIGNMENT PROBLEM: SEARCHING FOR AN OPTIMAL AND EFFICIENT SOLUTION

A. Vasilopoulos
St. John's University, USA

ABSTRACT

The 2-dimensional assignment problem, which consists of assigning n objects to n (or m) opportunities in an optimal way, has long been viewed as a special case of the Linear Programming problem. But solving the Assignment problem as a Linear Programming problem is to use, perhaps, the most inefficient method possible. Many other methods are available for solving the 2-dimensional assignment problem more efficiently. This paper briefly discusses several of these methods and then ranks them according to their efficiency, where efficiency is measured by the number of operations needed by each method to complete the assignment.

INTRODUCTION

The 2-dimensional algorithms discussed in this paper can be used to solve the assignment problem on their own, or they can be viewed as the last step of a more general “K-dimensional assignment problem” methodology in which the information of K sets of data is used to solve the assignment problem instead of the usual one (1) set of data. For example, the solution to the data association problem of Multitarget Tracking can be obtained by:

1. Processing the information of one data set (i.e. 1 scan) which, even though is real-time, often leads to incorrect assignments of reported information and established airplane tracks (2-dimensional problem), and;
2. Processing the information of K data sets (i.e. K scans, where $K \geq 1$) which achieves much higher percentages of correct assignments in real time (K-dimensional problem).

The dimensionality of the K-dimensional problem is determined by the number of data sets (K) used. This problem is solved recursively, by reducing the K-dimensional problem to a (K-1)-dimensional problem, by incorporating one set of constraints into the Objective Function, using a set of Lagrangian Multipliers. Then, given a solution of the K-1 dimensional problem, a Feasible Solution of the K-dimensional problem is reconstructed. The K-1 dimensional problem is solved in a similar manner, and the process is repeated until it reaches the 2-dimensional problem which can be solved optimally, or nearly optimally, using one of the several 2-dimensional algorithms discussed in this paper.

The reason there are so many 2-dimensional algorithms is the fact that these algorithms have different degrees of accuracy and computational complexity and, as a consequence, their potential applications should be carefully examined.

DISCUSSION

Two-Dimensional (Single Scan) Data Assignment Algorithms

The 2-dimensional assignment problem occurs when n facilities are assigned to m objects (jobs) on a one-to-one basis. When $n=m$, the assignment problem is called SYMMETRIC, while when $n \neq m$ the assignment problem is

called ASYMMETRIC. The assignment is made with the objective of minimizing the overall cost of completing the jobs, or, alternatively, of maximizing the overall profit from the jobs.

A typical illustration, even though very small, of an assignment problem is given by the example below. This problem can be solved by each of the six (6) 2-dimensional algorithms discussed in this paper, but only the solution using the COMPLETE ENUMERATION method is explicitly given. The solution, using the other methods can be obtained by using the attached flow charts for each method. The starting point for each of these 2-dimensional assignment algorithms is a COST MATRIX, a specific example of which is given by the cost matrix shown below.

EXAMPLE: A firm has 3 jobs that need to be assigned to 3 work crews. Because of varying experience of the work crews, each work crew is not able to complete each job with the same effectiveness.

The cost of each work crew to do each job is given by the cost matrix shown below in Table 1:

CREW (i)	JOB (j)			
		1	2	3
1		41	72	39
2		22	29	49
3		27	39	60

TABLE 1 – Cost Matrix

The objective is to assign the jobs to the work crews so as to minimize the total cost of completing all jobs.

The six (6) 2-dimensional algorithms discussed in this paper are:

1. The COMPLETE ENUMERATION method
 2. The SIMPLEX LINEAR PROGRAMMING method
 3. The ASSIGNMENT method
 4. The HUNGARIAN method
 5. The MUNKRES method
 6. The DEEPEST HOLE method
1. The most direct way of solving a 2-dimensional assignment problem would be a “complete enumeration” of all possible assignments of facilities to objects, the calculation of cost of each assignment, and the identification of the OPTIMUM assignment, which is the assignment with the MINIMUM cost.

The number N of possible assignments of n facilities to m objects (jobs) on a one-to-one basis is equal to:

$$N = \frac{n!}{(n-m)!}, \text{ if } n > m \quad (1)$$

and $N = n!$ if $n = m$ (2)

Therefore when $n = m = 3$, this number is equal to $3! = 6$; when $n = m = 5$, this number is equal to $5! = 120$, while when $n = m = 10$, the number of possible assignments is equal to $10! = 3,628,000$. The Flow Chart for this method, showing the specific steps needed to apply this method and the results of the solution of this example by this method, is shown in Figure 1, of Appendix I.

Quite obviously, enumerating all possible assignments is feasible only for very small problems and, therefore, it is necessary to investigate alternative solution techniques.

2. Since the assignment problem can be considered a special case of the Linear Programming problem, it can be solved as a Linear Programming problem using the SIMPLEX Algorithm. If c_{ij} is defined as the cost of assigning facility i to job j and x_{ij} is defined as the proportion of time that facility i is assigned to job j, the linear programming problem is:

$$\text{Minimize: } z = \sum_{i=1}^n \sum_{j=1}^n c_{ij} x_{ij} \quad (3)$$

$$\text{Subject to: } \sum_{i=1}^n x_{ij} = 1 \quad \text{for } j = 1, 2, \dots, n \quad (4)$$

$$\sum_{j=1}^n x_{ij} = 1 \quad \text{for } i = 1, 2, \dots, n \quad (5)$$

$$x_{ij} \geq 0 \quad (6)$$

But this approach involves much computational burden. In fact, it took 5 Linear Programming Tableaus to successfully solve the problem stated above which is a rather simple problem. In general, the number of Tableaus needed to solve a Linear Programming problem cannot exceed T_{\max} , where:

$$T_{\max} = \frac{n!}{m!(n-m)!}, \quad (7)$$

m = The number of constraining equations in the Linear Programming Problem,

and n = The number of variables in the Linear Programming Formulation of the problem

The Flow Chart for the SIMPLEX method is given in Figure 2, of Appendix I.

It is not clear how this maximum number of Tableaus translates into the “maximum number of operations” needed to solve the assignment problem so that the computational efficiency of this method could be compared to the computational efficiency of other methods, such as the MUNKRES Algorithm, where the computation efficiency is related to the size of the Square Cost matrix.

What is needed for a meaningful comparison is a complete Comparative study in which the “Computational Efficiency” and “Time-to-Solution” of each of these methods can be obtained as a function of the dimensionality (size) of the Cost matrix.

The: ASSIGNMENT, HUNGARIAN, and MUNKRES Algorithms, are related (to some extent) to each other because each of them, starting with the given Cost matrix, attempts to find the OPTIMAL assignment by inducing the “relative costs” of the Facilities / Jobs pairings to zero, through appropriate “manipulation” of the Rows and/or Columns of the given Cost matrix. Their differences are mainly in the way this “manipulation” is carried out, but the ASSIGNMENT and MUNKRES Algorithms can also be used to solve non-symmetric problems while the HUNGARIAN Algorithm cannot.

3. The ASSIGNMENT Algorithm is based on two facts, namely:

1. Each Facility must be assigned to one of the jobs.
2. The Relative Cost of assigning Facility i to Job j is not changed by the subtraction of a constant from either a column or a row of the Cost matrix.

It arrives at an OPTIMAL assignment when the Total Relative Cost of the assignment is zero. This method can also be used to solve MAXIMIZATION Assignment problems by first converting the given cost matrix into a “REVERSED MAGNITUDES” Cost matrix, and NON-SYMMETRIC problems. The Flow Chart of the ASSIGNMENT Algorithm is shown in Figure 3, of Appendix I.

4. The HUNGARIAN method (or Kuhn's Algorithm) is related to both, the previously discussed ASSIGNMENT Algorithm, and the MUNKRES Algorithm, which follows. The method consists of four (4) basic steps, and it is an iterative procedure because some of the steps have to be repeated. The method uses a "minimal set of lines" to cover the zeros of the "manipulated" Cost matrix, and the procedure terminates when the required "minimal set of lines" is equal to the dimensionality of the given Cost matrix. The Flow Chart of the HUNGARIAN method is given in Figure 4, of Appendix I.
5. The MUNKRES Algorithm is an OPTIMAL Assignment Algorithm, which can be considered a variant of the HUNGARIAN Algorithm. It differs from it in the detailed procedures for finding:
 1. The "minimal set of lines" which contain all the zeros.
 2. The "maximal set" of independent zeros.

An important feature of this algorithm is the fact that its inventor, in his paper introducing the algorithm, also derived an equation to calculate the "maximum number of operations needed to solve completely any nxn assignment problem." This equation is given by:

$$N_{\max} = (n/6) (11n^2 + 12n + 31) \quad (8)$$

This maximum is of both theoretical and practical interest because it is much smaller (for $n \geq 6$) than the $n!$ operations necessary to solve the assignment problem using the COMPLETE ENUMERATION method. But N_{\max} is larger than the number of operations needed to solve the assignment problem by some of the other methods discussed in this paper (the DEEPEST HOLE Algorithm, for example). There is, however, a problem in such comparisons because of the difficulty encountered in defining a "standard" operation in each of the algorithms. What is needed to obtain an accurate comparison of the Computational Complexity of each of the algorithms discussed in this paper is a complete comparative study in which the "time to obtain the solution to the problem" and the "accuracy of assignment" are evaluated as a function of the same Input Cost matrix, where the "size" of the matrix and the "sparsity" of the matrix are allowed to vary, but the same "size and sparsity" Cost matrix serves as the input to all six (6) 2-dimensional algorithms discussed in this paper. The Flow Chart of the MUNKRES Algorithm is shown in Figure 5, of Appendix I.

6. The DEEPEST HOLE Algorithm, is a "relatively" simple Algorithm and it is computationally more efficient than the OPTIMAL MUNKRES Algorithm. However, there is some loss in performance because it cannot be guaranteed to always select the lowest overall cost assignment. If this "loss in association" can be kept to a minimum, the benefits derived from this algorithm (because of its computational speed and simplicity of implementation) may out-weigh its non-optimality. The Algorithm consists of four (4) simple basic steps, and its iterative because the procedure continues until all pairs have been assigned. The Flow Chart of the DEEPEST HOLE Algorithm is shown in Figure 6, of Appendix I.

Comparing the Two-Dimensional Assignment Algorithms

As already stated in the Introduction section of this paper, the K-dimensional (i.e. K-scan) methodology of data assignment utilizes a 2-dimensional (i.e. single-scan) assignment in its "terminal phase". IF THE OBJECTIVE IS TO DESIGN THE "MOST EFFICIENT" K-dimensional Algorithm, we must select the "best" 2-dimensional algorithm available to support the K-dimensional algorithm. But even if we opted to use a single-scan algorithm to solve the assignment problem, again we need to select the "best" 2-dimensional algorithm available. But, what is meant by "best", and which of the 2-dimensional algorithms is the "best"? To answer the first part of this question it is necessary to first establish our criteria of "goodness". Accuracy (of assignment) and Computational Complexity appear to be two such criteria, but they are not independent. In general, Computational Complexity increases with Accuracy requirements, with "perfect" accuracy (i.e. OPTIMAL solution) resulting in more computational complexity, but the exact relationship between these two criteria is not simple, and it is not easy to obtain.

If Accuracy of assignment is the only criterion used, then both the "COMPLETE ENUMERATION" method and the MUNKRES Algorithm are "equally good" because they both result in the OPTIMAL solution.

However, when Computational Complexity is also considered as a criterion, the MUNKRES Algorithm is “better” because it requires fewer operations to arrive at the optimal solution than the “COMPLETE ENUMERATION” method, for $n \geq 6$. This conclusion is drawn from the fact that, if n is the size of the square Cost matrix, the “COMPLETE ENUMERATION” method requires $n!$ “operations” to arrive at the optimal solution while the maximum number of “operations” required by the MUNKRES Algorithm to arrive at the optimal solution is:

$$N_{\max} = (n/6) (11n^2 + 12n + 31) \quad (9)$$

and

$$n! \geq N_{\max} \quad \text{for: } n \geq 6 \quad (10)$$

However, a potential problem exists even with this apparently flawless logic! What is an “operation”, and are the “operations” of the two (2) algorithms the same? From the six (6) 2-dimensional Assignment Algorithms discussed in this paper, it appears that the DEEPEST HOLE Algorithm is the SIMPLEST (i.e. has the least computational complexity). But, as we have already stated, this Algorithm does not always produce the OPTIMAL solution! How much accuracy are we willing to sacrifice to gain a measure of computational SIMPLICITY?

The other 2-dimensional Assignment Algorithms, appear to fall somewhere between the MUNKRES and the DEEPEST HOLE Algorithms when Computational Complexity is considered as the primary criterion of “goodness”, since the other Algorithms (ASSIGNMENT, HUNGARIAN) are variations of the MUNKRES Algorithm.

How would each of the six (6) 2-dimensional Assignment Algorithms affect the Accuracy and Computational Complexity of the K-dimensional algorithm? We really do not know! Aubrey Poore of CSU (Colorado State University) claims that, for an $n \times n$ square Cost matrix, the Computational Complexity of the K-dimensional algorithm, is less than n^3 . But, unfortunately, he has not evaluated the Computational Complexity of the K-dimensional Algorithm with all of the 2-dimensional Algorithms discussed in this paper, in its “terminal phase”.

The Computational Complexity of some algorithms is shown in Table 2 and summarized below:

1. K-Dimensional “LaGrangian Relaxation” Method $< n^3$
2. 2-Dimensional “Munkres” Method $\sim n^3$
3. 2-Dimensional “Pure Combinatorial” Method $\sim n!$

Table 2			
n	n^2	n^3	$n!$
1	1	1	1
2	4	9	2
3	9	27	6
4	16	64	24
5	25	125	120
6	36	216	720
7	49	343	5,040
8	64	512	40,320
9	81	729	362,880
10	100	1,000	3,628,800

Obviously, what is needed to assess the relative merits of each of the six (6) 2-dimensional Assignment Algorithms, and the effect that each one of them has on the Accuracy and Computational Complexity of the K-dimensional algorithm, is a complete comparative study in which these two criteria of “goodness” (i.e. accuracy of assignment, and computational complexity) for each of the six 2-dimensional Algorithms will be evaluated as a function of the DIMENSIONALITY of the Cost matrix (i.e $n \times n$ or $n \times m$) and the SPARCITY (i.e. the number of zero elements) of the Cost matrix.

CONCLUSIONS AND RECOMMENDATIONS

1. The Assignment Problem, considered a special case of the Linear Programming Problem (LPP) can be either “K-Dimensional” or “2-Dimensional”.
2. There are many “2-Dimensional” methods available, and six of them are discussed in this paper.
3. Since the objective is to select the “Best” Assignment Algorithm, whether it is “K-Dimensional” or “2-Dimensional”, we need to define “Criteria of Goodness” to help us in this evaluation.
4. The criteria of goodness selected are:
 - a. Accuracy of Assignment, and
 - b. Computational Complexity of the method
5. The assignment methods discussed have varying degrees of accuracy and computational complexity.
6. Selecting the “Best” “2-Dimensional” method, which can be used by itself, or as the terminal phase of a “K-Dimensional” algorithm, is not easy, because the “Computational Complexity” of “2-Dimensional Methods” depend on the size (n) of the matrix.
7. What is needed, to assess the relative merits of each “2-Dimensional” method, and the effect each has on the Accuracy and “Computational Complexity” of the “K-Dimensional” algorithm, is a complete comparative study in which the 2 “criteria of goodness” will be evaluated as a function of the “Dimensionality” of the cost matrix (n x n or m x n) and the “Sparsity” of the cost matrix (i.e. the number of zero elements in the cost matrix).
8. At the conclusion of such a complete comparative study, we will be able to identify the “Best” “2-Dimensional” method, and also identify the “Best” “K-Dimensional” algorithm by attaching the “Best” “2-Dimensional” method to the terminal phase of the “K-Dimensional” algorithm.

SOCIAL CAPITAL AS A PREDICTOR OF WORK WELLNESS OF ACADEMIC STAFF

Dalene Vorster and Nicolene Barkhuizen
North-West University, South Africa

ABSTRACT

Researchers over years have paid a lot of attention to factors that can enhance the work wellness of employees in the workplace. What has not been researched in the South African context is the impact of Social Capital of employee health and work wellness. The main objective of this research was to determine whether social capital is a predictor of the work wellness of academic staff. The results showed that social capital is not a significant predictor of the wellbeing of academics. Recommendations are made.

INTRODUCTION

Economic issues had been at the top of policy agendas of governments around the world over decades. Economic growth, and the search for it, had become the Holy Grail. It was easily assumed, that, what was good for the economy, will necessarily be good for society. The primacy of the needs of the economy has not proved to be easy for health advocates. Social Capital, however, offers some hope within this widespread notion. An opportunity for the public health community to advance their social agendas prolong due to interest that increased in social capital. Within the seizing of this opportunity epidemiological and theoretical thinking require development specifically in the linking between social capital, economic development and health.

Studies, worldwide, have traditionally focused on social capital in either residential or geographical areas and has it been suggested now that social capital at work should also been focussed on (Baum & Ziersch, 2003). Civic engagement and social connectedness can indeed be found inside the workplace, not only outside of it. Social capital research has been taking the analysis into account of the multilevel structure of data comprising individuals in social units (Sundquist & Yang, 2006; Szreter & Woolcock, 2004). While considering these techniques which enable the inclusion of predictors at multiple levels and provide a flexible framework to examine not only group level differences (within and between groups), attributable to either compositional effects or contextual differences, but also interaction between variables of different levels. Several studies, to date, have examined social capital and self-rated health among working age population in a multilevel setting. Many studies have documented as association between better self-rated health and higher social capital at either aggregated level or individual level (Kavanagh, Bentley, Turrell, Broom & Subramanian, 2006; Kavanagh, Turrell & Subramanian, 2006; Kin & Kawachi, 2006; Kim, Subramanian & Kawachi, 2006, Sundquist & Yang, 2006). Against this background the main objective of this research is to determine whether social capital predicts the work wellness (i.e. physical and psychological ill-health) of academics in South African Higher Education Institutions. We propose that the higher the level of social capital the less the levels of physical and psychological ill-health academics will experience. This paper is motivated from the limited research that currently exists on the interactive relationship between the constructs of social capital and work wellness.

LITERATURE REVIEW

Micro-, Meso- and Macro levels of Social capital

There are three spheres in social capital namely micro-level social capital, meso-level social capital and macro-level social capital (Halpern, 2005). Embedded in each level are **networks, norms and sanctions**. Within these networks and norms individual linking, bonding and bridging occur as individuals constantly move or interact between networks. Within each level sanctions are used to maintain social networks and norms.

At the **micro level**, examples of social networks were parents and siblings within family, acquaintances and friends and consisted of links that was very powerful. The norms in such a relationship were love and care, reciprocity and generosity. Sanctions in the micro-level were for example to withdraw affection (Halpern, 2005). At the **meso level**, examples of social networks include the fact that the individuals knew some of their neighbors. Relationships may vary from simple recognition by sight or maybe a greeting exchanged as we pass to deep friendships that involved frequent visits to each other's homes and the exchange of both emotional and material support. Due to rivalry and dislike these relationships were not referred to positively. In the community, that forms part of the network, it may be defined either formally or geographically, for example in rural villages. Its boundaries can therefore be ill defined. Another example is workplace relationship between employees and colleagues and employees and employers. Norms within the meso-level were considered as community customs, out-group understanding and mutual respect. Sanctions in the meso level were for example group conflict and exclusion (Halpern, 2005). At the **macro level**, examples of social networks that were considered were on how a nation or race link within trade. Norms are based on patriotism and trust as well as human rights. Macro considerations of sanctions would be within international law, diplomacy and the development of war (Halpern, 2005).

Social Capital and Health

Health researchers have devoted much attention to social capital during the last two decades. It was determined by these researchers that two schools of thought can be distinguished within the social capital sphere a) individual social capital and collective social capital. On the one hand, social capital concerns elements at the collective level of communities, workplace or neighbourhoods. On the other hand, social capital refers to resources at the individual level. Putnam (2000) specifically defined social capital as "connections among individuals – social networks and the norms of reciprocity and trustworthiness that arise from them."

Recently a renewed interest in socioeconomic determinants of health has also emerged resulting in numerous studies linking social capital with various aspects of health and well-being. Lomas (1998) highlights "the importance of factors such as social cohesion resulting from high levels of social capital by noting that individuals and their ill-health cannot be understood solely by looking inside their bodies and brains; one must also look at their communities, their networks, their workplaces, their families and even the trajectories of their life." Research has found that people with more social network resources are more likely to have a better self-rated health and mental health (Halpern, 2005; McCulloch, 2001).

Social capital affects health through a variety of pathways. Kawachi, Kennedy and Glass (1999) suggest that individual health can be influenced by social capital in three ways. Firstly, the formal and informal social networks associated with high levels of social capital may help people to access health education and information, address cultural norms which may be detrimental to health (such as smoking) and advance prevention efforts. Secondly, social capital may influence health through collective action to design better health care delivery systems thereby increasing access to services. Thirdly, the support systems associated with social capital may act as a source of self-esteem and mutual respect. Brunner and Marmot (1999) claimed that social isolation and lack of social support may produce high levels of psychological stress. Chronic stress may be associated with conditions such as heart failure, depression, diabetes and high blood pressure. Putnam (2000) further claimed that in all the domains of social capital that have been traced in none is the importance of social connectedness so well established as in the case of health and well-being.

METHOD

A quantitative research approach was followed with questionnaires distributed among a convenience sample of academics in a South African Higher Education Institution. The General Health Questionnaire and a Social Capital Measurement were administered (Onyx & Bullen, 1997; 1998). The General Health Questionnaire

consists of 19 items and measures Physical and Psychological Ill-Health. Responses are measured on a four-point Likert scale ranging from Never (1) to Often (4). The Social Capital consists of 57 items and measures three dimensions: Family Life, Workplace Aspects and Community. Responses are measured on a four-point Likert scale ranging from Never (1) to Often (4). The data analyses were done with the aid of SPSS 20. Linear regression analyses were performed to test for the relationships between Social Capital and work wellness.

RESULTS

The Descriptive Statistics and reliabilities of the measurements are reported in Table 1 below. The results show an acceptable to excellent reliability for the measurements. When looking at the mean scores of the measures it is evident that the respondents experience above average levels of the three dimensions of social capital. The results show that the respondents receive sufficient support from their families to improve their work. The results however also show that the individual's family life is not that well supported by their work. As regards workplace aspects the respondents indicated that they receive sufficient support from their colleagues and supervisor and that there are opportunities for growth and developed in their careers. However, the compensation aspects of their work seem problematic as well as job security. The results further show that the respondents are moderately involved in communities outside their work. The results show that the respondents experience average levels of work wellness and seemed to experience more psychological health-related problems.

Table 1 Descriptive Statistics of the Measurements

	Mean	Std. Deviation	Cronbach Alpha
Family Life	3.1012	.55690	.896
Family Support for Work	2.7817	.74580	.917
Work Support for Family	3.4206	.52478	.804
Workplace	2.9732	.39902	.849
Career Development	3.1361	.52413	.762
Relationships with Colleagues	3.1627	.56368	.805
Relationships with Supervisor	3.4603	.63737	.872
Compensation	2.2500	.78864	.829
Job Security	2.8571	.85901	.893
Community	2.7524	.49792	.867
Work Wellness	1.8426	.49492	.871
Physical Ill-Health	1.9312	.49200	.677
Psychological Ill-Health	1.7540	.61963	.899

Next the results of the regression analyses between social capital and overall work wellness are reported. The results in Table 2 show that none of the social capital dimensions are significant predictors of overall work wellness.

Table 2 Regression Analyses between Social Capital Dimensions and Work Wellness

CONCLUSION

The results highlighted the importance of social capital as a means towards increasing the positive work-related states of academics. Higher Educational Management should thus assess the social capital of academics and provide interventions and corrective measures where applicable to ensure healthy work environments where academics can flourish and grow. This research proved the utility of an adapted version of a Social Capital Measure in the South African context. This research also added to the limited body of research that currently exists on Social Capital in the workplace.

SHOPPERS' PERCEPTIONS OF MALL ATTRIBUTES, SHOPPING SATISFACTION AND MALL COMMITMENT

M. Wiese

University of Pretoria, South Africa

ABSTRACT

Over the past decade or two, the South African retail environment has been characterized by the establishment and/or the renovation of shopping centres all over the country. Shopping malls or centres cater beyond the normal, grocery and clothing purchasing, it is more of a lifestyle and entertainment experience. The main purpose of this study is to investigate shoppers' mall perceptions of specific shopping centre attributes. Self-administered questionnaires were distributed via a mall intercept survey and a sample of 200 respondents was realized. The results found several gender and age differences. Furthermore, the findings indicate several positive relationships between the variables investigated. Shopping malls should focus on planning the appropriate retail tenant mix that will provide variety and entertainment but will also contribute to their image and attract more visitors.

INTRODUCTION

Over the past decade or two, the South African retail environment has been characterized by the establishment and/or the renovation of shopping centres all over the country. Not only does this show enormous growth for the retail industry as a whole, but also the aptitude of retailers to serve the evolving needs of shoppers in the 21st century. Shopping centres play a major role in consumers' lifestyle (Terblanche, 1999), as these centres are not only a place for shopping but also a community centre for social and recreational activities (Ng, 2003). Thus, shopping malls or centres are becoming new places that consumers visit where shopping has changed meaning and focus (Burnaz & Topcu, 2011). Shopping centre developers and mall managers are challenged by the competitive market environment and well-informed customers. As customers of retail stores have become more empowered with a vast amount of information and knowledge about product, prices and brands it has become harder to satisfy customers.

These competitive forces and other environmental factors challenge mall managers to differentiate and position their mall in the minds of the customer and they must employ various strategies to make the shopping experience as enjoyable as possible (North & Kotze, 2004). Customer satisfaction has been an important construct in retailing literature because satisfaction is an antecedent of positive outcomes (Gustafson, Johnson & Ross, 2005). Consumer's satisfaction is also important to mall managers, because it has been shown that satisfaction with previous experiences influences future shopping choices (Machleit, Eroglu, & Mantel, 2000:30). Furthermore satisfaction is gaining more attention because of intense competition in the business world and thus leading to the major concern of 'how to keep customers satisfied in order to maintain and grow profitably' (Im & Ha, 2011:2273).

Shopping malls cater beyond the normal, grocery and clothing purchasing, it is more of a lifestyle and entertainment experience. It has been suggested that shopping nowadays is not just a task-oriented activity but also a leisure activity (Cox, Cox & Anderson, 2005). In a shopping mall shoppers are exposed to a collection of

atmospherics such as music and decoration and a wide selection of stores, as well as entertainment options, which forms customers' perceptions (Stoel, Wickliffe & Lee, 2004; El-Adly, 2007). When shoppers visit a mall, they form general opinions about a mall based on their experiences at the mall. Attributes such as the variety of stores and entertainment offered (which forms part of the mall atmosphere) contribute largely to the shoppers' perceptions. A variety of stores at a mall provide shoppers with excitement in their purchasing experiences, offering a change of relief from boredom and increase the desire to stay longer at the mall (Sharma, Sivakumaran & Marshall, 2010:277). With the growing number of shopping centres, shoppers tend to be more selective and they are more likely to patronize malls that are attractive and have a wider variety of stores and merchandise that match their preferences (Wong, Yu & Yuan, 2001). In addition a shopping centre can contribute significantly to leisure by providing shoppers with entertainment offerings. Previous results also suggest that mall frequency visit is related to the number of mall entertainment offerings (Kim, Christiansen, Feinberg & Choi, 2005, 490). According to Barnes (2002:1) shopping centres in South Africa for example are increasingly utilizing the marketing opportunities offered by various kinds of entertainment activities, not only to draw customer to the centre, but also build possible long-term relationships. Im and Ha (2010) found that it is necessary for shopping satisfaction to provide a good selection of stores and fun that exceeds customer expectations. Shoppers' perceptions allow shoppers to be aware of the mall attributes by confirming their opinions about the mall, therefore, determining the shoppers' mall frequency visits. Shopping mall attributes such as variety of stores and entertainment, are some of the important attributes of shoppers' perceptions about shopping malls. These attributes and more, when managed properly, can contribute to the long-term shopping mall success.

The more shoppers visit a shopping mall, the more they tend to be committed to the mall. Commitment is general defined as a pledging or binding of an individual to behaviour acts and Chebat, Hedhli and Sirgy (2009:51) define mall commitment as the resistance to switch to other malls due to the high levels of satisfaction.

A wide range of studies investigating various aspects relating to consumer behaviour in the shopping centre context, and specifically the factors that could influence patrons' preferences to frequent a specific shopping centre, have been executed over the past three or four decades (Budkin & Lord, 1997; Wakefield & Baker, 1998; Wong, *et al.*, 2001; Sit, Merrilees & Birch, 2003; El-Adly, 2007; Allard, Babin & Chebat, 2009). Numerous studies also studied shoppers' evaluations of shopping enjoyment and mall image based on demographic factors such as age, gender and ethnicity (Kim & Kim, 2005; Seock, 2009). However not much is known about shoppers' perceptions, possible age and gender differences, as well as the possible correlations between shopper satisfaction and mall commitment in a South African context.

LITERATURE

Shoppers visit a shopping mall to do more than just shopping for products and services; they also visit the mall for lifestyle and entertainment experiences. Through these experiences the shopper forms perceptions about a shopping mall. Perceptions are influenced by mall attributes such as, perceived human crowding, variety of stores, safety, accessibility, location, decor and entertainment offered at the mall, to name but a few (Wong *et al.*, 2001; Sit *et al.*, 2003; North and Kotzé, 2004). Furthermore, these attributes will determine shoppers' level of satisfaction, mall image and commitment to a shopping mall.

A continuous question that might go through the mall manager's mind is "how to tempt customers to visit all parts of the shopping mall?" A way to address this question is to offer a variety of stores in a mall. Variety seeking is defined as a "means of obtaining stimulation of purchase behaviour by alternating between familiar choice objects such as stores simply for the sake of change" (Sharma *et al.*, 2010:277). Research has shown that a variety of stores within a mall influences mall selection, frequency of shopping and the image of the shopping mall (Wakefield & Baker, 1998:521). Rabbanee, Ramaseshan, Wu and Winden, (2012:271) found that shoppers have the desire to stay longer in a shopping mall that offers a variety of stores, thus increasing the probability of them spending more money. Store variety also provides shoppers with excitement and novelty in their purchasing experiences (Sharma *et al.*, 2010:277). In Im and Ha's (2011:271) study, it has been stated that shoppers drive past malls with less stores to reach their desired malls that have the best variety of stores. A mall that offers a variety of stores attracts more shoppers because of the excitement it creates and in addition, a one-stop shopping mall allows shoppers to conveniently compare offerings (Wakefield & Baker, 1998:521). The results of Teller and Reutterer's (2008:137) study show that retail-related factors, i.e. "tenant mix" and

“merchandise value”, exert the most substantial impact on the overall attractiveness of a shopping centre. They suggest that the marketing activities of shopping centres should focus on its core function: providing a broad and deep mix of stores and goods. This is supported by Wakefield and Baker’s study (1998) which highlighted the importance of merchandising (i.e. good choice of brands, good range of products) and tenant variety as stimuli that induce excitement in a shopping mall setting.

Shopping malls offer the shopper more than just the normal grocery and clothing buying, but also an element of entertainment. The integration of shopping and entertainment brought about the term “shoppertainment”. Entertainment is “something that amuses, pleases or diverts especially a performance or a show”. The entertainment mix of a shopping mall may comprise of a speciality event that is incorporated into the property of the shopping mall for a longer duration, for example movie theatres, gaming and bowling arcades (Sit *et al.*, 2003); special event entertainment (such as fashion shows) and food (such as food courts and cafes). These entertainment offerings motivate shoppers to extend the time spent at the mall. Ooi and Sim (2007) provide evidence that more than 70% of the patrons interviewed feel that the presence of a Cineplex would entice them to visit a shopping centre more often. Hart, Farrell, Stachow, Reed and Cadogan (2007) mention that the variety and quality of entertainment in shopping centres can have a positive influence on the enjoyment of the shopping experience. Entertainment enhances the total shopping mall image thus the shopping mall becomes favourable and unique, giving the shopping mall a sustainable competitive advantage (Kim *et al.*, 2005:490).

The above mentioned mall attributes all engage the sense and are likely to play a significant role in shopper satisfaction and a sense of well-being. If shoppers have a positive shopping experience they are likely to feel positive about the mall and express a deep sense of interest in and commitment to the mall (Hedhli *et al.*, 2011). Akroush and Abu-ElSamen (2011) found that the shopping environment as well as shopping motives positively influence shopper’s satisfaction and further stated that commitment and loyalty were related to shoppers’ satisfaction with the shopping experience. Factors such as the aesthetics of a mall and product variety were found to influence shopper’s satisfaction (Ahmad, 2012). Mahajar and Yunus (2010) also reported significant relationships between, satisfaction, commitment and loyalty of shoppers. Chebat *et al.*, (2009:50) noted that when a shopper has a positive awareness and perception of mall image dimensions/attributes (of which entertainment and store variety are two elements); it may lead to a commitment to the mall.

According to Chebat *et al.*, (2009:54) researchers began to study gender differences in shopping mall behaviour only recently. Several studies demonstrated that women compared to men have a more positive attitude towards shopping (Grewal, Baker, Levy & Voss, 2003). Hu and Jasper (2004) found that men and woman differ in shopping motives, enjoyment with shopping malls and time spent in malls. Research by Lim, Kim & Park (2007) also found that woman evaluates store attributes differently than men. Wesley, LeHew and Woodside (2006) reported that when comparing shopping mall behaviour, females were more recreational conscious, fashion conscious and perfectionist shoppers than males. The results of a survey by (Otnes & McGrath, 2001:116, 119) indicate that the typical male shoppers do not visit a variety of shops to do bargain hunting or engage in browsing activities. Female shoppers, however, view the shopping process as a leisure activity, weigh up the pros and cons of a purchase and visit more shops than men (Hart *et al.*, 2007:592). Generation theorists propose that as the macro-environment changes, there are distinct changes in patterns of consumer behaviour of different age groupings (Strauss & Howe, 1999). Littrell, Ma & Halepete (1995) reported that generational cohorts differ in their approach to shopping. Bakewell and Mitchell (2003:95) propose that younger consumers are likely to develop different shopping styles compared with older generations, for example they found that younger females tend to be more recreational shoppers as well as more easily confused by over-choice than older females.

RESEARCH OBJECTIVES

The main purpose of this study is to determine if there are significant gender and age differences with regards to specific shopping centre attributes, shoppers’ satisfaction and mall commitment as well as to investigate the existence of possible relationships between the selected attributes, shopper satisfaction and mall commitment. This study will focus on the following two attributes: variety of stores and entertainment (Kotzé & North, 2004; Kim *et al.*, 2005; Teller & Reutterer, 2008). To address the objectives the following are hypothesized:

- H₁ There is a significant difference between male and female shoppers' mall commitment.
H₂ There is a significant difference between male and female shoppers' satisfaction.
H₃ There is a significant difference between male and female shoppers' perceptions of entertainment.
H₄ There is a significant difference between male and female shoppers' perceptions of store variety.
H₅ There is a significant difference between younger and older shoppers' mall commitment.
H₆ There is a significant difference between younger and older shoppers' satisfaction.
H₇ There is a significant difference between younger and older shoppers' perceptions of entertainment.
H₈ There is a significant difference between younger and older shoppers' perceptions of store variety.
H₉ There is a significant positive relationship between mall attributes and shopper satisfaction.
H_{9a} There is a significant positive relationship between entertainment and shopper satisfaction.
H_{9b} There is a significant positive relationship between the variety of stores offered and shopper satisfaction.
H₁₀ There is a significant positive relationship between mall attributes and mall commitment.
H_{10a} There is a significant positive relationship between entertainment and mall commitment.
H_{10b} There is a significant positive relationship between the variety of stores and mall commitment.
H₁₁ There is a significant positive relationship between satisfaction and mall commitment.

METHODOLOGY

The target population for the study consisted of adult (18+) shoppers at a mall in Gauteng, South Africa. As an accurate sampling frame is not available, a non-probability convenience sampling was used and a sample size of 200 respondents was realized.

Chebat *et al.*, (2009:55) six item commitment scale (Cronbach alpha = 0.93); Im and Ha's (2011:2278-2280) four item, shoppers' satisfaction scale (Cronbach alpha = 0.84) and Kim *et al.*, (2005:489) three item entertainment scale (Cronbach alpha = 0.67) was used. Unfortunately, not much could be done to improve on the reliability of the scale by deleting items. However Hair, Anderson, Tatham and Black (1998:118) noted that reliability coefficients above 0.60 are satisfactory for exploratory research. Wakefield and Baker's (1998:523-524) variety of stores, scale was used to measure the variety of stores offered. All the Likert scale points in the questionnaire were labeled ranging from 1 ("Strongly disagree") to 5 ("Strongly agree"). The questionnaire was pre-tested via the participant pre-testing method.

The mall intercept survey targets participants in centralized locations, in this case the shopping mall. Permission to distribute the self-completion questionnaires at the mall was attained. To avoid the potential bias owing to the use of non-probability sampling, the mall intercept survey was conducted at various times and days during the week. There were no incentives involved for the shoppers to participate.

RESULTS

From the 200 respondents 86(43%) were aged between 18-30 years, 57(28%) were aged between 31-40 years, 40(20%) were between 41-50 years and 17(9%) were older than 51 years. The gender ratio for the sample was almost equal numbers of male and female respondents.

The independent sample *t*-test is the appropriate test for H₁-H₄, and ANOVA testing for H₅ -H₈. Assumption testing indicated substantial departures from normality in most of the sub-samples for each for the test variables, and the Mann-Whitney *U* test and Kruskal-Wallis H test were used instead. Since the assumptions of normality for H₉-H₁₁ indicated substantial departures, the Spearman's rank order correlation was used. All hypotheses were tested at a 5% level of significance (i.e., $\alpha = 0.05$). The results of Hypotheses 1-8 are reflected in Table 2 and Table 3.

Table 2: Descriptive statistics and results of the Mann Whitney *U* tests for gender

Hyp.		Gender	<i>N</i>	<i>M</i>	<i>SD</i>	Results: Mann-Whitney <i>U</i> test
H ₁	Mall commitment	Male	99	2.73	1.018	Test statistic: 4145 <i>p</i> -value: 0.037; H1(null) accepted
		Female	101	3.04	1.043	

H ₂	Shoppers' satisfaction	Male	99	3.34	0.722	Test statistic: 3933 <i>p</i> -value: 0.008; H1(null) rejected
		Female	101	3.46	0.865	
H ₃	Entertainment	Male	99	3.68	0.786	Test statistic: 4684 <i>p</i> -value: 0.437; H1(null) accepted
		Female	101	3.59	0.797	
H ₄	Variety of stores	Male	99	3.14	1.124	Test statistic: 4500 <i>p</i> -value: 0.216; H1(null) accepted
		Female	101	3.24	0.790	

It is evident from Table 2 that female shoppers are significantly more satisfied with their shopping experience and also more committed to the mall than male shoppers. This might be due to the fact that several other studies found that women compared to men have a more positive attitude towards shopping (Grewal *et al.*, 2003). Lim *et al.*, (2007) reported that woman evaluate store attributes differently than men but this was however not confirmed by the results in Table 2, as the Mann-Whitney *U* test did not reveal significant differences in male and female perceptions of the variety of stores or entertainment provided.

Table 3: Descriptive statistics and results of the Kruskal-Wallis H test for age

Hyp.		Age	N	M	SD	Results: Kruskal-Wallis H test
H ₅	Mall commitment	18-30 ^a	86	2.72	1.043	Test statistic: 8.070 <i>p</i> -value: 0.018 Conclusion: Significant difference, H1(null) rejected
		31-40 ^b	57	2.80	1.034	
		41+ ^a	57	3.21	.979	
H ₆	Shoppers' satisfaction	18-30	86	3.42	.800	Test statistic: 0.582 <i>p</i> -value: 0.748 Conclusion No difference, H1(null) accepted
		31-40	57	3.44	.763	
		41+	57	3.50	.855	
H ₇	Entertainment	18-30	86	3.54	.825	Test statistic: 2.612 <i>p</i> -value: 0.271 Conclusion: No difference, H1(null) accepted
		31-40	57	3.66	.773	
		41+	57	3.76	.750	
H ₈	Variety of stores	18-30	86	.3.28	.965	Test statistic: 2.824 <i>p</i> -value: 0.244 Conclusion: No difference, H(null) accepted
		31-40	57	3.07	.956	
		41+	57	3.34	.996	

The results of the Scheffé *post hoc* tests are indicated with ^a and/or ^b. All mean values containing the same letters (for example, ^a) indicate that the groups differ significantly from one another. All mean values containing different letters (for example, an ^a or ^b) indicate that these groups do not differ significantly from one another.

The only significant difference in Table 3 were found for mall commitment; with the younger age group (18-30 year) being significant less committed to the mall than older (41+) shoppers. This might be due to the fact that older shoppers were more positive, based on mean values, than the other two age groups across all the variables. The findings are thus only partially in-line with the findings of Littrell *et al.*, (1995) that argued that generational cohorts differ in their approach to shopping.

The results of the Spearman's rank order correlations for shoppers' satisfaction and mall attributes showed that: H_{9a}'s *p*-value = 0.000, and therefore the null hypothesis are rejected and the alternative hypothesis (H_{9a}) is accepted. It can, therefore, be concluded that there is a significant positive relationship between the two variables, entertainment provided and shopper's satisfaction. The correlation co-efficient of 0.388 can be described as medium or moderate (Cohen, 1988:79). The coefficient of determination, *r*², indicates that the two variables share 15% common variance. Since there is a moderate, positive relationship between entertainment offered and shoppers' satisfaction, mall management should focus their resources in providing entertainment at the mall to ensure shoppers' satisfaction. H_{9b} *p*-value = 0.000, and the null hypothesis can therefore also be rejected and the alternative hypothesis (H_{9b}) is accepted. The null hypothesis stated that there is no relationship between variety of stores and shoppers' satisfaction. The correlation co-efficient of 0.655, can be described as strong or large (Cohen, 1988:79). The coefficient of determination, *r*², indicates that the two variables share 43% common variance. It can, therefore, be concluded that there is a significant strong, positive relationship between the two variables. The findings above are thus in-line with Ahmad (2012) that reported that mall aesthetics and product variety were found to influence shopper's satisfaction.

For Hypothesis H_{10a} , $p=0.000$ and thus one can reject the null hypothesis. The correlation co-efficient of 0.273, can be described as small or weak (Cohen, 1988:79) and the coefficient of determination, r^2 , indicates that these two variables only share 7.5 % common variance. Since the p-value (0.000) for Hypothesis H_{10b} is also smaller than 0.05 one can reject the null hypothesis and accept the alternative hypothesis. The correlation co-efficient of 0.262, can be described as small or weak (Cohen, 1988:79) and the coefficient of determination, r^2 , indicates that these two variables only share 7 % common variance. It can therefore, be conclude that in both instances there are a positive, weak significant relationship between the mall attributes (entertainment and variety of stores) and mall commitment. The results thus supports Chebat *et al.*, (2009:50) findings that when a shopper has a positive perception of the mall image attributes (of which entertainment and store variety are two elements) it may lead to mall commitment. The p-value of H_{11} ($p=0.000$) is smaller than 0.05 and therefore the tentative hypothesis accepted. The correlation co-efficient of 0.575, can be described as large or strong (Cohen, 1988:79) while the coefficient of determination, r^2 , indicates that the two variables share 33% common variance. It can, therefore, be concluded that there is a significant positive, strong relationship between shoppers' satisfaction and mall commitment. Thus echoing the results of Hedhli *et al.*, (2011) and Akroush and Abu-ElSamen (2011) that reported that commitment were related to shoppers' satisfaction with the shopping experience.

RECOMMENDATIONS, IMPLICATIONS & LIMITATIONS

The results of the study indicate how shoppers' perceptions of mall attributes are important drivers of shoppers' satisfaction and their commitment to the mall. Shoppers' satisfaction is important to the mall management, because it has been shown that satisfaction with previous experiences influences future shopping choices (Machleit *et al.*, 2000:30). Since variety of stores offered and entertainment has a positive effect on shoppers' satisfaction, management should focus on providing a more stores at the mall as well as keep on providing various entertainment activities. The results again highlight the importance of entertainment and food courts facilities in attracting higher levels of patronage. The positive correlation of variety of stores with shopper's satisfaction and commitment support the notion of Kaufman and Lane (1996) that if a mall delivers a well-positioned mix of outlets it would stand a better chance of success. The results further revealed that entertainment as well as the variety of stores has a weak effect on shoppers' commitment to the mall. Therefore, shoppers' are unlikely to be committed to a mall based solely on the entertainment offerings or store variety of a mall. But since entertainment links with overall shopper satisfaction as well as mall commitment, it is important for shopping mall management to create a pleasing environment for shopping by providing entertainment such as video games, cinemas, special events, window shopping and restaurants. Since commitment to a mall is a strong antecedent to mall loyalty, mall managers need to develop strategies to enhance mall commitment. The results showed that females are more satisfied and committed to the mall and they should be encouraged to spread positive word-of-mouth. As males are less satisfied and committed, mall managers may want to consider specific offerings that would appeal to the male market. This is however a trend across countries as several studies demonstrated that women have a more positive attitude towards shopping compare to men (Grewal *et al.*, 2003). As older shoppers seem more committed, mall management should focus on keeping these committed shoppers by providing additional services and incentive such as mall loyalty cards or free parking to retain them. The results confirm that mall attributes such as store variety and entertainment can induce satisfaction and this suggest that the development and presentation of strong mall attributes relevant to the target market will help to satisfy the customers, but that these two attributes alone may not be enough to ensure mall commitment.

The main limitations related to the study are that a non-probability sampling approach was used and the results of the study cannot be generalized to a larger population on statistical grounds. The study are conducted in a single context and future studies could investigate more variables and include more shopping malls.

DEVELOPING A NEW VARIABLES SAMPLING PLAN FOR PRODUCT ACCEPTANCE DETERMINATION BASED ON THE PROCESS YIELD

Chien-Wei Wu, National Tsing Hua University, Taiwan
Shih-Wen Liu and Shi-Woei Lin
National Taiwan University of Science and Technology, Taiwan

ABSTRACT

The aim of this paper is to develop an effective sampling plan, called variables repetitive group sampling (VRGS) plan, based on process yield index with two-sided specification limits. The plan parameters are solved by a nonlinear optimization model where the objective function is to minimize the average sample number (ASN) and the constraints are formulated by acceptable quality level (AQL), limiting quality level (LQL), producer's risk and consumer's risk under the operating characteristic (OC) curve. The plan parameters are tabulated and the results show that the proposed plan requires less sampling than does variables single sampling plan under the same conditions.

INTRODUCTION

Acceptance sampling is a useful tool which can help both vendors and buyers to make a decision for determining whether a batch or a lot of product should be accepted or rejected. Since 100% inspection is usually impractical and the inspection cost may be extremely high if the inspected item is very expensive or destructive testing. Thus, a well-designed and efficient acceptance sampling plan becomes very attractive and essential. In general, acceptance sampling plans contains two types, attributes and variables. Even it is too costly to do the variables sampling plan than do attributes, but we can obtain more information from the real process which can help engineers to control and monitor the process. Furthermore, it has been investigated that the expected sample size for inspection of variables sampling plan is smaller (Hamaker, 1979; Kao, 1971; Montgomery, 2009).

In the literature, several acceptance sampling plans are designed based on different philosophies and purposes. A new sampling scheme named repetitive group sampling (RGS) plan was firstly proposed by Dr. Sherman for measuring attributes data (Sherman, 1965). Dr. Sherman emphasizes that the RGS plan can obtain the minimum sample size as well as the same protection. Balamurali *et al.* (2005) and Balamurali and Jun (2006) extended the attributes repetitive group sampling (RGS) plan concept to variables RGS plan, and also compute the average sample number (ASN) of variables RGS plan based on known and unknown sigma. Their computation shows that the required sample size of their proposed approach will be smaller than variables single sampling and double sampling plan.

The purpose of this paper is to develop a variables RGS plan for processes with two-sided specification limits which based on the process yield. The results indicate that the proposed sampling plan has idealized OC curve shape and requires fewer sample size for inspection but provide the same protection for both vendors and buyers.

Process Yield Index

Since the simplest process capability index C_p was proposed by Dr. Kane in 1986 (Kane, 1986), there are several advanced capability indices were developed for measuring process performance from different

perspectives in order to provide more accurate measures on process quality (Kotz and Johnson, 2002; Wu *et al*, 2009). These capability indices have become popular to determine whether the process is capable of reproducing products satisfying the quality requirement. Some basic capability indices are defined as follows:

$$C_a = 1 - \frac{|\mu - m|}{d}, C_p = \frac{USL - LSL}{6\sigma}, C_{pk} = \min \left\{ \frac{USL - \mu}{3\sigma}, \frac{\mu - LSL}{3\sigma} \right\}$$

where $d = (USL - LSL)/2$, $m = (USL + LSL)/2$, USL is upper specification limit and LSL is lower specification limit. In order to provide an exact measure on the process yield, Boyles (1994) developed the process yield index S_{pk} . It is defined as:

$$S_{pk} = \frac{1}{3} \Phi^{-1} \left\{ \frac{1}{2} \Phi \left(\frac{USL - \mu}{\sigma} \right) + \frac{1}{2} \Phi \left(\frac{\mu - LSL}{\sigma} \right) \right\}.$$

There is a one-to-one relationship between the yield index S_{pk} and the process yield %Yield or the number of nonconformities in units of parts per million (PPM) for processes with two two-sided specification limits. That is, the process yield can be expressed as %Yield = $2\Phi(3S_{pk}) - 1$ and the relationship between S_{pk} and the number of nonconformities in PPM can be expressed as $NCPPM = 2[1 - \Phi(3S_{pk})] \times 10^6$ or $S_{pk} = 1/3 \Phi^{-1} [1 - (NCPPM \times 10^{-6}/2)]$. For example, if %Yield = 99.9990% or the number of nonconformities is 10 PPM, then the corresponding S_{pk} value is approximately to 1.4724. In practical situations, the process mean and standard deviation are usually unknown, hence, we need to use $\bar{x} = (\sum_{i=1}^n x_i)/n$ and $s = [(n-1)^{-1} \sum_{i=1}^n (x_i - \bar{x})^2]^{1/2}$ to be the estimators of μ and σ and the estimator of S_{pk} can be defined as: $\hat{S}_{pk} = 1/3 \times \Phi^{-1} \left\{ 1/2 \times \Phi(USL - \bar{x}/s) + 1/2 \times \Phi(\bar{x} - LSL/s) \right\}$. It can be seen that the sampling distribution of \hat{S}_{pk} is a complex function and intractable to obtain. Therefore, Lee *et al.* (2002) obtained a normal approximation distribution by using Taylor expansion method and the estimator \hat{S}_{pk} is approximately distributed as $N(S_{pk}, [a^2 + b^2] \{36n[\phi(3S_{pk})^2]^{-1})$. The probability density function of \hat{S}_{pk} can be expressed as:

$$f_{\hat{S}_{pk}}(x) = \sqrt{\frac{18n}{\pi}} \frac{\phi(3S_{pk})}{\sqrt{a^2 + b^2}} \exp \left[-\frac{18n(\phi(3S_{pk}))^2}{a^2 + b^2} (x - S_{pk})^2 \right], -\infty < x < \infty,$$

where a and b are functions of μ and σ , and can be defined as follows:

$$a = \frac{1}{\sqrt{2}} \left\{ \frac{USL - \mu}{\sigma} \phi \left(\frac{USL - \mu}{\sigma} \right) + \frac{\mu - LSL}{\sigma} \phi \left(\frac{\mu - LSL}{\sigma} \right) \right\},$$

$$b = \phi \left(\frac{USL - \mu}{\sigma} \right) - \phi \left(\frac{\mu - LSL}{\sigma} \right),$$

and ϕ is the probability density function (PDF) of the standard normal distribution $N(0,1)$.

Developing a Variables RGS Plan Based on Process Yield Index

Suppose that the quality characteristic of interest follows a normal distribution and has two sided specification limits (LSL and USL). A commonly-used approach for developing a sampling plan is to require that the OC curve passing through two specified points, say (AQL, $1 - \alpha$) and (LQL, β). This implies that the probability of acceptance must be greater than $1 - \alpha$ if the quality level of the submitted lot is at the contracted AQL (i.e., $p_1 = p_{AQL}$ or $S_{pk} = S_{AQL}$). And, the probability of acceptance would be no more than β if the quality level of the submitted lot is only at RQL ($p_2 = p_{LQL}$ or $S_{pk} = S_{LQL}$), where α and β are usually called the producer's risk and the consumer's risk, respectively.

Let P_a and P_r be the probability of accepting and rejecting the entire product items respectively based on a single sampling under variables RGS plan with parameters (n, k_r, k_a) when the number of nonconformities is equal to p PPM.

$$P_a(p) = P(\hat{S}_{pk} > k_a | p)$$

$$P_r(p) = P(\hat{S}_{pk} < k_r | p)$$

The probability of repeating the sampling P_R can be expressed as:

$$P_R(p) = P(k_a < \hat{S}_{pk} < k_r | p) = 1 - P_a(p) - P_r(p)$$

The OC function can be expressed as:

$$\pi_A(p) = \frac{P_a(p)}{P_a(p) + P_r(p)}$$

According to the two-point condition on the OC curve, the plan parameters can be determined by satisfying the following two equations:

$$\pi_A(p_{AQL}) = \frac{P_a(p_{AQL})}{P_a(p_{AQL}) + P_r(p_{AQL})} \geq 1 - \alpha$$

$$\pi_A(p_{LQL}) = \frac{P_a(p_{LQL})}{P_a(p_{LQL}) + P_r(p_{LQL})} \leq \beta$$

The plan parameters (n, k_a, k_r) for variables RGS plan based on the process yield index S_{pk} could be several different combinations for satisfying the given risks simultaneously. Firstly, we have to determine the value of parameters which can obtain the smallest required sample size for inspection (Balamurali *et al.*, 2005). Therefore, the simple idea is to use the average sampling number (ASN) as an objective function, and it should be minimized with two constraints, $\pi_A(p_{AQL})$ and $\pi_A(p_{LQL})$ under the quality level p PPM. The ASN function can be calculated by:

$$ASN(p) = \frac{n}{P_a(p) + P_r(p)}$$

It is usual to formulate the objective function at the quality level p_{AQL} (Wu, 2012), then the plan parameters (n, k_r, k_a) can be determined by solving the following nonlinear programming problem as follows.

$$\text{Min}_{n, k_a, k_r} ASN(p_{AQL}) = \frac{n}{P_a(p_{AQL}) + P_r(p_{AQL})}$$

subject to

$$\pi_A(p_{AQL}) \geq 1 - \alpha$$

$$\pi_A(p_{LQL}) \leq \beta$$

$$p_{AQL} < p_{LQL}, k_a \geq k_r > 0.$$

The Computation of the Plan Parameters

Table 1 shows the plan parameters for various conditions by solving the nonlinear optimization model. From the given tables, we can easily to determine the sample size n and the corresponding critical value for acceptance k_a

and critical value for rejection k_r . For instance, the given requirements are $(p_{AQL}, p_{LQL}) = (100, 1000)$ and $\alpha = 0.05$, $\beta = 0.10$, the plan parameters can be obtained as $(n, k_r, k_a) = (55, 1.1420, 1.2849)$ and the average sample number is 94.

Please note that, if we solve the nonlinear optimization model under $k_a = k_r$, the variables RGS plan will reduce to the conventional variables single sampling plan. Under the same conditions, the required sample size n and the corresponding critical value c_0 can be obtained as $(n = 157, c_0 = 1.1763)$ by the variables single sampling plan. A desired sampling plan would be achieved if the required sample size for inspection is minimal and provided the same protection for both vendors and consumers (Balamurali and Jun, 2009). Hence, our proposed plan shows more economic and efficient than the traditional variables single sampling plan because it reduces sample size required for inspection on product acceptance determination.

Table 1: The plan parameters of the proposed method for various conditions.

p_{AQL}	p_{LQL}	$\alpha = 0.010$				$\alpha = 0.050$			
		$\beta = 0.050$				$\beta = 0.100$			
		n	k_a	k_r	ASN	n	k_a	k_r	ASN
1	100	51	1.5761	1.2259	79	29	1.6051	1.2203	50
	500	23	1.5525	1.0261	36	13	1.5985	1.0119	23
	1000	17	1.5408	0.9262	27	10	1.5957	0.9067	17
	3000	11	1.5195	0.7466	17	6	1.5862	0.7235	11
100	500	218	1.2747	1.1424	338	126	1.2849	1.1420	214
	1000	96	1.2644	1.0628	149	55	1.2805	1.0608	94
	3000	36	1.2464	0.9152	57	21	1.2745	0.9085	36
500	1000	869	1.1500	1.0911	1335	503	1.1543	1.0913	846
	3000	106	1.1325	0.9611	164	60	1.1461	0.9596	103
1000	3000	254	1.0794	0.9758	393	146	1.0873	0.9756	249

Figure 1 shows the OC curves of the variables single sampling plan with two parameters and the proposed variables RGS plan. The OC curve shows the discriminatory power of sampling plan. Obviously, the proposed variables RGS plan obtains more idealized shape of OC curve because it has steeper slope.

CONCLUSIONS

According to highly required quality levels today, the traditional method may inappropriate for adequately reflecting the actual lot quality, especially the fraction of nonconformities is extreme low. The process yield index S_{pk} can be used to evaluate for processes with two-sided specification limits and also provide an exact measure on process yield. Therefore, we develop a variables RGS plan based on the S_{pk} index for lot sentencing. The results show that the proposed plan requires fewer sample size for inspection and has a better OC curve than the conventional variables single sampling plan. In addition, tables of plan parameters of the proposed plan are provided for users to easily determine the sample size for inspection and the corresponding critical value for making decisions.

Figure 1: The OC curve of VSS plan under $(n = 100, c_0 = 1.05)$ and $(n = 100, c_0 = 1.15)$ and VRGS plan $(n = 100, k_r = 1.05, k_a = 1.15)$.

A GREEK WEDDING IN SADC? TESTING FOR STRUCTURAL SYMMETRY TOWARDS SADC MONETARY INTEGRATION

**Mulatu F. Zerihun, Tshwane University of Technology and
University of Pretoria, South Africa**

Marthinus C. Breitenbach, University of Pretoria, South Africa

Francis Kemegue, Framingham State University, USA

ABSTRACT

This paper investigates structural symmetry among SADC countries in order to establish, judged by modern OCA theory, which of these countries may possibly make for a good monetary matrimony and which countries may be left out in the cold. SADC remains adamant that it would conclude monetary union by 2018. It can ill afford a repeat of the type of financial and fiscal instability brought about by ex ante structural economic differences and asynchronous business cycles in the EU. This study contributes to the literature on macro-economic convergence in the SADC region. We make use of the Triples test to analyze each country's business cycles for symmetry and then evaluate SADC countries' ratio of relative intensity of co-movements in business cycles with co-SADC country and versus that of major trade partners. We find that not all countries in SADC conform to OCA criteria judged by both asymmetrical business cycles and weak co-movements in business cycles.

INTRODUCTION

African Union (AU) member states want to establish regional monetary integration with the belief that it would further overall integration and bring about a large number of economic benefits to the continent. In spite of many attempts to integrate African economies on a regional basis, overlapping membership of various Regional Economic Communities (RECs) and a lack of investment in the institutions and systems required for integration, are seen as the main reasons why the economies of most African countries remain detached from each other (ECA, 2010; Jovanovich, 2006). Even though the East African Community (EAC) has lost some momentum with integration, it is now targeting monetary union and ultimately a Federation (Buigut and Valev, 2006). The pace of integration among the Central African Economic and Monetary Community (CEMAC), the Economic Community of West African States (ECOWAS), and the Common Market for Eastern and Southern Africa (COMESA) has been very slow and complicated (World Bank, 2000; ECA, 2004). In the southern part of the continent, the Southern African Development Community (SADC) is moving towards the creation of a monetary union by 2018 (Belle, 2010). The economic integration in southern African countries is one of the oldest economic integration initiatives in the world and could be traced back to the Southern African Customs Union (SACU) which was created in 1910 between South Africa and its neighbours.

The launch of the European Monetary Union (EMU) in the early 2000s has sparked renewed interest in the creation and expansion of monetary unions across the world (Alesina et al., 2002; Masson and Pattillo, 2005, and Jefferis, 2007). Nevertheless, to pursue meaningful and effective monetary union in different parts of Africa, it is important to learn from already established monetary unions in the world. The United States enjoys a much higher degree of economic integration when compared to Europe. However, it took the United States at least one hundred and fifty years and several financial crises to become a monetary union (Rockoff, 2000). Currently the viability of the European monetary system is questioned as a result of the crisis that started in Greece and culminated into a crisis of the whole Euro zone. Portugal, Italy, Ireland, Greece and Spain (together known as

the PIIGS) are now depending on their rescue from the strong EU economies. As we show in our literature review, the PIIGS, and particularly Greece, did not comply with OCA theory prior to accession when measured against the criteria of business cycle synchronisation. Could the crisis have been avoided had the PIIGS complied with proper Optimal Currency Area (OCA) criteria prior to accession to the EMU?

The focus in this paper is on investigating the similarity of business cycles of SADC countries. This is firstly done by evaluating each country's real GDP (measure of business cycle) for symmetry. Secondly, SADC countries are then paired with each other, with non-SADC African countries and with major external trade partners and the co-movement in business cycles as a result of real shocks evaluated. For this very reason, this study is undertaken – to ascertain which countries in SADC could join in monetary matrimony without running the risk of destabilising the union, as was the case with the PIIGS.

Comovement and Optimum Currency Area (OCA) Theory

The theory of optimal currency areas, from the classic contributions by Mundell, 1961; McKinnon, 1963; Kenen, 1969; and Ingram, 1973 to its modern applications and revisions stresses that asymmetric, country specific shocks represent a key element in the choice of an exchange rate regime or of adopting a common currency. There are two broad approaches to modern OCA theory: the *traditional* and *endogenous approaches* (Tavlas, 2009). The traditional approach assumes that a country's characteristics are invariant to the adoption of a common currency while the endogenous approach assumes that a monetary union alters the economic structure of members. It is postulated that business cycle movements would become more similar over time for countries that join a monetary union. The argument for an endogenous optimal currency area emphasises that the monetary union itself could act as a catalyst for business cycle synchronisation, essentially by reducing foreign exchange transaction costs and therefore by promoting trade integration across countries (Corsetti and Pesenti, 2002).

However, there are counter arguments to the above. Eichengreen (1992) and Krugman (1993) stress that monetary integration could lead to greater specialisation in production, thus lowering output correlation and making regions more vulnerable to local shocks. Evidence presented by Frankel and Rose (1998) however, supports the view that trade links raise income correlations. The conclusion is that the OCA criterion may be satisfied ex-post even if it fails ex-ante (Corsetti and Pesenti, 2002).

Traditional OCA theory however, states that the requirements for suitable monetary unions are the symmetry of shocks, the mobility of factors, the diversification of factors of production, the similarity of inflation rates, the flexibility of wages and prices and the capacity of risk sharing (Tapsoba, 2009). As clearly stated by De Haan (2008), if business cycles in countries forming a monetary union diverge considerably the common monetary policy will not be optimal for all countries concerned. This is because countries in the downward phase of the cycle might prefer a more expansionary monetary policy while countries in the upward phase of the cycle might prefer a more restrictive policy stance. This study attempts to evaluate the feasibility of SADC monetary integration in line with modern OCA theory focusing on business cycle symmetry and co-movement *ex ante*.

Structural Symmetry and SADC Monetary Integration-Lessons from EMU

Economic heterogeneity across regions and countries is, in many ways, a vital sign of growing and healthy economies. However, OCA literature has for long emphasised that some elements of economic heterogeneity increase the likelihood of a-synchronous business cycle fluctuations at a regional level. Such fluctuations, according to Corsetti (2008), work against achieving the common goals of a currency area. This is evident from the experience of the EMU. Using an HP filter Boone and Maurel (1998) calculate correlation coefficients between the cyclical components of industrial production and unemployment rates for selected Central and Eastern European Countries (CEECs) against Germany and the EU. These authors find a relatively high degree of business cycle correlation for the CEECs with Germany, indeed higher than for Portugal or Greece. Because of technologically inferior production systems and a lower competitive position in the region, EMU countries such as Greece, have shown lack of cyclical convergence within the Euro area (Gouveia and Correia, 2008) and little sign of convergence (Crowley and Lee, 2005) (all discussed in Tsiapa and Panteladis, 2011). Using a Bayesian dynamic factor model, Lehwald (2012) examines the co-movements of output, investment and

consumption among Euro area countries before (1991-1998) and after (2000-2010) monetary union and finds that the co-movements of the main macroeconomic variables increase for core European countries from the first to the second period, while it decreases for most PIIGS economies. Bower and Guillemineau (2006) also found that the correlation of Greece's main macroeconomic variables with the rest of the Euro members reduced after accession to the EMU.

Within the SADC context, integrated development of the region as a whole is a priority. Despite large differences in the levels of economic activity and the peculiar structural features of the fifteen member countries, there is hope that all could potentially benefit significantly from regional monetary integration and economic co-operation (Khamfula and Mengsteab, 2004). However, Khamfula and Huizinga (2004) posit that the very diverse economic structures among these countries pose a very serious obstacle to regional monetary integration in SADC.

There are many questions that require answers before adopting monetary union in SADC (Jovanovic, 2006). Modern OCA theory emphasises, among other things, the importance of having symmetrical business cycles. This is certainly helpful if there is one common currency, hence one common exchange rate and one common monetary policy with which to stabilise the economies of the union in the face of external shocks. Specifically, asymmetric real shocks weaken the case for a common currency, as member states of a monetary union lose their ability to use domestic exchange- and interest rate policies for stabilisation purposes. General inferences of studies undertaken so far explicitly state that a common currency and single monetary policy may not be appropriate to all SADC countries. Some authors, however, obtained results supportive of a monetary union comprising a relatively small group of countries, usually including South Africa, sometimes with other Common Monetary Area (CMA) countries. Such findings should not be surprising for the same reason that similar results had been obtained for Euro-area countries prior to the formation of European monetary union. Tavlas (2009, p.24), in his summary of many studies carried out from late 1990s to 2007 concluded that the results are mixed and countries in the region with a higher share of trade with South Africa exhibit relatively higher co-movements in output growth.

In their review of the costs and benefits for South Africa of joining a SADC monetary union, Khamfula and Mengsteab (2004) state that it is unlikely that economic integration can flourish in the southern African region. They also caution that integration among countries with divergent levels of economic growth might run into serious problems. Instead they recommend adopting a common monetary area (CMA) such as that exists among South Africa, Namibia, Swaziland and Lesotho as a pace setter to the formation of a fully-fledged monetary union in the SADC region.

Bayoumi and Ostry (1997) in their study of 11 SADC countries found that bilateral correlations among SADC countries tend to be positive but small and insignificant, while the few positive and significant shocks do not involve continuous states. In contrast, Karras (2007) calculated correlations for 9 SADC countries against the SADC as a whole, and suggest monetary union of Malawi, Mozambique, South Africa, Zambia, and Zimbabwe. Similarly, Buigut and Valev (2006), using the Blanchard-Quah decomposition technique suggest a monetary union of the CMA countries including Mozambique and Zambia. Using the same technique aided by cluster analysis to group several variables, Buigut (2006) also obtained support for a monetary union, under the assumption that the rand was the anchor currency, for a small group of countries. His optimum cluster analysis supported monetary union comprising Botswana, Namibia, Seychelles, South Africa, and Swaziland. Grandes (2003), Khamfula and Huizinga (2004) provide support for monetary union among the same five countries. Results obtained by Masson and Pattillo (2005) and Wang et al. (2006) are less supportive of monetary union among SADC countries.

Following the *endogenous* approach to OCA theory, Frankel and Rose (1998) state that an economy that fails to satisfy OCA criteria prior to entry into a monetary union can satisfy the criteria after joining the union. Studies following the endogenous OCA approach were conducted in relation to SADC by Guillaume and Stasavage (2000), Carrere (2004), Masson and Pattillo (2005), and Masson (2006). Guillaume and Stasavage in their study covering the period 1968-93 for 5 core SADC countries analyse the credibility of a regional central bank by comparing measures of checks and balances in political systems including the degree of party fractionalisation and levels of constraints at the executive branch. They found mixed results. Low-party fractionalisation and low levels of constraint on executive branches indicated a low cost of breaking rules, which

is unfavourable for monetary union. Ease of exit and non-compliance from regional agreements has rarely been favourable for monetary union. Carrere (2004) in his analysis of trade creation uses a sample covering the period 1995-98 for 14 SADC countries using a gravity model. He uses bilateral nominal exchange-rate volatility as a proxy for the common-currency effect and obtained inconclusive results. Masson and Pattillo (2005) used a gravity model to assess trade-creation effects for 13 SADC countries and recommend a gradual and selective path to monetary union in the region. Later, Masson (2006) in his independent study for 15 SADC countries for the sample period covering 1995-2000 extended Masson and Pattillo's calibration model to include endogenous trade-creation effects. His study shows that under symmetric monetary union conditions, the costs of union exceeded the benefits for four CMA countries. Most other countries were net gainers.

Nowhere in the literature could evidence be found that member countries' business cycles consistently move closer together over time after having become part of a monetary union. Empirical evidence in support of endogenous OCA theory is thus weak. In fact, empirical evidence suggests that the business cycles of Greece, for example, tended to diverge more from other EMU members after accession. For this reason, a sober policy option in the presence of asymmetric business cycles and weak co-movement of business cycles would be not to accede to membership of a monetary union. For this reason we support a policy of compliance to these OCA criteria prior to accession.

The literature surveyed in the preceding paragraphs contains mixed evidence as the symmetry and co-movement of various macro variables of SADC member countries are concerned. When we infer lessons from EMU in the context of SADC in line with structural asymmetry of business cycles we should also note that there are other factors other than the lack of cyclical convergence within the Euro area. For example, there are other arguments like; clash between economic and political forces within the euro area (Darvas, 2012) and sovereign debt crisis in Europe (Martin and Waller, 2012; Mongelli, 2013). Weeks (2013) also demonstrates that the German export-led growth strategy as a "*beggar-thy-neighbour*" strategy that generated large trade and current account deficits throughout the euro-zone in the 2000s.

In the sections that follow, we introduce and apply methodologies that were found to provide robust results in the study of time-series cycles. These methodologies are however novice to the study of business cycles in SADC, hence two new contributions are made to the study of monetary integration and specifically the analysis of business cycle symmetry and co-movement in SADC: updated data and new techniques.

METHODOLOGY

Data

In this paper we use annual real GDP data measured in 2005 constant US dollar prices for all fifteen SADC countries as well as of Africa's fifteen major trade partners for the years 1970 – 2010. Real GDP is preferred in this study because it is the most comprehensive measure of economic activity and it is generally available for African countries on annual basis (Tapsoba, 2009; Mendonça, et al, 2011). Data were obtained from the World Bank's *World Development Indicators*, UN *statistics*, and the IMF's *International Financial Statistics*.

Table 1: Descriptive Statistics of Real GDP of SADC (1970-2010)

Country	Country Code	N	Minimum	Maximum	Mean	Std. Deviation
Angola	AGO	40	1.1928E9	5.3656E9	1.971519E9	1.1347071E9

Source: own computation

Table 1 presents descriptive statistics of SADC countries. Considering average GDP over 40 years, South Africa is, by far, the country with highest real GDP in the region. However, South Africa has the largest fluctuations in real GDP measured by highest standard deviation over the sample period. The rest of the member states have a comparable size of real GDP while Lesotho, Madagascar, and Swaziland have the lowest real GDP respectively.

Methodology for Evaluating Business Cycle Asymmetry and Synchronisation

The Triples Test

In this study we use a nonparametric method called the Triples test - first developed by Randles et al. (1980) and later introduced to the economics literature by Verbugge (1997) and Razzak (2001), respectively. The reason to adopt the Triples test is its accessibility and superior results. The Triples test method is more efficient than many other methods used in the literature to detect symmetry. The other good reason is that it is asymptotically distribution free, which means that the outliers and changes in the variance of the distribution of the time series cannot affect the test.

To perform the Triples test, we face the immediate problem of decomposing the series into trend and cyclical components. To carry out the Triples test, the series needs to be decomposed and de-trended to leave only the cyclical component of the series. We use the Baxter and King (1999) filter (B-K filter) to do this. The B-K filter was developed as a method to isolate business cycle components by applying moving averages to the macroeconomic data. The band pass filter designed by Baxter and King (1999) passes through the components of the time series with fluctuations between 6 (18 month) and 32 (96 month) quarters, removing higher and lower frequencies.

We then apply the Triples test to evaluate the symmetry of the classical cycles. Intuitively, the Triples test counts all possible triples from a sample of size N (i.e., $\binom{N}{3}$ combinations) of a univariate time series. When most of the triples are right-skewed, the time series said to be asymmetric. If i, j , and k are three distinct integers such that $1 \leq i, j, k \leq N$, the triple of observations x_i, x_j, x_k forms a right triple or skewed to the right if the middle observation is closer to the smallest observation than it is to the largest observation. This is illustrated by:

Right triple	$\frac{\text{X} \quad \text{X} \quad \text{X}}{\text{X} \quad \text{X} \quad \text{X}}$
Left triple	$\frac{\text{X} \quad \text{X} \quad \text{X}}{\text{X} \quad \text{X} \quad \text{X}}$

Formally, let x_i, \dots, x_N denote a random sample drawn from $F(x - \theta)$ where $F(\cdot)$ is a cumulative distribution function for a continuous population with $F(0) = \frac{1}{2}$ and θ is the median of the χ population.

Let

$$f^*(x_i, x_j, x_k) = \left[\text{sign}(x_i + x_j - 2x_k) + \text{sign}(x_i + x_k - 2x_j) + \text{sign}(x_j + x_k - 2x_i) \right]^3, \quad (1)$$

where $\text{sign}(u) = -1, 0$, or 1 as $u <, =$, or > 0 . Then we say x_i, x_j, x_k forms a right triple

if $f^*(x_i, x_j, x_k) = \frac{1}{3}$. Note that $f^*(x_i, x_j, x_k)$ can only assume the values $-\frac{1}{3}, 0, \frac{1}{3}$.

We define a *left triple* (looks skewed to the left) as any (x_i, x_j, x_k) for which $f^*(x_i, x_j, x_k) = -\frac{1}{3}$ (again see

the figure above). Finally, when $f^*(x_i, x_j, x_k) = 0$, the triple is neither right nor left skewed. This last event, however, has probability zero when sampling from a continuous population. The proposed test statistics is then the *U statistics* given by:

$$\hat{\eta} = \binom{N}{3}^{-1} \sum_{i < j < k} f^*(x_i, x_j, x_k) \quad (2)$$

So that...

$$\hat{\eta} = \frac{[(\text{number of right triples}) - (\text{number of left triples})]}{\left[3 \binom{N}{3} \right]} \quad (3)$$

It follows from Hoeffding (1948) that this is a U statistics estimate

$$E(\hat{\eta}) = \eta = \Pr\{X_1 + X_2 - 2X_3 > 0\} - \Pr\{X_1 + X_2 - 2X_3 < 0\}, \quad (4)$$

With

$$\text{var}(\hat{\eta}) = \binom{N}{3}^{-1} \sum_{c=1}^3 \binom{3}{c} \binom{N-3}{3-c} \zeta_c \quad (5)$$

Where

$$\zeta_c = \text{var}[f_c^*(x_1, \dots, x_c)] \quad (6)$$

And

$$f_c^*(x_1, \dots, x_c) = E[f^*(x_1, \dots, x_c, X_{c+1}, \dots, X_3)] \quad (7)$$

Letting $\sigma_A^2 = 9\zeta_1$ and since $0^2 A + 0(1)$, Randles et al.(1980) use the Slutsky Theorem to show that $N^{1/2} = (\hat{\eta} - \eta) / \sigma_A$ also has a standard normal limiting distribution.

We now discuss the appropriate hypotheses to be tested. First note that if the underlying distribution is symmetric, $X_1 + X_2 - 2X_3$ has the same distribution as $-X_1 - X_2 + 2X_3$, and therefore, $\eta = 0$. Hence we

can use $\hat{\eta}$ as a statistic for testing

$$H_0 : \hat{\eta} = 0 \text{ versus } H_1 : \hat{\eta} \neq 0 \quad (8)$$

This is a two-sided test, but could possibly be a one-sided test. This test is used to test the hypothesis that the distribution is symmetric around the unknown median θ against a broad class of asymmetric alternatives. The Triples test interpretation goes with hypothesis testing in equation (8). If we have significant evidence to reject the null hypothesis it means asymmetry. If we fail to reject the null hypothesis the opposite holds true.

The simple nature of $f^*(.)$ makes ζ_1, ζ_2 , and ζ_3 expressible in terms of probabilities, and thus it is possible to use U statistics to estimate these quantities consistently as follows:

$$\zeta_1 = \text{var}[f_1^*(x_1)], \text{ with } f_1^*(x_1) = E[f_1^*(.)] \quad (9)$$

$$\zeta_1 = N^{-1} \sum_{i=1}^N (f_1^*(x_i) - \eta)^2, \quad (10)$$

Where

$$f_1^*(x_i) = \binom{N-1}{2} \sum_{\substack{j < k \\ j \neq i \neq k}} f_1^*(x_i, x_j, x_k) \quad (11)$$

Similarly,

$$\zeta_2 = \frac{1}{\binom{N}{2}} \sum_{j < k} \sum f_2^*(x_i, x_k) - \eta^2 \quad (12)$$

Where

$$f_2^*(x_i, x_k) = \frac{1}{N-2} \sum_{\substack{i=1 \\ j \neq i \neq k \\ i \neq k}} f^*(x_i, x_j, x_k), \quad (13)$$

And,

$$\zeta_3 = \frac{1}{9} - \eta^2 \quad (14)$$

Replacing each with ζ_i and $\hat{\zeta}_i$ in the expressions σ_N and σ_A gives the estimators $\hat{\sigma}_N$ and $\hat{\sigma}_A$. Both estimators are consistent because each $\hat{\zeta}_i$ is written as a linear combination of U statistics. To test the hypothesis in (8), the Triples test is defined based on $T_1 = n^{1/2} \hat{\eta} / \hat{\sigma}_N$ and an associated test based on

$T_2 = n^{1/2} \hat{\eta} / \hat{\sigma}_A$ so that they reject H_0 as $|T_i| > Z_{(\alpha/2)}$ as the upper percentile of the standard normal distribution. Note that these tests are asymptotically distribution free provided only that the underlying distribution is not degenerate. Although we have illustrated how to construct an asymptotically distribution-free test of (8), we should keep in mind that the parameter η is defined in terms of the distribution of the triple X_1, X_2 and X_3 rather than the original F distribution. Results from Triple test are reported in Tables 1 and 2, and in the other tables reported in the annexure.

Correlation of cyclical and structural components bilateral co-movement

The next step in our analysis is to evaluate the bilateral co-movement of cycles by first considering pairs of SADC countries and pairs of SADC versus main trading partner countries. Following Croux et al. (2001) on the definitions of dynamic and static correlations in the particular case of a bivariate analysis and the notion of cohesion introduced by Tripier (2002), we can have the following notation specifying the coherency of the real GDPs of every pair of countries in our data sample.

Let's denote $r_{xy}(w)$, as the first co-movement index. It is defined by

$$r_{xy}(\omega) = \frac{S_{xy}(\omega)}{\sqrt{S_x(\omega)S_y(\omega)}} \quad (15)$$

Where $S_{xy}(\omega)$ is the cross spectrum between real GDPs of pair of countries, $S_x(\omega)$ and $S_y(\omega)$ are spectrum of every pair of countries in our analysis. This index in equation (1) measures the correlation between the complex representations of X_t and Y_t at frequency ω . Unfortunately, since the cross spectrum has an imaginary part this index is not real (Tripier, 2002). To obtain a more convenient measure of co-movement, the squared coherency $r_{XY}^2(\omega)$ is then generally preferred in the literature. It is defined by:

$$r_{XY}^2(\omega) = \frac{|S_{xy}(\omega)|^2}{S_x(\omega)S_y(\omega)} \quad (16)$$

To obtain results from equation (15) we apply a simple regression to each pair of countries and extract the R^2 of the regression as a measure of the strength of the connection between the cyclical components of real GDP between the pair of countries in the region and among major trade partners. As rule of thumb, R^2 values higher than 0.5 exhibit moderate to strong co-movements while values below 0.5 shows a weak connection among the country pair. The results from this process are reported in Table 4.

Lastly, using the coefficient of determination computed in equation (16), we compute SADC countries' ratio of relative intensity of co-movements (RICM) versus each other and that of major trade partners as follows:

$$RICM = \frac{\sum_{y=SADC} R^2}{\sum_{y=nonSADC} R^2} = \frac{\sum_{y=SADC} r_{XY}^2}{\sum_{y=nonSADC} r_{XY}^2} \quad (17)$$

The results from the above computation are reported in Table 5.

RESULTS

In the first part of this section results from the Triples test and graphical illustration of the co-movements in log real GDP are presented. The second part presents evidence from bilateral co-movements using the coefficient of determination as a measure of cyclical co-movements and we discuss the index of relative intensity of co-movement as a measure of relative strength of co-movement between pairs of member states and pairs of member states and their trade partners.

Triples Test Results

The Triples test statistics for symmetry for SADC countries are shown in Tables 2 and 3. As shown in both Tables symmetry in the first-difference dominates in SADC region. Figure 1 also supports the same line of argument showing that the real GDP of many of the SADC countries exhibits symmetry and possible co-movement. The null hypothesis is rejected only in the case of Malawi, Mozambique, South Africa, Swaziland and the Democratic Republic of Congo (DRC). The resulting tests are consistent because in the majority of the cases 'h' is statistically different from zero (Randles et al., 1980). This implies that the null hypothesis stated in equation (9) is not rejected in the majority of the cases and the test asserts that the log of the first difference of real GDP data in this analysis is symmetrical. As shown in Table 2 below, when the p-value is greater than 0.05, we fail to reach significance; therefore the null hypothesis is not rejected in the majority of cases.

Madagascar, Malawi, Mozambique, South Africa, Tanzania, Zambia and DRC show *negative* coefficients of symmetry (η) as shown in table below. In other words, half of SADC member states including five of the most important economies in the region have negative symmetrical business cycles. Negative symmetry implies that the time series falls rapidly, but rises very slowly. This indicates that for the most

important SADC members, economic recovery happens far slower than the preceding downswing. It also indicates that expansionary policy measures may be inadequate or that policy harmonisation and bilateral/multilateral co-operation among the member states are weak. However, the rest of the SADC countries exhibit *positive* symmetry. The majority of the industrialised trade partners to the region also exhibit *negative* symmetry (the results are not reported here). Positive symmetry implies that GDP undergoes rapid increases over a short period of time and slow, gradual decreases over long periods of time.

Table 2: SADC Countries log difference Triples Test Statistics for Symmetry (1970-2010)

Source: computed from sample data

The figures in bold in Table 2 above, show significant p-values at 5 percent level of significance. The finding in this section asserts that ten out of fifteen SADC countries exhibit symmetry in the distribution of real log GDP data (business cycles) for the full period (1970-2010). As reported in Table 3, when dividing the time series into subsequent window periods of decades, the symmetry further strengthens and the number of countries with symmetrical business cycles increases.

Table: 3 Summary results of Triples test for SADC countries for the full period (1970-2010) and subsequent window periods

Source: computed from sample data

The results obtained Table 2 and 3 suggest that the majority of SADC countries are good candidates to form the envisaged monetary union in the region, had symmetrical business cycles been the only OCA criteria to be fulfilled. However, having symmetrical business cycles does not necessarily mean that the cycles move together. Having a single currency and monetary policy requires fulfilment of the additional criteria toward OCA in addition to business cycles synchronisation. In the next section we explore this issue.

Results From Bilateral Co-Movements Tests

The intensity of co-movements in real GDP across SADC countries is measured by the coefficient of determination. The value of the coefficient of determination lies between zero and one; when its value is higher than the average value of 0.5 it implies that there is a higher degree of co-movement between countries under study. In other words, a value higher than 0.5 indicate that member countries' business cycle exhibit synchronisation. The coefficients of determination reported in Table 4 are obtained by using equation (16) in the methodology section. Unlike the correlation coefficients, coefficients of determination are additive. The regional mean of the determination coefficients is 0.04 with a standard deviation of 0.06. There seems to be a lack of co-movement in logs of real GDPs for SADC countries. Seychelles, Namibia, Madagascar, Mauritius, Malawi, and Botswana have average coefficients of determination below the regional mean; the rest of the SADC countries have average coefficients of determination above the regional mean. However, this value does not confirm that those countries can form any sensible monetary union in near future. This result is in line with the findings by Carmignani (2010) for CEMAC countries. In his study of CEMAC countries the corrected concordance index is barely above zero, which shows a lack of concordance of the cyclical phases across CEMAC countries (Carmignani, 2010).

The results reported in Table 5 are computed by using equation (17) in the methodology section by taking the R^2 values from Table 4. Results in the column 2 of Table 5 are computed by the summation of the R^2 of SADC country 'i' with the rest of the countries included in the sample minus one (i.e. R^2 equals to one when country 'i' regressed with its own real GDP), after regressing the log GDP of country 'i' with each with that of the other countries in the sample individually. The values in column three are computed in the same way as those in column two, except that values in column three are computed using the summation of the R^2 of SADC country 'i' with the rest of non-SADC countries minus one.

Column 4 reports the relative intensity of SADC country 'i' with the rest of SADC member countries by dividing entries in column three by respective entries in column two (see equation 17). By dividing the sum of the R^2 of all SADC-to-SADC country regressions, by the sum of all SADC-to-non-SADC countries gives the relative intensity of co-movement. A value of one means that the strength of the co-movement of a SADC country relative to the rest of SADC countries is just as strong as the strength of the co-movement of a SADC country relative to all non-SADC countries. If the value in column 4 is > 1 , it means that the SADC country's business cycles co-move more closely with other SADC countries. Conversely, if the value in column 4 < 1 , the SADC country's business cycles co-moves more closely with non-SADC countries (Non-SADC trade partners) compared to SADC countries.

As suggested by Carmignani (2010), countries must strengthen policy harmonisation and political connectivity in order to activate the channels through which business cycles can become more synchronised and hence maximize the benefits from the envisaged monetary integration in the region. This fact is evident from the result shown in Table 5 below that compare the relative intensity indexes of co-movement in the business cycles of pairs of *SADC-SADC* versus *SADC-Trade Partner* countries. Among SADC countries; Mozambique,

Zimbabwe, Zambia, Seychelles, Swaziland, Tanzania, Mauritius, and DRC show a relatively strong intensity in the co-movement of real GDP compared to the rest of SADC members (see the last column of Table 5). Note that the values in bold in Table 5 show countries with strong relative intensity of co-movement with SADC members. However, nearly half of the member states have more significant co-movement with their major trade partner countries than with member states.

CONCLUSION

The overall results confirm that some SADC member countries are potentially capable of forming a monetary union in the region based on OCA theory. Ten out of fifteen SADC countries exhibit symmetry in the distribution of their business cycles (real log GDP data) for the period (1970-2010). When dividing the time-series into decades, it is shown that symmetry strengthens among member countries. When we consider evidence from bilateral co-movements using the coefficients of determination; the result shows a general lack of co-movements in the business cycles of SADC countries. Mozambique, Zimbabwe, Zambia, Seychelles, Tanzania, Mauritius, and DRC, however, have relatively strong intensities in the co-movement of their business cycles when compared with the rest of SADC members. These findings confirm that there is no sufficient macroeconomic convergence among all member states for the entry into the monetary union.

This implies that a common monetary policy will not be optimal for all countries in the region, especially in the short run. These findings are in line with that of Carmignani (2009, P.39) in his study for CEMAC countries and other studies reviewed in this paper.

Many studies explicitly show that among the EMU countries, Greece and the rest of the PIIGS displayed patterns in the level of economic activity that are considerably different to developments in the other economies in the region. The crisis in the Euro zone could have been avoided if the PIIGS had complied with the traditional OCA criteria prior to accession to the EMU. However, when we infer lessons from EMU in the context of SADC in line with structural asymmetry of business cycles we should also note that there are other factors other than the lack of cyclical convergence within the Euro area. For example, clash between economic and political forces within the euro area and sovereign debt crisis. Others also argue that the German's export-led growth strategy as a "*beggar-thy-neighbour*" strategy that generated large trade and current account deficits throughout the euro zone in the 2000s.

Lessons that SADC could learn from experiences elsewhere is to strengthen policy harmonisation and coordination for business cycles to become more synchronised as a precondition to monetary union. Without doing so, SADC countries face the same risk as the PIGGS, having to contend with a fixed exchange rate and monetary policy with which to defend their own economies against adverse external shocks.

Recommended future research in the SADC region that would supplement the findings of this study includes testing the Generalized Purchasing Power Parity (G-PPP) hypothesis. It is also important to investigate the economic, political, and institutional prerequisites for SADC countries to gain an understanding of the factors that would determine the speed of integration in the region.

TIME SERIES ANALYSIS FOR CRISIS TIMES: A CASE STUDY WITH THE IBOVESPA INDEX (1999-2012)

Marcelo Zeuli, Antonio Carlos Figueiredo and Marcelo Cabus Klotze
Pontifícia Universidade Católica, Rio de Janeiro, Brazil

ABSTRACT

Kim et al. (2011) state that it appears to be a consensus that the recent instability in global financial markets may be attributable in part to the failure of financial modeling: standard risk models have failed to properly assess the risks associated with large adverse stock price behavior. Their empirical evidences indicate that time series modeled with a framework of stable and tempered stable innovations show better predictive power in measuring market risk compared to standard models based on the standard distribution assumption. This approach was tested for a Brazilian case. The MLE (Maximum Likelihood Estimation) tests – applied to the daily returns of the closing prices of the IBOVESPA stock exchange index, from January, 1999 to April, 2012, covering some high volatility periods – show that GARCH models that adopt Alpha-Stable or Tempered Stable distributions are a better fit for financial time series that cover turbulent periods.

INTRODUCTION

The forecast activity of financial instruments is essential to risk management and portfolio allocation. The debate between the financial sector and its regulators comprehend the evaluation of the sophisticated mathematical and statistical tools that have been used for risk management and the evaluation of complex financial instruments played a crucial role in the recent global financial crisis. The risk models such as the value at risk (VaR) and “black box” models used by the institutional investors and regulated financial entities have been blamed for the bad forecast of the financial assets - see Turner (2009) and Sheedy (2009). This is the context to discuss a model of distribution of returns that is able to explain the high volatility periods.

The volatility cluster effect may be captured by the heteroscedastic autoregressive conditional models (ARCH) and the general ARCH models (GARCH) and models formulated by Engle (1982) and Bollerslev (1986). However, there are plenty empirical evidences showing that GARCH models based on the normal distribution do not perform well in turbulent times. Some examples were given by Kim et al (2011), for the S&P/500 stock exchange index, in periods of time that included the black Monday crisis (October 19, 1987), and the recent global economic crisis, this later linked to the mortgages subprime collapse in 2007 and the Lehman Brothers failure in September, 2008.

Other several studies show that revenues arising from financial assets have well defined leptokurtosis and asymmetry patterns that cannot be captured by the assumption of normality. The non-normality assumption was recently regarded by Sorwar and Dowd (2010), Fajardo and Farias (2010), and by Bedendo et al (2010), to investigate the options pricing verification models. The extreme values theory (EVT) was applied to measure the financial risk and to capture the extreme events that cannot be described by the normal distribution, as stated by Neftci (2000), Bali (2003) and Gupta and Liang (2005). Despite a good performance, the EVT approach cannot be applied in a no-arbitrage scenario, since extreme values distributions and generalized distributions by Pareto (as the t-Student distributions) do not lead to semi-martingale procedures. Therefore, it is impossible to find a martingale measure equivalent for options pricing.

Introducing the alpha-stable and the Tempered stable models

Kim et al. (2011) evaluated alpha-stable and Tempered Stable (TS) models and found out that there is a superior prediction power in relation to other models that are widely used by the industries. Those models were applied for the daily returns series of the S&P 500 during highly volatile periods. The empirical evidences indicated that time series models with alpha-stable or tempered stable innovation have better predictive power of the market risk in comparison to the standard models based on the normal distribution assumption. Instead, time series models based on normal innovation do not offer a reliable prediction even if they represent volatility groupings. Time series models based on t-Student innovations were also empirically refused.

Due to the tail properties of the TS distributions, Kim et al. (2011) showed that the quantity of necessary capital by a risk manager who uses a TS-based model is smaller than the one used by other models. In contrast with t-student or EVT innovation models, the CTS (Classical Tempered Stable) assumption allows a good market model for prices options. Kim et al (2011) chose five recent turbulent periods: 1987(Black Monday), 1997(Asian Tigers' crisis), 1998(Russian Default), 2000(Dotcom Collapse) and 2008(USA Financial Crisis). Then, analyzed the VaR approach based on different distribution assumptions and performed the VaR backtest considering the latest four year- log-returns for the S&P/500. Based on the likelihood reason test by Christoffersen (1998), the models normally distributed were refused.

Table1: Recent crisis and the S&P 500 daily returns

Crash	Day	Returns (%)
Black Monday	19/10/1987	-23
Asian Crisis	27/10/1997	-7
Russian Collapse	31/10/1998	-7
Dot.com Crisis	14/04/2000	-6
Global 2007 Crisis-	29/09/2009	-9

Source: Kim et al (2011).

Considering the results and the last table, the probability of a new Black Monday, based on the three normal models from the related article, is considerably low compared with the proposed stable models. Conversely, the average times of occurrences based on the three normal models is very high. Each crash occur every $7,966 \times 10^{141}$ years in the normal model of constant volatility, $2,554 \times 10^{39}$ years in the GARCH normal density model and $2,904 \times 10^{39}$ years in the ARMA-GARCH normal density model. These values are bigger than the age of the Universe. In real life, this fall would be expected at each 30 to 50 year - interval. The authors conclude that models based on normal distributions are not realistic.

The Kim's et al approach (2011) was chosen for testing the daily returns series of the closing prices of the IBOVESPA Brazilian stock exchange Index - from January, 1999 to April, 2012 - verifying if it fits best to alpha-stable and/or Classical Tempered Stable densities in comparison with normal densities - and t-student in future tests. In the chosen time frame period, several unconditional volatility levels can be explained by several politic-economic scenarios. Among them, the most important where the mid-2002 confidence crisis in the eve of the Presidential Elections (October 27, 2002) when Luís Inácio da Silva (Lula) was elected for his first term as Brazilian President; and the international financial crisis that began in 2007, specially in 2008 (a high 5.81% volatility level between Sept 8, 2008 and November 21, 2008).

The coming sections comprehend a further bibliographical review (section 2) - introducing the alpha-stable and tempered stable distributions - the methodologies (section 3) and the results (section 4). The conclusion section (section 5) has a paragraph suggesting a possible alternative to the BIS (Bank for International Settlements) recommendation for risk modeling, in a recent Basel III Agreement Document (2011).

FURTHER REVIEW

It is clear from previous works, like Valls & Almeida (2000), that the chosen series - the daily returns of the closing prices of the IBOVESPA Stock Exchange Index - presents volatility clusters and ARCH effects. For

a review of the ARCH and GARCH effects, consider Engle (1982) and Bollerslev (1986). The existence of volatility clusters suggests either an approach under the viewpoint of changes in volatility regimes or an approach under the standpoint of volatility leaps. For the changes in volatility regimes, see Hamilton (1990) with the SW (Switching Regimes) models review. Referring to leaps, a quick review of the Lévy processes literature started from the Kim et al (2011) review. A previous identification of the unconditional volatility levels is considered, following Inclán and Tiao (1994).

Diffusion problems and leaps

A way to deal with diffusion problem is the use of Semimartingales, but the structure of these procedures is very complex. The alternative is the use of Lévy, additive processes (non homogeneous processes) or the use of models of stochastic volatility with leaps (Ornstein-Uhlenbeck). Following Kim's et al approach (2011), a distribution based on Lévy's processes is tested, which allows the modeling without resorting to much abstraction.

Mandelbrot (1963) was pioneer on the use of stable distributions (or alpha-stable) to model skewness distributions and fat tails. In a general sense, the alpha-stable distributions family is a varied class which includes as subclasses the following distributions: the Gaussian, Cauchy's and Lévy's distribution (or Gaussian or Pearson V). The Lévy's continuous stochastic procedure has stationary and independent increments. Using the notation $X \sim \text{Lévy}(y, o, v)$ for the Lévy's triplet, y is the drift, o is the diffusion component and v is the expected number of leap in the $[0,1]$ interval in the Lévy's process.

Alpha -stable Distributions

The Alpha-stable distributions can model the negative skewness and the excess of kurtosis that characterize, for instance, the returns of the hedge funds. They became popular in the 1960's, but the general interest has decreased since then, due not only to mathematical complexity and the huge computing power necessary to implement models, but also because of the success of the gaussian and Black-Scholes (1973) - Merton's approach applied to the finance theory that was developed simultaneously.

Tempered Stable Distributions

The tempered - stable process, also known as Lévy's truncated flight, combines alpha-stable tendencies with gaussian tendencies. In a short time interval it nears an alpha-stable process while in a long time interval, it approaches a brownian movement. It is considered a general and robust class of tempered-stable distributions and an identifiable parameterization according to Rachev et al. (2007), Scherer et al. (2009) and Kim et al. (2011). These representations exhibit alpha-stable and gaussian trends in tempered stable procedures, therefore they offer a probabilistic trait and they may also be used for simulations.

Changes of Volatility Regimes

In order to verify if there are levels of unconditional volatility, the determination of the discrete changes in the unconditional variance may be made with the ICSS-Iterative Cumulative Sum of Squares – the Inclán and Tiao (1994) algorithm.

Switching Regimes

A great part of the bibliography that deals with regime changes (mean and/or volatility) has Hamilton (1990) – and other of his works - as a main source. Hamilton utilizes the EM algorithm to obtain the maximum likelihood estimation (MLE) of the procedures parameters subject to discrete changes in their self-regression parameters. The premise of the model is that many of the movements in the assets prices appear from specific identifiable events. The author considers parameters such as level, variance regression or the proper dynamics of a self-regression - being subject to occasional and discrete changes. The probability law that governs such changes is openly declared and it is supposed that these changes exhibit a proper dynamic conduct. Cai (1994) conclusions recommends SWGARCH models in place of SWARCH models.

The SWGARCH models combine GARCH with regime changes. For Haas et al (2004), these models offer a direct estimate of the maximum likelihood; they are analytically treatable and allow a procedural breakdown of the conditional variance. These models were applied by Valls and Almeida (2000) to the IBOVESPA stock exchange index and by Haas et al (2004) for several currencies such as the Yen, Sterling Pound and the Singapore dollar. The general model for the variance, including the asymmetry effect, may be defined by:

Equation 1: Variance equation for SWGARCH (k,p,q)-L models, k for level and L for Leverage

$$h_t = \alpha_0 + \sum_{i=1}^q \alpha_i r_{t-i}^2 + \sum_{j=1}^p \beta_j h_{t-j} + \xi d_{t-1} r_{t-1}^2$$

METHODOLOGY

Methodology for identifying sudden changes in Variance

The determination of the discrete changes in the unconditional variance is identified with the ICSS (Interactive Cumulative Sum of Squares) algorithm, developed by Inclán and Tiao (1994).

GARCH and SWGARCH Models

The SWGARCH models combine GARCH with regime changes. Based on the models from Haas et al (2004), it was possible to offer a direct estimate of the maximum likelihood function.

Stable Distributions

The alpha-stable algorithms source code came from Veillete (2010). An alpha-stable distribution is calculated: to obtain initial parameters, using the STBLFIT function.

Classical Tempered Stable Distributions

The Tempered Stable distributions do not possess a closed form for their probability density. Instead, they are defined by their characteristic function, according to Kim et al (2011). The characteristic function **u** is calculated based on the FFT (Fast Fourier Transform), from Scherer et al (2009) and Menn and Rachev (2006).

Choice of the algorithms

The algorithms were obtained and adapted from five sources, summarized in the next table:

Table 2: Algorithms utilized/evaluated for this text

OPERATION	ALGORITHM	SOURCE
Unconditional Volatility Level Change	ICSS	Inclán and Tiao (1994)
ARCH/GARCH effects	GARCH	Haas (2004) modified.
ARCH/GARCH+ Volatility Level Change	SWGARCH	Haas (2004) modified.
α -stable Distribution	α -stable	Mark Veillet modified.
Classical Tempered Stable Distribution	pdf CTS with GARCH/SWGARCH	Scherer et al(2009)+ Kim et al (2011) developed

TESTS

The closing prices of the IBOVESPA stock exchange daily index were collected from the time series page of Banco Central do Brasil's website, from January 4, 1999 to April 27, 2012. The series presents heteroscedasticity, confirmed by the Engle's test. The IBOVESPA daily return of the daily closing prices is given by:

Equation 2: IBOVESPA daily returns series: $r_t = \ln(BOVESPA_t / BOVESPA_{t-1})$

The next table and figure illustrate the results from the ICSS algorithm, identifying the levels of unconditional volatility.

Table 3 and Figure: IBOVESPA's volatility levels from the daily returns (Jan., 1999 – Apr., 2012).

Ibovespa January 1999- April 2012: Unconditional Volatility Levels

The **ratio** among volatility levels is significant. The **ratio** between the lowest level (1.11%, between 06/30/2010 to 07/29/2011) and the highest level (5.81%, between 09/08/2008 and 11/21/2008) is 5.24.

Initial Tests with SWGARCH

Initially, the IBOVESPA series was tested with an AR Model (1) –SWGARCH (1,1) with two and three volatility levels and normal density, optimizing with the MLE method (Maximum Likelihood Estimation) in a Monte Carlo simulation, testing one million parameter combinations. The test with two levels of volatility gave significant values for the maximum likelihood estimation.

Alpha- Stable Distribution

The function STBLFIT was applied, where α , β , δ and γ stand for the characteristic parameter (tail), skewness, scale (equivalent to variance) and location (equivalent to mean). When fitting a normal distribution, the tail value is 2, the skewness value is zero, the scale is 1 and the mean is zero.

TESTING WITH GARCH AND SWGARCH

Some innovations models were tested, and the results for five models are reported: ARMA (1, 1)-SWGARCH (1, 1) with normal density, ARMA (1, 1)-GARCH (1, 1) with normal alpha-stable density, ARMA (1, 1)-SWGARCH (1, 1) with CTS density, ARMA (1, 1)-GARCH (1, 1) with alpha-stable density and ARMA (1, 1)-GARCH (1, 1) with CTS. Each round of simulations comprehended at least ten Monte Carlo Simulations. Each Monte Carlo simulation lasted about 35 hours, since the probability density of stable distributions was calculated from its characteristic function at each random parameter generation.

SWGARCH Tests: First Round of Simulations

Table 5: Differences among models Five Innovations Models

Parameter	Value	Parameter	Value
C	0.001	P1	0.415
AR	0.728	P2	0.428
MA	0.753	LL SWGARCH_alpha_STABLE	8046.662
V1	0.995	LL SWGARCH_NORMAL	7522.082
V2	0.833	LL SWGARCH_CTS	23117.972
AC1 / G1	0.976 / 0.750	LL GARCH_alpha_STABLE	5661.507
AC2 / G2	0.884 / 0.765	LL GARCH_alpha_STABLE CTS	23117.972

Where V1 and V2 are the volatility levels, and P1 and P2 are the probabilities to stay in the same volatility level among consecutive observations; C, AR and MA are the ARMA parameters; G1, G2, AC1, AC2 stands for the GARCH/ARCH parameters; LL stands for Log Likelihood (MLE method). The best models were the ARMA (1, 1)-GARCH (1, 1)-CTS model and the ARMA (1,1)-SWGARCH-CTS model.

SWGARCH Tests: Second Round of Simulations

The second round consisted of another group of simulations, **only with the stable models**. V1 and V2 are the volatility levels, and P1 and P2 are the probabilities to stay in the same volatility level among consecutive observations; G1, G2, AC1, AC2 stands for the GARCH/ARCH parameters; SWG STABLE, SWG CTS, GARCH STBL and GARCH CTS stands for the Log Likelihood of SWGARCH for alpha-stable and CTS distributions. The best model was the ARMA (1, 1)-GARCH (1, 1)-CTS model, slightly superior to the ARMA (1,1)-SWGARCH-CTS model.

Table 6: Simulation with the prevailing CTS-GARCH model slightly superior to the CTS-SWGARCH

V1	V2	G1	G2	AC1	AC2	P1	P2	SWGARCH /STABLE	SWGARCH/ CTS	GARCH /STABLE	GARCH / CTS
0.76%	0.93%	80.71%	79.66%	12.68%	12.83%	7.29%	36.65%	7.037.557	19025.597	5.707.295	19025.901

SWGARCH Tests: Third Round of Simulations

In this round – simulating **only the stable models** – the transition probability between two markovian states is equal to 50% and also the ARMA (1, 1) parameters are fixed. The best model was the ARMA (1, 1)-GARCH (1,1)-CTS model, slightly superior to the ARMA(1,1)-SWGARCH-CTS model. The ARMA parameters are (0.0006641; 0.72791; 0.7533); V1 and V2 stands for the unconditional volatility levels; SWGARCH_STBL, SWGARCH_NORMAL, SWGARCH_CTS, GARCH_STBL and GARCH_CTS stands for Log Likelihood for SWGARCH with alpha-Stable, normal or CTS distributions and Log Likelihood for GARCH alpha-Stable or CTS distributions.

Table 7: SWGARCH with transition probability set to 50%

V1	V2	SWGARCH /STBL	SWGARCH /NORMAL	SWGARCH /CTS	GARCH/ STBL	GARCH/ CTS
3.15%	4.45%	17396.41	7913.55	18227.87	6740.66	18135.91
1.70%	5.98%	5988.31	2096.80	17888.25	18550.80	17954.55
1.42%	6.64%	8817.29	4346.05	21482.31	6971.74	19685.46
1.13%	6.52%	8390.14	3327.58	20540.69	12719.43	21702.76

CONCLUSIONS

The recent instability in global financial markets may be attributable in part to the failure of financial modeling. One of the possible reasons for the weak modeling performance was the assumption of normally or t-student distributed innovations. The considered alternative is the stable innovation approach from Kim et al (2011), combined with SWGARCH models, from Haas et al. (2004).

When analyzing the daily return series of the daily closing prices from the main Brazilian stock exchange index - the IBOVESPA stock index, from January,1999 to April,2012 - the normal innovation was compared with alpha-stable and CTS (Classical Tempered Stable) innovations in a ARMA (1, 1) –GARCH (1, 1) and ARMA (1,1) – SWGARCH (1, 1) models. The highest MLE result occurred with ARMA(1,1)-GARCH(1,1) models with alpha-stable density and ARMA(1,1)-GARCH(1,1)-CTS(Classical Tempered Stable), even superior to the alternatives that adopted two volatility levels, i.e. ARMA(1,1)-SWGARCH(1,1) alpha-stable and ARMA(1,1)-SWGARCH(1,1)-CTS.

The results confirm that a financial time series that covers turbulent periods is better modeled with stable innovations, yet Monte Carlo simulations are considerably more time consuming than equivalent simulations that evaluates only normal or t-student innovations. Another disclaimer appears when creating a time series of daily returns with elements randomly generated by the Monte Carlo Method: the highest MLE is founded with the ARMA (1,1)-SWGARCH-alpha-stable and not with the ARMA(1,1)-SWGARCH-CTS stable distribution, differently from Kim et al (ibid.)

Banking Regulation and Possible Alternative Recommendation for Risk Management

The Basel Agreement III (BIS, 2011) - announced in response to the latest international financial crisis - recommendations suggest that quite different specifications for market risk models can be found in the literature, even though the VaR (Value at Risk) approach prevails as the main alternative. BIS III introduces a stressed value-at-risk - SVaR, a mix of VaR and Stress test - capital requirement based on a continuous 12-month period of significant financial Stress, but keep working with the standard 99% confidence interval (one-tailed), 10-day holding period and the **normal** density. Instead, Kim et al. (2011) recommend the Average Value at Risk (AVaR, a.k.a. CVaR) with **stable** innovations.

Future tests with several other financial time series could confirm that risks analysts may keep the usual VaR approach (or the AVaR), yet with stable densities in place of the usual normal density, as an alternative to the BIS recommended Stressed VaR approach. As Pengelly (2011) stated, the new BIS capital charge based on SVaR is blamed for being intellectually inconsistent and could potentially be troublesome for banks to implement.

AIRCRAFT MAINTENANCE REPAIR AND OVERHAUL MARKET IN RUSSIA – CHALLENGES AND OPPORTUNITIES OF THE HIGH-TECH INDUSTRY IN RUSSIA

Oleg N. Zhilkin and Rostislav V. Lopatkin
Peoples' Friendship University of Russia, Russia

ABSTRACT

Over the last 20 years the structure of the Russian and CIS air transportation industry has changed significantly. In some sense it is possible to say that it is degraded and weakened. But also it is obvious that the new opportunities unveiled. And these new opportunities lies in the field of underdeveloped areas of the Industry. One of the weakest links in a complex production chain for the civil aviation in Russia and former Soviet Union Countries is an organization of the Aircraft Maintenance Repair and Overhaul.

INTRODUCTION

Aircraft maintenance consists of periodical inspection of technical condition of aircraft and complex forms of diagnosis and replacement of components that have to be made by the operator of the vessel after a certain time or certain number of hours flown. There are several standard types of services: Transit check, Daily Check, A-check, B-check, C-check and D-check. A-check, and B-check - are simple forms of treatment, while C and D-check are heavy forms of maintenance under which the aircraft is actually fragmenting in components, and then is assembling again (including details of the airframe). The global MRO market on the way to its current operating model has done a fairly large evolutionary distance (see Fig. 1)

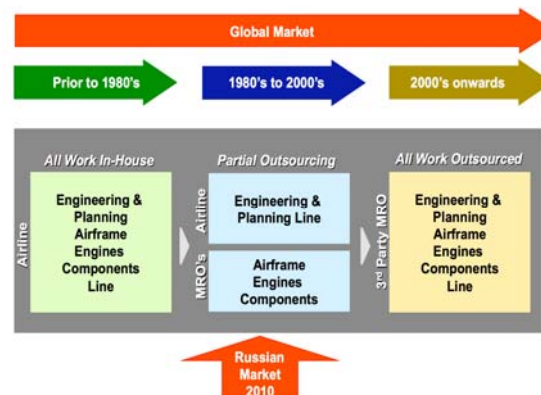

Figure 1. Global MRO industry evolution

At the beginning of the formation of the modern market of civil air transportation its MRO was carried out by structural units of airlines that have had fully independent system of planning and engineering for all types of maintenance. From the 80th of the 20th century heavy and most resource-intensive types of maintenance were delegated to the third party service providers, or to excluded from the mother-companies maintenance units - a former sterling economic units of airlines (still affiliated with the carrier). The onset of the XXI century marked the complete outsourcing of MRO services (since 2000).

SOME REASONS FOR EVOLUTION

There are several reasons for evolution. First of all the reason lies in the fact that the system itself has changed, the functioning principles of the air travel market have changed dramatically. Integration processes were gathering pace all over the world, trade liberalization has occurred. Many countries have changed laws; "free sky" agreement has appeared in the framework of the EU, which in combination led to the development of international air transport sector (according to IATA, in the period from 1980 to 2003 The international sector of the global air travel market has grown by more than 40%).

Aircraft production technology have changed and evolved as well. The intensity of aircraft production and exploitation together with their potential service life has increased signally. In every sense air transport became more liberal, both for airlines and for passengers. Airlines business became more flexible in terms of costs; the lack of multimillion-dollar investments was not any more a real constraint for creation of airlines' own technical infrastructure system as well as for transnational route network organization. Passengers got the opportunity to buy even more cheap tickets.

All these factors led to an increase in total world fleet and in the number of fleet operating companies. This, however, allowed the former maintenance units of large (almost monopolistic) airlines to find new opportunities in servicing third-party companies (competitors, in some sense). Thereby another modern trend of the MRO market was established. The list of largest companies (super providers) in the market at the moment includes: Air France Industries / KLM E&M (France, Netherlands), Delta TechOps (U.S.), Lufthansa Technik (Germany), SIA Engineering Co. (Singapore), SR Technics (Switzerland) and ST Aerospace (Singapore). Thus the fact is that these operators have been allocated from such airlines as: Air France, KLM, Delta Airlines, Lufthansa, Singapore Airlines, etc. In addition to them there are other 20-30 MRO service providers in the world ranging in size from medium to large. On the diagram in Fig. 2, it is shown the ratio of MRO market segments: Engines (up to 40%), components and line services (up to 20% each) heavy airframe and modification (up to 10% each).

Figure 2.

Modern regional structure of the market and its projected future changes are shown below in Fig. 3. Shifts in the regional MRO market value mainly is due to the size of the fleets, which will grow further in India, Eastern Europe and China and it is not a surprise. TeamSAI and Ascend predict that the total fleet in these regions will double over the next decade, as well as the overall regional fleet in Latin America, in the Middle East and in the Asia-Pacific region. This means that by 2020 the value of MRO market in the Asia-Pacific region, including China, will be approximately equal to the value of the market in Europe and North America, and it is possible that they will surpass them.

The world MRO industry in 2012 is estimated (by AeroStrategy) to 41 billion dollars. It is projected that by 2019 it should grow up to approximately 30% (to reach 60 billion dollars). According to other market forecasts (TeamSAI) by 2019 it will reach only 56.4 billion dollars (see Figure 2).

RUSSIAN MRO INDUSTRY ANALYSIS

According to AeroStrategy consultancy agency, MRO market size in Russia, CIS and Baltic countries in 2011, was close to \$ 1 billion in total (see Fig. 4)

Figure 3. Total expenditure on MRO by regions and segments 2011-2015-2020
Source: compiled by the author based on data TeamSAI and Ascend

The Transition of Russian airlines from Russian aircraft fleet to the imported products can be regarded as an accomplished fact. Airlines no longer conceal the reluctance to operate Soviet aircraft, and gradually reduce the number of regular flights with that old fleet. Thus, according to Transport Inspection of Russia, over the past 5 years the number of imported aircraft, declared to the operation in the Russian carriers had increased more than 3 times, up to 370 units. In 2012, foreign aircraft accounted for 88% of Russian civil aviation fleet,

Figure 4. The MRO market size of Russia, CIS and Baltic countries, million U.S. \$, 2011,
Source: Compiled by author based on AeroStrategy data

replacing older aircraft that were produced in Russia. While in 2006 imported fleet was available only in six Russian airlines, in 2011 more than 30 domestic airlines exploited foreign fleet. The five largest airlines in 2012 (Aeroflot, Transaero, S7 Airlines, UTair and SCC "Russia") are at the same time largest operators of foreign fleet. They account for more than 50% of Russian imported aircraft fleet. At the same time foreign produced aircraft are more actively operated by Russian airlines than domestic counterparts. The share of imported fleet in total passenger traffic in 2012 is close to the 92% and, for example, the Russian Tu-154 aircraft's share for one year decreased from 24% to 9%. The average age of the aircraft in Russia today is 15 years (the world average – 11 years), and regional - 31 years (and in the world - 13 years). In addition, according to the Boeing Corporation aircraft production industry forecast, by the following 20 years the fleet in the CIS countries, Baltic states and

Russia will increase by 13% yet 70% of the modern fleet in 2020 will be replaced with new aircraft, mostly Western-produced (and it shows that the age of the fleet operated in the region is close to edge of the appropriate exploiting conditions). The changes in the Russian airlines fleet composition involve a lot of consequences. One of the most important is the need for adequate and cost-effective system for maintaining the airworthiness, which in turn affects the MRO industry. As already mentioned above, global MRO market size in 2012 was estimated for 41 billion U.S. dollars. In fact, Russia has production facilities and qualified personnel to win a certain share of this market, not only in the framework of services provision to Russian airlines, but also in terms of exporting these services.

Meanwhile such a scenario can be considered only theoretically possible. According to estimations of Eugene Chibiryov (the President of the Russian Association of Air Transport Operators (RAAO)), only 10 foreign companies perform up to 60% of maintenance services for foreign-produced fleet of Russian airlines - of course, this ratio changes from year to year. And we must understand that in the remaining 40% share of Russian companies accounts for a substantial part of "Aeroflot", the technical service provider. Although from time to time it raises the question about the possibility of selling their services to other airlines it still fully loaded with its own fleet. Figure 5 shows the structure of the Russian and CIS MRO market by segments.

In addition, for the Russian and CIS market it is normal that line and A check services (20% of total expenditure on maintenance) are fully implemented in Russia. Engine maintenance (accounts for up to 40%) of western-produced aircraft is carried out almost exclusively by foreign providers, and Russian engine producers obviously maintain local-produced engines directly. Management of the supply chain of components and spare parts (Components - 20%) by nearly 90% is performed by foreign companies, due to the greater intensity of use of western technologies in the CIS countries and in Russia. The segment of heavy maintenance in Russia and CIS (16%) represents a synthesis of certain suppliers affiliated with airlines' MRO, independent MRO operators and foreign operators. In this case, only 3 big airlines (Aeroflot, Sibir (S7), Transaero) tend to completely implement its potential in the development of MRO facilities, adapted for heavy airframe service.

Current Status and challenges of the Russian MRO market

First of all, a number of serious shortcomings in the legal framework not only prevents the export of MRO services, but also creates difficulties and barriers for operation of foreign-produced aircraft in Russia.

The vast majority of the foreign-produced commercially used fleet in Russia has foreign registration (Bermuda, Ireland etc.), and the legal basis for their operation is provided by the amendment 83-bis to ICAO Convention, in accordance with which the country of registration of the Aircraft delegates a part of the enforcement power for the control over the maintenance of airworthiness to the country, where the operator is based. However, due to the fact that the Russian legal framework is not sufficiently harmonized with international law, there are a lot of inconsistencies. For example, during the operation of the same type of aircraft according to the Russian rules PRAPI-98 and U.S. operating rules JAR-OPS is completely different. The lists for the same regular technical check are different, and Russian rules are much stricter, the number of checked items in the average 2-fold greater. Obviously, this is reflected in the MRO system and in the economic efficiency of aircraft operation of foreign-produced fleet in Russia. It should be noted that the Department of airworthiness management of civil aircraft of Russian Federal Air Transport Agency "Rosaviatsia" has a full understanding of these issues and of the need to rework the rules for international requirements. It is declared that the Agency is already working on it. In particular, it is argued that the work on the modernization of PRAPI-98 has already begun. There are other problems remaining, but anyway, the dialogue of air fleet operators and MRO companies with "Rosaviatsia" and Russian Transport Inspection can be considered as constructive. But in the area of customs and tax legislation the situation is much worse. Probably, the most glaring example - is the absence of the AOG concept (Aircraft on the Ground) in the Russian customs legislation - a situation in which the aircraft lost its airworthiness and had to stand up to replacement of the corresponding component. The conventional approach is that the required spare part is installed in the shortest time on the plane, which continues than its operation as soon as possible, and after that you can deal with customs clearance, because all the details and manipulations are documented already. In Russia, it is impossible – firstly the customs clearance of spare parts should be carried out, and only then its installation on the plane can be performed. A time of registration may be delayed (one day demurrage costs an average from 10 to 50 thousand dollars). The possibility of repairing

foreign airline's aircraft in Russia negates by the fact that the temporary importation of aircraft may require (according to Russian law) a cash deposit, the amount of which to the cost of the aircraft makes pointless the whole operation. But in practice, there is no evidence of registration of such cases. As a result, we can say that despite all the prospects at this time, Russia is losing MRO market. Just because of the imperfections of the customs and tax regulations Russia loses about \$ 1.5 billion per year - roughly the amount spent on foreign providers for the maintenance and repair. Carrying out such works in Russia is simply unprofitable or impossible ("Siberia Technics" estimations).

There are several reasons why Russian airlines delegate these services to foreign contractors. First and foremost is the risk of delayed release of the aircraft because of missing or incomplete delivery of spare parts, and, as discussed earlier, each extra day of downtime cost airlines dearly. Typical spare parts' delivery time in Russia is from 5-14 days, whereas in Europe it does not exceed 72 hours.

A long time of customs clearance precludes units' maintenance in a short time. In addition, high tariffs lead to an increase of the value of the Maintenance on the territory of Russia. Components and consumables supply system management is difficult and extremely expensive.

As the final result - Russia is losing a lucrative high-tech market of civil aircraft MRO and workplaces as well. To solve this problem it is required a number of measures of the state support. It is important to accelerate and simplify the procedures of customs clearance of materials and spare parts for the maintenance of foreign-produced aircraft. The customs duties on components for maintenance and repair tools and diagnostics equipment (not manufactured in Russia) have to be eliminated. The government should create a special programme in order to encourage maintenance of the foreign-produced aircraft of Russian airlines on the territory of Russia.

CONCLUSION

The global MRO market is gradually moving toward complete outsourced model of the services provision. For airlines it means the potential release of resources and lower operating costs. For air travel market as a whole it means a magnification of the operational efficiency and increase of affordability of air transport for the people around the world.

Figure 5. Russia and CIS MRO market structure by segments, U.S. \$ millions, 2010.
Source: Compiled by author based on AeroStrategy data.

In the world there is a persistent trend of increasing airline costs of operating and maintaining power plants (engines), and other heavy forms of services despite the fact that the share of the remaining segments of the maintenance stabilizes or grow more slowly. That is a fundamental consequence of the evolutionary development of the global aviation industry: an increase of the between-maintenance intervals due to the

achievements of the modern materials and increase of the high-precision operations proportion in the process of final assembly of the aircraft and in the manufacturing of components.

In terms of regional structure of the market, the greatest growth prospects has the East and South-East Asia, strong growth is also possible in the Eastern European region (which, actually, includes Russian Federation), but on a global scale Russian market share growth is not expected.

Russian market of MRO has growth prospects, primarily for reasons of a rapidly changing structure of the fleet and just because of the further increase in their number. Also, because of the irrationality of the existing system of aircraft maintenance organization, in which a large share of the Russian market is occupied by foreign providers, that in fact provide their services abroad.

A number of serious institutional constraints imposed by imperfect Russian law prevent the further development of the MRO market as well as Russian Civil Aviation in general. Thus, based on the stated main objectives in this article the following headnotes can be formulated: the implementation of the large projects in the field of civil aviation (and they all are large a priori), in particular establishment of the MRO facilities on the territory of the Russian Federation has great perspective on the global and regional market conditions, but in reality it faces significant difficulties (perhaps unnecessary), because of the strong administrative barriers, as well as immaturity and defectiveness of institutional environment that makes any civil aircraft MRO enterprise uncompetitive in the global framework

GRAPHICAL ANALYSIS OF FINANCIAL STABILITY IN THE CORPORATE FINANCIAL MANAGEMENT

Anna N. Zhilkina
State University of Management, Russia

ABSTRACT

What is meant by the financial stability of the enterprise? How it may be estimate and provide. The paper presents the results of a study of approaches to the evaluation of financial stability, the analysis of the actual state of the companies represented by the author's approach to solving problems through engineering a visual model of financial equilibrium.

INTRODUCTION

To create the conditions for sustainable growth of the company, it should be provided with the necessary and sufficient financial resources. In other words, the condition of financial stability of the company's must be enough for core business and long-term investments. Now many enterprises have poor finance state. The authors analysis insure us that more, then about 60% of enterprises can not provide industrial assets (fixed assets and inventory) by normal resources of foundation (owners' equity, long-term debt and quick-term credit); 24% of enterprises have fixed assets to current assets ratio more then 0.3; 51 % of enterprises have ratio debt capital and current liabilities to owners' equity more then 1; 73% of enterprises have current ratio (liquidity) less 2; 75% of enterprises have profit margin low then 20%; 69% of enterprises have day's turnover off enterprise bills receivable more then 30 days and 80% of enterprises have day's turnover off enterprise bills payable more then 30 days.

This article continues the solving problems of a financial management quality control, management quality and financial management quality in an enterprise.

RESEARCH APPROACH AND METHODOLOGY

For a complete and comprehensive solution of the problems, for research process as a whole, the first step was the search and review of related literature. An understanding of key issues, themes, perspectives, and indicators was highlighted through the literature review.

Analyzing evidence were used data from the financial statements of public companies, mostly with the legal status of public corporations (about 250 companies). The research was organized in terms of both the quantitative and qualitative forms of analysis. Qualitative analysis was used to generalize the data in the analysis.

LITERATURE REVIEW

There are several approaches to the assessment of financial stability from narrowly specific (ability to repay debt) to the prospective evaluation of the quality of the financial capacity of the company.

Financial analyst practice and consultant work in the field of enterprise management allows the author to focus on the next point of view. It seems appropriate to consider the financial stability as part of the quality of financial statement of the company.

The company financial statement can be described by the following characteristics [12. Zhilkina, 2012; 13. Zhilkina, 2005; 14. Zhilkina, 2008]: Finance stability; Liquidity; Probability of bankruptcy; Financial results and its structure, Structure and effectiveness of capital investment, Structure and efficiency of the assets.

In this approach, financial stability will ensure the timeliness and adequacy of payments for uninterrupted production process, that is, to ensure Solvency of the company.

The very concept of the company's Solvency is in modern literature debatable. Most often, the concept of solvency occurs together with the concept of financial stability. Problems of solvency and financial stability on sacred work of many of the scientists, but as yet there is no generally accepted definition of the degree of solvency companies, as well as certain financial stability. A.D.Sheremet believes that the essence of the financial stability of the company lies in its ability of stocks to meet their corresponding sources of financial resources, the ability of its own funds to finance the tangible working capital means a coating reserves through appropriate sources (permanent capital) and company fixed assets. Thus, under the solvency means existence of its own funds to finance production and investment activities enterprise in sufficiently sizes. [15.Sheremet, 2011] Accordingly, the remaining uncovered part of current assets, which are not in material form, should be covered by current liabilities of the company. The company can be considered financial aggregate stable if the state financial resources, their distribution and use, provides enterprise development based on growth of profits and capital, while maintaining solvency and creditworthiness in the acceptable level of risk. M.A.Fedotova characterize financial stability as stability excess earnings over expenditure, the company's ability to freely maneuver cash and through the effective use Vat ensures the sustainability of production and sales. There are other points of view of the scientists.

Finance stability (Solvency) has five levels:

1) Absolute finance stability:

$$FA + Inv \leq Eq, \quad (1)$$

were FA - fixed assets;

Inv - inventory

Eq - equity

2) Normal finance stability:

$$FA + Inv \leq Eq + LTD, \quad (2)$$

were LTD – long-term debt

3) Permissible Finance instability:

$$\begin{cases} Eq + LTD < FA + Inv \leq Eq + LTD + STC \\ FA + Inv \leq Eq + LTD \end{cases} \quad (3)$$

were: STC – short-term credit;

Inv USP - unsaleable part of the inventory

4) Unpermissible Finance instability

$$\begin{cases} Eq + LTD < FA + Inv \leq Eq + LTD + STC \\ \end{cases} \quad (4)$$

$$\lfloor \text{FA} + \text{Inv USP} \leq \text{Eq} + \text{LTD}$$

5) Critical finance stability:

$$\text{FA} + \text{Inv} > \text{Eq} + \text{LTD} + \text{STC} \quad (5)$$

How can they be assessed as having complete and accurate information about the financial statement of the company?

All existing approaches can be divided into two groups: the ratio analysis and evaluation of analytical tables. Set of ratio can be quite diverse. With clear benefits - immediate evaluation and scale issues identified, still ratio analysis is more applicable in the comparative analysis of different companies.

If the task is to develop a system of financial management companies need a way to allow for a full factorial analysis. Let's see how we apply the method of analytical tables to address the problem (see tabl. 1, on APPENDIX date).

Tabl.1: The finance stability

Property	Value, % in balance		The trend
	at the beginning	at the end period	
1. Capital and reserves (equity)	78,75	78,84	↑
2. Fixed assets	68,38	69,38	□
3. Working capital	10,37	9,46	□
4. Long-term liabilities	11,58	11,62	↑
5. Permanent working capital	21,95	21,09	□
6. Short-term loans and credits	3,06	3,07	↑
7. The main sources of formation of the inventory	25,01	24,16	□
8. Inventory	3,01	24,03	↑
9. Excess or lack of own working capital	7,36	-14,56	↑
10. Excess or lack of permanent working capital	18,93	-2,94	↑
11. Excess or lack of the main sources of formation of the inventory	21,99	0,13	↑
12. Type of financial stability	Absolute finance stability	Finance instability	↓
13*. Unsaleable part of the inventory	-	2,03	n/a
14*. Excess or lack of permanent working capital for unsaleable part of the inventory	-	9,59	n/a
15*. Subtype of non-financial stability	-	Permissible	n/a
16. The degree of the enterprise solvency	Absolute finance stability	Permissible Finance instability	↓

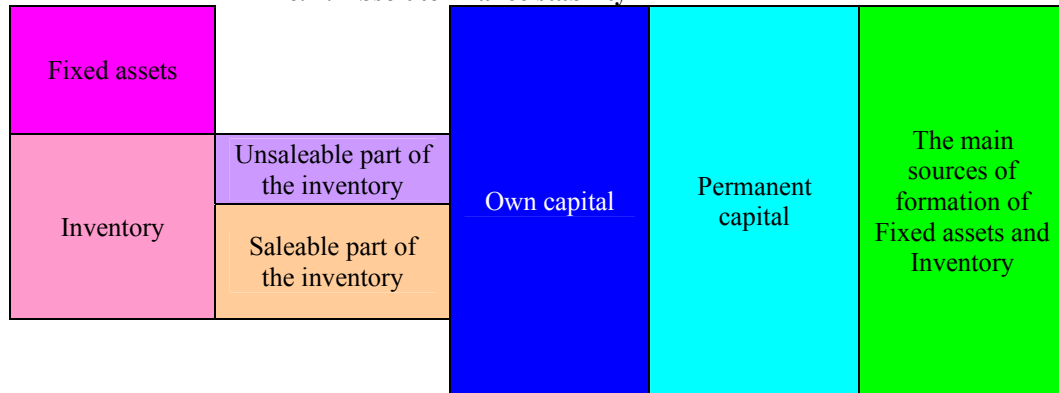

*- calculated in precarious financial condition.

The analysis made known absolute values of excess and lack of sources of production assets. However, factor analysis is not transparent.

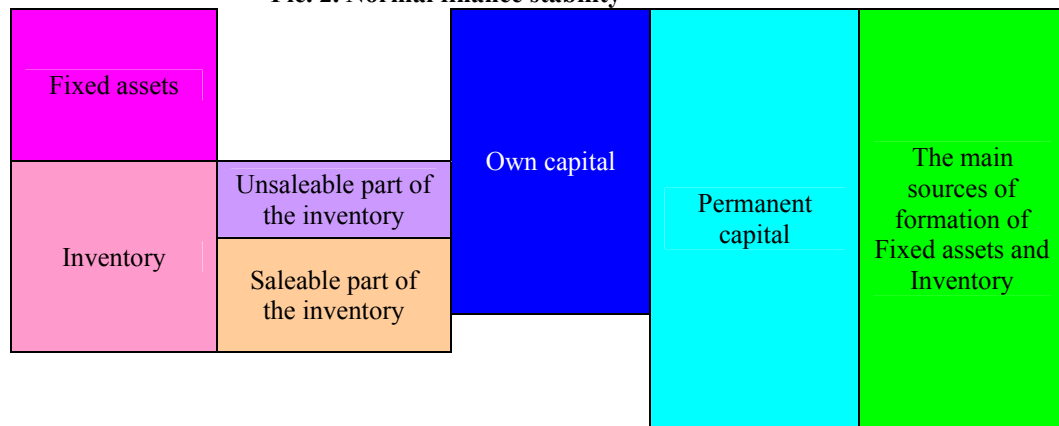

GRAPHICAL METHOD OF FINANCIAL ANALYSIS

Graphical method allows you to visualize not only present the actual financial condition, but also identify areas for improvement. Consider the possible combination of assets and sources of their formation (pic. 1-5).

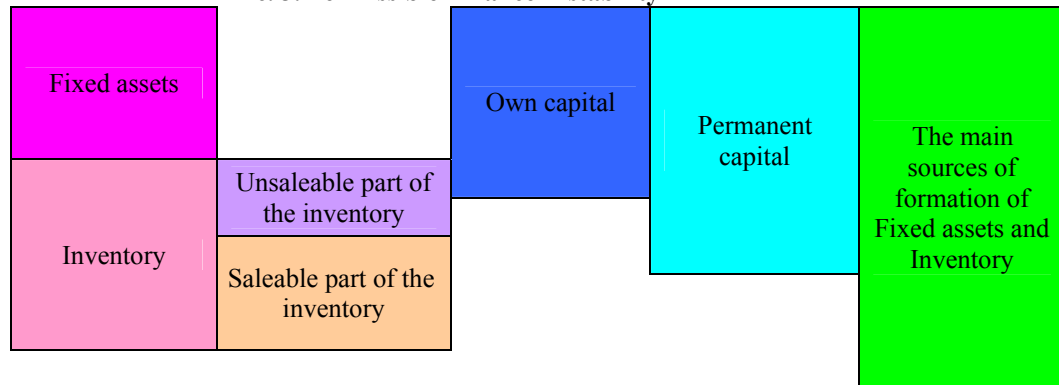

Pic. 1. Absolute finance stability

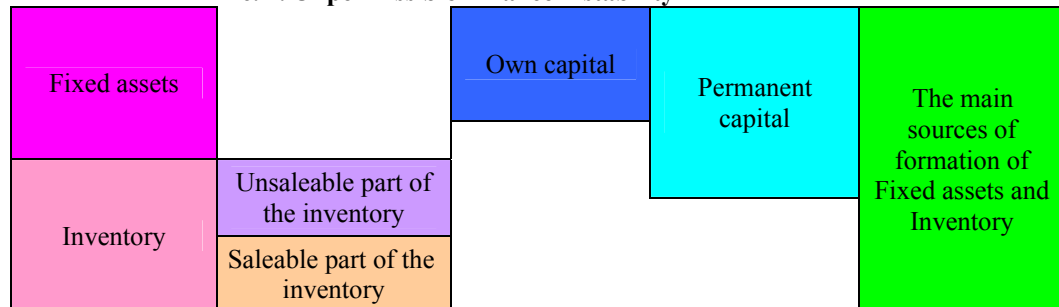

Pic. 2. Normal finance stability

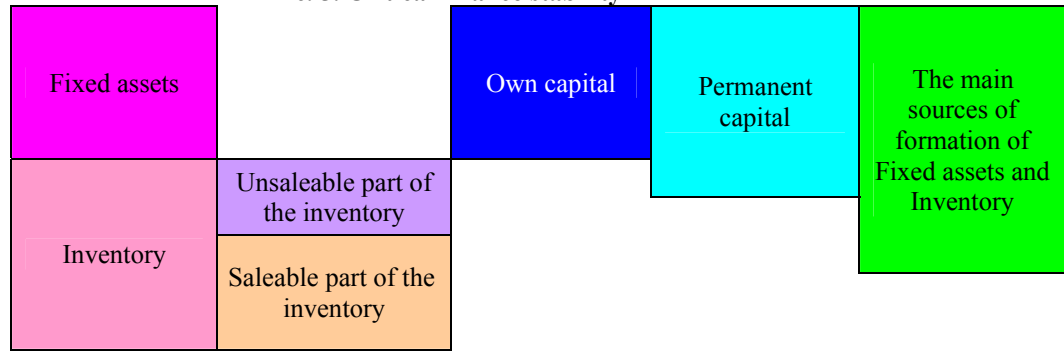

Pic. 3. Permissible Finance Instability

Pic. 4. Unpermissible Finance instability

Pic. 5. Critical finance stability

The analysis made known absolute values of excess and lack of sources of production assets. However, factor analysis is not transparent.

FINANCIAL MANAGEMENT USING

Comparison of graphics at the beginning and end of the analyzed period can not only assess the actual condition, but allow for a factor analysis. For this analysis is sufficient to compare the values of indicators factors. With the growth of asset situation is worsening, with the growth of liabilities - is improving. So, if we want to increase the financial stability we must growth the liabilities and reduce assets.

CONCLUSION

Summarize the listed models it is possible to say that the financial analysis system, undoubtedly, is an important element of a control system of knowledge at the enterprise and that this financial analysis system makes to enterprise management special demands. Integration of data of the financial analysis into the general management system at the enterprise will allow to raise quality of a control system of the enterprise, and to create enterprise competitive advantages.

INTERCONNECTION OF EFFECTIVENESS AND COMPETITIVENESS IN MANAGEMENT

Victoria Zubareva

The National Research University Higher School of Economics, Russia

ABSTRACT

The results of a large-scale methodological research of organizational effectiveness increasing methods as a part of its competitiveness. There are elaboration of the terms effectiveness and competitiveness in relation to the structural and functional management approach, attempt to explain the terminology model of effectiveness and competitiveness components. And also presented a methodological approach, which can be the basis of indicators system to measure the effectiveness of the organization.

INTRODUCTION

Methods of management development and improvement in accordance with the constantly changing environmental conditions have a special place at the modern reality of the Russian economy. So companies need to have a clear model of its own chain of added value tools and reliable tools to ensure its competitiveness. Only if the internal structure of the organization, including the structure of business processes, are constructed so that its can be measured and compared, the company is able to carry out their constant and continuous adaptation to the changing conditions of external environment. Any process should be described in such a way as needs to accounting, monitoring and operation (purpose of the process, its resources, expected results, performance and effectiveness indicators). It means that review of the business processes' effectiveness as a basis of processes' monitoring and as a consequence company's competitiveness becomes more and more actual.

ANALYSIS OF VARIOUS ASPECTS OF THE EFFECTIVENESS IN MANAGEMENT

Analysis of management literature showed that only 50% (including 40% of the definitions taken from dictionaries) sources provide a clear definition of "effectiveness". So this research will attempt to justify the definition of "effectiveness" and connection of "effectiveness" and "competitiveness".

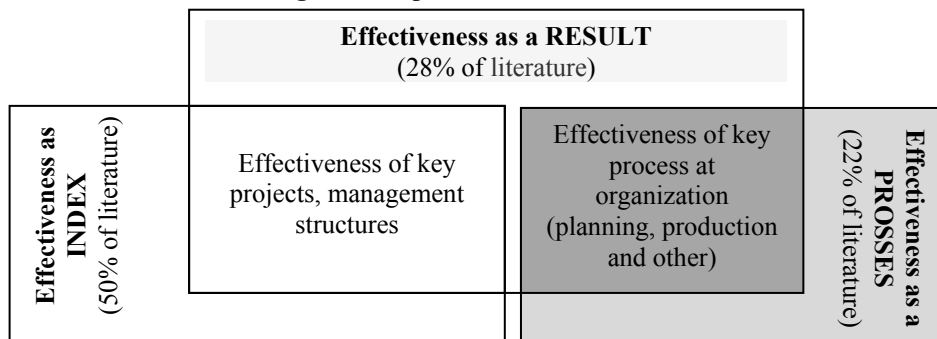

Results of literature review have shown that "effectiveness" is considered in three aspects: as an indicator, as a result, and as a process (see Figure 1).

There is the effectiveness as a result, which is understood as a specific useful effect in the top square of Figure 1. This aspect of effectiveness shows the ratio of the actual figure for the planned or the maximum possible figure. This is the result of operations, projects, processes, which is expressed as the absence or reduction of financial and time losses and other positive effects (increased productivity, sales growth, etc.). Thus, this aspect of the effectiveness emphasis on property management systems to produce a positive business results. And its main synonymous is performance.

There is effectiveness as index in the left square in Figure 1, it is understood as a ratio of the result (effect) and costs. There is impotent exactly numerical measurement of effectiveness. However, most authors target for organizations to define the maximum level of effectiveness, which mean maximum effect with

minimum cost. But market conditions do not always require it to achieve maximum efficiency. So it's necessary to define term of optimal level of effectiveness. Thus the ratio of the planned outcome to the planned cost can be defined as optimal level of effectiveness.

Figure 1: Aspects of the term “effectiveness”

Thereby, such aspect of effectiveness is understood as measure an effect of the system taking into account its cost to operate. There is efficiency as the process of achieving a positive result in the right square of Figure 1. Authors consider effectiveness of planning, production, distribution, etc. in this aspect of effectiveness. Process' effectiveness means the ratio between the process' effect and process' cost. As already mentioned, monitoring and as a consequence rising of process' effectiveness results in the ability to manage company competitiveness. But this statement requires further review.

INCONNECTION OF “EFFECTIVENESS” AND “COMPETITIVENESS”

So effectiveness is a characteristic of a processes' complex in major organizational systems (production, operational, information, logistics, financial), which determines realization of their properties and resources to achieve necessary results. But the concept of the overall organizational effectiveness as an open socio-economic system needs to be separate from effectiveness of organizational management structure in order to determine the factors of influence and the tools to improve the overall organizational effectiveness and competitiveness.

Consideration of the company in terms of its organizational structure and as a complex of departments' functions is typical only to functional management approach. Process management approach is characterized by consideration of the organization as a complex of result-oriented processes. Management structure defines the goals and direction of development in this approach, and process structure is responsible for its implementation.

And despite the fact that the optimization of the management structure is defined by many authors as a condition for increasing the overall effectiveness and competitiveness of the company, there is no separation of overall organizational effectiveness and effectiveness of organizational management structure in modern literature.

Thus, under the effectiveness of organizational management structure should be understood measure of its performance and impact in the implementation of the company strategy. Consequently, overall effectiveness of the company consists of the effectiveness of its management structure and processes' effectiveness in other systems (operating, logistics, etc.). The effectiveness of management structure is the basis of the overall organizational effectiveness and is the most important, but not the single defining factor in its internal environment.

For a clearer separation of concerns the overall effectiveness and effectiveness of organizational management structure it needs to consider in terms of environment and to determine the relationship between the concepts of "effectiveness" and "competitiveness".

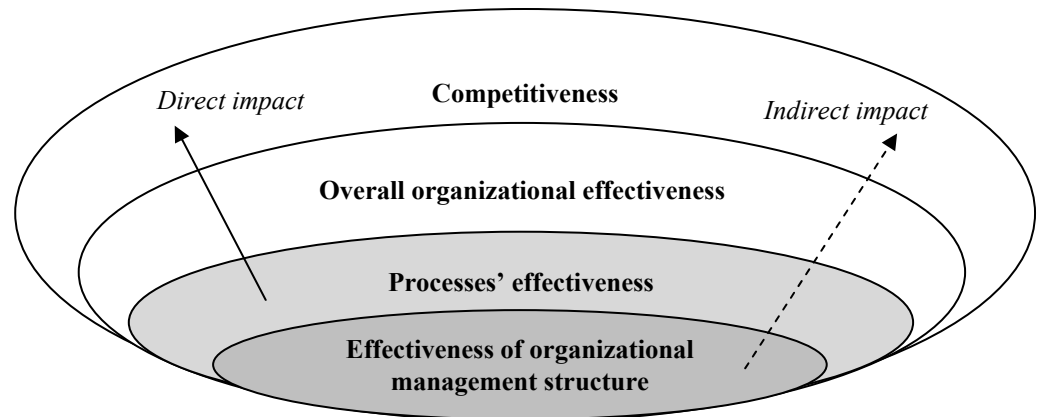

So there is product competitiveness as the set of competitive advantages that give the consumer bigger value (low price, high quality, providing greater benefits and service) in literature, which main factors are price and quality. And there is also company's competitiveness as the ability of the company to meet the demands of the customers, which is determined by the company's strategy and the ability of the company to implement it, means its effectiveness. Therefore competitiveness of products is part of the company's competitiveness.

For the other part of the competitiveness of enterprises is the overall effectiveness of the company, as characterizes the ability to achieve its goals with minimal cost (see Figure 2).

The overall organizational effectiveness provides flexibility and speed of reaction to the changing of external environment and improving the quality of services / products, and thus meet the expectations of customers.

The effectiveness of management structure of the company, as part of the overall organizational effectiveness, has an indirect impact on the competitiveness of the company (see Figure 2), because management structure determines only the goals and direction of development. But the effectiveness of key processes has a direct impact on competitiveness, because main processes determine the mechanisms of implementation of the set goals (see Figure 2).

Figure 2: Connection of “effectiveness” and “competitiveness”

The statement about the degree of influence of different kinds of effectiveness on the competitiveness of the company as a whole requires further empirical research. But at this stage of the analysis, the allocation of the components of competitiveness can better define and evaluate interdependence of competitiveness, processes and management structure in the functional and process-oriented organizations.

CONCLUSION

However, at this stage of the analysis, the separation of the overall organizational effectiveness on the effectiveness of its management structure and the processes' effectiveness is relevant because can combine management structure and key processes of the organization for evaluation, monitoring and improving according environmental requirements. As well as the identification of the competitiveness' components and overall organizational effectiveness allows to define more clearly the criteria for assessing the quality of the results of the company and its ability to meet customer needs, therefore, to influence the market and set new standards in the industry.

Thus, the proposed approach is the basis for monitoring and control components of the effectiveness and competitiveness, and thus the tool to creating a transparent model of value creation chain for the company and improve it according to the customers' needs and requirements of the owners.

INNOVATIVE BUYING BEHAVIOUR INTEND: A SEGMENTATION OF COMMERCIAL FARMERS IN SOUTH AFRICA

Dion van Zyl, University of South Africa, South Africa
Johan de Jager, Tshwane University of Technology, South Africa

ABSTRACT

With ever changing production requirements and progressive operational needs of commercial farmers, the market is constantly introduced to new product innovations. Despite the numerous studies that have been undertaken in the field of consumer buying behaviour, an extensive search of leading electronic journal databases could not yield any research findings relating to innovative buying behaviour intend amongst commercial farmers in South Africa. This paper focuses on addressing this gap by exploring levels of perceived innovativeness amongst commercial farmers in South Africa and using it as a base for market segmentation. A survey of 917 commercial farmers yielded quantitative data for analysis. The data was used to develop an index measure of innovative buying behaviour intend. The index was subsequently used as base for segmenting the market. The focus fell specifically on those farmers portraying high levels of intend and characterising them in terms of selective demographic, firmographic and behavioural discriminators. The findings contribute towards understanding buying behaviour intend amongst commercial farmers in South Africa.

INTRODUCTION

Consumers in general differ from one another in the degree to which they display innovative buying behaviour intend. Midgley and Dowling (in Roehrich, 2004) define innovative buying behaviour as the tendency to buy new products more often and more quickly than other people. With the risk of failure when launching any new product or service offering in a market, it is often of value to marketing practitioners to be able to predict early product adoption levels as well as understand drivers of innovativeness. Black *et al.* (2001) state that gaining insight into why some people adopt a particular product as well understanding the factors that may influence this decision is likely to be of considerable practical value.

The notion of innovative buying behaviour intend also holds true for the commercial farmer market in South Africa. With an estimated 39 000 commercial farmers in South Africa (Statistics South Africa, 2009), the agricultural sector has long served as viable target market for many firms. In order to address the ever changing production requirements and progressive operational needs of commercial farmers, the market is constantly introduced to new product innovations. But as in many other consumer markets, some farmers are often more willing or eager to try out unfamiliar and innovative products than others.

This paper intends to contribute towards furthering an understanding of consumer behaviour amongst commercial farmers in South Africa. It seeks to address the innovative buying behaviour intend in this market. Secondly, it concerns with how innovative buying behaviour intend can serve as base for market segmentation. The latter part of the paper reflects on the results and findings from a quantitative study that was conducted amongst a representative sample of commercial farmers in South Africa, measuring innovative buying behaviour intend. The paper concludes with a discussion on the implication of the findings for marketers.

PRODUCT ADOPTION AND INNOVATIVE BUYING

BEHAVIOUR

The importance of studying early product adoption

A review of the literature provides ample argument for the studying of early product adoption, including innovative buying behaviour. The innovator segment has in particular been researched extensively and is often described in relation to other adopter segments. Hirschman (1980), for example, state that “Few concepts in the behavioural sciences have as much immediate relevance to consumer behaviour as innovativeness”. The state of ever changing consumer behaviours furthermore emphasises the importance of studying early adopters. Firat, Dholakia and Venkatesh (1995:44) encapsulate one of the challenges of postmodern marketing by stating that “global competition and technological innovations ensure that, as soon as consumer behaviour in any field is on the verge of stability and explainability, new products and services are introduced to destabilise the consumer behaviour model so as to create competitive openings for challengers, niche players, and other contenders.”

Bowden and Corkindale (2005) cite the value of feedback on product design and benefits derived as essential reasons for studying early adopters. Much reliance is also placed by marketers on the characteristics that define the early adopter segment in planning their marketing communication. Despite a lack of evidence in the literature on the existence of a ‘super-innovator’ type consumer, whom adopts across all product categories, tendencies towards early adoption across certain product categories, for example technology, has been shown (Parasuraman, 2000). Bowden and Corkindale (2005) also postulate that it is very reasonable to assume that early adopters in most categories probably exhibit similar traits. It is on this basis that the researchers believe that studying innovative buying behaviour intend of commercial farmers and their general traits and characteristics without focusing on a specific product or product range, hold significant value for marketers.

Explaining innovative buying behaviour intend

A review of the literature highlights two main views on what constitutes innovative buying behaviour. The one view proposes an innate quality of innovativeness, while the other holds the premise of innovativeness being time dependent. Rogers (2003) defines innovativeness as the extent to which an individual adopts new ideas relatively earlier than other members of a social system. This definition is clearly time dependent, and this segment is statistically easily determined based on a subtraction of two standard deviations (or more) from the mean time it took to adopt a product. However, this approach provides limited predictive insight due to such a process being calculated only after the launch of a product (McDonald & Alpert, 2007). On the other hand, Midgley and Dowling (in McDonald & Alpert, 2007) promotes an alternative conceptualisation of innovativeness. They define it as the “degree to which an individual makes innovation decisions independently of the communicated experience of others.” Thus, innovativeness can take place very late in the diffusion cycle of a product. Midgley and Dowling make a further distinction between innate and actualised innovativeness. Innate innovativeness refers to the trait possessed by every human being towards innovative buying behaviour, while actualised innovativeness is concerned with showing actual innovative buying.

RESEARCH OBJECTIVES

Two primary research objectives guided the study. Firstly, to identify and define a set of valid and reliable items that can be used for measuring the level of perceived innovative buying behaviour intend amongst participants and secondly, to identify the characteristics of South African commercial farmers with high levels of innovative buying behaviour intend.

RESEARCH DESIGN AND METHODOLOGY

Research design and sampling

This research design is considered exploratory in nature due to the development of a segmentation model focussing on the commercial farmer market in South Africa. A quantitative approach facilitated the gathering of

relevant data for segmentation purposes. The data provide bases for both segmenting and profiling of the market. The population for this study was defined as all commercial farming operations located within the boundaries of South Africa. An available mailing list of commercial farmers constituted the sampling frame.

Data collection

A mail survey was used for collection of the data while a structured questionnaire served as data collection instrument. A total of 3 000 questionnaires were distributed. By cut-off date, 917 completed and valid questionnaires were collected to form the final sample. This represented a response rate of 30.5%. The characteristics of the sample compared well with known population characteristics and were therefore considered representative. Using the formula presented by Israel (1992), the sample error was therefore estimated to be approximately 2.8%, given a 5% level of confidence.

Measurement of ‘Innovative Buying Behaviour Intend’ and data analysis

The measurement scale proposed by Ailawadi, Neslin and Gedenk (2001) was adopted for measuring innovative buying behaviour intend. The scale consists of three items measured on a 5-point Likert scale, where 1 = do not agree at all, to 5 = definitely agree. The items are:

- When I see a product that is slightly different from the usual, I have a look at it
- I am usually one of the first people to try out a new product
- I like to try out new things and a variety of things

The first step of the scale development involved confirming if items showed internal reliability. This step was deemed important to ensure that the items provide a common measure of the scale to be developed, namely levels of perceived innovative buying behaviour intend. A Cronbach’s alpha was calculated to confirm internal reliability. The closer the alpha value to one, the more internal reliable or consistent the new scale is considered to be. An alpha value of 0.718 was produced. This value is also in line with the suggested level of 0.7 as recommended by Nunnally (1978).

In the next step of constructing the new scale, the ordinal data obtained from the rating of the three items was subjected to an exploratory factor analysis, with principle component extraction and varimax rotation. Principal component analysis is a technique for finding relationships in multivariate data, with the aim of reducing the dimension of the data without serious loss of information (Porkess, 2004). The aim was to use the underlying multivariate correlation that exists between items to produce a new scale measure that could represent perceived innovative buying behaviour intend. As expected, all three items loaded on one factor signifying the emerging of a single new construct dimension. The results are presented in table 1.

Table 1: Exploratory Factor Analysis – Component Matrix

Component Matrix ^a	
	Component 1
I am usually one of the first people to try out a new product	.867
I like to try out new things and a variety of things	.849
When I see a product that is slightly different from the usual, I have a look at it	.669

Extraction Method: Principal Component Analysis.

a. 1 components extracted.

The new scale explains 64.0% of the variation on the original item data. The results are presented in table 2.

Table 2: Exploratory Factor Analysis – Total Variance Explained

Total Variance Explained						
Component	Initial Eigenvalues			Extraction Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	1.920	64.001	64.001	1.920	64.001	64.001
2	.722	24.069	88.071			
3	.358	11.929	100.000			

Extraction Method: Principal Component Analysis.

The factor scores or factor loadings produced from the factor analysis are continuous with a normal distribution and are standardised with a mean of zero and a standard deviation of one. These scores represent an index of innovative buying behaviour intend, where higher values represent higher levels of intend. The range of the scale values was used to determine cut-points to form three meaningful groupings or segments of commercial farmers based on their extent of innovative buying behaviour intend. The focus of this study fell in particular on those farmers being classified as having high levels of intend. Further data analyses involved constructing of frequency tables.

RESULTS

Introduction

This section consists of two parts. The first part presents the main characteristics of those farmers that participated in the study as well as the characteristics of the farming units that were under consideration. While this study was not concerned with the characteristics of farming operations *per se*, but with levels of innovative buying behaviour intend amongst farmers themselves, they form relevant points of reference for describing variation in the levels of intend. The second part presents a segmentation of the South African commercial farmer market based on levels of innovative buying behaviour intend.

Sample characteristics

The majority of farmers were between the age of 50 and 64 years (42.0%), with a further 29.2% between 35 and 49 years. Farmers also reported varied levels of education. Of the 917 participants, the majority (69.4%) presented stock farming operations. The estimated annual turnover reported varied, with 48.0% having reported turnover in excess of R1 million. While the majority of farming units (62.9%) are operated as sole ownerships, a significant proportion is structured as companies (13.8%) and closed corporations (10.4%).

Segmenting the commercial farmer market based on innovative buying behaviour intend

Figure 3 presents the proportions of those farmers with 'high' levels of innovative buying behaviour intend by educational level, having an agricultural related qualification and age groupings. The results show higher levels of innovative buying behaviour intend being associated with higher levels of education (21.3%). Intend also seems to be more associated with farmers in the age groups 35 to 49 (23.1%) as when compared to farmers older than 65 years (11.2%). The results therefore signify that some demographic variables could serve as indicators for explaining variation in levels of intend amongst farmers.

Figure 2: Percentage of farmers with high Innovative Buying Behaviour Tendencies – By Demographics (n = 917)

Considering the type of farming operations as possible explanatory variables of innovative buying behaviour intend, the results show higher levels of intend being associated more with farming operations being structured as public companies (26.8%), trusts (25.0%) and partnerships (23.3%) but less so as sole ownerships (17.5%) and closed corporations (18.9%). Farmers in operations with annual turnover of between R500 000 and R2 million are most associated with higher levels of intend, with farmers from smaller farms showing less intend.

Figure 3: Percentage of farmers with high Innovative Buying Behaviour Tendencies – By Firmographics (n = 917)

The behaviour of farmers with 'high' levels of intend were also inspected in terms of main method of paying wages, access to the Internet and PC ownership. The results suggest that farmers with high levels of intend are more inclined to have access to a PC (20.7%), have access to the Internet (22.0%) and use the Internet (23.5%) or cheques (23.8%) to pay wages.

Figure 4: Percentage of farmers with high Innovative Buying Behaviour Tendencies – By Main method of paying wages, access to the Internet and PC ownership (n = 917)

CONCLUSION, IMPLICATIONS FOR MANAGEMENT AND RECOMMENDATIONS FOR FURTHER RESEARCH

The study of consumer behaviour is primarily concerned with understanding and predicting buyer behaviour. One focus area that is often of interest and value to marketing practitioners is that of identifying the characteristics of early adopters or buyers in the market. A clear description and understanding of this segment of the market can greatly assist in the development of marketing strategies that can enhance the trial and eventual adoption of new products. Early buyers are crucial in establishing an initial and viable foundation for the success

of a product. This study aimed to further an understanding of innovative buying behaviour intend in the South African commercial farmer market. While this study was limited to showing that type of ownership, annual turnover, access to internet/PC and method of paying wages explain variation in innovative buying behavior, future research can focus on identifying early buying behavior of more specific brands and product ranges within brands. This insight will provide marketing practitioners representing agricultural input suppliers and service providers with a means to develop more effective and efficient marketing programmes. The results showed that farmers in South Africa differed in the extent to which they show innovative buying behaviour intend and that they can be placed along a continuum ranging from lower to higher levels of intend.

ECONOMIC AND LEGAL ASPECTS OF ESTIMATING PUBLIC PROCUREMENT OF GOODS, SERVICE AND WORKS AND POSSIBLE PREVENTION OF CORRUPTION IN SERBIA

Dušica Karić, Petar Bojović, Bljerim Haljilji, Nehat Madjuni
University of Alfa, Serbia

ABSTRACT

Estimating the public procurement value, service and work is one of the contemporary issues with the distinct financial feature in fighting corruption. Economic and legal relations between a procuring party and a bidder and other parties involved, complying with the recommended terms and criteria for assessing the bid are the most important features in the process of public procurement, but also a possible source of conflicts of interest and corruption, which requires constant surveillance, more efficient control and implementation of the modern concept of public procurement using the model of the highly developed European countries. According to the research information procurement has grown significantly, which was registered by monitoring average contract values during the past eight years, thus the average public procurement value in 2011 was 2.5 times higher than in 2006, and higher by a fifth compared to 2009.

INTRODUCTION

Public procurement is a process where the government as the procuring party procures goods and service from other subjects on the market. Nowadays, public procurement has gained considerable significance on national and international level. Governments, as procuring parties, are very desirable for the suppliers, because their demand is enormous, and they are reliable guarantors of payment. Therefore, there is a question of transparency of public procurement, its procedures, and the means for maintaining the competition when bidding for special transactions, such as: procurement of medicines, arms, technological assets etc. Likewise, the aim of public procurement is satisfying the public interest, which can sometimes be controversial and the means for achieving that aim have to be highly developed in order to reduce the number of government's inadequate transactions to minimum. Accordingly, in order to carry out the public procurement process more efficiently with minimum expenditure, and to comply with legal terms at the same time, it is necessary to have well organized apparatus and a system of control to realize these criteria.

Setting up an efficient and legal public procurement system within a local municipality means being well acquainted with and obeying the Public Procurement Act and accompanying regulations, having an adequate organizational solution for the Public Procurement Office within the municipality, standard arrangement of procedures, adequate personnel, well trained employees in charge with public procurement who respect the standards of ethical behavior. Municipal managers, the officials directly involved in the process of public procurement and all the other parties in position to influence the process of bidder selection, are obliged to get acquainted with the public procurement system in the Republic of Serbia and to complete their duties consistently, correctly and expertly. In order to achieve that goal it is necessary to define activities, carriers, duties and responsibilities of all the parties involved in the public procurement process, with the clear, and whenever possible, written instructions.

Serbia has among the last in the South-East Europe standardized and set up the public procurement system. The first Public Procurement Act was passed on 05 July 2002. After five years of implementing the Law, the need arose for the public procurement system adjustment and approach to the experience and solutions practiced in the EU countries, especially in the new member countries. The new Public Procurement Act was passed on 22 December 2008 and it came into force on 06 January 2009.

THE ESTIMATED PUBLIC PROCUREMENT VALUE

The estimated public procurement value must be based on the market research, which involves the review of price, quality, warranty period, maintenance etc. and it has to be valid at the time of launching the process. It includes the total sum charged to the bidder in dinars without VAT. The public procurement value cannot be estimated in a way to avoid the open or restrictive process.

The basis for calculating the estimated public procurement value is determined in the following way:

- If the subject of the contract is purchase, lease or rent, and when the contract period is 12 months or less, the total estimated contract value for the entire period is considered, and when the contract period is longer than 12 months the total estimated contract value includes the estimated value for the first 12 months and the estimated value for the remaining period;
- In case of a contract for an indefinite period, as well as in case where there is uncertainty concerning contract period, monthly estimated contract value is multiplied by 36.

Likewise, in case of periodic contracts, as well as renewable contracts, the estimated public procurement value is determined according to the values of the similar periodic contracts from the previous budget year or from the previous 12 months, adjusted to the expected changes in quantity and value of goods whose procurement is the subject of the contract during 12 months starting from the day of signing the original contract or according to the total estimated value of the similar periodic contracts during 12 months after the first delivery or during the contract period in case that contract period is longer than 12 months.

When calculating the estimated public procurement of service value, the procuring party has to include all the costs the bidders would have relating the service they provide.

With certain services the procuring party takes into account the following sums:

- For the insurance service – premium rate, as well as all the other payments related to the service;
- For the banking and other financial services – reimbursement, commission, as well as all the other payments related to the service;
- For the credit services – total rate value for the repayment period, reimbursement and costs related to credit approval and credit agreement realization, including assessment costs for immovables and movables, insurance premium or other reimbursements related to the means for credit insurance, costs of providing the necessary documentation and other corresponding costs;
- For design, architectural works, spatial planning etc.- reimbursement or commission.

If the procuring party cannot determine the estimated service value because of the contract period length, the service value is estimated in the following way: in case the due date of the contract is determined to 36 months or less, or in case of the indefinite contract period, the total contract value for the entire period is monthly value multiplied by 36.

The estimated public procurement of works value is determined in a way that total works value is the basis for calculating public procurement of works value. When determining the estimated public procurement of works value the procuring party includes in works value the value of all the goods and services necessary for the realization of the public procurement of works agreement. The procuring party is obliged to state separately the value of material, goods and services they provide themselves apart from the estimated value incorporated into the process statement.

However, unlike estimating public procurement of goods, services and works value, when the public procurement subject is shaped after procurement, the procuring party determines the estimated value of each procurement. The estimated public procurement value shaped after procurement includes the estimated value of

each procurement for the time of contract period. It is necessary to point out that in case of qualification procedure, framework agreement and dynamic procurement system, the estimated public procurement value is determined as the value of all contracts appropriated during the candidate list term, framework agreement, that is, dynamic procurement system.

ECONOMIC AND LEGAL ASPECT OF PUBLIC PROCUREMENT

Economic and legal aspects allow the procuring party to refuse the offer on the account of unusually low price. Unusually low price is, from the economic aspect of public procurement, an offered price which significantly deviates from the comparable market price and doubts the possibility of public procurement execution in accordance with the offered conditions. If the procuring party estimates that the offer has an unusually low price, it is obliged to demand a detailed explanation of all its parts from the bidder, especially allegations of building method economy, production or selected technical solutions, extremely favorable conditions for the bidder to complete the agreement, or the originality of products, services and works offered by the bidder. The procuring party is obliged to give the bidder an appropriate deadline for the answer. Similarly, the procuring party is obliged, after receiving the explanation, to verify the relevant elements of the offer, especially to check the bidder's or candidate's completion of obligations that arise from the valid regulations concerning work safety, employment and work conditions, environment protection and intellectual property protection, and can demand from the bidder to convey adequate evidence.

It is necessary to respect certain principles in the public procurement process:

- efficiency and economy
- providing competition
- transparency of public procurement procedure
- bidder equality and
- environment protection and providing energy efficiency

In the course of public procurement the procuring party is obliged to supply the goods, services or works of the adequate quality having in mind the purpose, application and value of the public procurement, and to provide the realization of the public procurement process as well as assigning contracts in due time and in a proper way, with minimum costs related to the public procurement process and realization. Also, in the course of public procurement the procuring party is obliged to provide the best possible competition so that the procuring party cannot restrict the competition, and cannot prevent any bidder from taking part in public procurement process by using unjustified negotiation procedures, discriminating conditions, technical specifications and criteria. One of the procuring party's obligations is to make the public procurement procedure public and transparent. The procuring party is obliged to provide equal conditions for all the bidders in each public procurement stage, and cannot determine the conditions which would discriminate bidders on national, territorial, material or personal level, nor discriminate them according to the classification of activities performed by the bidders. Likewise, the procuring party is obliged to provide goods, services and works which do not endanger the environment, that is, which have a minimal influence on the environment, and provide adequate energy consumption reduction – energy efficiency, namely overall costs of public procurement subject life-cycle.

The criteria for estimating the offer are:

- the most favorable offer in economic terms or
- the lowest bid

The criterion for the economically most favorable offer is based on different criteria elements depending on the public procurement subject, such as: the offered price; discount on the procuring party's price list; delivery time or the time for realizing services or works within the minimal acceptable interval which does not compromise the quality, as well as the maximal acceptable interval; current expenses; cost-effectiveness; quality; technical and technological benefits; ecological benefits and environment protection; energy efficiency; post-purchase service and technical support; warranty period and types of warranties; spare parts responsibilities; post-warranty maintenance; quantity and quality of the personnel; functional characteristics etc.

Elements of the economically most favorable offer criteria can be divided into subcriteria. Participation prerequisites cannot be determined as criteria elements. To each criteria element, or the subcriteria, the procuring party assigns relative significance (ponder) in the bidding documentation, so that the total is 100 ponders. The selection of submitted offers using the economically most favorable offer criteria the procuring party conducts by ranking them on the basis of ponders determined as the criteria elements.

According to the Public Procurement Office, the Republic of Serbia, report (28 March 2012) for the period 01 January – 31 December 2012, procuring parties submitted reports for 111,249 procurement, the total value of 293,324,810,000 dinars. The number of recorded signed contracts has decreased during the last nine years, so that their number in 2011 was less than a half (48%) of the total number of signed contracts in 2003. At the same time, the total value of the recorded procurement has increased, and it was tripled in 2011 compared to 2003. The two mentioned tendencies indicate a significant procurement growth, registered by monitoring the average contract values from the previous eight years. (Table 1).

Table 1: Comparative survey of closed public procurement contracts per year

Year	2002 *	2003	2004	2005	2006	2007	2008	2009	2010	2011
Total number	71.2 92	231.66 1	215.81 5	148.75 8	152.48 5	122.58 7	109.910	91.992	83.693	111.24 9
Total value (thousands of dinars)	13.9 28.2 72	98.777 .652	109.28 2.212	124.75 3.207	168.91 4.947	187.55 9.752	234.028 .744	190.655 .028	273.05 5.306	293.32 4.810
Average value (thousands of dinars)	195	426	506	838	1.108	1.530	2.129	2.073	3.263	2.637

*The reports include the period 13 July – 31 December, without local municipality

The average public procurement value in 2011 was 2.5 times higher than in 2006, and higher by a fifth compared to 2009. Table 1 shows that public procurement growth has increased during the last two years. As for the procurement subject, in the structure of the total procurement value in 2011, goods dominate with 46%, followed by works (33%) and services (21%). (Table 2).

Table 2: Public procurement in 2011. (the type of subject)

The type of subject	Procurement value (thousands of dinars)
Goods	133.425.933
Service	62.009.306
Works	97.889.571

Source: The Public Procurement Office, the Republic of Serbia

From the total number of registered public procurement contracts, 99% of contracts were issued to domestic bidders, and 1% to bidders from the EU member countries. (Table 3).

Table 3: High value public procurement issued to bidders from Serbia, the EU and countries outside the EU in 2011

Country of the bidder	Number of issued contracts	Agreed value (thousands of dinars)
Serbia	35.056	246.414.942

The EU	116	2.620.972
Countries outside the EU	94	3.127.278

Source: The Public Procurement Office, the Republic of Serbia

When planning public procurement, as well as in its process or during the realization of its contract, the procuring party is obliged to undertake all the necessary measures to prevent corruption, to detect it beforehand, so as to remove or reduce harmful consequences and to punish the participants in the process of corruption. If it is not possible to realize proper communication, because of the circumstances in the case, the person in charge of public procurement, or other parties, are obliged to make a report, or record the taken actions in some other way. The executive and the procuring party's official are obliged to give all instructions to the public procurement personnel in written, or through emails. Public procurement personnel must refuse following the instructions from the authorized party if they do not comply with the regulations. Also, members of the personnel who refuse to follow the instructions cannot be transferred to other positions nor dismissed during the 12 month period starting from the day of refusal, on condition they work in accordance with the law.

CORRUPTION PREVENTION

The Public Procurement Office has to make a plan for fighting corruption in cooperation with the relevant Government Agency and deliver it to the Government for ratification. The procuring party whose annual estimated public procurement value is more than 1,000,000,000.00 (a billion) dinars, has to, according to the plan, create their own internal plan for corruption prevention in the process of public procurement. The procuring party delivers the internal plan within three months from the ratification of the plan. Likewise, the procuring party has to draw up an act which would closely regulate the public procurement process within the procuring party, especially the procurement planning (criteria, rules and ways to determine the public procurement subject and its estimated value, analysis and market survey), planning responsibility, aims of public procurement process, the manner of completing the tasks in the process, the methods for providing competition, realization and control of public procurement, the methods for observation of public procurement contract realization. The content of the act determines the Public Procurement Office. If the Public Procurement Office confirms the inconsistency of the internal act with the law, it is obliged to inform the procuring party and to give suggestion as how to adjust it as well as the interval in which to do it. In case the procuring party does not adjust the act in the given interval, the Office will inform the Agency which monitors the procuring party's dealings and State Audit Institution and start prosecution in the Constitutional Court.

The procuring party whose annual estimated public procurement value is more than 1,000,000,000.00 (a billion) dinars also has to form a special service that would control planning, process conducting and public procurement realization. The service controls appropriateness of particular public procurement planning from the point of view of needs and the procuring party's activities, criteria for drawing up technical specification, methods of market analysis, the validity of criteria for issuing contracts, and especially the quality of delivered goods and offered services, or conducted works, stock and the use of goods and services. Apart from this, the service undertakes other steps with the aim of affirming the facts in single public procurement procedures, that is, in the public procurement contract. The service reports about the audit to the procuring party executive and the Agency which monitors the procuring party's dealings, giving its recommendation. The internal act arranges business methods and the organization of the service. All the procuring parties planning or conducting public procurement with the total value more than the border amount of 1,000,000,000.00 (a billion) dinars have liability.

The party which has taken part in planning the public procurement, preparing tender documentation or some of its parts, and a related partaker cannot appear as bidders or bidder subcontractors, nor can liaise with bidders or subcontractors in the process of bid preparation. The procuring party will refuse the offer if the bidder, or the applicant, has directly or indirectly given, offered or had prospect of any gain, tried to gain confidential information, or to influence the procuring party in any way during the public procurement process. Methods for asserting the circumstances are determined by the internal plan, where the procuring party immediately has to

take steps set in the internal plan and notify the authorized Government agencies. Public procurement staff or any other employee hired by the procuring party, as well as any interested party with the information about corruption in public procurement process has to notify the Public Procurement Office, the authorized Government agency that prevents corruption and the relevant prosecutor's office. Those people cannot be fired nor transferred to other positions for reporting public procurement corruption, and the procuring party has to ensure them complete protection.

If the procuring party realizes public procurement process whose estimated value is more than 1,000,000,000.00 (a billion) dinars, the process is under supervision of a civil supervisor. The civil supervisor can be an eminent public procurement expert or an expert in any field associated to public procurement. Similarly, the civil supervisor can be an association engaged in public procurement, corruption prevention or conflict of interest. However, the civil supervisor cannot be a person employed or otherwise engaged by the procuring party, or the entity linked to the procuring party, nor a person that is a member of a political party. Terms and criteria for appointing a civil supervisor and defining practice manner are determined by the Public Procurement Office. The Public Procurement Office appoints the civil supervisor until the date set in the annual procurement plan as the outline date for starting public procurement process at the latest, or 30 days from the admission of the procurement plan. The procuring party cannot start the public procurement process before the appointment of the civil supervisor. The civil supervisor has to monitor public procurement process and has a constant access to the procedures, documentation and communication of the procuring party with other interested parties, that is, the bidders. At the same time the civil supervisor has to report to the National Assembly financial board, that is, to the Assembly of the autonomous province or the local municipality, and the Public Procurement Office about the realized public procurement process within 20 days from realizing contract or making a decision to stop the process. If the civil supervisor has a reasonable doubt about the validity of the public procurement process, he will inform the authorized agencies and the public. Civil supervisors are not entitled to any reward for their work.

The conflict of interest exists when the relation between the representatives of the procuring party and the bidder can influence impartiality of the procuring party when making a decision in the public procurement process, that is:

- if the representative of the procuring party or a person linked to it participates in the bidder's offer;
- if the representative of the procuring party or a person linked to it possesses more than 1% of the stake, or the bidder's shares;
- if the representative of the procuring party or a person linked to it works for the bidder or has any business association with them.

The procuring party cannot close the public procurement deal if there is a conflict of interest. The person in relation with whom there is a conflict of interest cannot be a subcontractor to the bidder who was issued the contract, nor the member of the group of bidders who were issued the contract. The Republic Commission for the Protection of Rights in the Public Procurement Procedures will upon the procuring party's request grant closing the deal, on condition that the procuring party proves that a ban would cause significant difficulties in work or the business disproportional in comparison to the public procurement, it would jeopardize the Republic of Serbia's interest, that they have taken all the steps towards diminishing negative consequences, that the other bidders do not comply with procedure requirements, that the discrepancy in prices after ranking their offers is 10% higher or that the selected bidder has 10 more bidders. The decision is announced on the procuring party's and the Republic Commission for the Protection of Rights in the Public Procurement Procedures website and the Public Procurement Portal.

Possible corruption prevention in public procurement can be achieved through higher transparency and competition, efficient control and significant sanctioning of rule breaking, and all that can be realized through implementation of modern monitoring concepts and public procurement control present in European countries where exists coordination between all institutions in the public procurement system. For example, special attention should be paid to the possibility of control efficiency in public procurement procedures reliance on the external and internal audit institutions. Similarly, it is possible to decrease the number of bargains, apart from the implementation of efficient control by the internal and external audit and change of regulations in order that every procuring party claiming there is only one bidder on the market that can satisfy the actual need has to announce that in the public information service and official gazettes and journals prior to closing the deal.

Parallel with these measures it is necessary to give much more significant and precise role to different regulatory bodies (the Public Procurement Office, the Commission for the Protection of the Rights, the Budget Inspection, the State Audit Institution etc.)

CONCLUSION

The field of public procurement is a very delicate transaction field, especially for subjects who righteously apply to tenders, behave properly, and follow the rules of free competition. However, situations where the procuring party decides to reject a bidder on a discriminating reason are frequent, and a quality regulation that has to be consistently and efficiently applied to the mentioned cases is necessary. Public procurement is not a purpose in itself, but means for achieving the goal, and genuine public procurement control is not control of obeying the formalities, but control of whether the procurement was necessary, and if so, whether the purpose of the procurement was fulfilled.

The protection of the procuring party's rights and the public interest is one of the most subtle and most delicate public procurement areas, because it has a function of providing legal security for all the participants in the public procurement procedures. Therefore, good acquaintance with the legal mechanism of right protection is equally important for all the participants in the procedures. To begin with, being well acquainted with and understanding the right protection process, the procuring parties and bidders have the opportunity to manage it better. The bidders have to make it a habit to react immediately to any inconsistency and flaws in the public procurement procedures, which are not always a reflection of the procuring party's bad intentions, but sometimes a result of an oversight or insufficiently trained staff in the domain of public procurement. It is also important that the procuring parties make it a habit to approach each objection equally, to analyze each of them extremely meticulously and earnestly, in order to solve the problem at the lower level with a minimal time and other resources consumption. On one hand, the bidder must be protected from possible irregularities or the procuring party's illegal activities, in that respect that those activities as a consequence might have law offense, in other words, causing damage. On the other hand, public assets are used in the public procurement procedures, therefore, protecting the public interest must ensure their rational and efficient use.

SUBJECTIVE EXPERIENCES IN ADVENTURE MOTORCYCLING: EXPLORING MARKETING POTENTIAL

JJ Prinsloo, North West University, South Africa
GW Collins, Tshwane University of Technology, South Africa

ABSTRACT

Along with the steady growth in adventure tourism comes a need to gain a better understanding of how participants experience adventure activities. It seems important to investigate their experiences, not purely from a customer satisfaction perspective but also at a deeper more personal and subjective level. This would allow adventure providers to gain a greater understanding of the factors that would provide adventure tourists with a rewarding experience. This study drew on the grounded theory approach of coding sorting and analyzing through open, axial and selective coding to explore the subjective experiences of a group of nine adventure motorcyclists who participated in a tour through parts of South Africa, Botswana and Namibia. The central idea that emerged from the analysis revolved around the expectations and realizations of the participants. These are divided into positive, neutral and negative expectations and realizations. The majority of these are positive and include experiencing the wilds of Africa, overcoming riding challenges and camaraderie. The neutral experiences involve knowing what to expect and taking it as it comes, while the negative expectations and realizations include mechanical problems, injuries and uncertainty regarding riding ability.

INTRODUCTION

Adventure tourism is a “growing segment of outdoor recreation” (Meisel & Cottrell, 2003, p. 393) and yet limited research seems to have been undertaken in order to gain an understanding of its participants (Pomfret, 2006). The focus of many researchers in the field of adventure tourism has been narrow and has often neglected to explore the individual experiences of participants. Weber (2001) points out that a comprehensive understanding of adventure tourism needs to involve a consideration of the “individuals’ subjective experience and perception” (p.361) of adventure activities. She goes on to indicate that it is essential to make use of qualitative research methods when exploring individual experiences and perceptions of adventure tourists. This qualitative study focus on the subjective expectations and realizations of a group of adventure motorcyclists who participated in a 7000 km tour through parts of South Africa, Botswana and Namibia. A grounded theory analysis was conducted on transcripts of both individual and focus group interviews in order to empirically explore the experiences and perceptions of the participants. The results of this study could provide valuable insights that would help marketers and adventure providers to determine the commercial marketability and feasibility of this extreme kind of tourism.

RATIONAL AND PROBLEM STATEMENT

The lack of research aimed at exploring the subjective experiences of adventure motorcyclists has left a gap in the understanding of their motives, expectations and the manner in which these are realized. This lack of understanding may lead to adventure providers not meeting their customers expectations and perhaps missing opportunities to offer other suitable tourist orientated experiences to those interested in adventure. Adventure marketers need to have a greater insight into the expectations of their potential customers if they are to successfully design activities that will prove to be satisfying. A better understanding of the expectations of adventure motorcyclists will also assist in determining more accurately the commercial potential of this type of

tourism. A limited understanding of the factors that serve as motivation for participants in adventure activities may leave the potential inherent in this market segment unexploited. An exploration of the expectations and experiences of adventure tourists will contribute to an understanding of what motivates people to participate in adventure activities.

AIMS AND OBJECTIVES

This study aimed to explore the subjective experiences of adventure motorcyclists by determining the expectations and realizations of an adventure tour through parts of South Africa, Botswana and Namibia. It is hoped that the insights provided by this exploration will provide adventure providers with a greater understanding of the factors which motivate those who participate in adventure activities. These insights will make a contribution toward an understanding of how to better market tourist activities to this tourism market segment.

A REVIEW OF THE LITERATURE

In order to gain a greater understanding of the framework in which the expectations and realizations of a group of adventure motorcyclists was explored it seems important to consider various concepts and definitions related to marketing, tourism in general and adventure tourism in particular.

Marketing

Currently, marketing must not be understood in the old sense of making a sale – “telling and selling” – but in the new sense of satisfying customer needs (Kotler & Armstrong, 2011, P.19). Armstrong et al. (2012) defined marketing broadly as a “social and managerial process by which individuals and organizations obtain what they need and want through creating and exchanging value with others” (p.9). Thus, marketing is defined as the “process by which companies create value for customers and built strong relationships in order to capture value for customers in return. Marketing thus, should be the cornerstone of any commercial adventure tourism undertaking or activity.

Tourism

Mills and Morrison (1992) propose that the term tourism is “given to the activity that occurs when tourists travel” (p.9) and involves all related activities “from the planning of the trip, traveling to the place, the stay itself, the return, and the reminiscences about it afterwards” (p.9). They indicate that implicit in the term are all undertakings relevant to the trip, these include “purchases made, and the interactions that occur between host and guest” (p.9). Leiper (1995) adopts a broader perspective and suggests that “tourism can be defined as the theories and practices of traveling and visiting places for leisure and related purposes” (p.20). Middleton et al. (2009) seem to support the arguments of both Mills and Morrison and Leiper when they pose the question “what, if any, are the differences between tourism and travel, used on their own as single terms, and travel and tourism used as a combined term?” (pp. 8-9).

Adventure tourism

The term “adventure” is evocative for many people – images and associations flood into the mind at the mention of the word. Words such as thrilling, awe-inspiring, risky, fear, excitement and adrenaline are often used when reflecting on adventure activities (Swartbrook et al., 2003). Scott (2007) indicates that there is no real consensus among academics regarding a definition of adventure tourism. Adventure does not need to involve physical challenge but can include the “mind and spirit” (Hopkins & Patman, 1993). Hopkins, Putman and Walle (1997) propose that adventure tourism involves the “quest for insight and knowledge into the unknown”. Edginton et al (2001) include fitness, environmentalism, multiculturalism, and travel in their definition of adventure tourism. Priest (2001) proposes that their needs to be an uncertain outcome in order for an activity to qualify as an adventure.

Smith and Jenner (1999) are of the opinion that the essence of adventure tourism needs to involve a sparsely populated, remote region with limited facilities. Muller and Cleaver (2000) argue that an adventure tourism activity needs to be characterized by "high levels of sensory stimulation" (p.156) that normally involves physically demanding experiences. Grant (2001) points out that an essential and distinguishing characteristic of adventure tourism is the requirement of planning and preparation.

Morgan (1998) proposes that the adventure tourism industry typically offers the tourist a singular "experience, often in an environment with real hazards" (p.7). Swartbrook et al. (2003) acknowledges that there is clear overlapping of adventure tourism and other forms of tourism in general but points out that adventure tourism involves various distinctive "attributes that set them apart from other forms of tourism markets" (p.59). Adventurers typically take risks and invite new experiences and mental and physical challenges.

Distinguishing between hard and soft adventure

Flucker and Turner (2000) indicate that it is essential to recognize the extent of the risk involved in the adventure activity when describing or defining adventure tourism. It seems important to consider the distinction between hard and soft adventure when seeking to establish a definition of adventure tourism.

Hard adventure involves activities that require specialized skill and have an element of high risk associated with them. Soft adventure, by contrast, has only a perceived risk and involves limited skill (Hill, 1995). The actual or objective risk associated with a particular activity is related to the actual "number of accidents reported", while "subjective risk is the number of risks perceived by" participants. (Flucker & Turner, 2000, p.381).

Adventure motorcycling could be considered to be a hard adventure activity. Scott (2001) proposes that adventure motorcycling "involves a challenging journey into the wilderness or a significantly unexplored country" (p.7). The motorcycle is considered a tool that allows the adventurer to explore exotic places and escape the safe world of the predictable (Scott, 2001). There are obvious risks involved in adventure motorcycling and the outcome is seldom predictable. Scott (2001) points out that adventure motorcycling demands a certain amount of commitment from participants.

The adventure tourist

Due to the varied nature of adventure tourist activities, defining the adventure tourist and what sets him or her apart from other tourists is a tricky endeavor. Notions of taking risks and relishing challenge would seem to have to form an important part of a definition of an adventure tourist but clearly this cannot be where the definition ends. One line of thought, according to Cater (2000), in relation to the growth of this form of tourism, is that modern-day living and work life lack clear meaning. This encourages people to search for meaning and fulfillment through active participation in leisure activities and tourism, seeking out ".... a deep embodied experience unavailable in everyday life" (p.51).

RESEARCH DESIGN AND METHODS

The philosophical worldview adopted in this study is closely allied to the social constructivist worldview. In a social constructivist worldview the objective of research "is to rely as much as possible on the participants' view of the situation being studied" (Creswell 2009, p. 9). The meaning inherent in a particular situation is commonly determined through "discussion or interaction with other persons" (p.9.). In this worldview the generation of meaning is invariably social and results from "interaction with a human community" (p.9.). Focus group interviews were principally used as a data collection method during this study in order to explore "multiple viewpoints or responses" concerning a specific issue (De Vos *et al.* 2009, p. 300). The emphasis was to uncover a "socially constructed meaning of reality as understood by an individual or group" (Guo & Sheffield 2007, p. 675). The data analysis of the focus group interview transcriptions was undertaken using the grounded theory method of coding, sorting and analysing.

The process of analysing interviews held with participants in the adventure tour

Open, axial and selective coding techniques were employed in the coding, sorting and analysis of the transcripts of the interviews held with the motorcyclists who participated in the adventure tour.

Open coding. De Vos *et al.* (2009) propose that open coding involve the “naming and categorising of phenomena through close examination of the data” (p.341). This basically involves “breaking down the data and identifying concepts embedded within individual statements” (Wasserman *et al.*, 2009, p. 359). Transcripts of the interviews that were held with the adventure tour participants were coded using Atlas.ti. Once this initial labelling had been done, and through a process of constant comparison, codes that contained similar central features or characteristics were grouped together to form more abstract higher-level categories. For instance, the following descriptive labels or lower-level categories; “happy customers”, “promote the experience”, “good food”, “awesome terrain”, “learn how to ride”, “get closer to nature”, “introspection”, “experience Africa”, “beautiful scenery”, “camaraderie”, and “see elephants” were grouped under the higher-level code “positive expectations” because they all had positive characteristics that the riders seemed to be looking forward to as a central idea or characteristic.

All codes and categories identified during the initial stage of the open coding process were grouped together in “code families” using Atlas.ti. These code families were printed and then arranged in a table that has the following headings: category, codes, quote to support creation of category and comment. This helped to establish groundedness and at times highlighted the necessity to regroup or rename codes/categories.

Table 1: A portion of the table used to sort codes into categories during the open coding phase

Category	Code	Quote to support category creation	Comment
Positive expectation	Awesome terrain	"Everything that I expected, the terrain is awesome, it is really what I wanted to do"	'Terrain' could mean scenery or could be the roads and paths the motorbikes road on?
	Get closer to nature	"...spend some time closer to nature"	Obviously because of the off the beaten track nature of adventure motorcycling.
	Introspection	"I think I really relaxed and am with peace inside, and finding this is for me" "The adventure is supposed to bring me to a state of mind where I will be much in contact with myself than I used to be."	First quote is more of a realisation. 'contact with myself', through introspection, challenges, being out of comfort zone?

Axial coding. Axial coding is a process that involves reassembling data in new ways after it has been fragmented during the open coding phase of the data analysis process (De Vos *et al.*, 2009). A thorough analysis was performed around a single category at a time primarily with reference to the coding paradigm outlined by Corbin and Strauss (1990). Causal conditions that gave rise to the occurrence of the category/phenomenon were investigated, the phenomena themselves were established, attributes of the context were explored by examining the set of facts or circumstances that surrounded the phenomena, intervening conditions were investigated, action/interaction strategies that were formulated by the actors to handle the phenomena were explored and the consequences of these strategies were taken into consideration during this phase of coding.

For instance, intense analysis was performed around the higher-level code/category/phenomenon, “positive expectations”. Some of what caused this phenomenon to come about were the anticipation of “spectacular terrain” and the opportunity of “learning how to ride” in challenging settings. The circumstances that surrounded this phenomenon was the motorcycle adventure tour itself. The action/interaction strategies that students employed to handle the phenomena involved adopting an enthusiastic attitude and positive approach toward the undertaking. The consequences of these strategies were that the riders “looking forward to the tour” and “having a positive attitude” toward the anticipated challenges.

Selective coding. The main idea that emerged during the open and axial coding phases were the expectations and realizations of a group of nine motorcyclists who took part in a twenty one day adventure motorcycle tour through parts of South Africa, Namibia and Botswana. All other categories were related to this core concept. The process employed to refine the description of the expectations and realisations of the motorcycle adventure tour group made use of several overlapping steps. These involved an explication of the story line, in which a general description of the expectations and realisations is outlined. Evans (2007) proposes that it is while explicating the story line that the researcher develops a story that “brings together the majority” of the elements uncovered during the research. Ideally only one core category should emerge (p.202).

A relationship between categories at a dimensional level as well as the way in which the categories relate to the core category was then outlined. Evans (2007) suggests that this step involve “asking questions and making comparisons” (p.202) of and between the categories and codes uncovered.

The relationships between categories were validated against the data by extracting salient quotations from transcripts of the interviews held with the group of adventure tourists incorporating them in a descriptive passage. The previously mentioned steps were not seen as distinct from one another but together allowed for the development of an analytic story. This analytic story was outlined in a descriptive passage

Table 3: Portions of the results of the selective coding process

	Central idea: The realizations and expectations of a group of adventure tourists.
Explicating the story line	The central idea that emerged revolved around the expectations and realizations of a group of nine motorcyclists who took part in a twenty one day adventure motorcycle tour through parts of South Africa, Namibia and Botswana. The motorcycles were accompanied by a backup four by four vehicle and a mobile kitchen. All participants slept exclusively in one man tents at various locations along the rout. Participants of the tour indicated positive, neutral and negative expectations....
	Some of the riders were also looking forward to improving their riding Many of the participants felt as though the fact that the adventure was going to be shared by others would likely lead to bonds being established between the riders.... Some of the riders expected that they and others would fall off of their motorcycles This seemed to result in some fear and excitement but also increased their expectations of adventure.
Relating categories at a dimensional level (extracts)	The expectations indicated by the participants ranged from positive to negative. Positive expectations were more dominant and there were also a few expectations that were neither positive nor negative, these could be termed neutral. The African terrain provided participants with predominantly positive expectations but the rough riding conditions resulting from this terrain ...
Relating all categories around the core category (extracts)	Positive expectations were principally centered on the spectacular African terrain and wildlife, learning how to ride in challenging conditions and getting to know oneself as a consequence. The negative expectations were mainly centered on the anticipation of mechanical problems and doubts regarding the various riders’ riding ability. Neutral expectations were mainly due to knowing what to expect and taking every moment as it comes.

Validating those relationships against the data	<p>Participants indicated that they were expecting the African terrain to be impressive. The following quotes relate to expectations of the African wilderness:</p> <p>“...the terrain is awesome, it is really what I wanted to do”.</p> <p>“...expected to see a lot of elephants”.</p> <p>Riding a motorcycle in challenging off road conditions emerged as a theme. The following quotes support this:</p> <p>“Learning how to ride a motorbike”</p> <p>“A little concerned about the guys on the motorcycles seeing that we have some foreigners”</p> <p>Neutral expectations were indicated by a participant who stated that he had "been through these places before so I know what to expect". Another stated that he “didn’t have any specific requirements”. Once again neutral expectations were expressed in the following statement: “I am not having any expectations about anything, time to reach a certain point. Were supposed to go further, we're not going further. I don't have expectations of what's going to happen and where to go and when to go Day by day, although there is a loose rotor, but it is a day by day experience”.</p> <p>Negative expectations centered mainly on mechanical problems and riding ability:</p> <p>"I was a little bit concerned about the guys on the motorcycles seeing that we have some foreigners, I was scared that they won't be able to handle the dirt or the sand road"</p> <p>Introspection emerged as one of the themes:</p> <p>"I think I really relaxed and am with peace inside, and finding this is for me"</p> <p>The positive realizations involved beautiful scenery, riding ability, introspection and camaraderie:</p> <p>“The food I can't complain about I know I only expect good food”</p> <p>"The food is great, and the company is great"</p> <p>"...the sand was my biggest fear and I really believe I overcame that fear"</p> <p>"Everything that I expected, the terrain is awesome, it is really what I wanted to do"</p> <p>Negative realizations involved mechanical problems, injuries and not being able to complete the tour:</p> <p>"...got hurt a little and could not complete the course, and is a bit disappointed about that."</p> <p>"Expected to see a lot of elephants (only saw one), the rest is fun"</p> <p>"No bikes must break anymore."</p> <p>"Did you think it would happen before we came? Why not.. Mechanical things break"</p>
---	---

Filling in categories and reflections. The expectations and realizations of participants can be divided into three different sections, positive, negative and neutral. The prospect of exploring the wilds of Africa contributed significantly to the positive expectations of the group of adventure motorcyclists. This resonates with ideas of freedom, escape, exploration and adventure. Weber (2001) points out that traditionally adventure has been allied to the “exploration of foreign, faraway places to search for new land, wealth, and scientific advances” (p.363). Much of the notion of adventure being associated with the exploration of far off places seems to remain part of the mindset of the modern day adventure tourist. Meisel and Cottrel (2003) argue that “perceived freedom” (p.393) is an integral part of many leisure activities. This seems to be particularly true of leisure activities that have an adventure component associated with it. Perhaps exploring the African wilderness, with its spectacular natural beauty and undeveloped rural areas, promises an experience that is free from the mundane restrictions of a more developed society.

The riding challenges that the motorcyclists would encounter in Africa’s untamed natural environment were generally regarded as a positive expectation. Implicit in these riding challenges is the notion of risk. An adventurer’s desire to be part of an adventure activity may be dampened if there is no risk involved (Weber, 2001:361). A significant positive realization experienced by some of the riders involved overcoming the riding challenges and the enjoyment experienced when riding over rough terrain. This is inline with Flucker, and Turner’s (2000) assertion that an adventure tourist would experience an activity most favorably if he or she was “able to match the degree of risk with his or her personal level of competence” (p.381). The various riding

challenges seem to present the motorcyclists with an uncertain outcome, they could not predict with certainty how they were going to deal with the rough riding conditions. The desire to achieve an uncertain outcome forms a significant part of the challenge that is inherent in many adventure activities (Morgan, 1998). These activities invite participants to pit their abilities against risky endeavors and in so doing attempt to overcome the various challenges associated with the activity. Participants self efficacy is directly proportional to the sense of control over the activity that they experience. It is interesting to note that participants perceive less risk in adventure tourism activities that are “voluntary, under personal control or undertaken as part of a group” (Morgan, 1998, p.5). Participants will typically only participate in an activity if they consider the risks associated with that activity to be acceptable. Morgan (1998) proposes that an unexpected outcome is often the result of a participant having an inaccurate perception of the level of risk involved in a particular activity. Physical injury, a negative psychological experience, fear or embarrassment could result from these inaccurate perceptions and unexpected outcomes. Injuries and the inability to complete the trip were some of the negative realizations experienced by the adventure motorcyclists. This is inline with Morgan’s (1998) assertion that negative experiences or realizations could be the result of an unexpected “accident, close call or mishap” (p.2). He goes on to point out that it is not altogether surprising that there is a potential for accidents given that participants in adventure tourism activities with limited skill are exposed to “conditions of high adventure” (p.2). Perceived risk is lower among participants in an adventure activity who have higher levels of competency associated with a particular activity (Morgan, 1998). Many of the more neutral expectations and realizations were expressed by riders who knew what to expect. Their previous experiences of similar activities allowed them to relax more and take each moment as it came. These riders did not seem to have the same level of fear for the unknown and did not consider the outcome of the adventure activities to be particularly uncertain.

Introspection and the opportunity to gain a better understanding of oneself emerged as a positive expectation. This seemed to be partially as the result of being alone on a motorcycle and partially due to being out of a comfort zone. Gaining some sort of insight serves as motivation for many individuals who participate in adventure activities (Weber, 2001). Often a participant would seek “risk for its own sake” (p.363) as well as for various emotional payoffs that result from the experience.

Meisel and Cottrell (2003) indicated that participants in adventure activities expected greater levels of excitement and surges of adrenaline if they lacked experience in the activity. Along with experience comes a more realistic approach that involved meeting people, enjoyment and the appreciation of nature. This could partially account for the fact that many of the participants in this research felt as though the fact that the adventure was going to be shared by others would likely lead to bonds being established between riders. This would lead to camaraderie and many pleasant social interactions. The sense of camaraderie may also be as the result of sharing the experience of talking a risky endeavor and being together in a relatively uncomfortable environment with limited facilities.

Mechanical problems emerged as a significant negative expectation and realization. Even though mechanical breakdowns were anticipated they can still be viewed as part of the uncertain outcome that seems to be a significant component of an adventure activity. None of the riders, even the more experienced, could anticipated exactly what mechanical problems would occur. It is interesting to note, however, that the realization of these problems were typically met with a kind of pragmatic resolve. They even seemed to provide bonding opportunities, perhaps because they made the adventure seem more authentic and encouraged participants to stand together. This resonates with Green and Chalip’s (1998) investigation related to sport tourism where participants considered themselves to be part of a subculture. They argue that the subculture element appeared to be “a source of mutual understanding, a basis for camaraderie” (p.280). Perhaps adventure motorcyclists are also inclined to see themselves as a subculture or exclusive group, a little separate from the more conventional.

IMPLICATIONS

The purpose of this study was to explore the subjective experiences of a group of adventure motorcyclists in order to gain a better understanding of their motives, expectations and the extent to which and the manner in which these expectations were realized. An understanding of the subjective experiences of adventure tourists will better enable tour operators and marketers to appreciate the kinds of activities that will appeal to this particular

type of tourist. This appreciation will place them in a better position to design adventure tours that would contribute to the positive realizations of their clients.

An understanding of the subjective experiences of adventure tourists would also help to improve the definition of this particular tourist activity and distinguish it from other forms of tourism. This distinction may also extend to the various types of adventure activities and help to articulate the distinction between, for instance, hard and soft adventure.

An understanding of the factors that attract participants to adventure activities would open up possibilities for cross selling within the tourism industry. Activities and experiences similar to the expectations of adventure tourists that are present in non adventure tourist packages could be accented in marketing material. For instance, an expectation of an adventure tourist may be to experience a different culture in an authentic setting or to be provided with an opportunity for introspection. These experiences could be promoted in other types of tourism as well.

Possible future research could involve an exploration of the other tourism activities undertaken by adventure tourists to uncover similarities and differences in expectations and motivation.

CHALLENGES OF SERVICE DELIVERY IN THREE COMMUNITY SERVICE CENTRES OF SOUTH AFRICAN POLICE SERVICE IN EAST RAND POLICING AREA OF GAUTENG, SOUTH AFRICA

P. Zondi, EE. Obioha and ID. De Vries
Tshwane University of Technology, South Africa

ABSTRACT

Community Service Centres (CSC) of the South African Police Service (SAPS) usually referred to as charge offices are the only offices which remain open daily, on a 24-hour basis to provide services to the community relating to safety and security. However, little is known from studies on the problems militating against their optimal service delivery to the clients, especially in the present dawn of public clamouring for effective service delivery in South Africa. Against this background this study was motivated to investigate the associated problems that inhibit the optimal service delivery of police officials deployed at CSCs in the East Rand area of Gauteng Province in the course of their duties and services to the communities. Three locations were purposefully selected from the East Rand Policing area, namely Bedfordview, Devon and Katlehong, from where the population of the study was derived. Though this paper relied mainly on the key informant interview source, the study made use of 112 respondents and 9 other interviewees which comprised of members of the Community Policing Forum (CPF) (3) and senior police commissioned officers of the SAPS (6). Survey and Key Informant Interview techniques were utilised as the main sources of data. Among other issues, the study generally revealed that poor road infrastructure, inadequate town planning shortcoming such as irregular numbering of houses, unoccupied houses and assistance to traumatized clients were seen as the major challenges that face these police officials at the CSCs. Remedies and measures to address and substantially deal with the challenges were identified in the study.

INTRODUCTION

The main issue regarding service delivery by the South African Police Service (SAPS) centres on professionalism and the manner in which these services are rendered for smooth running of the criminal justice system in South Africa. Customer care is a key issue for the government as members of the community need professional and efficient service. In their requirement for such services, organisational policies about how things should be done or why they cannot be done do not matter to the members of society (Ford, 1997:10). Service delivery is one of the priorities of the SAPS as outlined in their strategic plan for 2002-2005. All the five financial programmes have service delivery as one of the priorities that need to be looked at and accomplished (South African Police Services, 2002:23). The inclusion of service delivery as a priority shows that members of the SAPS top management view their customers as very important people to do business with and by implication furthering the business model of the SAPS functions and duties.

Police officials at the Customer Service Centres (CSC) of the South African Police Service are not just expected to deliver services, but quality services to the community. Quality services may include, but are not limited to, the following: quick attendance to and the use of good manners when answering a telephone call; quick response to complaints from within the policing precinct; quick attendance to and professionalism displayed when assisting clients who visit the CSC; knowledge of the job; demonstration of creativity when attending to clients; no laziness; and showing respect to clients. This mandate has been re-enforced by recent

guidelines initiated by the current President of South Africa, Mr Jacob Zuma, in which accountability by government officials was made a necessity (Mahlangu, 2009:1). Poor service delivery by various government departments, including the SAPS has caused the state a lot of unquantifiable material loss in many instances. It is difficult to predict what communities' reaction will be as a consequence of persistent poor, inefficient, and ineffective service delivery. As has been observed, they may either protest by means of mass action or resort to acts of vigilantism, especially where there is miscarriage or failure of the criminal justice system and police poor performance. Community reactions are not limited to the latter and there are various ways in which they show their dissatisfaction. In response to poor service delivery by the SAPS and reported delay or miscarriage of justice, some communities resort to unlawful self-organised activities that usually bring about lawlessness and disobedience to the law. This manifest in organisations being formed such as *Masithwalisane* in Mpumalanga Province, *Mapogo* in Limpopo Province, People Against Gangsterism and Drugs (Pagad) in the Western Cape Province and other provinces of South Africa (Sekhonyane and Louw, 2002:1).

The South African Police Service, like any other public organisation, has the main objective of delivering quality services to its customers. Delivery of services to the community members who are the clients of SAPS will not just be an easy and unchallenged task. Observation has provided enough proof that there is still much to be done by the South African Police Service to satisfy their clients from various communities that they serve. This scenario of apparent inability of the SAPS to completely satisfy their customers in terms of the expected service delivery is a national issue, though more pressure tends to mount on the Police service in highly urbanised provinces such as Gauteng, especially in areas with relatively high population density. Against this notion, this study highlights arrays of challenges which hinder the smooth delivery of services, which results to poor service delivery to the public in the East Rand policing area of Gauteng Province. This paper specifically presents findings on the problems associated with service delivery at the CSC and strategies that are already in place and those that can be put in place to resolve the identified problems.

LOCATION OF STUDY AND METHODOLOGY

For the purpose of this study, three locations were purposefully selected from the East Rand Policing area, namely Bedfordview, Devon and Katlehong, from where the population of the study was derived. According to Management Information Centre (MIC) in these stations, these locations have estimated community population of 800 000 (Katlehong), 135 000 (Bedfordview) and 16 103 (Devon). A total stratified sample of 112 respondents was selected for the survey, while 9 other interviewees were purposefully selected for the key informant interview that was conducted in the field, which comprised of three (3) members of the Community Policing Forum (CPF) and six (6) senior police commissioned officers of the SAPS. As data collection instruments, the study utilized a close ended questionnaire and a Key Informant Interview Guide for the survey and oral interviews respectively. The responses were focused on general and specific problems that the police officials encounter in the delivery of their services to the community and what remedies available to deal with the challenges. This discourse relied mainly on interviews conducted among the police officials in the three stations studied.

CHALLENGES FACING POLICE OFFICIALS AT THE COMMUNITY SERVICE CENTRES

Senior police officers from the Detective Service and Visible Policing units were interviewed with the aim of highlighting the challenges that negatively impact on service delivery by the CSCs. Based on the knowledge that police officials will not succeed in their endeavours to fight crime or to deliver excellent services without the involvement of the community, it became important to also elicit the views of senior members of the Community Policing Forum (CPF). Community Policing Forum is the legalised body in terms of section 18 of the South African Police Service Act, 68 of 1995 (Republic of South Africa 1995, Government Gazette) which stipulates that: The Service shall, in order to achieve the objects contemplated in section 215 of the Constitution, liaise with the community through Community Police Forums and Area and Provincial Community Boards, in accordance with sections 19, 20, and 21, with a view to- establishing and maintaining a partnership between the community and the Service; Promoting communication between the Service and the Community.

Generally, CPF members carry the joint mandate of the community and that of the police. They advance whatever points of concern from the community to the police or vice-versa. Through inclusive discussions with the CPF, members will send the message to the broader community via the CPF representatives. The CPF plays a crucial role in policing as a whole, but more specifically in discussion of security problems that face their respective community and vice versa, offering sponsorship to assist with training, assisting with resources and language interpretation when the need arises.

Specific to this discourse, since the locations investigated by the study differed demographically, the challenges may not be exactly the same; however, there are certain organisational problems that are the same for all areas. During the in-depth interviews, data were collected with regard to local challenges and organisational problems were highlighted by the respondents. A few challenges that have the potential to negatively impact on service delivery were revealed, and they are discussed.

Presence of Criminal Enclaves and Colonies (“hideouts”) in the Policing Area

During the interview with a senior member of the CPF in Katlehong, she mentioned that criminal hideouts exist in her locality. According to her, *“we have problems with empty houses which are used by criminals.”* A similar challenge was also echoed by the CPF member of Bedfordview. Of course, criminal hideouts are really community irritants. These hideouts are places such as unoccupied houses which the owners have left or abandoned because of various reasons. In many instances shacks in informal settlements are also used as hideouts. To some extent proper houses and even old, neglected government buildings are used by criminals. People migrate willingly and leave their properties such as houses unattended. Some could have left in the state of emergency, running away from law enforcement agents or when their lives were threatened. For instance, during the xenophobic attacks which troubled South Africa in the past few years especially before 2009, many people, especially foreigners, left their houses or places of shelter. Criminals use these empty houses to evade law enforcement agents, to plan their criminal activities, and to hide stolen items. Victims of rape are sometimes dragged into these places where the perpetrators will take advantage of them.

Cases that have demonstrated the dangers of hideouts are many in South Africa. In December 2010 a police Constable was shot dead while patrolling in Zola, Soweto. Similarly, the Area CPF raised a concern about mushrooming shacks in the Mzimhlophe hostel which is linked to another related incident where two police officials were shot dead while patrolling the Mzimhlophe hostel. The response from one of the officials of the CPF pointed towards the inappropriateness of the shacks as hideouts for criminals. According to the General Secretary of the Meadowlands CPF, *“The hostel harbours criminals. Long ago it was Ok. It’s only now that bad things are starting to happen”* (Mashaba, 2010:7). The demographics and environment of Katlehong are not much different from those of Soweto as there are a lot of hostels and informal settlements in the area. Bedfordview, however, does not have an informal settlement. Most people live in proper houses but observation has shown that people living in proper houses also leave their houses unattended for a long time, causing some unidentified people to seize the opportunity to inhabit them. All sorts of negative, criminal activities as mentioned above take place in the areas under investigation which, on closer scrutiny, are facilitated by empty/abandoned dwellings or premises.

The issue of criminal hideouts is becoming a growing problem that is not an easy battle. This problem grows as townships get more densely populated due to the movement of local unemployed people and foreigners who come here to seek employment. As some of them move from one location to another seeking for employment, their shacks are usually left behind unattended, perhaps in the hope of returning to them in the future. Similarly, observation has shown that as undocumented foreigners get arrested and deported on a daily basis, their places of shelter while in South Africa are often not destroyed. These people live in the hope of coming back after their deportation. The researcher frequented a hostel in one of the areas a lot and he is familiar with hostel life. There is a growing concept that the rooms are “inherited”. For example, a father will hand over his room to the son after retirement or to a family member upon leaving the hostel. A visit to the hostel will reveal that people who come from a certain area or are of a particular clan are usually located in one block. This

situation now allows uncontrolled influx of people into the hostel, out of which some may resort to criminal activities.

Unprofessional and Low Quality of Written Statements by Police Officials at the Charge Offices

Police officials deployed at the CSC are expected to spend most of their time writing statements from various complainants. The poor quality of many statements was raised as one of the challenges facing the CSC of the SAPS. Senior officers from the Detective Services from all the locations raised a concern about the poor quality of the statements when they were asked specifically to comment on the inclusion of elements of crime in the written statements just to test if that has reached a level of excellence, or could even just be rated as good. A Senior Detective police officer from Katlehong for example stated: *"The standard of statement taking is average; we cannot described it as good because we still find crime dockets which were not supposed to be opened due to lack of the criminal elements being identified [in the statements]."* According to Snyman (2002:32) "the requirements of criminal liability include: legality, act, conduct, unlawfulness, and culpability." These elements must be there before a person can be accused of committing a crime. Besides, these elements must somehow be visible in the statement when a criminal docket is opened. This is very important because the National Prosecuting Authorities of South Africa will check such elements before taking a decision whether a criminal case is feasible or not. Prosecutors will not even put the case docket on the court roll if the statement submitted by the police official does not meet the above requirements for criminal prosecution. In support of this, the Senior Commissioned Detective Officer of Bedfordview stated: *"It is an ideal situation that all statements taken will cover all elements of crime, but it is not always the case. We have young members who lack the knowledge"*. The Detective Senior Officer of Devon on the other hand maintained that most of the statements that he receives from the CSC do contain all the necessary elements of crime. In cases where dockets are received but the elements of crime are not clearly visible, a re-take of the statements may be required. This adversely affects the time spent by the complainant to make a statement and has economic consequences in instances where the complainant might have been coming from another area or province. The re-take of a statement becomes crucial if the matter is before the court, and the original statement contains omissions and vital elements of the case disregarded. However, it is also a very costly exercise where tracing witnesses or making calls to the complainants usually cost lots of money and time.

Another important issue which the officers from the Detective Service unit were required to comment on was the issue of linking suspects to a committed crime. Without comparing the different stations in terms of performance, all officers mentioned that this point was not always covered in the crime dockets they received on a daily basis. When they were asked to roughly quantify the success level out of one hundred percent, Commanders gave figures which ranged from 60% to 80% for correct statements. In criminal cases, when suspects are not linked to a crime, there is no justification for the arrest. In practical terms, some criminals will not face charges for crimes which they actually committed and in certain instances they will not be found guilty in court, or the cases will be discharged or withdrawn, due to the poor quality of the statements taken at the CSC. This results in ordinary members of the community pointing fingers at the judicial system, believing that it has failed them as law abiding citizens. Accurate descriptions of suspects and records of witnesses were the other points which were highlighted as not usually done properly during the opening of case dockets.

Inaccessibility of Areas and Inability to Locate House Addresses during Patrols

This issue was raised as a two-fold challenge, namely the shortage of resources like vehicles and police officials, and poor road infrastructure. Compared to Katlehong and Devon, Bedfordview policing area has a better infrastructure. In this regard the Senior Visible Policing police officer of Bedfordview who was interviewed stated the following: *"The policing precinct is very big and colossal. Vehicle allocation is not enough and these vehicles are not reliable"*. A similar problem with the size of the area was a point of concern for the Senior Visible Policing police officer at Devon, *"We have big farms which are far apart. We lack manpower. We cannot attend to all complaints within the shortest reasonable time"*. In Katlehong, it appeared from the interviews that in addition to problems of shortage of vehicles, some areas are not easily accessible because of

poor road infrastructure. In some areas, there are no street lights and no house numbers displayed which, according to the Senior Visible Policing police officer, are big challenges especially during the night. A senior member of the CPF in Katlehong stated: *“The Patrollers do appear as rescue to police in areas where it is not easy to locate an address. In some instances, the complainants will be asked to wait for the police next to a prominent structure like a tuck shop or something”*. Patrollers refer to the members of the community, not employed but assist the police by patrolling the streets on voluntary basis. By all indications, this practice is dangerous, especially when the complainant has to wait for the police in a lonely spot. Besides, the present problem makes on spot arrests and rescues somewhat difficult to accomplish.

Dealing with Psychologically Traumatized Clients in the Station

Crimes like rape and other violent crimes such as armed robbery, assaults with intent to inflict serious bodily harm, and vehicle accidents especially where loss of life has occurred may negatively affect sensitive people. Some victims and potential sources will be so traumatized that it will not be easy for the police to obtain their statements. It was learnt during fieldwork that stations like Katlehong and Bedfordview have put measures in place to effectively deal with traumatized clients. Victims of traumatic crime incidents get de-briefed by volunteers who are professional social workers. It must be added that trauma crime scenes do not only affect the victims or witnesses, but that members of the SAPS also become traumatized by such incidents.

REMEDIES FOR THE CHALLENGES OF POOR SERVICE DELIVERY IN THE POLICING AREA

As the problems were raised by the respondents, it was also interesting to note that in certain instances they had already put measures in place to address the identified problems. It must be remembered that some of the problems need a long term solution, while some will not completely disappear even after the implementation of corrective measures. Such latter challenges should be gradually dealt with as time progresses. For example, there will always be depressed and traumatized clients in the community out there as long as there are still criminals in the neighbourhood, and police officials will still face gruesome crime scenes. Meanwhile, other challenges like road infrastructure, street lights, and displaying street names and house numbers can be collectively rectified by the relevant authorities in consultation with the community.

Regularity of Police Patrol and Raids around the Enclaves

The presence of criminal hideouts is usually a major problem for community members and the South African Police Service alike. A short term solution for the police is usually to raid such premises often to disrupt criminal activities. In this regard, a senior member of the CPF in Bedfordview indicated: *“The Community Police Forum takes the issue of empty houses as their own responsibility. We make sure that we involve the relevant people, but only in those incidents which are reported to us.”* There seemed to be no remedy from Katlehong for this problem during the time of this study. The CPF representative mentioned that Katlehong is so big, that some places are known to the CPF while others only come to light when problems occur there.

Involvement of Council level Political Structure

This situation needs the involvement of the councillors in whose jurisdiction some hostels fall. Since some hostels are owned by municipalities, they should document all persons who are renting the rooms and make sure that there are bylaws which must be enforced. In 1990 system was working well when Municipality Police patrolled these premises. The Municipality Police were responsible for enforcing the Municipality Bylaws. This sentiment was echoed by the CPF Secretary General of Meadowlands who correctly stated that councillors have to go to the hostel and ask for permits from the residents (Mashala, 2010:7); in so doing, they will be exercising some control measures. This sentiment was expressed particularly after the killing of police officials who were on patrol around *Mzimhlophe* hostel in Soweto. Councillors on the other hand have to do something to solve the problem related to empty shacks as they are built on municipality grounds; in this regard, some municipality laws or bylaws must be enforced. There must be community leaders in each block around the informal

settlements whose job will be to liaise with community members and the police. This challenge has to be addressed jointly by the CPF and the police.

Regular and Appropriate Focused Police Training

Similarly, the solution to the problem of quality statements can only be addressed by means of vigorous training of police officials. The South African Police Service as the employer should lay a foundation which will allow police officials to engage themselves in further training at tertiary institutions of their choice. Senior police officers interviewed made mention during fieldwork of the in-service training given to young, inexperienced members which is used to uplift the standard of police officials while waiting for the formal courses. The police engage qualified trainers to impart knowledge to trainees in these SAPS training centres. However, one of the senior police officers from the Visible Police unit stated during the interview that the training process sometimes faced the challenge of unqualified trainers. This respondent stated: *“Training is not outstanding because some people providing this training are not educated enough and some do not have the necessary skills.”* It is also true that it depends on the individual to improve him or herself. Police management should come up with incentives that will encourage employees to further their studies. Training employees is an investment on its own, but government should also develop good career paths to prevent losing trained employees to private companies that offer better remuneration packages.

Procurement of Adequate Facilities and Equipment

Problems with regard to accessibility to certain areas during patrols were two-fold; shortage of vehicles and poor road infrastructure. On the issue of the vehicles, the SAPS as the employer recently distributed vehicles to be used by the police. To be exact, the SAPS in Gauteng received 313 new vehicles in January 2010, some of which were earmarked for use by CSC police officials. During the handing over of those cars, the National Police Commissioner at the time, General Cele, said officers receiving the vehicles should not abuse them, but should treat them like their children (Manzi, 2011:5). It must be mentioned that police stations in the East Rand, including those which formed part of the study, were also recipients of the new fleet.

It was revealed during study that complainants would be asked to wait for the police next to prominent structures like tuck shops, telephone containers or schools when their place of residence was not easily accessible by a vehicle. Proper road infrastructure is the responsibility of the government, and attempts to deal with this problem are noticed on a daily basis where construction sites are visible; however, it seems to occur at a very low pace.

Police stations also make use of community patrollers to access areas that are not easily accessible by vehicles, especially in Katlehong. Community patrollers help to locate complainants' addresses where no proper street numbering exists. In these cases local authorities should intervene as well, because the interim process is time consuming. Perhaps there should be some Municipality bye-laws to be enacted which will require house owners to visibly display house numbers. In reality, local authorities in Katlehong and Devon should start by naming and displaying street names because there are a lot of streets without signage. This practice will make the job of the police easier will find addresses more quickly when there is a complaint. Proper numbering and naming of the streets will prevent situations where the police arrive after many hours have lapsed, or not at all, after calls were made.

Victim and Trauma Support Programme

A distinction must be made between victims and witnesses who are traumatised because of exposure to serious criminal scenes. Victims of crime will be those whom the suspects confronted face to face, for instance a rape victim, while witnesses will be those who happened to see the incident in progress or after it has happened, for example people who come back home and find members of the family slain. Some of the victims will not find it easy to give statements to the police without having obtained professional help. Information gathered during the in-depth interviews revealed that traumatised complainants in Katlehong and Bedfordview have access to social workers who provide voluntary services to assist victims with counselling after exposure to traumatic incidents.

Counselling takes place at the police stations even after normal working hours. People who help with victim counselling are members of the CPF. Devon did not have a similar intervention programme at the time of this study. However, a senior member of the CPF mentioned that they started to put everything in place for such a programme. It is a fact that police officials who attend serious crime scenes are at times also deeply traumatised by the incidents they encounter. A clear example is a fatal car accident. Each police station has initial de-briefers who engage with such traumatised members before referral to the organisation Help Professionals. South African Police Service employs professional social workers and all employees of the SAPS have free access to them if there is a need. These social workers are stationed at respective Police Stations and at Provincial level. In addition to the latter initiative, the SAPS have trained members at each police station and at specialised units who can conduct initial de-briefings with traumatised members and they will in turn refer some of the police victims to professional social workers if there is a need, or on request of the members.

CONCLUSION

The study further reveals that although a number of inhibiting factors were identified, there are remedies already put in place to address such challenges. It is understood that not all the problems raised may be dealt with permanently, for example the problem of getting statements from traumatised clients. Some of the challenges require that the SAPS deal with them alone, whereas others need an integrated approach where the involvement of external role-players in the community and political structures, such as community leaders, local government councillors and social workers, may be of assistance.

Addressing the factors that inhibit optimal provision of quality services as raised by both the police officials and members of the CPF needs a concerted effort from both the SAPS and the concerned local political authorities. The initiatives already put in place to deal with the identified challenges by the role-players include in-service and formal training in statement writing, use of Community Patrollers, assistance given to traumatised complainants, and road construction in formally disadvantaged areas. They involved: the SAPS, the CPF and local Councillors. Quite spectacularly, while the other two locations are beginning to gain ground with regard to identifying respective criminal enclaves in their areas, Bedfordview CPF has already succeeded in taking ownership of identified criminal hideouts or unoccupied premises.
